(4) *The Social Welfare.*—In studying the social welfare we investigate the social functioning. The sum of the ends for which society exists is social warfare. Such ends are approximate or ultimate. The immediate results of efficient social organization are certain general conditions of well-being, in which all members of the community may share. They include the security of life and property which the political system maintains; the liberty and the justice which it is the business of the legal system to maintain; the material well-being which is created by the economic system; and the knowledge and the command over nature which are created by the cultural system. Collectively these proximate ends are public utilities. The ultimate end of society, as Plato and Aristotle so clearly recognized, is the perfection of personality, the creation of the social man. In the evolution of the social personality all phases of the life of the individual are affected. Vitality, mentality, morality, and that special aspect of morality which may be called sociality, are broadened and strengthened, or they are diminished, by the relations which man bears to his fellows. No two individuals are affected by social conditions in quite the same way or degree, and therefore the population is differentiated, in respect of these matters, into classes.

The primary distribution of the population according to vitality is into physically normal persons and defectives, and the normal are conveniently graded into the high, the medium, and the low vitality classes. In the high vitality class are those individuals who have a high birth rate, a low death rate, and a high degree of bodily vigor and mental power. This class is found chiefly in the well-to-do agricultural sections of the population. The medium vitality class roughly corresponds to the business and professional men of the large towns and great cities. The low vitality class is created chiefly

by unsanitary conditions in great cities, but it is found also in an ignorant, uncleanly part of the rural population. The defective include the blind, the deaf and dumb, and the congenitally deformed.

In respect of mentality the population is differentiated into the normal and the mentally abnormal or defective. In respect of morality it is differentiated into the moral and the immoral, and in respect of sociality into the social and the unsocial. The mentally normal, the moral, and the social are conveniently divided into the low, medium, and high classes. The mentally abnormal include the neurotic, e.g. the emotionally unbalanced and the hysterical, the intellectually unbalanced or insane, and the idiotic. The immoral include those to whom the word is ordinarily applied, also the vicious and the depraved. Morality is here used to mean objectively that conduct which the community as a whole approves, and subjectively self-respect and that desire for the good opinion of others which Spencer has called ego-altruism. Viciousness is that degree of variation from the prevailing practical resemblance in matters of conduct which the community disapproves and informally punishes. Sociality as here used means objectively a willing and efficient sharing in the acquaintance and coöperation of society, and subjectively altruism, thoughtfulness for others, sympathy, kindliness, and helpfulness. The opposite of sociality is criminality—that degree of variation from the prevailing practical resemblance in matters of conduct which the community disapproves and formally punishes. The low sociality class is composed of those in whom the social nature is positive but undeveloped. In the medium sociality class this nature is highly developed. Those who belong to this class are socialized. In the high sociality class the social nature is developed in the highest degree. Those who belong to this class are both socialized and individualized. They not only participate in altruistic activities, but they also plan and lead them. The unsocial include the de-individualized, who contribute nothing to society, but are dependent upon it; the desocialized, who have become hostile to society and forcibly prey upon it; and the degraded, who are both de-individualized and desocialized. The de-individualized include paupers, and the desocialized include criminals.

The supreme achievement of society and the final measure of the success or failure of any State is its contribution of great personalities, great creations of art, great thoughts and ideals, to that universal society which embraces all mankind and endures through the ages of history. Measured by this standard some petty city States, like Athens and Florence, have been among the supreme examples of social evolution.

Historical Sociology. In historical sociology we again study the phenomena of the social population, the social mind, the social organization, and the social welfare, but on a larger scale. We inquire into the evolutionary origins of society and we find that long before man appeared upon the earth social relations had become established in the animal world, and that man undoubtedly began his career with an endowment of social instinct. Social relations and mutual aid influenced natural selection, and thereby affected the whole course of animal evolution. Association in its beginnings, therefore, was zoögenic. Through a further development of association, language, animistic ideas, arts, and religions came into existence, and the animal mind was converted into the human mind, and the animal body into the human body. This stage of evolution was anthropogenic. A higher evolution of the consciousness of kind created tribal instincts and customs, and gradually built up the highly complex system of ethnic society. This was ethnogenic association. Finally, through the recognition of mental and practical resemblance irrespective of kinship, civil or demotic society came into existence. The demos or people, as distinguished from the tribe, appeared, and with it civilization.

In animal societies all the essential phenomena of a social population may be observed, but those of the social mind are of the most rudimentary sort. There is no social organization beyond the slight beginnings of family life, and a loose formation of bands or flocks.

In anthropogenic association the phenomena of the social mind begin to assume importance. Language is a product of association and reacts upon it. Vocal signs become conventionalized through imperfect imitation. The power of conceptual thinking, correlated with the evolution of language, is correlated also with association, for every true concept is a product of more than one mind. Conceptual thinking and self-consciousness enormously multiply the possible responses to stimuli and bring into the consciousness of kind all its higher reflective elments.

The great problems of ethnogenic association are those of the genesis of family, clan, tribe, and confederation; of the priority of relationship through mothers over relationship through fathers; and of that gradual disintegration of organization based on kinship, by the growth of an essentially feudal association based on personal allegiance, which prepared the way for civilization.

The primitive family, we may now feel reasonably sure, was an unstable pairing arrangement, usually of short duration. From this form were differentiated polyandry (q.v.), polygamy (q.v.), and monogamy. (See Family; Marriage.) The steps by which the clan was formed perhaps cannot be quite clearly traced. Primitive man counts relationships in one line of descent only. This fact accounts for the exclusion from the kindred of one-half of all those persons who are equally near in blood. The development of the tribe and the confederating of tribes is a consequence chiefly of warfare, which often brings weak groups under the domination or protection of the strong, or leads related tribes to combine against their common foe. When new tribes are formed by the subdivision of one that has grown too large for subsistence on the tribal domain, families from each clan of the older tribe may go into the new tribe. In this way a cluster of tribes may be closely related in blood and speak dialects of a common language, conditions highly favorable to confederation and subsequent evolution as a nation.

Tribal confederations that have become civil States have undergone a further evolution, however, which has destroyed many of the characteristic features of tribal organization. To begin with, the metronymic system is superseded by

the patronymic. The transmission of property and office from father to son thus made possible leads to the differentiation of certain families as of superior rank. If a primitive agriculture has been supplemented by pastoral industry, wealth in cattle becomes one of the chief temptations to engage in tribal wars. Chieftains as leaders of successful expeditions receive an exceptionally large number of stolen cattle, and the privilege of pasturage on the border lands of tribal territory. They obtain also as retainers and herdsmen the broken and ruined men of other tribes, whose clans have been destroyed, and whose future position in society is secured only by their allegiance to a powerful protector. From such beginnings a rude tribal feudalism develops, which encroaches steadily upon the earlier kinship system. (Consult Sir Henry Maine, *Lectures on the Early History of Institutions.*) Evidences of this stage of evolution are found in various bodies of barbarian law, but especially in the Irish and Welsh codes.

When a confederation of tribes becomes thoroughly consolidated by war or otherwise, the chieftaincy of the confederation, having become hereditary, may develop into a kingship through the uniting into one of the offices of chief military leader, supreme judge, and high priest.

At this stage the ethnic society is on the point of passing over into civilization. If it is tempted by the pressure of population upon the means of subsistence to migrate to a more productive region, and after conquering the occupiers of a coveted territory, reduces them to task work, and establishes itself permanently on the soil, it undergoes a further development of feudal organization, and in the course of time begins to include as members of the settled clans and tribes any newcomers who come to reside among them.

Civilization once established develops through three stages, which are well marked so far as the structure, policy, and activities of society are concerned, but which to some extent overlap and run into one another chronologically. The breakdown of the kinship system, and the intermingling of men of diverse origin at centres of industrial and commercial activity, are presently followed by the beginnings of assimilation and amalgamation. When this process is perceived, the possibility of creating a new ethnic unity on a broad scale—the unity of a people, one in language, in religion, and in standards of conduct—is seized upon, and a passion for homogeneity begins to express itself in certain great policies. The attempt is made by military campaigns to bring into one political organization adjacent peoples nearly related in blood, in language, and in tradition, and to annex any territory which may form with that already occupied a geographic unity. The militarism thus developed is of itself a powerful unifying agency, and it is supplemented by policies of religious unification, and by harsh systems of sumptuary legislation and of criminal law.

When the work of nation-making by policies of unification has been completed, the first stage of civilization yields to a second, which is a result of the liberation of energies no longer demanded in military activity. Commerce, travel, and learning receive a new impulse. The comparative study of peoples and institutions leads to criticism and discussion. The authoritative régime is subjected to review; it begins to disintegrate under impeachment and resistance. Rationalism and liberalism create the great institutional products of civil liberty and constitutional law. Men no longer care as of old for perfect mental agreement; they encourage the growth of independence and variety. This is the age of progress, of the liberal-legal civilization.

Presently, however, wide liberty, divergence of mental type, and the multiplication of differing interests begin to threaten social cohesion. Powerful and unscrupulous men abuse their liberty, using it to take an unfair advantage of others and to curtail the liberties of the weak. Freedom of enterprise and of contract are followed by an enormous increase of wealth and of population. But the wealth is concentrated in relatively few hands and increasingly large numbers of working men find that they are not receiving a proportional share of well-being. Growing inequality places the severest strain upon the social system, and compels the community to limit liberty in some measure by equality. Political and legal equality come first, but measures of economic equality also are demanded, and great educational enterprises try to achieve an equality of cultural opportunities. This is the modern democratic movement, and the third stage of civilization.

Explanatory Sociology. This department is as yet in a very incomplete state of development. So far as the physical side of social evolution is concerned, it exhibits the same phenomena of integration, differentiation, and increasing definiteness of organization, that material bodies undergo. The cause also is the same, namely the equilibration of energy between bodies overcharged and contiguous bodies undercharged. There is such an equilibration between a population and its environment, and all the energy that society is enabled to expend it derives from the bounty of nature, supplemented by industrial activities. There is such an equilibration of energy between strong and weak States and between strong and weak races. The transformation of the weak by the strong can never cease until equilibrium is established. The transformation need not be a military conquest, however, or even an economic exploitation. So far as physical law is concerned, it may equally well be an uplifting of the weak to higher planes of sympathy and intelligence by the hands of the strong. The extent to which the process may thus be philanthropic depends upon the growth of the consciousness of kind. Originally limited to the kindred of horde and clan, it has broadened into tribal and at length into a national consciousness. To-day it is becoming a human consciousness. In all this transformation every change obeys the laws of parsimony. Motion follows the line of least resistance and human activities try to achieve given results with the least expenditure of effort. In is only a corollary of this law that activity is conditioned by the consciousness of kind, since strangeness and antipathy are resisting conditions. It is only another corollary again that dogmatic like-mindedness develops out of sympathetic, and deliberative like-mindedness out of dogmatic; for the results achieved by the lower forms of concerted volition, namely the instinctive and the

sympathetic, are wastefully accomplished as compared with those achieved by the higher forms. These laws are otherwise formulated as the great laws of diminishing and increasing returns, long familiar to economic science, but equally true in the realm of social phenomena. When the lower forms of activity are carried far they begin to yield diminishing returns. When old channels of activity are obstructed energies break through into new channels, and for a time new adjustments yield increasing returns. By these laws we account for the substitution of reason for impulse, of deliberation for mob-like action. The substitution is in a broad sense a natural selection. Social activities and forms begin unconsciously. In the course of time men, becoming aware of the social relations that have spontaneously developed, try to perfect them. They create institutions and carry out policies. The unconscious operations of nature now again assert themselves. Some of the products of man's invention, proving useful, and promoting his welfare, survive. Others perish and are forgotten. Those social forms survive which, like organisms successful in the struggle for existence, yield on the whole increasing returns of useful conversions of energy.

BIBLIOGRAPHY. See works quoted in text.

SOCKEYE (corruption of Indian name *sauqui* or *sawkeye*). One of the most prominent of Pacific salmon, the blueback. See SALMON.

SOCLE. A plain plinth, forming a pedestal for the support of a statue, column, etc.

SOCORRO. A town of the Department of Santander, Colombia, formerly its capital, 145 miles northeast of Bogotá (Map: Colombia, C 2). It has crooked streets and flag pavements. Its chief industries are the weaving of mantles and the manufacture of straw hats. Its population in 1886 was about 20,000. The town was founded in 1540 and after its destruction in 1681 moved to its present location. In 1781 a formidable revolt took place here, and in 1810 there was issued a formal declaration of independence from Spain.

SOCOTRA, or **SOKOTRA,** sō-kō'trȧ or sōk'ō-trȧ. An island in the Indian Ocean, at the entrance to the Gulf of Aden, about 147 miles east of Cape Guardafui (Map: Africa, K 3). It is 80 miles long and 55 miles broad. Area, 1382 square miles. The centre of the island is occupied by the Haghier chain, attaining nearly 5000 feet. The coasts are partly fringed by cliffs, mostly low. There is a long plain of drifted sand along the southern shore. The valleys are well watered and rich in vegetation. The climate is hot and dry. The dry season lasts from May to October, during which time there is practically no rain in the lower parts of the island, and many of the rivers dry up entirely. The flora is of great variety and abounds in many aromatic species, such as dragon's-blood, myrrh, frankincense, aloe, etc.

There is little agriculture. The principal products of the island are butter and incense which are exported to Bombay, Zanzibar, and Arabia. The natives keep extensive herds of goats and cows. Politically Socotra is a protectorate of Great Britain, but foreign control extends hardly beyond the collection of taxes. The population is estimated at 10,000—a mixed race of Arabs and Hindus who are found along the coasts, and the Sokotri, the aborigines of the island, who are also believed to be of Arabic origin, and are confined principally to the mountainous districts. Alexander is credited by the Arab geographers with having founded a settlement in Socotra, which came later under Persian influence. It was occupied by the Portuguese at the beginning of the sixteenth century and now forms a part of the Sultanate of Kishin. It was annexed by Great Britain in 1886.

SOCRATES (Lat., from Gk. Σωκράτης) (B.C. 469-399). An Athenian philosopher. He lived through the age of Pericles, the Peloponnesian War, and the tyranny of the 'Thirty,' and was condemned to drink the hemlock cup by the restored democracy. He was of humble but genuine Athenian stock. Plato makes him compare his own art of delivering pregnant minds of their conceptions to the profession of midwife exercised by his mother. He received as a boy only the old-fashioned elementary education in music and gymnastics, but later familiarized himself with the modern education of the Sophists in rhetoric and dialectics, with the speculations of the Ionic philosophers, and all the new culture of which Periclean Athens was the focus. Plato represents him as veiling behind an ironical profession of ignorance an ingenuity and resourcefulness that made him more than a match for the most distinguished specialists. Xenophon, while affirming that Socrates held the proper study of mankind to be the moral life of man, adds that he was by no means unversed in the curious inutilities of mathematical and physical speculation. He followed at first the craft of his father, a sculptor, and tradition attributed to him a group of the three Graces draped, which Pausanias saw on the Acropolis. The greater part of his mature life, however, was spent in the market place, streets, and public resorts of Athens in conversation with all who cared to listen, or whom he could lure to render an account of their souls and submit themselves to his peculiar style of interrogation. In Plato and Xenophon he has no other occupation, except, of course, the normal civic duties of every free-born Athenian. He served as a hoplite with conspicuous bravery at Potidæa (B.C. 432), Delium (424), and Amphipolis (422). In B.C. 406 the chances of the lot made him a member of the senate of the 500 and presiding prytanis on the day when the illegal motion was offered to condemn to death by one vote the generals who had neglected or been unable to rescue the wounded after the naval battle of Arginusæ. He refused to consent to the putting of the vote, defying the anger of the mob, even as a few years later he withstood the tyrants and refused to execute the command of the 'Thirty' bidding him assist in the arrest of an innocent citizen, Leon of Salamis. By his wife, Xanthippe, he had three sons, one of whom was a lad at the time of his father's death. The tradition of Xanthippe as the scolding wife and typical shrew is ignored by Plato, who merely mentions her presence in the prison on the last day before and after the dialogue on immortality.

In the *Apology* or defense which Plato puts into his mouth on his trial, Socrates half seriously affirms that his peculiar way of life was a mission imposed upon him by God. The oracle of Delphi (the story presupposes that he was already well known), in response to the question

of a more enthusiastic than judicious disciple, had pronounced Socrates the wisest of men. Conscious that his only wisdom was self-knowledge, the knowledge that he knew nothing, he proceeded to test those reputed wise at Athens, the poets, the statesmen, the artists. He found in each case that the value of the specialist's particular talent was more than nullified by his inability to render a rational account of it, and the false conceit of a larger knowledge not possessed, and he inferred that it was his divinely appointed mission to force upon his fellow men self-knowledge and conviction of ignorance as the first step toward self-betterment. Such a profession exercised for thirty or forty years amid a gossipy and jealous population brought him more notoriety than popularity.

The effect was heightened by the startling contrast, to Greek feeling, between Socrates's exterior and the dignified and impressive demeanor to be expected of a great teacher and leader of men. The ungainly figure; the protuberant belly; the Silenus-like masque with bald head, prominent eyes, and wide, upturned nostrils; the beggarly garb; the vulgar instances and homely parables in which his wisdom disguised itself; the personal oddities of the man; his hour-long fits of staring abstraction; his ingenious art of cross-examination entrapping the cleverest into self-contradiction; the mysterious admonitions of his 'Dæmon' or inner voice; the habitual asceticism of this barefoot philosopher, content with bread and water and one garment summer and winter, yet able on occasion to outdrink and outwatch and outtalk the boldest revelers and most brilliant wits of Athens—all these traits as felt by the inner circle of disciples and portrayed by Plato's art only add piquancy to the demoniac personality thus half revealed and half concealed. But to the multitude they only made up a figure of comedy. In the *Clouds* of Aristophanes (423), the man whom we conceive as the anthithesis of the Sophistic rhetoric and the founder of moral and mental as opposed to physical philosophy appears as the master of a 'thinking shop' in which pale-faced disciples burrow into the bowels of earth, and where unscrupulous fathers can have their sons taught the art of making the worse appear the better reason, while he himself aloft in an aërial basket "treads the air and contemplates the sun." The comedian is not bound to make nice distinctions. For Aristophanes, Socrates was an apt comic embodiment of the new learning which the conservative poet detested. Like the Sophists, he occupied the young men with something else than the care of healthy bodies, and he resembled the Sophists in the unsettling effect of his questioning of the established order. Plato, for artistic reasons, puts these attacks of comedy as manifestations of the popular prejudice in the forefront of the *Apology*. The immediate causes of Socrates's condemnation were probably the hostility aroused by his ironical comments on the democratic method of deciding great questions by the lot or the show of hands, and the distrust felt by the average man for the leader of the traitor Alcibiades, the tyrant Critias, and the Philo-Laconian Xenophon. In 399 a poet, Meletus, a demagogue, Anytus (a prominent democratic politician), and an orator, Lycon, presented a formal charge in the Court of the King (Archon): "Socrates is guilty of rejecting the gods of the city and introducing new divinities. He is also guilty of corrupting the youth." The first charge relates to the 'Dæmonion,' or divine something of Socrates about which a large and unprofitable literature exists. In Plato, it is merely the voice of an inward spiritual tact always operating negatively as a check to actions, however trifling, opposed to the true interests of the soul. Other writers have reported it with superstitious, psychological, or pathological flourishes after their kind. Corruption of youth was the serious charge. The case came before a jury of about 501 members. Socrates declined (the story goes) the professional aid of the orator Lysias, and defended himself in a speech of which the spirit is preserved in the Platonic *Apology*, a masterpiece of art in its seeming simplicity. Condemned by a small majority, he took still higher ground when it came to fixing the penalty, and proposed, so Plato says, that it be maintenance in the Prytaneum as a public benefactor. At the solicitation of Plato, Crito, and other friends, he finally proposed to pay a fine. The jury naturally voted by an increased majority for the alternative penalty of death, which Socrates doubtless expected and was willing to accept as an appropriate crown of martyrdom and a release from the approaching infirmities of age. The rest is told in two immortal dialogues of Plato. The *Crito* shows us Socrates in the interval of respite caused by a religious festival and the absence of the sacred ship at Delos, resisting the importunities of his friends that he should escape by bribing his jailers, and so, as he says, in very deed teaching young men by his example to violate the law. The *Phædo* depicts the long final day spent with friends in conversation on the immortality of the soul, and the last scene of all, "how bravely and cheerfully the first great martyr of intellectual liberty met his doom."

The self-control which he exemplified and the self-knowledge which he inculcated are the keynote of Socrates's philosophy. The basis of his ethics was the principle or paradox that all vice is ignorance, and that no man is willingly bad. In logic Aristotle tells us that there are two things which we may justly attribute to him: inductive arguments and the quest for general definitions. But, as he left no writings, we cannot tell what system of thought, if any, he constructed on these presuppositions and by this method. We may divine that he was much more than the homely Johnsonian moralist of Xenophon, and something less than the poetic dialectician and metaphysician of Plato. But we cannot know. Plato was a cunning dramatic artist, and the seeming simplicity of Xenophon's *Memorabilia* is no warrant of its historical fidelity. Ten years of adventure presumably separate Xenophon from the conversations which he professes to record. Both the *Memorabilia* and the minor Platonic dialogues doubtless contain many genuine reminiscences of the 'real Socrates.' But we cannot use them to construct a body of doctrine for him. The tremendous influence of his personality remains one of the great facts of history. Through the 'complete Socratic' Plato and his pupil, Aristotle, he determined the entire subsequent course of speculative thought. The 'imperfect Socratics,' the founders of the other schools of ancient philosophy, drew their in-

spiration from partial aspects of his character. The Socrates who wore one garment summer and winter, walked barefoot on the snow, and exclaimed at the fair: "How many things there are that I do not need," became through Antisthenes the author of the Cynic way of life and the Stoic philosophy. The Socrates who was all things to all men, and outdrank Aristophanes at Agathon's banquet, was the model of Aristippus, the founder of the Cyrenaic (and Epicurean) philosophy of experience and pleasure. The ideal Socrates depicted in the Platonic *Apology, Crito, Gorgias,* and *Phædo* became, in the decay of the old religions, the chief religious type of the ancient world, and to such moralists as Epictetus, Seneca, Dio Chrysostomus, and Marcus Aurelius the very embodiment and guide of the higher life.

The best authority accessible to the English reader is Zeller's *Socrates and the Socratic Schools* (Eng. trans., 1877). Joel's *Der echte und der Xenophontische Socrates* (Berlin, 1901) is an ingenious attempt to extract the 'real Socrates' from Xenophon's *Memorabilia.*

SOCRATES, Prison of. The name popularly given to three chambers hewn in the face of the hill of Philopappus at Athens. The chambers are of small dimensions, and one of them is connected with a vaulted rotunda, the circular opening of which was originally closed by slabs. The arrangement in general is similar to that of the so-called Treasury of Athens at Mycenæ.

SODA (It. *soda,* soda, saltwort, glasswort, contracted from *solida,* fem. of *solido,* from Lat. *solidus,* hard, solid; connected with OLat. *sollus,* Gk. *ὅλος, holos,* Skt. *sarva,* whole, entire), or Sodium Carbonate, Na_2CO_3. A white solid substance having a strong alkaline reaction and crystallizing with ten molecules of water, $Na_2CO_3+10H_2O$. In commerce it appears both with and without water. Crystallized, hydrated sodium carbonate, also called 'sal soda,' is the common washing-soda; sodium bi-carbonate, or 'acid' sodium carbonate, $NaHCO_3$, is the common cooking-soda, an important constituent of all baking powders. The dry carbonate, Na_2CO_3, is used in enormous quantities in the manufacture of glass and soap. Native sodium carbonate, or 'sodium sesquicarbonate,' $Na_2CO_3.2NaHCO_3+2H_2O$, is found to some extent in all dry regions, notably in Hungary, Egypt, and the deserts of Africa, Asia, and North and South America, but in no other country does it occur in greater quantities than in the region lying east of the Sierra Nevada Mountains. The mineral is known as *trona.* Formerly most of the sodium carbonate of commerce was derived from the ashes of certain plants, chiefly barilla and kelp, but at the present time the quantity derived from all other sources is insignificant when compared with that manufactured from common salt.

Natural soda, which is the residue obtained by the evaporation of natural alkaline waters without the aid of artificial heat, occurs as white incrustations on the alkali plains; the most important deposits, however, are in the form of 'sinks' or lakes without outlet, in which the leachings and drainings of the alkali plains have been collected and concentrated. In the United States the waters of three lakes only, Albert Lake in Oregon and Mono and Owens lakes in California, are estimated to contain more than 118,000,000 tons of sodium carbonate and nearly 30,000,000 tons of sodium bi-carbonate. Owing to the great distance from large Eastern markets and the consequent high freight charges, this immense supply of raw material for the manufacture of the various sodium salts has not entered into successful commercial competition with the brine deposits of the Eastern States. The production of soda ash (sodium carbonate), sal soda (hydrated), sodium carbonate, sodium bi-carbonate, and caustic soda (sodium hydrate), from 50 works in the United States during 1902, aggregated more than 500,000 tons, which involved in the manufacture approximately 1,000,000 tons of salt. The quantities and values of these sodium compounds produced in the United States during 1900, according to the Twelfth Census, are given in the subjoined table:

	Pounds	Value
Soda ash	781,306,000	$4,559,656
Sal soda	126,498,000	875,243
Sodium bicarbonate	138,712,000	1,332,765
Caustic soda	233,566,000	3,170,280
Total	1,280,082,000	$10,237,944

Manufacture of Sodium Carbonate. Sodium carbonate is manufactured commercially by several processes, of which only two are of importance—the Leblanc process and the Solvay process, each named from its respective inventor. The *Leblanc process* consists of three stages: (1) The conversion of common salt (sodium chloride) into sodium sulphate by the action of sulphuric acid, accomplished by the aid of heat in a reverberatory furnace. This stage is called the salt-cake process, 'salt cake' being the technical name applied to the sodium sulphate product. Two chemical reactions are involved in this stage, viz.:

$$NaCl+NaHSO_4=Na_2SO_4+HCl$$
$$NaCl+H_2SO_4=NaHSO_4+HCl$$

(2) The decomposition of the sodium sulphate, by means of calcium carbonate and coal, at a high temperature in a furnace, the result being a crude product known as 'black ash,' which consists of sodium carbonate, calcium sulphide, calcium oxide, calcium carbonate, and small quantities of other substances. The principal reactions taking place in this stage of the process may be expressed by the following chemical equations:

$$5Na_2SO_4+10C=5Na_2S+10CO_2$$
$$5Na_2S+7CaCO_3=5Na_2CO_3+5CaS+2CaO+2CO_2$$

(3) The extraction of the sodium carbonate by treating the black ash with water to dissolve the sodium salt, which yields a solution called 'tank liquor,' containing also sodium hydrate. The crystals of sodium carbonate are obtained ultimately by evaporation, and, when calcined, yield the dry sodium carbonate of commerce, technically known as soda ash. The calcium sulphide remaining undissolved in the residues is treated for its sulphur content, and the hydrochloric acid produced in the first stage of the Leblanc process is saved for use partly as such, partly for making bleaching powder. In this manner from first to last there is practically nothing wasted except the calcium.

The transformation of the salt cake into black ash is generally carried out in a reverberatory furnace (Fig. 1), called a 'black-ash' or 'balling

furnace.' Usually 100 pounds of salt cake, 100 pounds of calcium carbonate, and 50 pounds of coal dust form a charge. The hand-worked furnace is a long reverberatory with a hopper in the roof through which the charge is dropped into the first hearth near the flue where the heat is not

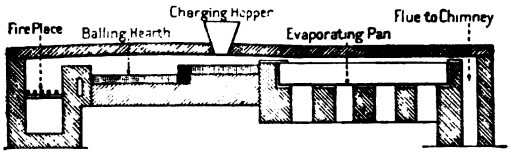

FIG. 1. LONGITUDINAL SECTION OF A BLACK-ASH FURNACE.

very high; after thorough drying and heating, the materials are raked down onto the second or 'balling hearth,' where the temperature is usually about 1000° C., and thoroughly rabbled until it becomes a thick, pasty mass from which carbonic acid gas escapes freely. As soon as the salt cake is decomposed, the charge begins to stiffen and carbonic acid gas (CO) is evolved, as is shown by jets of blue flame (the carbonic oxide is produced by the action of coal on the excess of calcium carbonate present). The charge is then raked into a ball and removed from the furnace to an iron truck, the escaping bubbles of gas causing the pasty mass to become porous. The shallow iron pan between the furnace hearth and the flue to the chimney is used for the evaporation of the tank liquor obtained by the lixiviation of the black ash in the third stage of the process. The furnace operation is quite difficult, and although the heavy tools are suspended by chains, the temperature is so intense that the quantity a man can handle at one time is limited to 300 pounds. In order to eliminate expensive hand-labor and to work larger charges, revolving cylindrical black-ash furnaces are used; the common size, 16 feet long and 10 feet diameter, can treat as much as two tons of salt cake in a single charge. The lixiviation of the black ash is accomplished in a series of terraced tanks each with a false bottom perforated with small holes. The uppermost tank is charged with black ash, and water added to cover the charge; the solution of sodium carbonate formed, being heavier than water, sinks to the bottom of the tank and is passed through the perforations, and is withdrawn by means of a pipe which delivers it to the second tank in the series, through which it passes to the third tank, etc. The operation is continuous, fresh water being added to the nearly exhausted ash in the uppermost tank to yield an unbroken flow of strong liquor. Good tank liquor contains approximately 23.5 per cent. of sodium carbonate and sodium hydrate.

The French Academy of Sciences in 1775 offered a prize for a method of making sodium carbonate from salt. Among the processes submitted was that of Nicolas Leblanc, which was of promising merit, and, being granted a patent in 1791, he began the manufacture on a commercial scale. The Leblanc process is regarded as the most important discovery in the entire range of chemical manufactures, and has furnished about one-half of the world's supply of soda. The fact that it produces both hydrochloric acid and bleaching powder as by-products has enabled it to survive competition, but the recent introduction of electrolytic processes, which also yield bleaching powder as a by-product, is a serious menace to its future.

The *Solvay process*, or 'ammonia-soda process,' is based on the fact that hydrogen-ammonium carbonate, $(NH_4)HCO_3$, is decomposed by a strong solution of common salt, yielding sodium bi-carbonate and ammonium chloride, as shown by the equation:

$$(NH_4)HCO_3+NaCl=NaHCO_3+NH_4Cl.$$

The brine is first saturated with ammonia gas, and the cooled ammoniacal liquor is subsequently charged in carbonating towers with carbonic acid gas under moderate pressure; the sodium bi-carbonate, being much less soluble, separates out and leaves the more soluble ammonium chloride in solution, from which the ammonia is subsequently recovered by treatment with lime. The sodium bi-carbonate is converted into sodium carbonate by calcination, and the carbonic acid gas evolved is again utilized to carbonate a second quantity of ammoniacal brine. In this cycle of operations no sulphuric acid is required and no hydrochloric acid is evolved.

The reactions involved in the ammonia-soda process were discovered by H. C. Dyar and T. Hemming about 1838, but the process was not perfected until 1873. In 1863 Ernest Solvay, a Belgian, constructed the first successful plant, which has led to an enormous development of the industry.

SODIUM HYDROXIDE, SODIUM HYDRATE, OR CAUSTIC SODA, NaOH. This is of importance next to sodium carbonate only, on account of its use in enormous quantities in refining fats and vegetable oils, and in the manufacture of soap. In appearance it is a white solid, strongly caustic and highly deliquescent. It is readily soluble in water, with evolution of heat, and by cooling a concentrated solution to 8° C., a deposit of crystalline sodium hydrate ($2NaOH + 7H_2O$) is obtained.

Sodium hydroxide is one of the strongest alkalies known. On a large scale it is manufactured by the action of milk of lime (calcium hydrate) upon a boiling solution of sodium carbonate, whereby calcium carbonate is precipitated, and sodium hydrate remains in the solution. The reaction is

$$Na_2CO_3+Ca(OH)_2=CaCO_3+2NaOH.$$

After the removal of the solid calcium carbonate the solution is evaporated, and finally yields the solid sodium hydrate. One of the chief sources of supply is the tank liquor, produced in the manufacture of sodium carbonate by the Leblanc process (see above). The tank liquor, containing essentially sodium carbonate and sodium hydrate, is heated to boiling and an excess of lime is stirred into the mixture. The sodium sulphide present in the tank liquor is oxidized to sodium sulphate by the combined action of air injected into the mixture and of sodium nitrate, which is added for the purpose. The solid calcium carbonate is separated by filtration. The action of sodium nitrate is shown by the following equation:

$$NaNO_3+2H_2O=NaOH+NH_3+4O.$$

The oxygen set free reacts upon the sodium sulphides present, and converts them into the sulphate.

In recent years sodium hydrate has been manufactured to a considerable extent by the electrolysis of brine, also by the direct electrolysis of fused common salt. The two most recent electrolytic processes are the Aussig 'bell process' and

the Acker process. The former has been under development at Aussig. The broad features of the method are illustrated in Fig. 2. In this diagram, *a* represents the anode, *b* the solution of

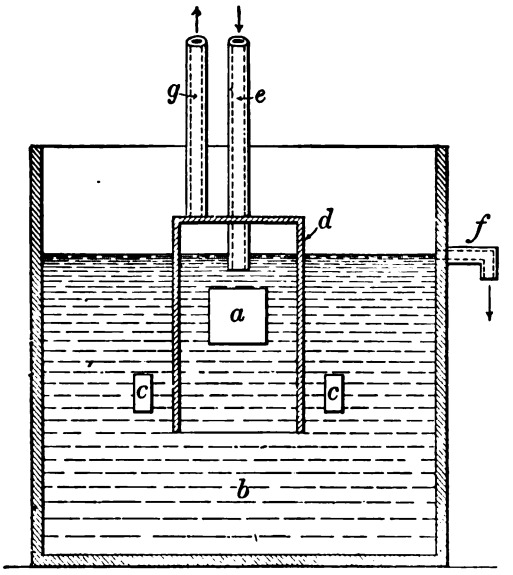

FIG. 2. DIAGRAMMATIC SKETCH OF THE 'BELL' TYPE OF GRAVITY CELL.

common brine which forms the electrolyte, *d* the bell, and *c* the cathodes; *e* is the pipe through which fresh brine is supplied and *g* serves to carry away the chlorine gas. The caustic alkali solution overflows through the pipe *f*. A current efficiency of from 85 to 90 per cent. is claimed and the strength of the alkali solution varies between 100 and 150 grams of caustic soda per liter.

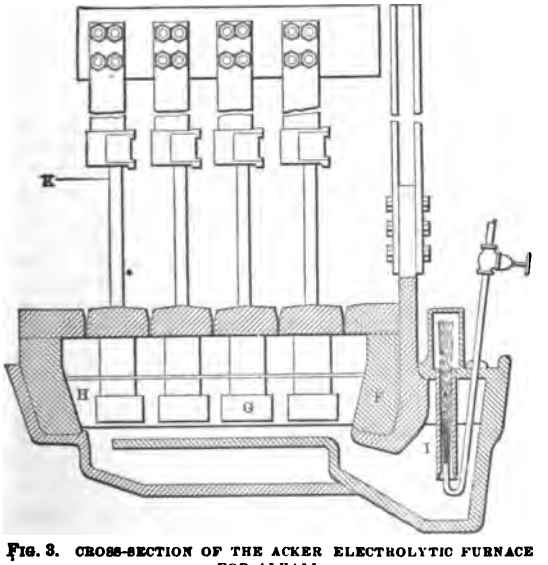

FIG. 3. CROSS-SECTION OF THE ACKER ELECTROLYTIC FURNACE FOR ALKALI.

In the Acker fusion process, which is employed at Niagara Falls, N. Y., the electrolyte consists of fused salt and the cathode of molten lead; a diagrammatic sketch of the cell is shown in Fig. 3. K represents the connections between the bus bar and the anodes G, F the cell walls, H the upper level of the fused salt electrolyte, which overlies the molten lead cathode I. A steam jet at the side of the cell circulates the molten lead cathode, and the decomposition of the lead-sodium alloy produced is accomplished in a separate vessel.

SODA WATER. See AËRATED WATERS.

SODEN, zō'den, HERMANN, Baron (1852—). A German Protestant theologian, born in Cincinnati, Ohio. He was educated at Esslingen, Urach, and Tübingen, and was a vicar in various places from 1875 to 1880. From 1880 to 1882 he was a pastor in Dresden, then in Chemnitz (1882-86), and in 1887 he took charge of the Jerusalemskirche in Berlin. In 1893 he was appointed professor of theology in the University of Berlin. His publications include: *Philipperbrief* (1889); *Was thut die evangelische Kirche?* (3 eds., 1895); and *Palästina und seine Geschichte* (1899). He also contributed vol. iii. to the *Handkommentar zum Neuen Testament* (1890), of which he was one of the editors.

SÖDERHAMN, sē'dēr-hämn'. A seaport of Sweden on a small inlet of the Gulf of Bothnia, 135 miles north of Stockholm (Map: Sweden, G 6). It has flour and saw mills, iron works, breweries and woodpulp factories, and exports timber, iron, and woodpulp to the value of nearly $5,000,000 annually. Its harbor has recently been enlarged and improved, and is entered each year by vessels aggregating about 300,000 tons. Population, in 1901, 11,258.

SÖDERTELJE, sē'dēr-tĕl'ye. A town of the Län of Stockholm, Sweden, 15 miles southwest of the city of Stockholm, of which it is practically a suburb (Map: Sweden, G 7). The town is on the Södertelje Canal, which connects Lake Mälar with the Baltic. It is a noted summer resort, with mineral springs. There are machine shops, match factories, and spinning and weaving mills. Population, in 1900, 8207.

SODIUM (Neo-Lat., from It. *soda*, soda, saltwort, glasswort). A metallic element isolated by Sir Humphry Davy in 1807. (See POTASSIUM; CHEMISTRY.) Compounds of sodium occur distributed in large quantities, especially sodium chloride, which is found in nature as halite or rock salt, and in solution in sea and other natural waters. Sodium also occurs in the form of nitrate (soda nitre, or Chile saltpetre), which is found abundantly in superficial deposits in the rainless districts of the Pacific coasts of Chile, Peru, and Bolivia; as the sulphate (Glauber's salt) or mirabilite; as the carbonate; and in numerous minerals of more complex composition, such as cryolite, the various feldspars, including albite, labradorite, oligoclase, and the zeolites. Sea plants, as well as animal organisms, likewise contain sodium salts. The preparation of the metal itself may be accomplished by decomposing sodium hydroxide by electrolysis. It was first prepared on a large scale by Sainte-Claire Deville, who reduced sodium carbonate with coal and chalk at a white heat, and collected the resulting metallic sodium under coal oil in suitable condensers. A commercial process now extensively employed was

invented in 1886 by Castner, and consists in reducing sodium hydroxide by an iron carbide prepared by adding finely divided iron to melted pitch and coking the mixture in large cylinders. The metal is distilled over into condensers and is purified by passing through linen under petroleum at about 100° C. (212° F.).

Sodium (symbol, Na; atomic weight, 23.05) is a very soft white metal possessing a silvery white lustre when freshly cut. Its specific gravity is 9.85, and its melting point is 95.6° C. (204° F.). It is one of the best conductors of heat and electricity, and is one of the most electro-positive metals. Its vapor is colorless when seen in thin layers, but has a purple or violet tinge by transmitted light when seen in quantity. Sodium burns with a bright yellow flame when heated in the air. When thrown into cold water it decomposes it, liberating hydrogen, but not with sufficient heat to ignite the latter, unless the temperature of the water is above 60° C. (140° F.). The metal readily takes up oxygen, and in consequence finds its chief use in the preparation of aluminum, boron, magnesium, and silicon by reduction from the oxides. Sodium forms alloys with many metals, and the amalgam with mercury is employed in the extraction of gold. It combines with oxygen to form a monoxide (Na_2O) and a peroxide (Na_2O_2), of which the former may be obtained by heating sodium hydroxide with sodium, yielding a gray mass, which melts at a dull red heat; while the latter, which is a white solid that deliquesces in the air, is formed by heating metallic sodium in oxygen.

The salts of sodium are among the most important of the commercial chemicals. Chief among them is *sodium acetate*, which is prepared by treating acetic acid or vinegar with sodium carbonate, filtering the solution and concentrating to crystallization. *Sodium arsenate* is prepared by fusing arsenious acid, sodium carbonate, and sodium nitrate, dissolving the resulting mixture in hot water, filtering, and crystallizing. The colorless crystals thus obtained are official in the pharmacopœia and are used in skin diseases and as a substitute for arsenic. Mixed with sugar this salt is frequently employed as a poison for flies. *Sodium bromide* and *sodium iodide*, which are prepared by decomposing, respectively, ferrous bromide and ferrous iodide with sodium carbonate, are white crystalline compounds that find some use in medicine as nervous sedatives. *Sodium carbonate*, which is the soda of commerce, is a colorless crystalline odorless compound with a strong alkaline taste, which is found native in many mineral waters and as efflorescences in the neighborhood of soda lakes. *Sodium bicarbonate* or 'acid' sodium carbonate is made by passing a current of carbon dioxide through a strong solution of sodium carbonate until it is saturated and then allowing the mixture to crystallize, yielding a colorless compound which finds extensive use in the manufacture of baking powders and of artificial mineral waters, and also in medicine as an antacid. *Sodium hypophosphite* is prepared by treating calcium hypophosphite with sodium carbonate and recrystallizing the resulting product from alcohol. It forms small colorless crystals that are deliquescent and finds some use in medicine as a restorer in exhausted conditions of the nervous system, and as an ingredient in the syrup of hypophosphites. *Sodium hyposulphite*, or more correctly *sodium thiosulphate*, is prepared by decomposing soluble calcium thiosulphate with either sodium sulphate or sodium carbonate, resulting in the formation of a colorless crystalline compound that is efflorescent in dry air, and is used in photography as a solvent for the unaltered silver chloride or bromide on the film, and in medicine as an alterative and resolvent. *Sodium silicate* is prepared commercially by fusing sodium carbonate with sand and a small quantity of charcoal in a reverberatory furnace and then dissolving by prolonged boiling in water. (See WATER-GLASS.) *Sodium sulphite* is obtained by passing gaseous sulphur dioxide into a solution of sodium carbonate and evaporating the mixture to dryness or crystallization, resulting in a colorless, transparent, efflorescent compound that is used as a bleaching agent under the name of *antichlore*, in the manufacture of paper, for the purpose of removing the last traces of chlorine from the bleached pulp; it is also employed in medicine as an antiferment. See also SODA; SALT; SALTPETRE; GLAUBER'S SALT; etc.

SODOM (Heb. *Sĕdōm*) and **GOMOR'RAH** (Heb. *'ămōrāh*). Two ancient cities near the Dead Sea, almost invariably spoken of together in the Bible. With Admah, Zeboiim, and Bela or Zoar, they formed the five 'cities of the plain,' which on account of the wickedness of their inhabitants are said to have been destroyed by a rain of brimstone, perhaps also accompanied by an earthquake. Lot and his family were the only ones who escaped. His wife, however, for disobedience was turned into a pillar of salt (Gen. xix. 1-29; Deut. xxix. 23; Zeph. ii. 9; Isa. i. 9). Some scholars say the cities were at the northern end of the Dead Sea, others at the southern end. Names like Jebel Usdum (Sodom) and Zoara or Zughar (Zoar), at the southern end, point to a tradition of the existence of the cities there. The biblical story of the destruction of the cities is considered by many critics similar to tales found among Arabs (and other nations) regarding the sudden disappearance of places. Those who thus deny the literal truthfulness of the narrative call attention to the weird character of the district around the Dead Sea, fatal to plant and animal life, as naturally suggesting the thought of some catastrophe. See LOT.

SODOM, APPLE OF. A name sometimes given to the fruit of Solanum sodomæum. Many unsatisfactory attempts have been made to determine the source of the true apple of Sodom or mad apple of the Dead Sea region mentioned by Strabo, Tacitus, and Josephus, and described as beautiful to the eye, but filling the mouth with bitter ashes if tasted. One explanation is that it is a kind of gall (q.v.) growing on dwarf oaks. These beautiful, rich, glossy, purplish-red galls are about 2 inches long and 1½ inches in diameter, and are filled with an intensely bitter, porous, and easily pulverized substance.

SO'DOMA, IL, properly GIOVANNI ANTONIO BAZZI (1477-1549). An Italian painter of the High Renaissance. He was born at Vercelli (Piedmont) and studied for six years with Martino de Spanzattis, a painter on glass. He then came under the influence of Leonardo da Vinci, probably at Milan, and though he maintained an

individual quality, his work took color from that master. In 1501 he was established at Siena, the city with which he was chiefly identified for the remainder of his life. In 1507 or 1508 he visited Rome and was commissioned by Pope Julius II. to paint frescoes in the Camera della Segnatura of the Vatican. Only a fresco on the ceiling remains, all the rest having been removed when he was superseded by Raphael. His relations with Raphael were friendly, however, and he thereafter showed traces of Raphael's artistic influence. Raphael painted Sodoma's portrait beside his own in "The School of Athens." Sodoma visited Rome a second time, where he lived with Agostino Chigi and painted in Chigi's Villa Farnesina the "Marriage of Alexander and Roxana," his most beautiful picture of an antique subject, and "Alexander in the Tent of Darius." For his portrait of the Roman Lady Lucretia he was made a knight by Leo X. In 1515 he returned to Siena, and his movements for the succeeding ten years are but vaguely recorded. From 1525-37 he resided at Siena, where he died February 15, 1549.

Sodoma is to be seen at his best in his frescoes at Siena, where, after his Roman period, he painted a large "Flagellation" for San Francesco, the "Ecstasy" and the "Swoon of Saint Catharine" in San Domenico, a "Nativity" in Sant' Agostino, and a large altarpiece in Santo Spirito. In the Convent of Monte Oliveto, near Siena, is a series of twenty-five scenes from the life of Saint Benedict, belonging to the artist's early period. His panel paintings include a "Saint Sebastian" in the Uffizi, a perfect representation of "suffering, refined and spiritual, without contortion or spasm;" an "Ascension" at Naples; a "Sacrifice of Abraham" at Pisa; a "Caritas" at Berlin; and a "Leda" in the Borghese Gallery, Rome. Sodoma's influence on the Sienese school was very great and resulted in a new manner practiced at Siena. The popularity of his work has increased with recent writers. His merits are the power to express tenderness, sensuous grace, and an exalted sweetness and suffering. He was often inferior in the composition of his pictures, weak in the handling of draperies, and uncertain in the setting-up of individual figures. Consult: Jansen, *Leben und Werke des Malers Giovanantonio Bazzi von Vercelli* (Stuttgart, 1870); Frizzoni, in *Nuova Antologia* (August, 1871).

SODOMY. The unnatural carnal intercourse of persons with each other or with beasts; so called from the form of vice practiced in the ancient city of Sodom. It is punished by death or long terms of imprisonment in all civilized countries.

SOEMMERRING, *zē'mĕr-ing*, SAMUEL THOMAS VON (1755-1830). A German anatomist and physiologist of note, born at Thorn, educated at Göttingen, and chosen professor of anatomy at Mainz in 1784. He defended the theory that the nerves act independently of the brain, and he considered the brain as not essential to life. His division of the cranial nerves into twelve pairs instead of nine is generally adopted. His principal works were: *De Basi Encephali et Originibus Nervorum*, etc. (1778); *Von Hirn- und Rückenmark* (1788); *Vom Baue des menschlichen Körpers* (1791); *Ueber das Organ der Seele* (1796); and *De Morbis Vasorum Absorbentium Corporis Humani*, etc. (1795). Consult his biography by Stricker (Frankfort-on-Main, 1862), also *Lancet*, vol. ii., p. 243 (London, 1830); Wagner, *Soemmerrings Leben und Verkehr mit seinen Zeitgenossen* (Leipzig, 1844).

SOEST, *zĕst*. A town in the Province of Westphalia, Prussia, 34 miles southeast of Münster (Map: Prussia, C 3). Relics of its mediæval splendors still survive in its churches. Of these the finest is the "Meadow Church," restored in 1850-52. The tenth-century Romanesque cathedral has excellent mural paintings. The manufactures include machinery, cigars, tinware, bricks, sugar, and lamps. There are markets for cereals and cattle. In the Middle Ages Soest was an important member of the Hanseatic League, and had a population of over 25,000. Its municipal law, the *jus Susatense*, was the oldest in Germany and served as the model for the other Imperial free towns, Lübeck, Hamburg, etc. Population, in 1900, 16,724.

SOETBEER, *zĕt'bâr*, ADOLF (1814-92). A German economist, born at Hamburg. After studying at Göttingen and Berlin he returned to Hamburg, where in 1839 he published a monograph on the customs duties of that city. In 1840 he became librarian, and in 1843 secretary of the Hamburg Chamber of Commerce, where he laid the foundation of the excellent system of commercial statistics for which Hamburg is still noted. In 1846 he published *Denkschrift über Hamburgs Münzverhältnisse*. Subsequently he published a great number of monographs and pamphlets, defending the cause of gold monometallism. Until his death he ranked as the leading defender of the single gold standard. The adoption of the gold standard by Germany was due in no small measure to his efforts. Among his most important works are: *Denkschrift betreffend die Einführung der Goldwährung in Deutschland* (1856); *Zur Frage der deutschen Münzeinheit* (1861); *Beiträge zur Geschichte des Geld- und Münzwesens in Deutschland* (1862); *Edelmetallproduction und Wertverhältnis zwischen Gold und Silber seit der Entdeckung Amerikas bis zur Gegenwart* (1879); *Materialien zur Erläuterung und Beurteilung der wirtschaftlichen Edelmetallverhältnisse und der Währungsfrage* (1885).

SOFALA, *sō-fä'lä*. A name applied formerly to a considerable part of Portuguese East Africa (q.v.), but confined at present to a single district under the administration of the Mozambique Company. The seaport of Sofala, in latitude 20° 10′ S., has a population of about 1300.

SOFIA, *sō'fē-ä*, or **SOPHIA** (Bulg. *Sredetz*). The capital of the Principality of Bulgaria, situated in a plain between the Vitosha Mountains and the main Balkan chain, 206 miles southeast of Belgrade and 300 miles northwest of Constantinople (Map: Balkan Peninsula, D 3). It has been largely rebuilt since 1878 and presents the appearance of a modern city with electric lighting and street railways and creditable public buildings. In old Sofia are the ruined Sofia Mosque, the Mosque of Buyuk-Jami, now used as a national museum and library, and the vast baths with hot springs. The principal modern buildings are the palace of the Prince, the university buildings, the new cathedral of Saint Alexander, the house of Parliament, and the various administration buildings. Sofia has a university (founded in 1888) with about 500

students, colleges for boys and girls, and a military school and college. It is the industrial centre of Bulgaria and has manufactures of silk, cloth, tobacco, etc. Situated at the converging of the principal highways of the principality and connected by rail with Constantinople, Belgrade, and Saloniki, the city is well adapted for its prominent position as a commercial centre, and has an extensive export trade in agricultural products, hides, and attar of roses. The population was 30,400 in 1887 and 67,920 in 1900, principally Bulgarians. Sofia is identified with the *Serdica* or *Sardica* of the Romans, which became the capital of *Dacia Ripensis*, and about 344 was the seat of a Church council. The town was plundered by the Huns in the fifth century, and at the beginning of the ninth century it was taken by the Bulgarians. In 1382 it passed to Turkey, and in 1878 it was occupied by the Russians under Gurko.

SOFTA (Turk. *sōfta*, from Pers. *sōxtah*, *sūxtah*, burned [with zeal], p.p. of *sūxtan*, Av. *saoc*, Skt. *śuc*, to burn). The name applied in Turkey to the students of the theological schools. They are drawn largely from the lower classes and are as a rule opposed to Occidental ideas. Because of this they have often opposed the Turkish Government. From them are appointed the Mollahs and the Ulemas (qq.v.). There are now about 16,000 Softas in Constantinople.

SOFT GRASS (*Holcus.*) A small genus of grasses. The English name is derived from the soft and abundant pubescence of the two British species, creeping soft grass (*Holcus mollis*) and woolly soft grass, meadow soft grass, or velvet grass (*Holcus lanatus*). The latter is found most abundantly on damp soils, on which it is sometimes sown for forage. The former is generally found on dry, sandy, or other light soils. The roots sometimes extend five or six feet in a season. These grasses are seldom planted for forage, except in situations little suited to more valuable species.

SOFT-GROUND ETCHING. A species of etching in which the ground ordinarily used is softened by a mixture with tallow. In ordinary etching (q.v.) the subject to be represented is scratched directly upon the ground by means of the needle; but in soft-ground etching it is drawn with a lead pencil upon a piece of fine-grained paper stretched over the ground. The impression thus produced upon the ground, when bitten, gives the effect of pencil or chalk lines in the proof. Soft-ground etching is not much used, because the same effects can be obtained by lithography and heliographic processes.

SOFT-SHELLED TURTLE. Any of various fresh-water turtles of the family Trionychidæ, represented in the United States by the two genera Amyda and Aspidonectes. These turtles take their name from the characteristic leathery consistency of the shell, well seen in the common soft-shell (*Aspidonectes ferox*), which is about twelve inches long. Another species, the 'leather turtle,' is *Amyda mutica*. They are carnivorous, strongly web-footed, and entirely aquatic, with long serpentine necks. The eggs are laid in the ground near shore. Times of drought and winter are spent in the mud underneath water. The flesh of these turtles is said to be of superior quality.

SOGDIA'NA (Lat., from Gk. Σογδιανή, *Sogdyanē*, Av. *Sγγδa*, OPers. *Suguda*, Pers. *Sγγd*). An ancient country in Central Asia, comprising part of modern Turkestan, bounded on the northeast by the Jaxartes, which separated it from Scythia, and on the southwest by the Oxus, which separated it from Bactria. It was conquered by the Persians in the reign of Cyrus and was invaded by Alexander the Great, after whose time it fell into the power of the Seleucidæ (q.v.).

SOGNE FJORD, sŏg'nē fyōrd. An inlet in the Province of North Bergenhus, in the eastern part of Norway. It pierces the land for a distance of nearly 90 miles, and in some places has a depth of 4000 feet. The region through which it extends is remarkable for its many glaciers and the wild grandeur of its scenery.

SOHN, zōn, KARL FERDINAND (1805-67). A German painter of the Düsseldorf school. He was born in Berlin and studied there under Wilhelm von Schadow, whom he followed to Düsseldorf and afterwards accompanied to Italy. He treated principally mythical and poetic subjects of a highly romantic character, and attained great proficiency in color, especially in treatment of the nude. In 1832 he was made professor in the Düsseldorf Academy, where he exercised an important influence in the development of German painting. Among his best-known works are: The "Rape of Hylas" and the "Lute Player" (1832), both in the National Gallery, Berlin; "Romeo and Juliet" (1836); "Tasso and the Two Leonoras" (1839, Düsseldorf Gallery); "Rinaldo and Armida," "Loreley," and "Donna Diana" (1840, Leipzig Museum). His nephew and pupil, WILHELM (1830-99), born in Berlin, painted at first biblical subjects, such as "Christ Stilling the Tempest" (1853, Düsseldorf Gallery), then devoted himself to genre scenes, masterly in characterization and drawing and of great coloristic charm, in the manner of the Belgian school. Among these are: "A Question of Conscience" (1864, Karlsruhe Gallery); "Consultation at the Lawyer's" (1866, Leipzig Museum); and "Warrior of the Seventeenth Century" (1869, Dresden Gallery).

SOHO SQUARE. A square in London, dating from the time of Charles II. and once called King's Square, from the name of its builder. It was at one time one of the fashionable quarters of the city.

SOHRAB AND RUSTUM. A narrative in blank verse by Matthew Arnold, based on the Persian legend of Rustam (q.v.).

SOIL (OF., Fr. *sol*, from Lat. *solum*, ground, soil, foundation, sole). A term applied to the superficial unconsolidated portion of the earth's crust (regolith), which is composed of broken and disintegrated (weathered) rock mixed with varying proportions of decayed and decaying organic matter (humus). The processes by which soils are formed from the parent rocks are mechanical and chemical, and in some cases biological. The fertility of a soil will, therefore, be determined to a considerable extent by the character of the parent rock and the stage of its decomposition. Thus granite, being richer in the elements of plant food, yields a more fertile soil as a rule than the siliceous sandstones.

According to the method of their formation

soils are classed as sedentary or transported. When a soil is found resting on the parent rock from whose decay it has originated it is spoken of as *sedentary soil*. It may show a gradual transition from the fully formed soil at the surface to the solid rock beneath. With this class may be grouped the humus or peaty soils due to accumulations of organic matters in bogs, swamps, and marshes. In many cases the residual products have been removed from the place of their formation by the action of water, ice (glaciers), and wind and deposited elsewhere in the form of clayey, sandy, or loamy soils, often representing the mingling of material from several different sources. This type is termed *transported soil*, and, though naturally very variable in character, includes some of the most productive soil in the world. The most important soils of this class are the alluvial soils, which often form a broad flood-plain (q.v.) bordering a river or a delta (q.v.) at the mouth, as in the case of the Nile and the Mississippi rivers. In the northern half of the United States much of the soil is of the *glacial drift type* and represents the débris of decayed rocks of various kinds brought down from the north during the glacial period (q.v.).

Æolian soils are formed by wind action. They include: (1) Sand dunes, those shifting, sandy soils heaped up by wind action upon many ocean coasts and the shores of inland seas. (See DUNE; DUNE VEGETATION.) (2) Ash soils, the accumulations of ashes ejected by volcanoes. The deposits are often of considerable extent and are frequently very fertile. Much of the highly productive region around Mount Vesuvius, in Italy, is of this kind. Such soils are found in Nebraska, Colorado, and Montana. Soils derived from disintegration of volcanic lava are of frequent occurrence, as, for instance, in the Hawaiian Islands, in Idaho and other Northwestern States. The loess soils of China and other countries are of æolian origin, although the so-called loess soils of America are believed to be for the most part of alluvial origin. Soils containing an excess of soluble salts are found scattered throughout regions of deficient or irregular rainfall and are known as alkali soils (q.v.).

Humous, peaty, or moor soils are composed largely of organic matter. The purest types are represented by the accumulations of peat (q.v.) formed in ponds and swamps; marine marshes, and muck soils represent a less pure variety. When properly drained and aërated and, in the case of marine marshes, freed from excess of soluble salts, they often prove very productive.

In practice soils are classified as gravelly, sandy, loamy, calcareous, humus, or peaty, etc., distinctions based on the fineness of the soil particles and the relative proportions of sand, clay, lime, and humus, which they contain. Soils are also frequently classed as light and heavy, according as they are easy or difficult to till. In this sense a sandy soil is termed 'light' (easy to till), although actually having greater weight than a clayey soil, which is termed 'heavy' (difficult to till). The productiveness of a soil depends chiefly upon its chemical composition and its physical properties. Chemical and physical or mechanical analysis separates soil constituents into two general classes: (1) food constituents, and (2) physical constituents. The food constituents necessary to plant growth are nitrogen, silicon, sulphur, phosphorus, chlorine, aluminum, calcium, magnesium, potassium, sodium, and iron in various forms of chemical combination. The mechanical constituents include clay, silt, sand, humus, etc., which act as a physical support to plants and have an indirect fertilizing value. They form as a rule the large proportion of the soil mass, usually 90.95 per cent.

CHEMICAL PROPERTIES. The average chemical composition of soils of humid and arid regions is shown in the following table prepared by Kilgard:

AVERAGE CHEMICAL COMPOSITION OF SOILS OF HUMID AND ARID REGIONS

CONSTITUENTS	Humid region (average of 466 soils)	Arid region (average of 313 soils)
	Per cent.	*Per cent.*
Insoluble matter	84.031 } 87.687	70.565 } 76.135
Soluble silica	4.212 }	7.266 }
Potash	.216	.729
Soda	.091	.264
Lime	.108	1.362
Magnesia	.225	1.411
Iron oxid	3.131	5.752
Alumina	4.296	7.888
Phosphoric acid	.113	.117
Sulphuric acid	.052	.041
Carbonic acid	.....	1.316
Water and organic matter	3.644	4.945
Humus	2.700	.750
Nitrogen in humus	5.450	15.870
Nitrogen in soils	.122	.101

The proportions of actual fertilizing constituents in soils, viz. potash, phosphoric acid, nitrogen, lime, etc., are relatively small, arid soils showing somewhat larger proportions than humid soils. Other mineral constituents are usually present in sufficient quantity to supply the needs of plants. Humus (q.v.) is of special importance as a soil constituent not only on account of its beneficial effect on the physical properties of soils, but because it is an important source of nitrogen, as well as of phosphoric acid, potash, lime, etc. The proportions of the latter constituents found in humus in the form of humates represent to a large extent the amounts available in the soil for plant food. The nitrogen of humus is converted into a form (nitrate) available for plants by the process of nitrification (q.v.).

PHYSICAL PROPERTIES. The physical properties of soils which are of special importance are color, weight, fineness of division or texture, structure or arrangement of particles, adhesiveness, and relations to gases, heat, moisture, and dissolved solids. Variations in these properties determine to a large extent the productiveness of soils. Good tilth and texture with their accompaniments of good water conditions, aëration, and temperature are fully as essential to plant growth as an adequate supply of plant food. Physical properties of soils are, however, so largely dependent upon their natural character, and can be modified to such a limited extent by man, that it is of the greatest importance in practice carefully to select soils with special reference to the suitability of their physical characteristics to the crop to be grown.

The physical properties of soils are determined to a large extent by the proportions they con-

tain of stones, gravel, sand, clay, lime, and organic matter. A soil containing much sand is dry, warm, and easy to work, but as a rule is naturally poor and has little absorptive power for water and fertilizing matter. A soil in which clay predominates is apt to be cold, wet, and difficult to till, but to have a high absorptive power not only for water, but for fertilizing matter as well. Clayey soils generally contain more plant food than sandy soils. Humus makes soils light in weight and dark in color and greatly increases their absorptive power. Lime not only has value as a plant food, but improves the structure of both clayey and sandy soils and corrects acidity. It also promotes the decomposition of organic matter and aids nitrification.

Mechanical analysis, which separates the particles of a soil into six or more grades of fineness ranging from stones and gravel through sand and silt to clay, furnishes a valuable means of securing data for judging of the physical properties of soils. The productiveness of a soil depends very largely upon its texture and structure, i.e. the size of the particles and their arrangement. These determine very largely the circulation of water and gases, the solution and retention of plant food, and the growth of plant roots. When the grains are single or separated the soil is said to have a puddled structure, while a compounding of the soil grains gives a flocculated structure. The latter is desirable in all good soils, as it increases the pore space and facilitates the circulation of air and water through the soil mass. Flocculation may at times be caused by frost action, but more frequently is produced by the action of lime. Fertilizers vary in their action on soils, some, like nitrate of soda, producing puddling, while others produce flocculation. The finer the soil particles the greater the injurious effects of puddling, clay soils suffering from this cause more than sandy soils. Puddling increases the water-retaining power, and thus retards percolation, but may accelerate capillary rise of water in the soil layers. Flocculation of the particles decreases the retention of water, aids percolation, and may retard evaporation. Water passes more easily from a coarse to a fine layer than from a fine to a coarse one, a fact taken advantage of by the farmer when he firms the soil by rolling and then loosens the surface by harrowing, which destroys the capillary spaces and so checks the escape of water into the air. The water is thus held near the surface, where it is readily accessible to the roots of plants. The action of the mulch (q.v.) depends upon this principle. In humid regions the clay particles of the soil are usually washed down to a layer several inches below the surface, the surface layer being called the soil proper, and the lower one the subsoil. In arid regions this difference does not exist, but the fine clay particles are evenly distributed throughout the soil layers.

Soils vary widely in their absorption power for water and for fertilizing matter, a property frequently due in clayey and humus soils to the presence of colloid substances. Of the three principal fertilizing constituents—nitrogen, phosphoric acid, and potash—soils apparently have the least retentive power for nitrogen (in the form of nitrate) and the greatest for phosphoric acid.

The temperature of soils is modified by a variety of conditions, e.g. a dark-colored soil is usually warmer than a light-colored one; soils so exposed as to receive a large amount of the direct rays of the sun are warmer than those not thus exposed; dry soils are warmer than wet. The relation of soils to water probably more than any other one factor determines their productiveness. Water is not only necessary as a constituent of plant tissue, but it performs a most important function as a solvent and carrier of food in both soil and plant, and the amount required in plant growth is very large—from 250 to 500 pounds for each pound of dry matter produced by the plant.

SOIL AMENDMENTS. Substances, such as lime, gypsum, salt, muck, etc., which increase the productiveness of soils without directly supplying any constituent which the plant needs. They act mainly by improving the physical condition of soils, collecting and conserving moisture, setting free latent plant food, and correcting certain faulty conditions, such as acidity and alkalinity. Some of them, like muck, contain considerable amounts of available fertilizing ingredients. In all cases, however, they are used mainly for their secondary or incidental effects.

SOILING, SOILING CROPS. Soiling consists in feeding grazing animals in inclosures or in barns with green forage grown especially for the purpose, instead of turning them out to pasture; and soiling crops are the crops grown for this purpose. Soiling is a feature of intensive farming and small holdings, but it is also practiced with profit in regions where the agricultural resources are in process of development. Under European conditions stock is frequently fed in barns the year round, but in the United States soiling is usually combined with pasturing, stock being less frequently fed in barns during the sum-

mer. In some instances, however, as in the case of dairy farms in the immediate vicinity of large cities, complete soiling is not infrequent and is on the increase.

American farmers began to turn their attention to soiling early in the nineteenth century, and agricultural literature shows that about the middle of the century the practice had become general in the Eastern and Southern States. The crops used for green forage at that time were grass, clover, corn, oats, cabbage, and root crops. In the West, where large tracts of wild grass land afford unlimited pasturage, there is no need to resort to soiling; but as soon as the land is settled and the natural pastures become confined to individual farms, soiling has not only been found expedient, but oftentimes necessary. Its advantages are many. It requires far less land to sustain a given number of farm animals than under pasturing; feeding green forage in the barn or yard eliminates the expense of constructing and keeping up pasture fences, at the same time greatly diminishing the waste of food, and animals are assured sufficient feed at all times. Practically the only serious disadvantage is the extra labor involved.

Since animals kept in the barn seem to require exercise, the two systems of soiling and pasturing are often combined in the United States. In such cases the soiling crops should be grown remote from the pasture, so that the animals may not become restless and disinclined to graze. The fodder should not be fed in open racks, and the quantity given should never be more than will be eaten at the time.

Nearly all farm crops can be utilized in soiling, corn being considered one of the best. The soil, the climate, and the kind of stock to be fed naturally determine the kinds of crops to be grown. The purpose of soiling crops is to afford abundance of succulent forage. This is best accomplished with rapidly growing plants that produce large amounts of foliage. The list of soiling crops generally grown includes rape, turnips, sorghum, kafir corn, millet, many cereals such as rye, barley, oats, and many legumes such as clover, cow-peas, alfalfa, and combinations of oats and peas, and barley and peas. Consult: Peer, *Soiling, Soiling Crops, and Ensilage* (New York and London, 1900); *United States Department of Agriculture, Farmers' Bulletin No. 16.*

SOISSONS, swä'sôN'. An episcopal city and the capital of an arrondissement in the Department of Aisne, France, 65 miles northeast of Paris, on the Aisne River (Map: France, K 2). The principal building is the cathedral of Notre Dame, a composite of the Romanesque and Gothic styles of architecture, founded in the twelfth century. There are also some remains of the great castellated Abbey of Saint Jean des Vignes, where Thomas à Becket found refuge when in exile. A short distance from Soissons is an institute for the deaf and dumb, which occupies the site of the famous Abbey of Saint Médard. Other features of the town include the town hall with a library of 50,000 volumes and a museum; the mediæval Abbaye Notre Dame (built on the site of a convent dating from 660), now utilized as barracks; and the seminary occupying the old Abbaye Saint Léger. Soissons is in a region extensively engaged in farming, and carries on a large trade in grain, haricot beans, live stock, etc. The principal manufactures are leather, foundry products, lumber, flannel, and farm implements. Population, in 1901, 13,240. Soissons is one of the oldest towns in France. In the time of the Romans it bore the names of *Noviodunum, Augusta Suessionum,* and *Suessiona.* It is famous for the victory obtained in the vicinity by Clovis in 486 over the Roman general Syagrius, which put an end to Roman dominion in Gaul. It was the capital of the Frankish kingdom of Neustria. It has undergone numerous sieges. On October 16, 1870, after a bombardment of four days, it surrendered to the Germans.

SOISSONS, Louis de Bourbon, Count of (1604-41). A French noble, born in Paris. Succeeding to the office of grand master of France and Governor of Dauphiné, he took the part of the Queen Mother, Maria de' Medici, while at the same time making approaches to the Huguenots. He conspired against Richelieu, who had opposed his marriage to Mlle. de Montpensier, and was obliged to flee to Savoy. He was, however, recalled by Louis XIII. and took part in the siege of La Rochelle in 1627. In 1636 he again formed a plot against Richelieu, and after its failure fled to Sedan, where he joined an alliance with the Duke de Bouillon, Duke de Guise, and the Spaniards against Richelieu. In July, 1641, they met the royal forces at Marfée, near Sedan, and vanquished them; but at the moment of victory Soissons was killed.

SOKO'TO. One of the largest States of Central Sudan, extending with its dependencies eastward from the Lower Niger, above the confluence with the Benue, to the Kingdom of Bornu and the borders of French Congo, and embracing the larger part of Northern Nigeria (see Nigeria) (Map: Africa, E 3). Area, estimated at over 100,000 square miles. Its population is composed principally of Hausas (see Hausa States), but includes also the Fulbe, who are the ruling class, as well as Tuaregs, Arabs, etc. The total population is believed to number about 10,000,000. The Sokoto Empire took its rise in the nineteenth century. It originally formed a part of the great Fulah Empire established by Othman in Central Sudan at the beginning of the same century. It remained in the possession of the family of Othman until the conclusion of the commercial treaty with the Royal Niger Company in 1885, since when the territory has gradually come within the British sphere of influence, with the exception of Adamawa (q.v.), which is partly within the German sphere. The city of Sokoto, formerly the capital of the empire, with a population of over 100,000, is now an insignificant place, and the capital has been transferred to Wurnu, a small town about 25 miles northeast. The commercial centre is Kano (q.v.).

SOKOTRA, sō'kō'trȧ *or* sōk'ō-trȧ. An island in the Indian Ocean. See Socotra.

SO'LANA'CEÆ (Neo-Lat. nom. pl., from Lat. *solanum,* nightshade), or The Nightshade Family. A natural order of mostly offensively smelling tropical and subtropical herbs and shrubs, and a few trees. There are 70 genera and about 1500 species, most of which are found in Central and South America; a few in the temperate zones, but none in the cold regions. The principal genera are Nicandra, Lycium, Atropa, Hyoscyamus, Physalis, Capsicum, Solanum, Lyco-

persicum, Mandragora, Datura, Petunia, Nicotiana, Salpiglossis, and Schizanthus.

SOLAN GOOSE. See GANNET.

SOLANO. See SIMOOM.

SOLANUM (Lat., nightshade). A genus of widely distributed spiny, downy, or smooth herbs or shrubs of the natural order Solanaceæ, containing several hundred species, particularly abundant in tropical South America and the West Indies. The species almost always contain more or less solanin, an alkaloid said to occasion distress when the plants are eaten too freely. By far the most important of all the species is *Solanum tuberosum*, the potato (q.v.), in which solanin is found in considerable quantity. Of the species with edible fruit, the principal is *Solanum melongena*, the egg-plant. *Solanum Dulcamara*, the bittersweet, and *Solanum nigrum*,

HORSE-NETTLE (*Solanum Carolinense*).

the common nightshade, are both common in the United States, having been introduced from Europe. The berries of *Solanum saponaceum* are used as a substitute for soap, and in Australia those of several species are eaten by the natives, some with and others without cooking. In the United States there are a dozen or more indigenous species, some of which, as *Solanum Carolinense*, the horse-nettle, and *Solanum rostratum*, are very spiny troublesome weeds.

SOLAR. An upper chamber or loft. The only private apartment in the old baronial halls was so called. It was placed over the pantry, at one end of the hall, and served as parlor and sleeping apartment for the baron and his family.

SOLAR CYCLE. See PERIOD.

SOLARI, sō-lä'rē (**SOLARIO**), ANDREA (c.1460-1515). A Lombard Milanese painter of the High Renaissance. He is frequently called Andrea del Gobbo, after his elder brother Cristoforo, the sculptor, who seems to have brought him up and whose artistic influence may be seen in Andrea's delicate modeling of the heads. Together they went to Venice, where Andrea executed many paintings in the manner of Bellini. On his return to Milan he fell completely under the influence of Leonardo da Vinci, and his standing was such that in 1507, when Cardinal George d'Amboise summoned Leonardo to France, Andrea was sent in his stead. He finished his decorations of the Cardinal's chapel at Gaillon in 1509, after which he seems to have gone to Flanders. The latter part of his life was not passed in Southern Italy, but probably at Milan.

In color, chiaroscuro, and subtle modeling of heads, Solari approached nearer Leonardo than any other of his disciples. His portraits display a characterization and strength that suggest Holbein, and his execution is of great delicacy. His principal paintings include the portraits of a Venetian senator and of Longoni (1503), in the National Gallery (London); a "Madonna," "John the Baptist," and "Saint Catharine" (1499), in the Brera (Milan); a "Crucifixion" (1503), a "Male Portrait," and the "Madonna of the Green Cushion," in the Louvre; a "Riposo" (1515) and "Ecce Homo," in the Poldi Collection, Milan, which is especially rich in his works; and the altarpiece of the Certosa at Pavia.

SOLARI (SOLARIO), CRISTOFORO (called IL GOBBO, the hunchback) (c.1450-1523). A Lombard sculptor and architect of the Renaissance. The events of his life are little known. Of the works which he executed while with his brother Andrea at Venice a "Saint George" survives in the Church of the Carità. In 1495 he was appointed ducal sculptor to Ludovico Sforza, and in 1498 he executed his masterpiece, the tomb of Duke's wife, "Beatrice d'Este," in Santa Maria delle Grazie. The monument was destroyed after the fall of the Duke, but the recumbent figures of himself and wife were taken to the Certosa of Pavia. They are charmingly realistic, and thoroughly in the style of the Early Renaissance. For the Certosa, Cristoforo also executed a "Pietà," and probably many of the figures of the façade. The sculptures which he executed for the cathedral at Milan cannot be distinguished among the myriads of others, but his statue of "Christ" in the sacristy shows the influence of Michelangelo. In 1519 he was appointed chief architect of the cathedral. His chief architectural work is the cupola of Santa Maria della Passione (1509).

SOLAR MICROSCOPE (Lat. *solaris*, relating to the sun, from *sol*, sun; connected with Gk. *ἥλιος, hēlios*, Skt. *sūra, svar*, AS. *sōl*, Goth. *saiwil*, Ir. *sul*, Lith., Lett., OPruss. *saule*, sun, and ultimately with Eng. *sun*). An instrument for projecting magnified images of minute objects on a screen, through the agency of the sun's rays. The microscope consists of a brass tube which is fastened to the interior side of a closed window-shutter over a hole in the latter, and a reflector so placed that the rays of sunlight falling on it are reflected into the tube. They are then collected by a powerful double convex lens, and brought to a focus on the object, which is placed on a stage at the opposite end of a tube. An enlarged image of the object thus illuminated is then produced by a second lens or system of lenses upon a white screen. Should the object be opaque, the rays of light reflected from the mirror are concentrated by the double convex lens on another mirror near the opposite end of the tube; they are then reflected upon the back of the object, and diverge on the system of lenses which form the image.

Instead of the sun's rays, the oxyhydrogen limelight and the electric arc have been employed, the rays being thrown on the double convex condenser by means of a reflector.

SOLAR PARALLAX. See PARALLAX.

SOLAR SYSTEM. The planets and comets pursuing orbital revolutions round the sun combine with it to form a system to which is given the name of *solar* system. It is not impossible that many stars are the centres of somewhat analogous systems. This, however, is merely a matter of speculation. No change of much magnitude can take place in the elements of the planets' orbits without having effect on the earth and its inhabitants, on account of the mutual attractions of the planets for each other; in fact, they appear as members of one isolated family, bound together by common ties, which could not be ruptured in the case of one individual without communicating a general shock to the others. (See ASTRONOMY.) The various members of the solar system are noticed under PLANETS (and each planet under its own name), PLANETOIDS, COMET, SUN, MOON, SATELLITES, METEORS; their motions are treated of under GRAVITATION, CENTRAL FORCES, PRECESSION, ORBIT, PERTURBATIONS; and their probable origin under COSMOGONY, NEBULÆ; so that it only remains here to give the more interesting numerical facts connected with them:

NAME OF PLANET	Diameter in miles	Density, earth's being 1	Mass, earth's being 1	Distance from sun in millions of miles	Period of revolution, in days
Mercury	3,030	0.85?	$\frac{1}{17}$	36.0	88
Venus	7,700	0.89	$\frac{1}{1}$	67.2	225
Earth	7,918	1.00	1	92.9	365
Mars	4,230	0.71	$\frac{1}{3}$	141.5	687
Planetoid Ceres	488?	?	?	257.1	1,681
Jupiter	86,500	0.24	318	483.3	4,333
Saturn	73,000	0.13	95	886.0	10,759
Uranus	31,900	0.22	15	1,781.9	30,687
Neptune	34,800	0.20	17	2,791.6	60,181

SOLDER (*souldure, soudere*, Fr. *soudure*, solder, from *soulder, souder*, to solder, consolidate, from Lat. *solidare*, to make firm, from *solidus*, solid, connected with OLat. *sollus*, Gk. ὅλος, *holos*, Skt. *sarva*, whole, entire). Any fusible alloy that may be used for joining metals. Solders vary widely in composition according to the metals which it is desired to unite. Soft solder consists of tin 1 part and lead 2 parts; while a finer variety consists of tin 2 parts and lead 1 part. Spelter solder is copper 2 parts and zinc 1 part. In addition there are numerous solders for special metals, such as gold, platinum, silver, etc. (See ALLOY.) When solders are to be applied in the common work of plumbers and tinmen, a tool called a *soldering iron* is used, which is heated red hot, and affords a convenient means of applying the heat direct to the solder, the parts to be united, and the flux, which may be borax, rosin, zinc chloride, etc. In place of a soldering iron a blowpipe is often used to advantage. For brass soldering, see BRAZING.

SOLDIER BEETLE. A name in the United States for any beetle of the tribe Telephoridi of the family Malacodermidæ. The name is partly derived from the trim appearance and colorational markings, which suggest an army uniform. The larvæ are predatory and feed extensively upon soft-bodied insects, such as plant-lice and small caterpillars. The Pennsylvania soldier beetle (*Chauliognathus Pennsylvanicus*) is a common species in the Eastern United States and is considered very beneficial. The adults are commonly found upon flowers, where they probably feed upon the pollen, and are of value to agriculture as cross-fertilizers of plants.

SOLDIER BUG. A name given to certain predatory stink-bugs (q.v.) of the family Pentatomidæ, especially such forms as *Podisus spinosus, Stiretrus anchorago, Nezara hilaris*, and *Euschistus servus*, which are common enemies of caterpillars.

SOLDIER FLY. Any one of the broad, flat-bodied flies of the family Stratiomyiidæ, called 'soldier flies' on account of the brightly colored stripes with which some species are marked. As a rule they are dark-colored and smooth. About 1000 species are known, and 200 of these are found in North America.

SOLE (OF., Fr. *sole*, from Lat. *solea*, sole, slipper, from *solum*, ground, soil). A flatfish (q.v.) of the family Soleidæ. The common sole of Europe (*Solea vulgaris*) attains a length of from 10 to 20 inches and is highly esteemed for food. The American sole (*Achirus fasciatus*), or 'hog-chocker,' is only about six inches long and is of less value. See Plate of FLATFISH AND FLOUNDERS.

SOLEILLET, sȯ'lâ'yâ', PAUL (1842-86). A French explorer, born at Nîmes. In 1873-74 he attempted to find a route for a commercial road between Algeria and the Niger. He failed in this, but his explorations convinced him of the practicability of a trans-Saharan railroad. He went to Senegambia in 1878 in the interests of this project, but his operations were frustrated by the Governor. In 1881 he went to Kaffa by way of Shoa and laid the way for French approach to the southern borders of Abyssinia. Then he was intrusted with founding the French colony of Obok on the Gulf of Aden. He died while on a new expedition to Shoa. His most important publications are: *Exploration du Sahara central* (1874); *Voyage à Ségou* (1878-79); *Voyages en Ethiopie* (1885); and *Une exploration en Ethiopie* (1886).

SOLEMN LEAGUE AND COVENANT. The agreement between the Scotch and Parliamentarians during the great Civil War in England. See COVENANTS, THE.

SOLENHOFEN (zȯ'len-hō'fen) **LITHOGRAPHIC STONE.** A deposit of limestone of Upper Jurassic age, which, on account of its fine-grained character and homogeneous texture, is admirably adapted for lithographic purposes. The most important quarries occur at Solenhofen, near Pappenheim, in Bavaria. The beds of good

stone aggregate about 50 feet in thickness and are found in the lower portions of the quarries, many of which are 100 feet deep. Most of the lithographic limestone used in the world is obtained from this district. See ARCHÆOPTERYX.

SOLENOID (from Gk *σωληνοειδής, sōlēnoeidēs*, pipe-shaped, grooved, from *σωλήν, sōlēn*, pipe, channel + *εἶδος, eidos*, form). A cylindrical coil of wire used for producing magnetic effects by electric currents. The coil when traversed by a current possesses all the qualities of a magnet. See MAGNETISM.

SO'LENT. The west portion of the strait between the Isle of Wight and the mainland of England (Map: England, E 6). It is 17 miles long by 2 to 5 miles wide, is a favorite yachting ground, and affords safe anchorage. Hurst Castle guards its entrance on the southwest.

SOLEURE, sô'lēr'. The French name of Solothurn (q.v.).

SOLEY, sō'lĭ, JAMES RUSSELL (1850—). An American jurist and author. He graduated at Harvard in 1870 and was admitted to the bar in Washington, D. C. From 1872 to 1882 he was professor of history and law at the Naval Academy at Annapolis. From 1876 to 1890 he was professor in the United States Navy. In 1882 he was transferred to Washington to arrange the Naval Library, and until 1890 was engaged in preparing the Naval Records of the Civil War. From 1890 to 1893 he was Assistant Secretary of the Navy. He afterwards practiced law in New York, and was counsel for Venezuela at the Paris arbitration of the Venezuela-British Guiana boundary in 1899. His publications include: *History of the Naval Academy* (1876); *Foreign Systems of Naval Education* (1880); *The Blockade and the Cruisers*, in the "Campaigns of the Civil War Series" (1883); with Commodore Schley, *Rescue of Greely* (1885); *Boys of 1812* (1887); and *Admiral Porter* (1903), in the "Great Commanders Series." He also edited *Autobiography of Commodore Morris* (1880), and contributed to *The Battles and Leaders of the Civil War* (1887), and F. Winsor's *Narrative and Critical History of America.*

SOLFATARA, sôl'fà-tä'rà (It. *solfatara*, from *solfo*, sulphur). A dormant volcano near Naples. The word is used as a common name for a volcanic vent which emits only vaporous materials. Volcanoes after periods of violent activity frequently pass into a stage of gaseous eruption when steam, sulphureted hydrogen, carbon dioxide, and hydrochloric acid are given off, usually without explosive effects. Sulphur and chlorides are sometimes deposited around the vents as sublimation products. Solfataras are quite numerous in the old volcanic regions of Italy. The Soufrière on the island of Saint Vincent is a notable example of a solfatara which at times becomes violently eruptive.

SOLFEGGIO, sôl-fĕd'jô. See SOLMIZATION.

SOLFERINO, sôl'fe-rē'nô. A village in the Province of Mantua, Italy, 20 miles northwest of Mantua (Map: Italy, E 2). It is famous as the scene of a bloody battle on June 24, 1859, in which the allied French and Sardinians, under Napoleon III., defeated the Austrians. The Tower of San Martino, commanding a splendid view, and containing a military museum, commemorates this victory, which was decisive in securing Italian independence.

SOLICITOR. Under the laws of Great Britain, a person duly admitted to practice law under the provisions of the Solicitor's Acts, and who thereby becomes an officer of the Supreme Court and entitled to certain privileges and immunities. Before the Judicature Act (1873) the term was applied only to persons who conducted litigation in the Court of Chancery, but by the above act all solicitors, attorneys, and proctors authorized to practice in any division of the High Court of Justice are known as solicitors of the Supreme Court. The Incorporated Law Society was appointed 'Registrar of Solicitors' in 1843, and in 1877 that society was given control of the examination of candidates for admission as solicitors. Candidates must serve an articled clerkship under a practicing solicitor for five years, and pass three rigid examinations, unless they are university graduates, writers to the signet, or Scotch solicitors or advocates, in which cases three years is sufficient. A barrister of five years' standing may procure himself to be disbarred, and on passing the final examination be admitted as a solicitor. Colonial solicitors of seven years' standing are exempted from this examination if they have already passed one in their own colony. Each solicitor must obtain annually a certificate of his right to practice from the Registrar of Solicitors. A solicitor can practice in the High Court of Justice, the Court of Appeal, the House of Lords, Privy Council, and all inferior courts. They have a monopoly on certain legal business, as, for example, the attestation of documents required by the Land Transfer Act. A solicitor has a general lien on his client's papers for his charges; has peculiar and extensive powers with reference to binding his client in litigation which he conducts; and has certain personal privileges, as exemption from service in the militia, etc. The fees and costs of solicitors are fixed and regulated by statute in great detail and must be observed. Special provisions are made for the collection of these statutory fees. They are held to a strict accountability for reasonable skill in advice and the management of any matters intrusted to them, and are liable for any negligence or lack of reasonable skill and learning whereby a client is prejudiced. As a solicitor is an officer of the court the latter can exercise summary jurisdiction over him in case of a breach of duty. A solicitor who permits another to practice in his name will be disbarred and can never be readmitted. Where a solicitor is struck off the rolls for other misconduct, he may be subsequently readmitted in the discretion of the court. Consult, Christian, *A Short History of Solicitors* (1896); Cordery, on *Solicitors* (1888).

SOLICITOR-GENERAL. One of the important law officers of the English Crown, appointed by letters patent. He is always a member of the House of Commons, and is *ex officio* a Minister of the Crown and a member of the General Council of the bar. He is not, however, a member of the Cabinet. He is next in rank to the Attorney-General and represents him in his absence. His term of office expires with the fall of the Ministry of which he is a member. The Solicitor-General of Scotland is next in rank to the Lord Advocate.

SOLINGEN, zō'ling-*en*. A town in the Rhine Province, Prussia, 18 miles north-northeast of Cologne (Map: Prussia, B 3). It has long been famous for its steel and ironware manufactures, especially sword blades, helmets, cuirasses, knives, scissors, and hand bells. Population, including the town of Dorp, in 1900, 45,249.

SOLIPSISM (from Lat. *solus*, alone, only + *ipse*, self). A term applied, usually by opponents, to any system of philosophy the principles of which do not logically warrant the belief in any other being than the mind of the thinker. It is a subjective idealism (q.v.) which is so subjective as to leave no valid ground for belief in objectivity.

SOLIS, sō-lēs', JUAN DIAS DE (c.1470-1516). A Spanish navigator. He is said, although without good authority, to have discovered Yucatan with Vicente Yañez Pinzon in 1506. After the death of Vespucci in 1512 he was appointed pilot-major of Spain. In October, 1515, he sailed in command of an expedition in search of a southwest passage to India. He discovered the entrance to the Rio de la Plata and explored the river as far as the region of the Charrua tribe, by whom he was killed, and it is reported, eaten, before September, 1516. His brother-in-law, Francisco de Torres, conducted the survivors of the expedition back to Spain.

SOLITAIRE, sŏl'ĭ-târ' (Fr., solitary). An extinct dodo-like bird (*Pezophaps solitarius*), differing from the dodos in a smaller bill and longer legs. It inhabited Rodriguez, and appears to have been peculiar to that small and lonely island. François Leguat, in his *Voyages et aventures* (London, 1708), has left an interesting and trustworthy account of the solitaire. He describes it as a large bird, the male sometimes weighing 45 pounds, the head of the male without comb or crest, that of the female with something like a widow's peak above the bill; the wings small, and the bird incapable of flying, but using the wings to flap itself or to flutter when calling for its mate, or as a weapon of offense or defense. He further describes the plumage as very full and beautiful, but the tail was a roundish mass of feathers. It became extinct about 1775, but many skeletons are preserved in European museums. See DODO; EXTINCT ANIMALS.

THE SOLITAIRE (After a drawing by Leguat).

In America the name solitaire is given to the flycatching thrushes of the genus Myadestes, species of which occur in Jamaica, Martinique, and other West Indian islands, as well as on the continent. One species, *Myadestes Townsendi*, dwells in the Western United States from the Rocky Mountains to the Pacific. It is about 8 inches long, and dull brownish ash in color, and is a superb singer, as indeed are all the members of the genus. The name 'solitaire' refers to the habit of several species of hiding in the most solitary and out-of-the-way depths of the forests, especially when singing.

SOLITAIRE. A game played by only one person. The date and place of its origin is not known, but it is supposed to have been invented by a prisoner in the Bastille some time during the sevententh century. It is played with 37 balls (usually of glass) on a circular board which has 37 hemispherical cups or depressions. The game is played by removing one ball from the board and then placing an adjoining ball into the vacancy, passing over one intervening ball. The ball passed over is then taken from the board. This process is then continued till only one ball remains, when the game is said to be won. Should two or more balls be left and they more than one space apart, and consequently isolated so as not to be liable to capture by each other, the game is lost.

SOLITAIRE WITH CARDS, or PATIENCE. The pack or packs (sometimes with the exception of certain cards, which are laid face upward on the table) are first shuffled. The player then takes the cards, backs uppermost, and plays them one by one, turning them face upward as he does so. His object is to arrange the cards in 'families,' each family being a complete series from ace to king, although not necessarily of the same suit. They may be formed by building upward, i.e. placing a higher card on the one next below it, or vice versa. The cards may be taken from the pack in the player's hand as already described, or they may be taken from an arrangement of card-piles on the table, or from either. If the player places any top card of these piles (should he elect to arrange the game that way) on any other just above or below it in rank, he is said to be making a marriage, by which he frees the cards underneath and utilizes them in 'building.' Cards that the player is unable to use at the time are laid aside and constitute 'stock.' Thus the stock may be used over again once or twice, but must first be shuffled. There are several other varieties of solitaire played with cards.

SOLLOGUB, sŏl'o-gōōp', VLADIMIR ALEXANDROVITCH, Count (1814-82). A Russian author, born at Saint Petersburg. He graduated at the University of Dorpat (1834) and held various diplomatic and official positions. He made his literary dêbut in 1837 with the novelettes *Two Students* and *Three Fiancés*, but attracted general attention with his *Story of Two Rubber Shoes* (1839), and still more so with his *Tarantas* (1845). Of his numerous works for the stage the farce *Grief from a Tender Heart* (1850) and *The Official* (1856) are the best known. His works of fiction appeared in five volumes (Saint Petersburg, 1855-56).

SOLL UND HABEN, zŏl ụnt hä'ben (Ger., Debit and Credit). A noted romance by Gustav Freytag (1855). It is based on a study of modern industrial conditions, and is a glorification of the German merchant class at the expense of the worn-out nobility.

SOLMIZATION (from *sol* + *mi*, names of two notes of the gamut), or SOLFEGGIO. A peculiar method in use for centuries for teaching musical intervals and scales by means of certain syllables. The syllables are *ut* (or *do*), *re*, *mi*, *fa*, *sol*, *la*, and *si*. The first six are the commencement of the lines of an ancient hymn to John the Baptist,

which had this peculiarity, that the first syllable of each line (with the exception of the last) was sung to a note one degree higher than the first syllable of the line that preceded, so as to present the type of a scale.

These syllables are said to have been first made use of by Guido of Arezzo in the eleventh century. As Guido employed a hexachord, six syllables were sufficient. But when the importance of the leading tone was recognized the heptachord superseded the old hexachord. Then Le Maire, a French musician of the seventeenth century, added to them *si*, for the seventh of the scale. When applied to the key of C, their equivalents, in the ordinary musical nomenclature, are:

Do re mi fa sol la si do
C D E F G A B C.

These syllables may, however, be applied to other keys, with *do* always as the key-note, so as to express, not the absolute pitch of a note, but its relation to the key-note.

SOLMONA, sôl-mō'nȧ, or **SULMONA**, sōōl-mō'nȧ. A city in the Province of Aquila, Italy (Map: Italy H 5). Solmona manufactures wine, paper, cloth, and strings for musical instruments. Population (commune), in 1901, 17,988.

SOLMS-LAUBACH, zōlms lou'bȧG, HERMANN, Count (1842-1904). A German botanist, born near Giessen and educated there and at Berlin, Freiburg, and Geneva. He became professor extraordinary at Strassburg in 1872 and professor of botany and director of the Botanical Garden at Göttingen in 1879, and was called to a similar position at Strassburg in 1888. His publications include: *Ueber den Bau und die Entwickelung der Ernährungsorgane parasitischer Phanerogamen* (1867-68); *Corallina* (Naples, 1881); *Herkunft, Domestikation und Verbreitung des gewöhnlichen Feigenbaums* (1882); *Die Geschlechterdifferenzierung bei den Feigenbäumen* (1885); and *Einleitung in die Paläophytologie* (1887).

SOLO (It., alone). In music, a piece or passage for a single voice or instrument. In orchestral compositions 'solo' indicates that one instrument is to take the leading part.

SOL'OMON (Heb. *Shĕlomōh*, peaceable). A son of David and Bathsheba (II. Sam. xii. 24), successor of David on the throne of Israel. The date of his reign may be stated approximately as B.C. 977-937. The biblical account of Solomon is found in I. Kings, chapters i.-xi., and its parallel II. Chronicles, chapters i.-ix. The facts furnished by these passages may be briefly summarized as follows: When David was old, his son Adonijah set himself up as a pretender to the throne, but Bathsheba interceded for Solomon. David granted her request and Solomon became King. One by one the new King had his enemies, Adonijah, Joab, and Shimei, put to death, so that he rested securely on his throne. He took to wife a daughter of Pharaoh and at the time of his marriage he worshiped in the 'high places.' Solomon divided Israel into twelve parts for administrative purposes, and we are told that his territory extended from the river (Euphrates) unto the land of the Philistines, and unto the border of Egypt, and that he made bondsmen of the Canaanites who remained in the land. He made an alliance with Hiram, King of Tyre, and, in return for food, furnished him with timber; the ships of the allies went out trading together. The temple was built in great splendor with Hiram's aid and dedicated with much magnificence. The King also built a house for his Egyptian wife and a palace in the Lebanon. The temple took from the fourth to the eleventh year of Solomon's reign for its completion; the palace in the Lebanon from the seventh to the twentieth year. Several cities also were built by the King. Many strange women were in his household, who are said to have influenced him to worship alien gods; and for this sin the historian assigns as a punishment Solomon's troubles at the hands of enemies in his lifetime, and the division of the kingdom between Rehoboam and Jeroboam after his death. (See JEROBOAM I.; REHOBOAM.) Almost all other details about Solomon are amplifications either of his wisdom or his splendor. We are told that the Lord appeared to him in a dream and asked him to choose a gift, whereupon Solomon chose neither riches nor power, but wisdom, and as a reward was given both what he chose and what he resigned. A proof of his wisdom immediately follows (I. Kings iii. 16-25), and it is never lost sight of afterwards (cf. I. Kings iv. 29 et seq., where he is said to be "wiser than all men;" v. 7-12; x. 1-3, where Solomon answers the 'hard questions' propounded by the Queen of Sheba, and x. 24). The entire narrative is a recital of the magnificence of the King, especially the description of his building operations (I. Kings iv. 22-28; ix. 26-29; x. 1-13, the story of the Queen of Sheba, who voluntarily pays the King tribute; II. Chron. ix. 9).

The narrative in Kings concerning Solomon is based upon earlier documents, such as the "Book of the Acts of Solomon" (I. Kings xi. 41). Although the main facts are authentic in the opinion of many Bible critics, they are so entwined with legendary lore and colored by a traditional view of Solomon belonging to a period many centuries later, that it is difficult to determine the exact position to be assigned to him in Hebrew history. This traditional view is still more consistently carried out in the narrative in Chronicles, which has no independent historical value. In the Book of Kings there are still traces of a conception of Solomon which did not hold him up in a favorable light. The extension of power is made responsible for the introduction of foreign religious customs, and the blame for the rebellion immediately following upon the death of Solomon is in part, at least, put upon the King. In Chronicles, however, all these unfavorable features are suppressed and the King is held up as a marvel of piety and wisdom, as well as a great ruler under whom the kingdom rose to its highest point of glory.

Solomon's distinguishing quality was as an administrator. He kept the confederacy of the Hebrew tribes intact during his reign, though not in such a condition that his successor could continue his policy. An important step was his strengthening the fortifications of the country, and no less significant was his foreign policy, which involved alliances with surrounding nations such as the Phœnicians. He kept the Egyptian power at bay by becoming the vassal of the Egyptian King. Through this international intercourse, an impetus was given to commerce in Solomon's days, which prompted the tale of Sol-

omon's personal achievements as a great marine merchant. Contact with other nations also had its result in a marked intellectual advance, and it is probably safe to date from Solomon's days the beginnings of a genuine literary activity in Israel, though several centuries elapsed before the movement assumed important dimensions. The new epoch thus marked by Solomon's reign is sufficient to account for the view taken by the later tradition, which makes Solomon himself an author of high rank and prodigious fertility. The books ascribed to him, Proverbs, Canticles, and Ecclesiastes (qq.v.), belong to various periods which, however, are all considerably subsequent to his days. That the simpler sanctuary of former days was replaced in his reign by a more ambitious edifice was a natural consequence of a general political growth, but the description of the new edifice is colored by the desire to extol the grandeur of Solomon's achievements, while the account of the ceremonies, including the prayer, is probably a post-exilic production. Similarly the visit of the Queen of Sheba is a bit of folk lore brought by tradition into connection with Solomon as the most commanding figure in the annals of Hebrew royalty. Consult the chapters on Solomon in the Hebrew histories of Guthe, Stade, Kent, Wellhausen, Piepenbring, Kittel, and Cornill; also McCurdy, *History, Prophecy, and the Monuments* (New York, 1894-1901).

SOLOMON, WISDOM OF (Gk. *Σοφία Σαλομῶντος, Sophia Salomōntos*, Lat. *Liber Sapientiæ*, Book of Wisdom). One of the apocryphal books of the Old Testament, sometimes called also the Book of Wisdom. Solomon is introduced as the speaker (cf. chaps. vii.-ix.), whence the name first mentioned. The book consists of three parts: (1) chapters i.-v. commend wisdom to rulers and incidentally attack Greek philosophy, particularly the Epicurean school, and show how absorption in worldly affairs leads to spiritual ruin; (2) chapters vi.-ix. teach how wisdom, which is above all other benefits, may be gained, and Solomon relates how he came to choose wisdom as his life's companion; the section closes with Solomon's prayer for wisdom; (3) chapters x.-xix. illustrate the influence of wisdom on Israel's history, the miracles in the history are ascribed to wisdom, and, by way of contrast, the results of folly in the history of heathen nations are held up to scorn.

SOLOMON BEN GABIROL, bĕn gā'bē-rōl'. A Jewish philosopher and poet, best known as Avicebron (q.v.).

SOLOMON ISLANDS. A group of islands in the Pacific Ocean, extending in a direction from northwest to southeast between latitudes 5° and 11° S., and longitudes 154° 40′ and 162° 30′ E. (Map: Australasia, J 3). It is about 120 miles distant from the Bismarck Archipelago on the west. Area, estimated at over 16,000 square miles. The principal islands are Bougainville, Choiseul, New Georgia, Ysabel, Malaita, Guadalcanar, and San Cristoval. Most of the islands are oblong in shape, mountainous, and lined with coral reefs along the coast. Traces of the volcanic origin of the group are found in the shape of craters, hot springs, etc. There are some active volcanoes, and earthquakes are of frequent occurrence. The flora is luxuriant and many of the islands have dense forests of ebony and sandalwood. The fauna is essentially Papuan in character, and the climate hot, moist, and unhealthful. The value of copra, pear-shell, and vegetable ivory exported is about $150,000 per annum.

The population, estimated at over 176,000, belong to the Melanesian division of the Papuan Melanesian stock. Their physical type is not uniform, the people of the islands on Bougainville Strait being taller, darker, more robust, and more brachycephalic, those of San Cristoval and the islands adjacent shorter, lighter, less vigorous, and more dolichocephalic. The languages of the islands (very little intercommunication exists between some of them) show great variation, amounting sometimes to mutual unintelligibility. Traces of Malay and Polynesian influences occur in speech, institutions, etc. Headhunting, slavery, cannibalism, and taboo (here tambu) are among the native institutions now mostly on the wane.

With the exception of the island of Bougainville and a few smaller islands, belonging to Germany, in the northwestern part of the archipelago, Great Britain controls the group. The discovery of the Solomon Islands is attributed to the Spanish navigator Mendaña (1567). By an agreement in 1885 the group was divided between Great Britain and Germany and by that of 1899 Great Britain acquired a large part of the German share. Consult: Guppy, *The Solomon Islands and Their Natives* (London, 1887); id., *The Solomon Islands, Their Geology, etc.* (ib., 1887); Woodford, *A Naturalist Among the Head Hunters* (ib., 1890); Reclus, *Nouvelle géographie universelle*, vol. xiv. (Paris, 1889).

SOLOMON'S-SEAL (*Polygonatum*). A genus of plants of the natural order Liliaceæ, differing from lily of the valley chiefly in the cylindrical tubular perianth, and in having the flowers joined to their flower-stalks. Of several European species, the common Solomon's-seal (*Polygonatum multiflorum*) has a stem about two feet high, the upper part of which bears two rows of large, ovate-elliptical, alternate leaves. The flower-stalks are generally branched; the small flowers white and drooping. The young shoots of *Polygonatum officinale* are eaten by the Turks like asparagus. The root is white, fleshy, inodorous, with a sweetish, mucilaginous, acrid taste. It has been applied to bruises to prevent or remove discoloration and has been made into bread in times of scarcity. Among the American species *Polygonatum giganteum*, the great Solomon's-seal, and *Polygonatum biflorum*, smaller Solo-

SOLOMON'S-SEAL (*Polygonatum*).
A fruiting spray of Solomon's-seal, with a terminal piece of a root-stem; *s*, showing the scars or "seals."

mon's-seal, occur from the Atlantic Coast to the Great Plains region. The name is derived from the curious seal-like markings left upon the knotted rootstocks by the falling of the annual stems. Medicinal virtues were once attributed to the dried rootstocks of this plant. *Smilacina racemosa*, an allied plant, is called false Solomon's-seal.

FALSE SOLOMON'S-SEAL (*Smilacina racemosa*).

SOLOMON'S SONG. See CANTICLES.

SO'LON (Lat., from Gk. Σόλων) (c.639-559 B.C.). An Athenian law-giver and patriot, son of Execestides, and descendant from the noble line of the Codrids. In his earlier years Solon engaged in trade and in the course of his commercial undertakings probably visited the Eastern Ægean, where he learned much from progressive Ionia. He acquainted himself with the Ionic literature, and trained himself to write verse in the Ionic dialect; indeed, he was the first Athenian to win renown by his poetry. Solon's life fell in the time of great social and economic change in Greece. As a result of the growing importance of commerce, capital was becoming concentrated in the hands of a few, while the small farmers and agricultural laborers were crushed beneath the increasing weight of debt. The small proprietors were deprived of their lands, and many free Athenians who could not pay what they owed were sold into slavery. The law favored the rich and powerful, and a revolution seemed imminent, when, in the year 594-3 (or 592-1), Solon was elected archon, probably by the more moderate of both parties, and given full power to reform the oppressive conditions. He began with two radical measures: he forbade the borrowing of money on the person of the debtor, and also annulled all mortgages and debts in which the person of the debtor had been pledged. Probably he reduced debts in general and lowered the rate of interest. This great reform was called the *Seisachtheia* (σεισαχθεία) and was celebrated by a public festival. He then restored by general amnesty all who had lost civil rights before his archonship, with the exception of those who had been punished for murder or attempted tyranny. The next remedial measure which he adopted was to forbid the export of all products with the exception of oil, thereby securing a sufficient supply of grain for Athens at a moderate price. He seems also to have limited the amount of land which might be held by a single person. Of great importance was the substitution of a standard of coinage closely resembling the Eubœan for the prevailing Æginetan standard. Seventy of the new drachmæ equaled one hundred of the old. This secured to the poor great relief, and emancipated Athens from her rivals, Ægina and Megara, and gave her the advantage of trade with the colonies in Sicily and Italy. Solon abolished Draco's laws with the exception of that portion of his ordinances which referred to murder. In place of the old four classes, which had been based on the amount of capital possessed, he divided the citizens into four classes on the basis of income. The political offices were open only to the members of the first three classes; the treasury and archons were reserved for the first. The fourth class had simply the right to take part in the assembly (Ἐκκλησία) and the public law courts. But the gaining of this privilege was a most important step in the direction of the democracy, for before the popular courts every magistrate might be accused when he laid down his office, and in this way the people had a control over the administration. For the selection of officials Solon introduced a peculiar combination of choice and lot. The Senate (Βουλή) was composed of 400 members, 100 from each tribe. This body and the popular assembly undoubtedly received many of the rights formerly possessed by the Areopagus, which now retained jurisdiction only in murder cases, together with general censorial power over the guardianship of the laws. Tradition says that after his year of office Solon bound his fellow citizens by an oath to keep the laws and withdrew from Athens for a period of ten years. Although many details of his reforms are obscure and disputed, it is undoubted that Solon emancipated the individual and took the first decisive step toward complete democracy. It is true that after his year of office internal disorder broke out within the State, and Solon lived to see, thirty years later, a tyranny established at Athens by one of his own kinsmen. (See PISISTRATUS.) Consult the Greek histories by Grote, Busolt, Beloch, Abbott, and Eduard Meyer; also Schömann, *Griechische Altertümer* (4th ed., Berlin, 1897); Hermann, *Griechische Staatsaltertümer* (6th ed., Freiburg, 1889); Gilbert, *Griechische Staatsaltertümer* (Leipzig, 1893; English trans. London, 1895); Busolt, *Griechische Staats- und Rechtsaltertümer* (Munich, 1892).

SOLOTHURN, zō'lō-tōōrn (Fr. *Soleure*). A canton of Switzerland, bounded by Basel on the north, Basel and Aargau on the east, and Bern on the south and west (Map: Switzerland, B 1). It is traversed lengthwise by the main ridge of the Jura, reaching a maximum height of 4754 feet. The northwestern part is covered by the minor Jura ridges and parallel mountain valleys, while along the southeastern boundary extends the valley of the Aar. The climate is somewhat severe. Almost the entire area is utilized for grain and stock raising, and the output of cereals is above the domestic demand. Fruit, dairy products, wood, marble, gypsum, and building stone are exported. The chief manufactured article is matches. The Constitution of the canton dates from 1875, and, as amended in 1895, provides for a legislative assembly elected for four years at the rate of one member for every 800 inhabitants. The 5 members of the executive council are also elected by the people for the same period. The canton returns 5 members to the National Council. Capi-

tal, Solothurn. Population, in 1888, 85,621; in 1900, 100,762, of whom the Catholics form over three-fourths. German is the predominating language.

The history of the canton centres chiefly around its capital, Solothurn, which dates from pre-Roman times, and which in 1218 became a free Imperial city. The burghers were associated with Bern in the struggles against the petty princes of the region. Solothurn was formally admitted into the Swiss Confederation in 1481, by which time it had extended its rule over the region now constituting the canton. The aristocratic régime which had long existed in the canton came to an end in 1830.

SOLOTHURN. The capital of the Canton of Solothurn, Switzerland, on the Aar, about 20 miles north-northeast of Bern (Map: Switzerland, B 1). It is a walled city with broad streets and numerous churches. The Cathedral of Saint Ours (the cathedral church of the Bishopric of Basel) is a cruciform structure of the eighteenth century, built on the site of an old church dating from 1050. Other interesting architectural structures are the ancient clock-tower and the cloth hall with its collection of weapons. The town library contains about 40,000 volumes. There is a natural-history museum with valuable zoölogical and paleontological collections. The environs of the town are exceedingly picturesque and abound in villas and resorts. The chief industries are watchmaking and stone-quarrying. Population, in 1900, 10,100.

SOLOVIEFF, sō'lô-vyĕf', SERGEI MIKHAILOVITCH (1820-79). An eminent Russian historian, born and educated at Moscow. From 1842 to 1844 he was abroad as tutor in Count Stroganoff's family, attending the lectures of Ranke, Böckh, and Michelet. His thesis, *The Relations Between Novgorod and the Grand Princes* (1845), and his dissertation, *History of the Relations Among the Princes of the House of Rurik* (1847), established his reputation, and he was appointed professor of Russian history at Moscow. Subsequently he was dean of the Historico-Philological Faculty and rector of the university for a number of years. His *History of Russia* in 29 volumes (7th ed., 1879) was the first thorough treatment of the subject from the earliest period to 1774. He wrote also a number of historical text-books, including *Historical Letters* (1858), *History of the Fall of Poland* (1863), and *Political and Diplomatic History of Alexander I.* (1877).

SOLSTICE (Lat. *solstitium*, from *sol*, sun + *sistere*, to stand, reduplication of *stare*, to stand). That point in the ecliptic (q.v.) at which the sun is farthest removed from the celestial equator, and where it is consequently at the turning point of its apparent course. There are two such points in the ecliptic, one where it touches the Tropic of Cancer, the other where it touches that of Capricorn. (See TROPIC.) The former is the *summer* and the latter is the *winter* solstice to those who inhabit northern latitudes, and vice versa. The term is also employed to signify the date at which the sun attains these two points in its orbit, viz. June 21st and December 21st.

SOLUBLE GLASS. See WATER-GLASS.

SOLUTION (Lat. *solutio*, from *solvere*, to loose, dissolve, from *so-*, *se-*, apart, away + *luere*, Gk. λύειν, *lyein*, to loose). In chemistry, a term applicable to any mixture that can be formed by the interdiffusion of two or more substances, gaseous, liquid, or solid. A mixture so formed is invariably homogeneous, i.e. its ingredients do not exist alongside of one another in separate masses, and therefore cannot be distinguished separately even by means of a powerful microscope. For the distinction between a homogeneous mixture and a chemical compound, see the article CHEMISTRY.

GASEOUS MIXTURES. The formation of these is not limited to any particular set of substances, as is the case with liquids and solids; all gases are capable of mutual interpenetration by diffusion and hence of forming homogeneous mixtures. In a gaseous mixture the properties of each ingredient are practically unaffected by the presence of the other ingredients. Therefore, provided no chemical reaction takes place, a gaseous mixture obeys the laws of gases (viz. those relating to the mutual dependence of volume, pressure, and temperature) as if it were an isolated gaseous substance.

LIQUID SOLUTIONS. These may be formed by liquids with gases, by liquids with other liquids, and by liquids with solids.

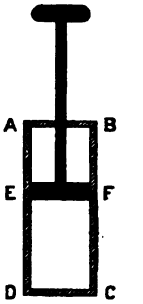
The mass of any gas absorbed by any liquid is proportional to the pressure of the gas (Henry's law) and diminishes with increasing temperature. Of course, even under the same conditions of pressure and temperature the solubility of different gases in some liquid is not the same; thus carbonic acid gas is much more soluble in water than oxygen. The solubility in the case of each system consisting of a gas and a liquid is termed by Bunsen the 'coefficient of absorption.' To understand clearly the meaning of this term imagine some gas in contact with a given liquid and maintained at some temperature *t*, under a pressure equal to the normal pressure of the atmosphere; imagine that when no more of the gas is being absorbed, all the gas contained in one cubic centimeter of the solution is driven out of it, confined separately, and cooled off to 0° Cent.; the volume that the gas will then occupy is its coefficient of absorption with respect to the given liquid at the temperature *t*. In the case of gases (such as ammonia, with respect to water) that are copiously soluble, i.e. whose coefficient of absorption is very large, that coefficient itself is variable, not only with the temperature, but also with the pressure of the gas; in other words, such gases fail to obey Henry's law—probably because they enter, to a greater or less extent, into chemical combination with the solvent liquid. Why the coefficient of absorption should be exactly what it is, whether Henry's law is obeyed or not, is not yet understood. Nor do we understand clearly the state of a gas when absorbed by a liquid. Are its molecules combined with those of the solvent in the form of hydrates, or do they exist in the solvent independently? On the other hand, it has been demonstrated that if a gas obeys Henry's law its molecules in solution are neither dissociated into simpled molecules nor associated with one another. It has also been shown that dilute solutions of gases in liquids obey the laws of osmotic pressure as

well as do dilute solutions in general (see further below).

Passing now to solution of liquids in liquids, we find, first of all, that some liquids (e.g. water and alcohol) are miscible in all proportions, that the mutual solubility of others (e.g. water and ether) is limited, and that still others are practically insoluble in each other. There are strong reasons for assuming that the third of these classes is really identical with the second; only the amounts dissolved are so small that they cannot be detected by the analytical means at our disposal. One of the most important properties of solutions of liquids in liquids is their vapor-tension, which plays an important part in processes of fractional distillation. (See DISTILLATION.) When two liquids, A and B, are mixed, the vapor-tension of either undergoes a diminution: A in the solution is less volatile than in the free state, and so is B. The vapor-tension of each in the solution is termed its 'partial vapor-tension,' and the total vapor-tension of the solution is equal to the sum of the diminished, partial vapor-tensions of its ingredients. If A and B are mutually soluble to a limited extent, two solutions may be formed (viz. A in B and B in A), of which the partial as well as the total vapor-tensions are respectively equal. Take, for instance, water and ether; if shaken up in sufficient relative quantities and then allowed to stand undisturbed they will form two distinct liquid layers, the upper a saturated solution of water in ether, the lower a saturated solution of ether in water; the partial vapor-tension of the water in the upper equals the partial vapor-tension of the water in the lower solution; the partial vapor-tension of the ether in the upper equals the partial vapor-tension of the ether in the lower solution; and hence, the total vapor-tension of the upper solution equals the total vapor-tension of the lower. Analogous relations are found in all cases examined.

The solubility of solids in liquids is invariably limited. As a rule it increases with the temperature, but cases are known (e.g. that of sodium sulphate, with respect to water) in which an elevation of temperature may cause a decrease in solubility. A fact important to remember is that if a solid is capable of existing in two or more different modifications (e.g. in different allotropic forms, in an anhydrous form and one or more forms containing water of crystallization, etc.), each modification has its own solubility, and a solution exactly saturated with the more soluble modification is more or less 'supersaturated' with the less soluble one. Bearing in mind that the supersaturation of a solution is destroyed, with rapid separation of the excess of dissolved substance, when a trace of the latter is introduced into the solution, the following experiment may serve to illustrate the point under consideration: Let ordinary Glauber's salt, i.e. sodium sulphate containing 10 molecules of water of crystallization ($Na_2SO_4.10H_2O$), be heated to boiling with about one-half its weight of water. in a flask whose mouth is loosely closed with a plug of cotton (to keep out particles of Glauber's salt that may be floating in the air). If the solution thus obtained be cooled to —10° C., a sodium sulphate containing seven molecules of water of crystallization ($Na_2SO_4.7H_2O$) will separate out, and when the separation is complete the mother-liquor will be exactly saturated with respect to this salt. Now, $Na_2SO_4.7H_2O$ has a greater solubility than $Na_2SO_4.10H_2O$. Hence, the saturated mother-liquor of $Na_2SO_4.7H_2O$ must evidently be supersaturated with respect to $Na_2SO_4.10H_2O$. As a matter of fact, if a trace of the latter be now introduced into our mother-liquor, a new crystallization will set in, a mass of $Na_2SO_4.10H_2O$ separating out and leaving the solution exactly saturated with respect also to this form of the salt. Such, as well as a host of other phenomena, complicate exceedingly the problem of discovering a precise relationship between the solubility of substances in various solvents and their nature.

SOLID SOLUTIONS. The existence of solutions in the solid state has only been recognized within recent years. It was mentioned in the article on diffusion (q.v.) that cases of that phenomenon have now been actually observed in solids. But there is also an increasing number of indirect proofs that many homogeneous solid mixtures are true solutions, i.e. might be formed by the inter-diffusion of their ingredients, although actually such a process would of course be very slow. Isomorphous crystalline mixtures, while homogeneous, may not be solutions at all; for it is possible that in them free diffusion cannot take place, the molecules of either of the ingredients being controlled by the forces that determine the crystalline form of the whole; but this is not certain. Among solid solutions containing fluids may be mentioned the well-known case of metallic palladium and hydrogen gas. The two were formerly supposed to combine chemically, forming the compound Pd_2H. But the composition of this substance has now been shown to vary with the temperature. Hence it cannot be considered as a chemical compound (see CHEMISTRY), and as it is formed by direct diffusion of hydrogen into palladium, it must be considered as a true solid solution.



OSMOTIC PRESSURE. It may be seen from the above that a theory of solutions does not yet exist. Some of the most important questions with regard to solutions remain unanswered and the known facts are mostly uncorrelated; in brief, the subject is largely not yet rationalized.

In one of its phases, however, the subject of solutions has, within recent years, received a development which must be counted among the most brilliant scientific achievements of our time. The achievement in question is based on the most characteristic property of solutions, viz. the capacity of the 'solute' (i.e. the dissolved substance) to diffuse within the solution until the concentration of the latter is the same at all its points. Let an aqueous solution of sugar, for instance, be placed at the bottom of a vessel, and let some pure water be introduced over it, cautiously, so as not to disturb the solution; the result will be that the sugar will gradually diffuse upward, and after a certain length of time the liquid will have a perfectly uniform composition throughout. Now, to cause this motion of the sugar upward, against gravity, there must obviously be some force. An analogous case that readily suggests itself to the mind is that of gases. A gas, too, will flow upward, and, like a substance in solution, will distribute itself evenly within an available volume. Of course,

when a gas is evenly distributed within a vessel, it still exercises pressure on the walls, while in the case of a substance in solution, once diffusion is over, there would seem to be no evidence of the existence of a pressure. Yet there, too, a pressure must exist; for let a new volume of pure water be placed over our diluted solution of sugar, and diffusion upward against gravity, as well as in all other directions from points of higher to points of lower concentration, will recommence.

All this suggests that, in general, the properties of matter in a highly dilute state (i.e. when a small mass occupies a large volume) may be the same whether the dilute state is that of a gas or that of a substance in solution. For in either of those states matter possesses the most important characteristic of gases, viz. the capacity for expanding indefinitely. The problem therefore arises, to ascertain whether the laws of the interrelation of pressure, volume, and temperature of substances in solution are not similar to, or identical with, the corresponding laws of gases—a problem that can be solved only by experimental inquiry. The volume and temperature are evidently those of the solution and can be easily measured. So the solution of the problem depends on a method for measuring the pressure of the solute. To measure this directly, it is obviously necessary to employ an apparatus by means of which it would be possible to exert pressure upon the solute without at the same time exerting pressure upon the solvent—in other words, an apparatus for separating the solvent and the solute. Such an apparatus would show the resistance offered by the solute alone and would thus furnish a measure of its pressure. Let, for instance, an aqueous solution of sugar be placed in a cylindrical vessel with a tight-fitting piston just touching the solution. If the piston is made of a solid *impermeable* material, then external pressure upon it will be resisted by the solution as a whole, most of the resistance being of course offered by the water, which is highly incompressible. If, on the other hand, the piston is made of some ordinary, *permeable*, filtering material, then external pressure upon it will scarcely be resisted at all, the solution as a whole passing through it. Evidently, to answer our purpose, the piston must be made of a *semi-permeable* material, through which the water, but not the sugar dissolved in it, could pass freely. By means of such a piston alone could we compress the sugar without compressing the water and thus ascertain the resisting pressure of sugar within the volume of the solution, as we might ascertain the pressure of a gas within an ordinary vessel.

The best artificial semi-permeable material thus far discovered, especially well adapted for separating water from dissolved sugar, is a membrane of ferrocyanide of copper, formed by the action of potassium ferrocyanide upon copper sulphate. Pfeffer, who was the first to employ this substance for measuring the pressure of substances in solution, proceeded as follows: He filled a porous clay cylinder with a solution of copper sulphate and immersed it in a solution of potassium ferrocyanide; the two solutions, penetrating into the clay from the opposite sides, yielded a precipitate of copper ferrocyanide where they met within the walls of the cylinder, the walls serving to impart to the precipitated membrane considerable mechanical resistance. The cylinder was now filled with a solution of sugar, its upper end was tightly closed with a lid bearing an ordinary mercury manometer, and the apparatus was placed in pure water so that the level of the latter was precisely the same as that of the solution within. To understand the phenomenon that followed, imagine a cylindrical vessel ABCD in which, say, air has been compressed within the volume EFCD, while the space ABFE is empty; if we relieve the piston EF, it will be driven up by the expansive power of the air until it is stopped by AB or by some other resistance; if, instead, we hold up the cylinder in the air by the handle, the expansive power of the compressed air will cause the entire volume ABCD to move over, the result being, again, a larger space occupied by the air. Precisely analogous phenomena would be observed if EFCD were filled with a solution of sugar and ABFE were pure water, while EF were a semi-permeable membrane: Either the piston would move upward or the entire liquid volume (pure water *plus* solution) would move in the direction of the dissolved sugar; in either case the cause would be the expansive power of the sugar and the result an increase of the volume occupied by it, i.e. an addition of pure water to the solution. As a matter of fact, in Pfeffer's apparatus, the semi-permeable walls being fixed, the expansive power of the dissolved sugar caused pure water to enter the clay cylinder. The increasing amount of liquid naturally caused an increasing compression of the air within the cylinder, and finally a point was reached when the expansive power of the sugar was no longer capable of overcoming the resistance of the air, the latter having grown precisely equal to it. Then equilibrium ensued, the mercury manometer showing the pressure of the air within the cylinder, and hence the equal of that pressure—the 'osmotic pressure' of the sugar in solution. Similar experiments showed: (1) That the osmotic pressure of sugar and other substances in dilute solutions is proportional to the concentration, i.e. inversely proportional to the volume of the solution; (2) that the osmotic pressure of sugar and other substances in dilute solution is proportional to the absolute temperature (i.e. the centigrade temperature *plus* 273 degrees); (3) that the osmotic pressure of substances in dilute solution is equal to the pressure that the solute would exert if removed from the solution, vaporized, and inclosed within an empty volume equal to that of the solution, at a temperature equal to that of the solution. In brief, the laws of gases, viz. the law of Boyle and Mariotte, the law of Charles and Gay-Lussac, and Avogadro's rule, hold good in the case of dilute solutions as they do in the case of gases. Further experiments have shown, besides, that the osmotic pressure in solutions is the same no matter what the solvent.

The importance of these results will be evident to those who realize that the science of chemistry is based on the laws of the gaseous state, Avogadro's rule, which embodies those laws, being the only sure guide in finding those comparable

units of compounds—their molecular weights. (See CHEMISTRY; MOLECULES — MOLECULAR WEIGHTS; AVOGADRO'S RULE; ATOMIC WEIGHTS; GASES, GENERAL PROPERTIES OF; etc.) Yet a majority of compounds are non-volatile, and therefore our theoretical knowledge of them remained uncertain, and in many cases vague, until the above results proved that what we can learn of a substance by studying it in the gaseous state we can learn with equal certainty by studying it in dilute solution. Very few indeed are the substances that are neither volatile nor soluble in any liquid. Direct methods for measuring osmotic pressure, like the one described above, have been of importance only in demonstrating the fundamental laws; the experimental difficulties involved render their use for determinations of molecular weights practically impossible. But, on the other hand, it has been shown that the depression of the freezing-point or the elevation of the boiling point caused by dissolving a substance in a given liquid is proportional to the osmotic pressure in the solution; and so, molecular weights are now generally determined by observing the freezing-points or the boiling-points of solutions. (See MOLECULES—MOLECULAR WEIGHTS; FREEZING-POINT; BOILING-POINT.) At first, experimental research seemed to show that compounds of three important classes, viz. acids, bases, and salts, do not obey the laws of osmotic pressure; their osmotic pressure was found to be much higher than it should be theoretically. But Arrhenius's theory of electrolytic dissociation (see DISSOCIATION) soon came to add itself to the theory of osmotic pressure, and, instead of disproving it, only furnished further proof of its correctness, just as the phenomena of chemical dissociation, when correctly understood, had once furnished additional proof of the reliability of Avogadro's rule for gases. See AVOGADRO'S RULE.

HISTORY. The history of our subject commences perhaps with Graham's researches on the diffusion of substances in solution, dating back to 1851. Ten years later Graham investigated the well-known method of dialysis, based on the fact that many animal and vegetable membranes are permeable to water and the so-called 'crystalloids,' but impermeable to 'colloids' (q.v.). In 1867 Traube discovered that copper ferrocyanide is permeable to water, but impermeable to sugar, and more or less impermeable to many other substances. Ten years later Pfeffer published the researches mentioned above (*Osmotische Untersuchungen*, Leipzig, 1877). Finally, in 1886, on the basis principally of the experimental researches of Pfeffer, De Vries, and Raoult, Van't Hoff worked out the theory of dilute solutions, which has extended the domain of rational chemistry as few general ideas had done before. The principal names connected with the further development of the theory are those of Nernst, Ostwald, and Arrhenius. In this country Arthur A. Noyes has made a number of original contributions of recognized importance. For an account of the physiological importance of osmotic phenomena, see OSMOSIS.

SOL'WAY FIRTH. An inlet of the Irish Sea, separating Cumberland from Scotland, and forming in its upper part the estuary of the Esk (Map: Scotland, E 5). Its length is 33 miles and its width increases gradually, although irregularly, to upward of 20 miles. It is noted for its spring tides, which rush in as a bore from three to six feet high at the rate of eight to ten miles an hour.

SOL'YMAN (or **SULEIMAN**) **II.** (c.1495-1566). Sultan of the Turkish Empire, surnamed 'The Magnificent.' In September, 1520, he succeeded his father, Selim I. (q.v.). He overthrew the rebellious governor of Syria, repressed the Egyptian Mamelukes, and concluded a treaty with Persia. In 1521 he took Belgrade, the key to Hungary. He next drove the Knights of Saint John from Rhodes (1522) after a five months' siege. In the succeeding years he devoted himself to improvements in the administration and to military preparations for a great onslaught upon Hungary. On August 29, 1526, he overwhelmed the army of King Louis II. at Mohács. (See HUNGARY.) In 1529 he was summoned to Hungary in aid of his protégé, John Zápolya, Waywode of Transylvania, who was contesting the crown with Ferdinand, brother of the Emperor Charles V. He invaded that country with a great army, and laid siege to Vienna, but after a number of unsuccessful assaults he was compelled to retreat. In 1532 he laid Styria waste and again advanced to the neighborhood of Vienna, but his arms were baffled by the resistance of the little Hungarian fortress of Güns, and the advance of the Imperial army under Charles V. forced him to retreat. Soon after this the Sultan waged a successful war against Persia. In 1535 Solyman concluded with Francis I. the famous treaty which opened the commerce of the Levant to the French flag alone. By 1541 the Turks were in permanent possession of the heart of Hungary. In 1542 the combined French and Turkish fleets ravaged the Italian coasts and pillaged Nice. The Turks were now supreme in the Mediterranean; in 1551 Tripoli fell into their hands. A second and third war with Persia, which was now in a state of semi-subjugation, a brilliant naval victory (1561) over the Knights of Malta and their allies, the Spaniards, an unsuccessful siege of Malta (1565), and a fresh expedition to Hungary (1566), were the chief events of the remainder of Solyman's reign. He died during this last expedition, while besieging the little town of Sziget (whose defenders had stayed the advance of the Turkish host) September 5, 1566. Solyman encouraged literature, and did much for the improvement of the laws as well as for the military organization of the State. He was a ruler of many great qualities, and under him the Ottoman Empire reached the height of its power. Consult the works referred to under TURKEY.

SOMA (Skt., from *su*, to press). An Oriental plant identified, but not certainly, with the *Sarcostemma acidum*. It was at first deified in India on account of the intoxicating nature of its juice, and was then identified as a divine being with the moon, which it resembled in color and in its swelling, as well as in its magical maddening effect. The plant is plucked up by the roots by moonlight in the mountains and is crushed between two stones, after being carried on a goat-car to the place of sacrifice. It is then strained through a sieve into a tub, where it is allowed to ferment; and being thickened with meal and sweetened, it is drunk by the priests after being offered to

the gods. Only the priests at the present day may drink of it. The Vedic hymns (see VEDA) are chiefly concerned with the Soma cult. In the later Vedic hymns the identification with the moon is already complete, and Soma and the war-god Indra are regarded as two allied divinities. The deification of the plant had already begun before the separation of the Indo-Iranians. In the Persian cult, *haoma*, the Iranian equivalent of the Indian *soma*, is a god, but also the tree of life. It is probable that the name has been applied to different plants even in India. Consult: Windischmann, *Ueber den Soma-cultus der Arier* (1847); Muir, *Original Sanskrit Texts*, vol. ii. (London, 1871); Hillebrandt, *Vedische Mythologie*, vol. i. (Breslau, 1891).

SŌMADĒVA, sō'mȧ-dā'vȧ (eleventh century A.D.). A Sanskrit author. Of his life nothing is known. He composed but one work, the *Kathāsaritsāgara*, or 'Ocean of the Streams of Story,' which he began about 1070. This is the longest and most important collection of stories which has been preserved in Sanskrit. It contains a series of tales which are of considerable importance to students of comparative literature. They are told in the main for their intrinsic interest, not to point a moral. Although in the main Brahmanistic in spirit, Buddhistic influence is frequently apparent. The *Kathāsaritsāgara* was edited and translated into German by Brockhaus (Leipzig, 1839-66), edited by Durgaprasad and Parab (Bombay, 1889), and translated into English by Tawney (Calcutta, 1880-87).

SOMALI, sō-mä'lē. A Hamitic or Ethiopian people in the extreme eastern part of Africa, partly in Italian, partly in British territory. They are tall (1.725m.), dark-skinned, and dolichocephalic. The infusion of Negro and later of Semitic blood causes much variation in color. Their activities are the raising of grains, coffee, and spices, camel-breeding, and coastwise industries. The chief clothing of the men is a toga-like robe of cotton. They are not mechanical nor artistic. Being always at strife, they pride themselves on their weapons, which are of African pattern, lances, edged weapons, and rawhide shields. Their social organization is patriarchal, the clans and chieftains being innumerable. Their religion is fanatical Mohammedanism.

SOMALILAND. A region on the east coast of Africa. See BRITISH SOMALILAND; FRENCH SOMALILAND; ITALIAN SOMALILAND.

SOMASCHIANS, sō-mȧs'kĭ-anz. A Roman Catholic congregation of priests founded by Saint Jerome Emiliani (1491-1537). The mother-house of the congregation was at Somasco, Italy, between Milan and Bergamo, whence it took its popular name. It was confirmed by Paul III. in 1540; after it had been for a short time united with the Theatines, Pius V. enrolled it among the religious Orders in 1568, assigning it the rule of Saint Augustine. From 1616 to 1647 the French *Doctrinaires* (see DOCTRINE, FATHERS OF CHRISTIAN) were united with them. They have greatly diminished in numbers and now have only about ten houses. Consult Heimbucher, *Die Orden und Congregationen der katholischen Kirche* (Paderborn, 1897).

SOMATOLOGY (from Gk. *σῶμα, sōma*, body, + *-λογία, -logia*, account, from *λέγειν, legein*, to say). That division of anthropology which treats of the anatomy and physiology of mankind, especially by a comparative survey of different races from this point of view. Anatomical somatology deals with stature, tegument, pigmentation, measurements of the body, and the anatomy of special portions of it. Under physiological somatology are included discussions of the functions of nutrition, respiration, circulation, communication, reproduction, and the influence of environment, as well as various problems of a psychological or a pathological nature. Stature, the first anatomical division of somatology, treats of the height of mankind, and thus of giants (q.v.) and dwarfs (q.v.) also, while the tegumentary study concerns itself with the varying phenomena presented in the skin and pelage of different races. Pigmentation deals with the complexion (q.v.) or color of the skin, the colors of the eyes and hair, and with such deviations from the normal type as the albino (q.v.). One of the most important provinces of somatology is the measurement of the body, thus affording ratios for comparative study. These ratios form the basis of the anthropometric indexes, of which the chief ones are the cephalic, cranial, nasal, facial, dental, maxillary, and pelvic. The anatomy of special parts of the body is of less importance excepting in the case of the brain, yet there is scarcely a part of the body which does not undergo ethnic variation.

Physiological somatology shows as marked a diversity as the anatomical division, although it has been far less studied. The functions of nutrition and the temperature of the body show comparatively slight variations, while respiration and circulation are noticeably divergent. The functions of communication, including the expression of emotions, the acuteness of the senses, and similar phenomena, differ to a degree which is remarkable and important. Susceptibility to environment is also marked by great variation, and the same statement holds regarding pathological features, such as relative predisposition to or immunity from diseases. Psychological divergencies, like reproductive variations, while manifestly existent, have not yet been reduced to scientific classification. Consult: Roberts, *Manual of Anthropometry* (London, 1878); Deniker, *Races of Man* (ib., 1900); Livi, *Anthropometria* (Milan, 1900). See ANTHROPOMETRY; INDEX.

SOMBRERETE, sôm'brȧ-rā'tȧ. A town of Mexico in the State of Zacatecas, situated 85 miles northwest of Zacatecas, in a mountainous district celebrated for its rich silver mines, from which Sombrerete derives all its importance (Map: Mexico, G 6). Population, in 1895, 10,082.

SOMERS, sŭm'ẽrz, or **SUMMERS**, Sir GEORGE (1554-1610). An English mariner, born at or near Lyme Regis, Dorsetshire. He was an active promoter of the London company formed to colonize Virginia, and in 1609 he sailed for America in command of a small fleet. His squadron was scattered by a hurricane and Somers's vessel was wrecked on the Bermuda Islands, which Somers took possession of in the name of England. He died there while on a second visit. One of the many contemporary versions of his shipwreck is said to have given Shakespeare the setting for *The Tempest*.

SOMERS, JOHN, Lord (1651-1716). An English lawyer and statesman. He was born in Worcester and educated in private schools and at Trinity College, Oxford. He was called to the bar in 1676, distinguished himself in the trial of the seven bishops, became leader in the negotiations of the discontented nobles with William III., and was an important member of the first Parliament after the revolution of 1688-89. The Bill of Rights was drafted by a committee of which he was chairman, and its chief defence in Parliament was intrusted to him. He was made Solicitor-General in 1689, Attorney-General three years later, and Lord Keeper in 1693, and became Speaker of the House of Lords a few months later. In 1697 he was appointed Lord Chancellor of England. At this time he was raised to the peerage. Somers was closely associated with John Locke and Sir Isaac Newton in the measures looking to the reform of the coinage. He was removed from the Chancellorship in 1700, impeachment proceedings being begun against him, which, however, were soon dropped. His literary reputation is most closely associated with the great library he collected, from which was afterwards edited the *Somers Tracts* by Sir Walter Scott (13 vols., London, 1809-13).

SOMERSET, sŭm'ẽr-sĕt, EDWARD SEYMOUR, Duke of (c.1506-52). See SEYMOUR.

SOMERSET, FITZROY JAMES HENRY, Lord; First Baron Raglan. See RAGLAN.

SOMERSETSHIRE. A maritime county in the southwest of England, bounded on the northwest by Bristol Channel, and in other directions by Devonshire, Dorsetshire, Wiltshire, and Gloucestershire (Map: England, C 5). Area, 1615 square miles. Population, in 1891, 484,337; in 1901, 508,104. The surface is diversified with lofty hills and barren moors, rich vales and marshy levels, many thousands of acres of the latter being below high-water mark, and depending for security on sea banks and sluices. The hills are divided into several ranges running from east to west, the most conspicuous being the Mendips. In the extreme west is the wild district of Exmoor (q.v.). The chief river, the Bristol Avon, rises in Wiltshire and for some miles divides Somersetshire from Gloucestershire. The wheat and barley grown around Bridgewater are famous; grazing and dairy farming form the leading branches of husbandry; and the cheese of Cheddar has a great reputation. The hilly districts are rich in minerals, especially iron, with some lead and freestone. The manufactures are woolen cloth, coarse linens, lace, silk, and gloves. Capital, Taunton. British camps are numerous on the hills, and extensive remains of stone circles are visible at Stanton Drew, near Bristol. Consult Cooke, *Topography of Great Britain* (London, n. d.).

SOMERS (sŭm'ẽrz) **ISLANDS.** A group of islands in the Atlantic Ocean. See BERMUDA.

SOMERSWORTH, sŭm'ẽrz-wûrth. A city in Strafford County, N. H., five miles north of Dover, on Salmon Falls River, and on the Boston and Maine Railroad (Map: New Hampshire, L 8). There is a public library. Somersworth is chiefly noted for its manufacture of cotton cloth and woolen goods, but has also important boot and shoe interests. The water-works are owned and operated by the municipality. Settled in 1729, Somersworth was incorporated as a town in 1754, and was chartered as a city in 1893. Population, in 1890, 6207; in 1900, 7023.

SOMERVILLE, sŭm'ẽr-vĭl. A city in Middlesex County, Mass., adjoining Boston, on the Mystic River, here spanned by two bridges, and on the Boston and Maine Railroad (Map: Massachusetts, E 3). It is largely a residential city. Many places of historic interest add to its attractiveness. Broadway, over which Paul Revere passed on his famous ride; Central Hill, occupied by a redoubt during the siege of Boston; the old Powder House, where the powder for the American Army was stored; Prospect Hill, said to be the scene of the first unfurling of the American flag, and the headquarters of Generals Greene and Charles Lee, are especially noteworthy. The city has a public library with 56,000 volumes, Somerville Hospital, Catholic Home for the Aged, Somerville Home for the Aged, a State armory, and a fine city hall. In the census year 1900 the various industrial establishments of Somerville had an invested capital of $10,131,596, and a production valued at $21,776,511. Slaughtering and meat packing, cloth bleaching and dyeing, the distillation of liquors, and the manufacture of metal tubing, desks, pictures and frames, and jewelry are the leading industries.

The government is vested in a mayor, chosen annually, and a unicameral council. Of the subordinate officials the majority are appointed by the mayor subject to the confirmation of the council; the school board, however, is elected by popular vote. The assessed valuation of real and personal property in 1902 was $55,485,370, and the net debt (January 1, 1903) $1,477,000. The city spends annually for maintenance and operation about $1,000,000, the main items being: For schools, $300,000; for streets, $159,000; for the police department (including amounts for jails, workhouses, reformatories, etc.), $69,000; for the fire department, $68,000; for municipal lighting, $63,000; for water-works, $52,000; and for interest on debt, $51,000. The water-works are owned by the municipality. Population, in 1890, 40,152; in 1900, 61,643. Settled about 1631, Somerville was a part of Charlestown until separately incorporated in 1842. In 1871 it was chartered as a city. Within the limits of the present city a large body of Hessian prisoners were quartered in 1777-78. Consult: Samuels (editor), *Somerville, Past and Present* (Boston, 1897); and Hurd, *History of Middlesex County* (Philadelphia, 1890).

SOMERVILLE. A town and the county-seat of Somerset County, N. J., 36 miles west by south of New York City, on the Raritan River, and on the Central Railroad of New Jersey (Map: New Jersey, C 2). It is an attractive residential place and has a public library. The principal manufactures are woolen cloth, clothing, and brick. Population, in 1890, 3861; in 1900, 4843.

SOMERVILLE, MARY (1780-1872). A writer on mathematics and physical science, born at Jedburgh, Scotland. In 1804 she married Captain Greig of the Russian navy, and removed to London. After three years of married life she was left a widow and free to devote herself to study. In 1812 she married her cousin, Dr. William Somerville. After presenting

a successful paper on the *Magnetic Properties of the Solar Spectrum* to the Royal Society in 1826 Mrs. Somerville was invited by Lord Brougham in the following year to try to popularize for the English public Laplace's great work, the *Mécanique Céleste*. This was published as the *Celestial Mechanism of the Heavens* in 1831. *The Connection of the Physical Sciences* was published in 1834, *Physical Geography* in 1848, and *Molecular and Microscopic Science* in 1866. The Mary Somerville scholarship in mathematics for women was founded at Oxford University in her honor. An autobiography, edited and supplemented by a daughter, Martha Somerville, was published in 1873.

SOMERVILLE, WILLIAM (1675-1742). An English poet of an ancient family, born at Colwich, in Staffordshire. In 1690 he was sent to Winchester School, whence he passed to New College, Oxford (1694). He obtained a fellowship, which he kept till 1705, though he was for a time student at the Middle Temple (1696). On his father's death (1705) he inherited the family estate at Edstone, Warwickshire, where he settled and passed his life with his books and his hounds. Somerville is remembered mainly for his blank-verse poem *The Chase* (1735), which vividly depicts his favorite sport. He also wrote some good verse fables (1725, 1727), a burlesque of rural games entitled *Hobbinol* (1740), and *Field Sports* (1742). His poems with a *Life* are in the collections of Johnson and Chalmers. Consult also *The Chase*, with memoir by G. Gilfillan (Edinburgh, 1859).

SOMME, sôm. A small river of Northern France, entering the English Channel through an estuary which is navigable for ocean steamers to Saint-Valery (Map: France, H 1). From that point a lateral canal follows the river past Amiens to Saint-Simon, whence two other canals communicate with the Oise and the Scheldt.

SOMME. A northern maritime department of France, bounded on the north by the English Channel, south by Pas-de-Calais, and northeast by Seine-Inférieure (Map: France, J 2). Area, 2443 square miles. Population, in 1896, 543,279; in 1901, 537,848. The chief river is the Somme, which traverses the department from southeast to northwest. Somme is mostly level, but in some parts is marshy. The department produces corn and garden fruits. The raising of cattle is carried on to a great extent. The chief manufactures are velvets, chemicals, woolens, cottons, linens, silk, leather, and tapestries. Capital, Amiens. The department was formed mainly out of the old Province of Picardy.

SOMNAMBULISM (from Lat. *somnus*, sleep + *ambulare*, to walk). A state intermediate between those of sleeping and waking, characterized by the performance of various acts apparently indicative of conscious control, by absence of the usual reaction to stimuli, and usually by inability to recall on awakening any of the thoughts or movements which have taken place during the abnormal condition. Somnambulism may be self-induced, spontaneous, or idiopathic, or artificially induced, as in the hypnotic trance. In the latter sense, the term is popularly used as a synonym of hypnosis, but strictly speaking it should be limited in accordance with its definition by the 'Paris school,' who apply the term only to the 'third stage' of the hypnotic state. (See HYPNOTISM.) In this, the final stage, the subject is almost completely anæsthetic, obeys orders by movement and perception, and, when awakened, has no memory at all of what has elapsed during the somnambulistic period.

Spontaneously induced somnambulism of a mild or imperfect type is frequent. It is most obviously, though perhaps not most strikingly, manifested by persons who walk at night during sleep. A slight stimulus, enough to catch the attention, will restore the normal condition. In its pronounced form, often exhibited by patients suffering from hysteria, somnambulism approaches, if it does not cross, the border-line between the merely anomalous and the abnormal or pathological. Psychologically, sleep-walking is only a dream carried one step beyond its usual limitations. In dream-walking the barrier to execution is partially lifted, and the conditions of normal connection between idea and movement are fulfilled. Somnambulism further differs from normal sleep in that, within certain limits, there is in it cognizance of external objects. The somnambulist may walk the ridge-pole thinking it a boulevard, but his actions are confined to relatively simple acts, which, like walking, have become automatic by practice.

Consult: Tuke, *Sleep-Walking and Hypnotism* (London, 1884); Liégois, *De la suggestion et du somnambulisme dans leur rapport avec la jurisprudence et la médecine légale* (Paris, 1889); W. Wundt, *Lectures on Human and Animal Psychology*, trans. (New York, 1894).

SOMNATH, sŏm'nāth, or PATAN. A town in Gujurat, Province of Bombay, India, on the Kathiawar Peninsula; 38 miles northwest of the island of Diu, on the Arabian Sea (Map: India, B 4). Its port is Verawal, 3 miles to the northwest. Of great antiquity as an important commercial centre and pilgrimage resort, the town was captured by Mahmud of Ghazni in 1025 and its celebrated temple despoiled of its vast riches. Population, about 6600.

SOM'NUS (Lat., sleep). The Latin god of sleep, son of Night and twin brother of Death, corresponding to the Greek Hypnos. His home was in the far west, from which he brought sleep to gods and men alike. In art he is variously represented, with eagle's wings, a butterfly, a poppy stalk, with a horn from which he poured out slumber.

SONATA (It., *sonata*, sonata, p.p. fem. of *sonare*, to sound, from Lat. *sonare*, to sound, from *sonus*, sound). In music, an instrumental composition in cyclical form, originally any instrumental work as opposed to a cantata or vocal work. At first the sonata was almost identical with the suite (q.v.), but it soon abandoned the pure dance forms which the suite embodied. The violin sonata attained a somewhat perfected form before that of any of the keyed instruments. Its slow introductory first movement generally shows traces of ecclesiastical influence; the second movement, an allegro, which corresponds to the first movement of a modern sonata, was derived from vocal madrigals or part music; the third movement, which is characteristically slow, was evolved from solo vocal music, while the last movement showed elements of dance music, and was therefore a pure suite

movement. Of the popular dance forms, the minuet survived the longest but was ultimately supplanted by the scherzo, while the gigue and chaconne, of which Bach left so many examples, were succeeded by the finale or rondo. The first noteworthy advance is in a set of seven sonatas for the clavier, *Frische Klavierfrüchte* (1703), by Johann Kuhnau, in which he shows a partial recognition of the relation and balance of keys. Johann Mattheson chose the gigue for the concluding movement of his sonatas, and both he and Alessandro Scarlatti did much to define and unify the sonata form. In the works of Domenico Scarlatti are found the first traces of a distinct secondary subject in the first allegro. The domain of the sonata was long monopolized by writers for the violin, and through the advances made by Locatelli, Geminiani, and Tartini the sonata finally reached the four-movement type. Johann Sebastian Bach wrote many sonatas for various instruments and for combinations of instruments, but he did not aid in the direct development of the form. His son, Philipp Emanuel Bach, established the number of movements as three. Haydn is important principally for having clearly indicated the outlines and for having made the use of the minuet and the rondo imperative. Mozart adds to Haydn's unemotional forms symmetry, grace, and more mature and elaborate themes and harmonies. Beethoven brought the sonata to its greatest perfection. In the Kreutzer sonata, for violin and pianoforte, and in the pianoforte sonatas, in D minor (Op. 31), C major (Op. 53), F minor (Op. 57), B flat (Op. 106), and C minor (Op. 111), he attains to such a command of technical resource and emotional expression that the form seems incapable of further development.

SONATA FORM is a term applied to the form of the first movement of a sonata, symphony, or chamber-music composition. The first movement of a sonata or kindred cyclical form consists of three sections: (1) the exposition, (2) the development, (3) the repetition. The first section begins with the principal subject in the tonic key. An episode consisting of some development of the principal subject leads into the secondary subject. This appears in the key of the dominant, if the movement is in major. If the movement is in minor the secondary subject is announced in the key of the relative major. Then follows some slight development of the secondary subject. After this the entire exposition section is repeated literally. The second or development section is devoted to a full thematic working out of either one or both the themes announced in the previous section. In the development section episodes built upon new themes may also be introduced. The third or repetition (also recapitulation) section is a repetition of the exposition section, though composers generally vary the instrumentation. In this section the secondary subject appears in the key of the tonic. A more or less extended coda, constructed either upon the material already introduced or upon new material, closes the movement. Frequently the movement is preceded by a shorter or longer introduction in slow tempo. (See INTRODUCTION.) The essential features of this form have not been changed since Beethoven's time. Consult Shedlock, *The Pianoforte Sonata* (London, 1895).

SONATINA, sō'nȧ-tē'nȧ (It., little sonata, diminutive of *sonata*, sonata). In music, a short sonata. There are generally two or three movements, and the themes are much lighter in character than those of the regular sonata. Sonatinas are designed especially for young players as a preparation to the study of a sonata.

SONDERBUND, zŏn'dĕr-bụnt. A league formed in the fall of 1843 by the Swiss cantons Lucerne, Fribourg, Zug, Uri, Schwyz, and Unterwalden for the protection of the interests of the Church, then threatened by a powerful liberal movement in many cantons of the Confederation. The Canton of Valais joined the league in 1845. In 1847 the Liberal majority in the National Assembly decreed the dissolution of the Sonderbund, and this was accomplished by force of arms in the same year. See SWITZERLAND.

SONDERBURG, zŏn'dĕr-bo͝orK. A town on the island of Alsen (q.v.).

SONDERSHAUSEN, zŏn'dĕrs-hou'zen. The capital of the Principality of Schwarzburg-Sondershausen, Germany, 33 miles northwest of Weimar, on the Wipper (Map: Germany, D 3). The Prince's castle, in a beautiful park, contains a natural history collection and a museum of antiquities. Sondershausen was founded in 525 and passed to Schwarzburg in 1248. Population, in 1900, 7054.

SONG (AS. *song*, *sang*, Goth. *saggws*, OHG. *sang*, Ger. *Gesang*, song, from AS. *singan*, Goth. *siggwan*, OHG. *singan*, Ger. *singen*, to sing). A short lyric or narrative poem set to music in such a manner that the music reproduces the mood of the poem, and at the same time lends more impassioned utterance to the words. The term song should properly be applied only to compositions for one or two voices with instrumental accompaniment. The art-song (Kunstlied) was developed in Germany from the folk-song. The form has been received with universal favor. See BALLAD; FOLK-MUSIC; LIED; MEISTERSINGER; MINNESINGER; MUSIC; NATIONAL HYMNS; ROMANCE.

SONG-BIRDS. The song-birds of the world belong almost entirely to the order Oscines, which is that of the highest organization, and distinguished as a group by the possession of vocal organs of a specialized and peculiar sort. Yet all Oscines are not capable of singing, and some birds which utter melodious notes are to be found in other groups. The principal singers are to be found among the thrushes, wrens, warblers, pipits, larks, starlings, and in the great family of finches. These are largely birds of temperate climates, and the popular idea that the birds of the tropics are not singers has a basis in fact, though it is by no means true that no tropical birds utter melodious strains.

SONGEESH, sŏn-gēsh'. A tribe of Salishan stock (q.v.) occupying a territory on the southeastern end of Vancouver Island, B. C. Their proper name is *Lkungen*, the other being a corruption of one of the subtribal names. Their general culture is that of the coast Salishan tribes. Their houses are large communal dwellings of cedar planks, carved and painted with symbolic figures, and divided inside into family

compartments separated by rush mats. They wear blankets of dog and goat hair and duck down, cleaning the material of grease by means of native white clay, the spinning and weaving being by the simplest hand process. Cordage for nets is spun from nettle fibre. Their chief dependence is upon fishing, and the catching and drying of salmon constitutes the main industry, with the usual number of connected taboos and ceremonies. They have several clans, each of which has its own fishing coast and its own set of personal names. Women are subject to many taboos. Head-flattening and tattooing are practiced. The dead are laid away in canoes in the forest or rolled in mats which are deposited in the branches of the trees. Slaves were formerly buried with the dead chief. They have the potlatch custom (q.v.) and two principal secret societies. The majority are now professed Catholics, but the old customs still survive among the others. No tribal census is taken, but their different bands may number 500, and are known to be on the decrease.

SONGHAY, sôŋ-gī′, **SONRHAY,** or **SURHAY.** A Sudanese Nigritian people numbering two millions, living in the bend of the Niger, below Timbuctoo, with separate speech. They are mixed at the north with Moors, and at the south with Fulahs, and are Moslem.

SONG-KOI, sông′koi′. A river of Indo-China. See RED RIVER.

SONG OF SOLOMON. See CANTICLES.

SONG-SPARROW. See SPARROW.

SONG-THRUSH. Any of several thrushes locally conspicuous for their song. In the United States the wood-thrush (q.v.) is most often the one meant. In Great Britain it is the thrush (*Turdus musicus*) called 'mavis,' provincially, and very often kept caged for the sake of its melody. It is a permanent resident of all temperate Europe, and in its ground-hunting and hardy habits resembles its congener, the American robin; its nesting habits are similar, too, though it uses less mud and its blue eggs are spotted with brown. The adult male is dark brown above, tinted with golden brown; throat buff; under parts yellowish white, closely spotted with brown. It is a most pleasing songster, and especially a favorite in Scotland and Scandinavia. See THRUSH.

SONNEBERG, zôn′e-bĕrk. A town and summer resort in the Duchy of Saxe-Meiningen, Germany, on the Röthen, 13 miles northeast of Coburg (Map: Prussia, D 3). Its principal industry is the manufacture of toys. Masks, grindstones, slates, and pencils are also manufactured. Population, in 1900, 13,317.

SONNENFELS, zôn′en-fĕls, JOSEPH VON (1732-1817). An Austrian author, born in Nikolsburg. He served in the Austrian Army in 1749-54, was then for a time a lawyer's clerk, and became particularly active in endeavors toward the improvement of the Vienna stage, in connection with which he wrote the *Briefe über die wienerische Schaubühne* (1768; new ed. 1884). His *Abschaffung der Tortur* (1775) effectively secured the abolition of the torture throughout Austrian domains. In 1763 he was appointed professor of political science in the University of Vienna, and subsequently received various posts, including that of president of the Academy of Fine Arts. His collected writings appeared at Vienna in thirteen volumes (1783-87). Consult the biography by Müller (Vienna, 1882).

SONNENSCHEIN, zôn′en-shīn, WILLIAM SWAN (1855—). An English publisher and compiler, born in London. He was educated in London at University College. In 1878 he established there a publishing business which in 1895 became a limited company with himself as chairman. He collected an important library in bibliography and literary history, and published *The Best Books* (1887; 5th ed. 1901), a classified list of about 50,000 available works, and *A Reader's Guide to Contemporary Literature* (1894; 2d ed. 1901), supplementary to the foregoing.

SONNENTHAL, zôn′en-täl, ADOLF VON (1834—). An eminent Austrian actor, born in Budapest. He first worked as a journeyman tailor, but after some experience on the provincial stage was engaged at the Court theatre in Vienna, one of whose brightest ornaments he became, excelling equally in tragic rôles and in comedy. In 1881 he was knighted by the Emperor. In 1885, on a visit to New York, he was most cordially received by the public. He visited the United States again in 1899 and 1902. Consult Eisenberg, *Adolf Sonnenthal* (Dresden, 1896).

SONNET (Fr. *sonnet*, OF., Prov. *sonet*, song, diminutive of *son*, sound, song, from Lat. *sonus*, sound). As perfected by the Italian humanists, a stanza of fourteen hendecasyllabic verses, rhyming according to a clearly defined plan. The stanza is divided into two unequal parts. The first part, called the octave, is composed of two quatrains (or four-line strophes). The second part, called the sestet, is composed of two tercets (or three-line strophes). The octave runs on two and the sestet on two or three rhymes. According to a common type, the rhymes are arranged thus: *abba, abba, cde, cde.* This rhyme-scheme may vary considerably, especially in the sestet. An important point to observe is that the four divisions—particularly the octave and the sestet—are kept distinct. In this most rigid of all metrical forms, the idea, mood, or sentiment of the poet is developed by stages. Stated in the first, the idea is elaborated in the second quatrain; and then, gathering emotional intensity in the first tercet, it flows on full to the conclusion. The result in the hands of the masters is absolute unity. The sonnet was primitively a lyric sung with musical accompaniment. Indeed, the Provençal and French poets employed the word *son* or *sonet* to designate a lyric in the vernacular. It is now generally held that the sonnet originated in Sicily. Some philologians, however, find its germ in the Provençal *cobla esparsa.*

The sonnet, widely cultivated in Italy and Provence during the thirteenth century, assumed its highest art under the hand of Petrarch (1304-74). The form was also practiced by Lorenzo de' Medici, Michelangelo, Tasso, and many others. From Italy the sonnet spread over Western and Northern Europe. In Spain it was naturalized by Juan Boscan (c.1493-c.1542). Portugal had the great Camões (q.v.). The form seems to have been introduced into France by Mellin de Saint-Gelais, and at once adopted by his master Marot. It received an immense vogue from the Pléiade. Du Bellay produced nearly

two hundred sonnets, and Ronsard more than nine hundred. The fashion, after dying out in the eighteenth century, came in again with the romantics. Among recent French adepts in the sonnet are Sully-Prudhomme and Hérédia.

The sonnet was introduced into England by the Earl of Surrey and Sir Thomas Wyatt. Their collection, numbering thirty-six altogether, first appeared in Tottel's *Miscellany* under the title *Songes and Sonnetes* (1557). Between 1591 and 1597 were published, according to the conservative estimate of Sidney Lee, more than two thousand English sonnets. Of the vast Elizabethan product, the sonnet-sequences of Sidney, Daniel, Spenser, and Shakespeare stand out prominently. The Elizabethans did not follow strictly the Petrarchan type. Spenser and Shakespeare, though logically developing the idea, reduced the sonnet to three quatrains clinched by a final couplet. With rich musical effect Spenser interlaced his rhymes thus: *abab, bcbc, cdcd, ee.* Shakespeare further simplified the sonnet by employing a distinct set of alternating rhymes in each quatrain. His rhyme-scheme is *abab, cdcd, efef, gg.* After 1600 the sonnet impulse, though weakened, was still a force. And then came Milton, with his small but grand group. Scholar as he was, he held very closely to the Italian octave, sestet, and rhyme scheme. For a century after Milton, few English sonnets were written, but with the romantic revival the sonnet returned (about 1750), though even Wordsworth, as late as 1827, thought it necessary to defend the form against the critics. Among the great English poets of the nineteenth century who practiced the sonnet, in the Petrarchan, Shakespearean, or some modified form, are Wordsworth, Coleridge, Keats, Mrs. Browning, and the Rossettis. In Germany, though the sonnet appeared as early as the seventeenth century, with Weckherlin (1585-1653) and Opitz (1597-1639), it was not much cultivated till taken up by the romantics and a few poets just preceding them: Bürger, A. W. Schlegel, Arnim, Voss, Goethe, Rückert, Eichendorff, Heyse, Geibel, and Redwitz. Consult: Biadene, "Morfologia del Sonetto," in *Studj di Filologia Romanza* (Rome, 1889); Welti, *Geschichte des Sonettes* (Leipzig, 1884); Schipper, *Grundriss der englischen Metrik* (Vienna, 1895); Tomlinson, *The Sonnet, Its Origin, Structure, and Place in Poetry* (London, 1874); Corson, *A Primer of English Verse* (Boston, 1892); Théodore de Banville, *Petit traité de poésie française* (Paris, 1891); Lee, *A Life of Shakespeare*, containing chapters on Italian, French, and English sonnets (London, 1898); Vaganay, *Le sonnet en Italie et en France au XVIème siècle* (Lyons, 1902); Noble, *The Sonnet in England* (London, 1896); Main, *A Treasury of English Sonnets* (Manchester, 1880); *The Book of the Sonnet*, edited with essays by L. Hunt and S. A. Lee (Boston, 1867); *Sonnets of Europe*, trans., ed. by Waddington (London, 1886); and Herrick, *A Century of Sonnets* (New York, 1902).

SONNINO, sôn-nē'nō. A town in the Province of Rome, Italy, 64 miles southeast of the city of Rome. Its chief feature is the Convent of Fossanova, an exceptionally fine specimen of early Gothic architecture. Population, about 3000.

SONORA, sō-nō'rȧ. A northwestern State of Mexico, bounded by Arizona and New Mexico on the north, the Mexican State of Chihuahua on the east, Sinaloa on the southeast, and the Gulf of California on the west (Map: Mexico, D 3). Area, 76,900 square miles. Along the coast extends a low arid region rising gradually toward the interior. In the east rises the Sierra Madre with its numerous offshoots inclosing deep valleys. The rivers of the State are few, the Yaqui being the most important. The climate differs considerably in the different parts of the State, but the rainfall is generally scanty, and agriculture can be carried on only with irrigation. The mineral deposits of Sonora are among the richest in Mexico, and include silver, lead, gold, copper, coal, iron, and graphite. Mining is carried on extensively and a large proportion of the mineral products is exported to the United States. Sonora is crossed by a railway line from Guaymas, its chief port, to the United States frontier. Population, in 1900, 220,553. Capital, Hermosillo (q.v.).

SONORAN REGION. An American faunal region whose bounds are very widely extended by some writers, but which is more intelligibly restricted to the high and dry plateau region of the northern interior of Mexico and to the contiguous arid region of the Southwestern United States, reaching eastward into Texas and northward into Colorado, Utah, and Nevada between the mountain ranges. It is characterized by a large variety of small animals adapted to a desert life, and has been most studied and described by Merriam.

SONS OF LIBERTY. In American history, a name applied to an organization extending throughout all the colonies, opposing first the Stamp Act, and afterwards advocating separation from Great Britain. When the Stamp Act (q.v.) was proposed in 1764, loose secret organizations, chiefly of workingmen, were formed in the various colonies to concert resistance. Col. Isaac Barré (q.v.) in a speech in Parliament in February, 1765, used the phrase 'Sons of Liberty,' which was at once adopted by these societies. With the passage of the Stamp Act they took the lead in opposition to its enforcement, and prevented its execution by force. Committees of correspondence were formed and each colony was kept in touch with the sentiment in the others. Though there was no central organization, the activity of John Lamb (q.v.), Isaac Sears (q.v.), and others in New York made the Sons of Liberty in that colony perhaps more important than in any other. With the repeal of the Stamp Act in 1766, the organization was dissolved in some towns, but in others was active in supporting the Non-Importation Agreement. As sentiment favoring entire separation grew in strength, the secrecy was discarded, and the name was given to the younger and more active patriots. In New York they controlled the Committee of Safety, and in 1774 the calling of a Continental Congress was, in part, due to them. In Georgia they were called Liberty Boys, and finally drove the royal Governor from the State. In colonies where there was a large Loyalist element the organization was efficient in preserving American supremacy, and was kept up during the Revolution. Afterwards many of the leaders were prominent Anti-Federalists and opposed the adoption of the Constitution. The name was also applied during the Civil War to the Knights of the Golden Circle (q.v.). Con-

sult: Leake, *Life of Gen. John Lamb* (Albany, 1850); and Dawson, *Sons of Liberty in New York* (Poughkeepsie, 1859).

SONS OF THE AMERICAN REVOLUTION, SOCIETY OF THE. An hereditary patriotic society organized in New York City on April 30, 1889, by representatives of the Society of the Sons of the Revolution, and of the Sons of Revolutionary Sires. The latter had been organized in San Francisco, Cal., on October 22, 1875, and after April 30, 1889, became the California State Society of the Sons of the American Revolution. Membership in this society is restricted to lineal descendants of an ancestor who rendered actual service in the cause of American independence, either as an officer, soldier, seaman, marine, militia, or minute man in the armed forces of the Continental Congress, or of any one of the several colonies. The total membership was about 10,500 in 1903.

SONS OF THE CLERGY MUSICAL FESTIVAL. A musical festival held in Saint Paul's Cathedral. It was first organized in 1709, the proceeds being devoted to the needs of the Sons of the Clergy Corporation. The Royal Society of Musicians for a long time supplied the orchestra.

SONS OF THE REVOLUTION. A patriotic hereditary society originally organized in New York City on February 22, 1876, and reorganized on December 4, 1883. It admits to membership any male lineal descendant from an ancestor who actively assisted in establishing American independence during the War of the Revolution between April 19, 1775, and April 19, 1783. This society has been specially active in marking historic localities with tablets, especially in New York City. Noteworthy among these monuments are the tablets commemorating the battle of Long Island and that marking the site of the battle of Harlem Heights. The statue of Nathan Hale in City Hall Park, New York, was also erected by this organization.

SONS OF VETERANS. A patriotic society organized in Philadelphia, Pa., on September 29, 1879. It admits to membership lineal male descendants of honorably discharged soldiers, sailors, and marines who served in the Civil War. The insignia consists of a bronze bar on which are the words 'Filii Veteranorum;' and pendant from this bar is a red, white, and blue ribbon attached to a medallion containing a monogram of the letters 'S. V.' in relief on a wreath over crossed cannons, surmounted by a spread eagle. Of similar character is an organization known as Daughters of Veterans, which admits to membership daughters of honorably discharged soldiers, sailors, and marines, and daughters of Sons of Veterans, who are fifteen years of age and upward.

SONS OF WAR VETERANS, SOCIETY OF. A patriotic society founded in 1893, having for its objects to preserve and perpetuate the principles for which the Federal soldiers fought in the Civil War; to assist surviving veterans and their widows; and the mutual benefit and advancement of its members. It admits to membership any male lineal descendant of an honorably discharged Union soldier, sailor, or marine who served during the Civil War for a period of not less than six months, part of which service must have been at the front.

SONSÓN, sôn-sōn′. A town of the Department of Antioquia, Colombia, 110 miles northwest of Bogotá, on the Sonsón River, at an altitude of 8300 feet (Map: Colombia, C 2). In the vicinity are extensive mines of gold, silver, and salt. The industries include weaving of cotton and woolen mantles, and the manufacture of straw hats. Population about 16,000.

SONSONATE, sôn′sō-nä′tā. A town of Salvador, situated 32 miles west of San Salvador (Map: Central America, C 4). It is the capital of a department of the same name, and is regularly built. It is the centre of a rich agricultural district. Population about 9000. It was founded in 1524 by Pedro de Alvarado.

SONTAG, zôn′täg, HENRIETTE (1806-54). A German operatic soprano, born at Coblenz. She was engaged upon the stage from her earliest childhood. In 1824 she sang at Leipzig in *Der Freischütz* and *Euryanthe,* in which latter opera she created the title rôle. Her success was immediate and sensational, and in 1824 she accepted a call to the Königstädter Theater, Berlin. Two years afterwards she sang the part of Rosina in *Il Barbiere di Seviglia,* in which her remarkable powers of coloratura gave her a distinct triumph over Catalani. In 1827 she was engaged at the Paris Italian opera, and a year afterwards married Count Rossi. She sang in all the musical centres of Europe, and in 1852 visited the United States. In 1854 she was engaged for the Italian opera in Mexico, but was stricken with cholera and died there.

SOO-CHOW, sōō′chou′. A town of China. See SU-CHOW.

SOPHIA, sō′fē-ȧ. The capital of Bulgaria. See SOFIA.

SOPHIA DOROTHEA (1666-1726). Consort of George I., King of England, and Elector of Hanover. She was the heiress of Duke George William of Brunswick-Luneburg-Celle, and married her cousin, the Crown Prince of Hanover, in 1682. She bore her husband two children, who became King George II. of England and Queen Sophia Dorothea of Prussia, mother of Frederick the Great. Her life at the Hanoverian Court was made miserable by the intrigues of her father-in-law's mistress, the Countess von Platen, who accused her of a liaison with Count Philip Christopher von Königsmarck. The Count, a wealthy young Swedish nobleman, had been a page at her father's Court, and was then colonel of the guards at Hanover. One night as he left the Crown Princess's apartments he was set upon by four soldiers stationed there to arrest him, and accidentally killed. The body was hastily concealed and his disappearance long remained a matter of mystery. Soon afterwards the Crown Princess was arrested, tried before a court appointed for the purpose, and her marriage annulled. She was then sent to the little Castle of Ahlden, where she was confined until her death, thirty-two years later. Her guilt or innocence has long been a matter of controversy. Consult Wilkins, *The Love of an Uncrowned Queen* (London, 1900). See KÖNIGSMARCK.

SOPHIOLOGY (from Gk. *σοφία, sophia,* wisdom, from *σοφός, sophos,* wise; connected with *σαφής, saphēs,* clear, and perhaps with Lat. *faber,* smith + *-λογία, -logia,* account, from *λέγειν, legein,* to say). The science of philosophies; one

of the principal divisions of anthropology. All peoples in every stage of development produce philosophies, or general systems of thought designed to explain the phenomena coming within their observation. To some extent these systems are the product of individual minds, yet each philosophy is in no small measure a collective product. The development of philosophic systems is outlined in the article MAN, SCIENCE OF.

SOPHISTS (Lat. *sophista*, from Gk. *σοφιστής*, *sophistēs*, wise man, teacher of arts and sciences for money, sophist, from *σοφίζειν*, *sophizein*, to make wise, from *σοφός*, *sophos*, wise). A class of thinkers and teachers who appeared in the fifth century B.C. in Greece, and especially at Athens. Unfortunately, we have little information concerning them except such as has come to us from their opponents. We can perhaps form a fair estimate of the character and significance of their work if we keep in mind the fact that much of what is said of them in extant Greek writings is extravagant satire. The change of political institutions following upon the Persian and Carthaginian wars, the growth of democracy with an increasing opportunity for the orator, the inevitable distrust in the inviolable character of social rules which were now seen to differ in various countries, all conspired to create a demand for up-to-date instruction which should qualify men for life under the new conditions. The Sophists arose to meet this demand. They popularized the results of the investigations of previous philosophers. Of the earlier Sophists some were Eleatic, some Heraclitean, some Pythagorean, and some atomistic in their views, but they laid more emphasis on equipping their pupils for the tasks of public life than for philosophic or scientific work. Philological studies, rhetoric, and argumentation by which the worse could be made to appear the better reason, were their leading interests. In the history of philosophy their significance, apart from the fact that their activity called forth the philosophical activity of Socrates, and through him that of Plato and Aristotle, is mainly epistemological and ethical. The readiness with which all their arguments were received by their listeners made them distrustful of human knowledge. They came to believe that any proposition could be proved as satisfactorily as any other. When every statement is demonstrable none can command absolute credence, and skepticism (q.v.) is the foregone conclusion. This skepticism found a theoretical confirmation in views then becoming current as to the origin of knowledge. Against the older rationalism (q.v.), which distinguished between sense and thought, Protagoras, the leading Sophist, maintained that sensations were the sole content of consciousness. But if this is true and if sense impressions of one and the same object vary, there is no court to which appeal can be made to adjust the disputes of sense. One sensation is as good as another; everything is just what it appears to be at the moment. There is no ascertainable identity underlying the differences of appearance. The unity of phenomena in their laws is lost sight of, and each individual man becomes the measure of the universe. Opposite conclusions have been drawn from this sensationalism. Gorgias argued that nothing is, inasmuch as everything is full of contradictions. Euthydemus, on the contrary, denied that there can be contradiction. If subject and predicate mean different things, then what seems to be contradiction is mere difference. Lycophon went so far as to advise the omission of the copula in propositions, presumably because all judgments are supposed to be mere unrelated sequences of words. In ethics the upshot of the sophistic teaching was an ultra-individualism with consequent license in practical life. But this result was only gradually reached. At first the distinction was made between the natural and the conventional in human usages; but when the distinction was once made gradually everything institutional and social came to be regarded as conventional, with nothing natural left except unscrupulous self-seeking. Protagoras recognized the rationality of justice and of regard for social approval (*αἰδώς*). But other Sophists were not so conservative. Callicles, in Plato, is made to say that all laws are created by the strong and enforced on the weak, while Thrasymachus contends that no man but a fool is willingly just. It is obvious that where the whole of morality is brushed aside as a trick whereby the strong make the weak do their will, religion cannot stand untouched. Protagoras prudently claimed that he knew nothing about the gods, while his successors ran the whole gamut from skepticism to avowed atheism.

It is interesting to note the unanimity with which Socrates, Plato, and Aristotle condemned the Sophists for accepting pay for their teaching. The reason for this is no doubt the same reason which nowadays makes some conservative educators look with apprehension upon large endowments given by living benefactors to colleges and universities. Fear is expressed that in such institutions not what is true, but what is pleasing to the donor, will be taught. In like manner, Socrates, Plato, and Aristotle doubtless had apprehension for the cause of what, to use a modern phrase, we may call academic freedom. And it was with them in many cases something more than a mere apprehension. The truth was that by many of the Sophists learning was prostituted; and yet no universal condemnation may properly be passed on the Sophists as a class, as was done by modern historians till the appearance of Hegel's *History of Philosophy*. On the other hand, Grote in his *History of Greece*, vol. viii., has gone to the other extreme and has failed to appreciate the subversive tendency of much of the sophistic activity. Among the Sophists are to be mentioned Protagoras, Gorgias, Prodicus, Hippias, Polus, Thrasymachus, Euthydemus, Dionysodorus, Callicles, and Antiphon. Consult: Grote, *History of Greece;* Sidgwick, *Journal of Philology*, vols. iv. and v.; and the histories of philosophy by Ueberweg-Heinze, Windelband, Erdmann, Zeller, Gomperz, Benn, and Schwegler (for titles and dates of these works, see article on PHILOSOPHY); also Schanz, *Die Sophisten* (Göttingen, 1867).

SOPHOCLES, sŏf'ō-klēz (Lat., from Gk. *Σοφοκλῆς*, *Sophoklēs*) (c.496-406 B.C.). An Athenian dramatist, born of a prosperous family at Colonus, a beautiful suburb of Athens. His long and happy life coincided with the period of the Imperial greatness of Athens. His dramas are the most perfect exemplars of Attic art. His statue in the Lateran is the ideal type of Greek manhood. All the prizes of youth, maturity, and

old age fell to him in their season. At the celebration of the victory of Salamis (B.C. 480) he was selected to lead the chorus of dancing and singing youths. His grace and youthful beauty in the rôle of the Princess Nausicaa playing ball with her attendant maidens were long remembered. In another part he served as the model of the painter Polygnotus for his ideal picture of the bard Thamyris. He composed the music of his beautiful choric odes, and in addition to his plays wrote many poems, including a Pæan to Æsculapius, which was still sung in the third century A.D. He served his country in various capacities as ambassador, treasurer of the tribute, and general. He was noted for his piety, held a minor priesthood in his old age, and was worshiped with heroic honors after death. His cheerful temper and agreeable manners made him a universal favorite, against whom even the scurrilous comedians found little to say. He was the friend of Herodotus, who wrote an ode in his honor, and the associate and colleague of Pericles. His life is a verification of the Periclean boast that grace and versatility in varied service stamp the true Athenian.

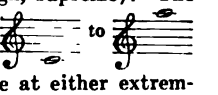
In the year 468, at the age of twenty-eight, he produced his earliest play, the *Triptolemus*, which won the first prize against the veteran Æschylus. For the remaining years of Æschylus's life the two mighty rivals contended, with varying success, each learning much from the art of the other. The first recorded contest with Euripides occurred in the year 438, when the younger poet's *Alcestis* won the second place. In the contests of the next thirty-two years Sophocles was generally successful, bearing away the first prize about twenty times and never falling below the second place.

He held public office not as a professional politician, but "like any other good Athenian." In the year 440 he was elected one of the board of generals for the Samian War with Pericles, according to the legend, because of the popularity or political wisdom of the *Antigone*. The great poet as general was the theme of many anecdotes, some of which have been preserved by the writer of memoirs, Ion of Chios, who met him in Chian society and at a banquet, where he debated the proprieties of poetic diction with a pedantic schoolmaster and triumphantly displayed his 'strategy' in the capturing of a kiss from a pretty child. His old age is said to have been clouded by the attempt of his son, Iophon, to deprive him of the management of his estate on the ground of mental incapacity. The legend adds that Sophocles refuted the charge by reading to the jurors the magnificent chorus in praise of Colonus from the *Œdipus at Colonus*, his latest play, produced after his death by his grandson and namesake. If the tale is true it is strange that Aristophanes makes no allusion to it in the *Frogs* (B.C. 405). There the relations between father and son are so friendly that Dionysus is unwilling to bring back Sophocles to the upper world until he has had an opportunity to test Iophon's poetic powers when unaided by his father. On the death of Euripides in the spring of 406 Sophocles assumed mourning and ordered his chorus to appear without wreaths. A few months later he himself followed his younger rival.

The chief changes in the external form of tragedy attributed to Sophocles are the raising of the number of members of the chorus from twelve to fifteen and the introduction of a third actor, which made possible the complication of the action and the more effective portrayal of character by contrast and juxtaposition. He also abandoned the Æschylean fashion of composing plays in groups of three about a central myth or motive and made each play an independent psychological and dramatic unity. The chorus participates very slightly if at all in the plot, and the length of the choric odes relatively to the dialogue diminishes, though they never become mere musical interludes, as is too often the case in Euripides. The Sophoclean chorus is the ideal spectator and interpreter of the ethical and religious significance of the action. The great choric odes of the *Antigone* and the *Œdipus* unite the grace of the Greek lyric to the moral earnestness of the Hebrew psalm.

Sophocles composed about 120 plays, of which seven are preserved, together with fragments of eighty or ninety others. (1) *Ajax*, brooding upon the dishonor done him by the awarding of the arms of Achilles to Odysseus, is bereft of his reason by Athena, whom he has offended by presumptuous speech. In his frenzy he wreaks his wrath upon the cattle of the Greeks. At this point the action begins. Awakening to the intolerable humiliation of his position, he slays himself after a touching farewell to his infant son and a noble apostrophe to earth and sea and sky. The debate on the question of granting him honorable burial, which fills the last third of the play, is an anticlimax to modern feeling, but effectively displays the conciliatory temper of the sagacious Odysseus and the vindictive spirit of Menelaus. (2) The *Antigone*, perhaps the first problem play in literature, presents the moral antinomy that arises from a conflict between political authority and the law of the individual conscience. Antigone, in obedience to Greek religious feeling and the dictates of her woman's heart, bestows the rites of burial upon her rebel brother Polynices in defiance of the edict of King Creon, and so brings about her own death, and, by tragic complication, that of her lover, Hæmon, the King's son. (3) The *Electra* corresponds to the middle play of Æschylus's trilogy the *Oresteia*, and to the *Electra* of Euripides. It treats of the slaying of Clytemnestra and her paramour, Ægisthus, by her children, Orestes and Electra, in revenge for the murder of their father, Agamemnon. The psychological interest centres in the character of Electra, a sort of ancient Colomba, nerving her brother to the prosecution of the blood feud. (4) The *Œdipus Tyrannus* is the most ingeniously constructed of Greek plays and a typical example of the so-called Sophoclean or dramatic irony. The plot turns on the gradual inevitable revelation to Œdipus, through his own insistent inquiry, of the dreadful truth, already known to the audience, that he has unwittingly fulfilled the oracle which doomed him to slay his father and live in incestuous marriage with his mother. (5) The *Trachiniæ*, named from the Trachinian maidens of the chorus, treats of the poisoning of Hercules by the Nessus robe sent to him as a love charm by his jealous wife, Deianira, and his translation to heaven from the funeral pyre on Mount Œta. (6) The *Philoctetes* was produced in 409. Philoctetes, bitten by a serpent and afflicted with a

disgusting wound, had been abandoned by the Greeks on the desert shore of Lemnos. After many years an oracle declares that he, the possessor of the bow of Hercules, is indispensable to the besiegers of Troy. Odysseus and Neoptolmeus, the son of Achilles, are sent to fetch him if need be against his will. Very beautiful are the descriptions of nature and the account of Philoctetes's lonely life. But the chief interest of the play lies in the psychological study of the final revolt of the frank nature of Neoptolemus against the treachery which Odysseus requires him to practice upon the unsuspecting Philoctetes. (7) The *Œdipus at Colonus* (first produced in 401) depicts the reconciliation of Œdipus with destiny and his sublime and mysterious death at Colonus after years of wandering as a blind exile, sustained by the loving tendance of his daughter, Antigone.



As a poet Sophocles cannot vie with the imaginative sublimity of Æschylus. As a thinker he may be less fertile in suggestion than the ingenious Euripides. But regarded as a Greek artist, shaping Greek legends in the conventional molds of Attic tragedy, he holds the just and perfect mean between the titanic symbolism of the older poet and the sentimental, rhetorical realism of the younger. He is reported to have said that Æschylus did right without knowing it, and that Euripides painted men as they are, while he himself represented them as they ought to be. A slight plot suffices him for the creation of a masterpiece because his subtle dramatic art and his exhaustive psychological analysis elicit from a simple situation a complete revelation of character and destiny. Fate, the prime motive of ancient tragedy, is no longer felt as a capricious external power, but as the inevitable outcome of character and the unavoidable condition of life. Tragic pathos is refined to a sense of the universal human fellowship in frailty and suffering. And beauty, the all-pervading, gracious serenity of an unfailing and unobtrusive art, takes from pathos and tragedy their sting and dismisses us from the scene calmed, elevated, and reconciled. 'Sophocles is the most truly Hellenic of the Greek tragedians, and for those who have drunk deeply of the Hellenic spirit the most human too.'

The best edition is that of Jebb, in seven volumes, with elaborate commentary and English translation facing the Greek. There is a good annotated edition by Campbell, and an excellent monograph by the same author. Plumptre's verse translation is much esteemed. That of Whitelaw is perhaps better.

SOPHOCLES, EVANGELINUS APOSTOLIDES (1807-83). A Greek-American scholar, born at Tsangaranda, near Mount Pelion, in Thessaly. As a youth he spent much time in Egypt, and received his earlier education at the Convent on Mount Sinai. In 1829 he emigrated to the United States and continued his studies at Amherst College. He was tutor at Harvard College, with a short intermission, from 1842 to 1849. In this year he was appointed assistant professor of Greek, and in 1860 he became professor of Ancient, Byzantine, and Modern Greek. His publications include a *Greek Grammar* (1838; 3d ed. 1847), *First Lessons in Greek* (1839), *Greek Exercises* (1841), *Greek Lessons for Beginners* (1843), *Catalogue of Greek Verbs* (1844), *History of the Greek Alphabet* (1848), *Glossary of Later and Byzantine Greek* (1860), revised and published under the title, *Greek Lexicon of the Roman and Byzantine Periods* (1870).

SOPHONIS'BA (Lat., from Gk. Σοφόνισβα). The daughter of the Carthaginian Hasdrubal, son of Gisco. When young her father promised her in marriage to the Numidian prince Masinissa (q.v.), but subsequently gave her to Masinissa's rival, Syphax. When Masinissa in the Second Punic War overthrew Syphax, Sophonisba fell into his hands and he soon made her his wife, to the displeasure of Scipio, who insisted that he should surrender her. In order to save her from captivity, her husband sent her poison with which she put an end to her life. Her history forms the theme of a large number of tragedies, among them, in English, those by Thomson (1729), Nathaniel Lee (*Sophonisba, or Hannibal's Overthrow*, 1676), Marston, (*Sophonisba, or The Wonder of Women*, 1602); in French, under the title *Sophonisbe*, by Mairet (1630) and by Corneille (1663); in Italian, as *Sofonisba*, by Galeotto del Carretto (1502), Trissino (1529), and Alfieri (1783).

SO'PHRON (Lat., from Gk. Σώφρων) **OF SYRACUSE** (B.C. 460-420). A Greek writer of mimes. Though from time immemorial the Greeks of Sicily had practiced the mimes at their public festival, Sophron was the first to reduce them to the form of a literary composition. They consisted in the representation of scenes from actual life, chiefly in the lower classes, brought out by a dramatic dialogue, interspersed with numerous colloquial forms of speech. These pieces of Sophron, which were in the Doric-Greek dialect and in a kind of cadenced prose, were great favorites with Plato, who made use of them for the dramatic form of his dialogues (Quint., i. 10, 17; Diog. Laert., iii. 13). It is said that Theocritus borrowed his second and fifteenth idyls from Sophron. Very unsatisfactory fragments have been preserved. Consult Botzon's collection (Marienburg, 1867) and his *De Sophrone et Henarcho Mimographis* (Lyck, 1856).

SOPRANO (It., treble, high, supreme). The highest species of female voice, whose range normally extends from  to

With the exception of those at either extremity, all the tones are common to both the head and chest registers. A voice sometimes distinguished as intermediate between alto and soprano is the *mezzo-soprano*. See MEZZO.

SO'RA. A city in the Province of Caserta, Italy, on the Garigliano, 62 miles east-southeast of Rome (Map: Italy, H 6). The river is here spanned by two bridges. There are remains of walls and castle ruins above the town. It manufactures woolen cloth and paper and trades in wine, oil, fruits, and cattle. Sora, originally a Volscian town, was colonized by the Romans in B.C. 303. Population (commune), in 1881, 13,208; in 1901, 16,001.

SORA. A small rail (q.v.); especially, in the Middle States, the Carolina rail (*Porzana Carolina*), which is very abundant in the marshes of the Atlantic Coast in the early fall and gives fine sport and a welcome delicacy. It is eight or nine inches long, olive brown above varied

with black and white, and beneath (in the fall) it is plain brownish. In breeding plumage the face and throat are black, the other under parts slate-gray. The sora breeds from the Middle States northward to Hudson Bay, and winters from the Carolinas southward to South America. The nest is of grass on the ground in swamps and the eight to fifteen eggs are buffy, spotted with brown. See Plate of RAILS, ETC.

SORATA, sō-rä'tà, or ILLAMPU. The highest mountain of Bolivia and one of the highest of the South American continent (Map: Bolivia, D 7). It is situated in the Bolivian Department of La Paz, about 16 miles east of Lake Titicaca, and reaches an altitude of 21,500 feet. It was first ascended by Sir William Martin Conway in 1898.

SORAU, zō'rou. A town in the Province of Brandenburg, Prussia, on the Sorebach, 60 miles south-southeast of Frankfort-on-the-Oder (Map: Prussia, F 3). It has an old castle (now a prison) and a new castle (the seat of the magistracy). There are important bleach-fields, print-works, color-works, iron foundries, and manufactories of cloth, machinery, glass, porcelain, tubing, waxwares, wooden shoes, and glazed bricks. In the neighborhood are deposits of lignite. Sorau, the oldest town of Lusatia, received municipal privileges in 1260. It was ceded by Saxony to Prussia in 1815. Population, in 1900, 15,945.

SORAUER, zō'rou-ĕr, PAUL (1839—). A German botanist, born at Breslau. In 1871 he became director of the experiment station at the Proskau Pomological Institute, and in 1892 he was made professor. In 1893 he went to Berlin as secretary of the International Phytopathological Commission. He became distinguished for his investigations in the diseases of plants, and founded the *Zeitschrift für Pflanzenkrankheiten* (Stuttgart), besides writing such books as: *Das Handbuch der Pflanzenkrankheiten* (ed. 1886; its atlas, 1887-93); *Die Obstbaumkrankheiten* (1879); *Die Schäden der einheimischen Kulturpflanzen durch Schmarotzer*, etc. (1888); *Populäre Physiologie für Gärtner* (1891); *Pflanzenschutz* (with Frank, 1892 and 1896).

SORBONNE, sôr'bôn', LA. An institution of learning in Paris, founded by Robert de Sorbon. Robert was born October 9, 1201, in Sorbon, near the town of Rethel, not far from Rheims. During the subsequent centuries and even to the present day, the place-name of this man has been attached to the focus of intellectual activity in France. Robert pursued his studies in Paris, looking forward to the priesthood. He became a priest, a doctor of theology, and a canon, first in the Cathedral of Cambrai, and then in that of Paris. By his eloquence and piety he soon won renown and was presently made chaplain, and perhaps confessor to King Louis IX., known as Saint Louis. Impressed by the importance of theological science and by the necessities of poor young men who might need support while engaged in the study of theology, Robert de Sorbon established a society of secular ecclesiastics. The King and some of the ecclesiastical dignities favored this enterprise; and in the year 1257 a site was secured by royal bounty for the home of the society. It was near the Palais des Thermes, in the heart of what has long borne the name of the Latin Quarter. There were other similar associations or colleges, but this was destined to perpetuity and distinction. The founder called the establishment *La Communauté des pauvres maîtres étudiant en théologie;* but the public shortened this long phrase, and before the close of the century the college was called, from its founder's name, La Sorbonne, which it has borne amid all the changes of social and intellectual life from that day to the present. Its Latin title was Domus Sorbonnæ. The House was a hall of residence and of study—not a place for systematic instruction and lectures. For the work of Robertus, the Papal approbation was secured in 1268. Several years later, to this theological seminary the founder added a college for the humanities and philosophy, and he died soon afterwards, at Paris, seventy-three years old (1274).

His life is full of interest and may be read in a memoir by Jadart, published at Rheims, in 1880. The principal incidents are well presented in the *Biographie générale*, and by Baroux in *La grande cyclopédie* (vol. XXX.). The early muniments of this foundation may be found in Denifle's masterly compendium of *Documents relatifs à l'Université de Paris* (Paris, 1883), and in the *Cartularium Universitatis Parisiensis*, tom. i., (Paris, 1889).

From its origin until the present time the Sorbonne has been the centre of intellectual activity, and until the French Revolution it was recognized as especially the seat of theological learning. The Faculty pronounced their opinions on the most important questions and their decisions were recognized as of great authority. The reader need only consult the *History of France* by Henri Martin to discover many illustrations of this statement. The Faculty intervened in the trial of Jeanne d'Arc; it condemned the views of Luther and showed great hostility toward reformers; censured many noteworthy books and writers; opposed the Cartesian philosophy; and addressed the Czar in regard to a reunion of the Greek and Latin churches. Among the books which it condemned were the treatise of Helvetius, *De l'Esprit*, the fourth volume of Buffon's *Natural History*, and Rousseau's *Emile*. Among the glories of the Sorbonne was its encouragement of printing in France, by giving quarters for their presses to Ulric Gering and other early printers.

The buildings of the Sorbonne were reconstructed at the beginning of the seventeenth century by Richelieu, who merits the distinction of a second founder. The church which he caused to be built as the college chapel is one of the celebrated monuments of ecclesiastical architecture in Paris. His tomb is there, not far from the tomb of Robert de Sorbon. The Sorbonne was given to the city of Paris in the middle of the nineteenth century, and the construction was begun of a magnificent building for the departments of science and letters. This edifice, called La Nouvelle Sorbonne, was completed in 1889, and it is perhaps the finest university building in the world. Its lecture-rooms and laboratories are well equipped, and the mural decorations (especially the great picture of Puvis de Chavannes) are of rare beauty. In the transition from the old to the new Sorbonne

M. Gréard published a noteworthy pamphlet, entitled *Nos adieux à la vieille Sorbonne.*

The changes in the interior administration due to the progress of science and to the increase of funds are too complex for presentation here. The most radical are the disappearance, after the French Revolution, of the Faculty of Theology, which was once the sole authority, so that a Sorbonnist was of course a theologian; the consequent supremacy of literature and science, evinced by the organization of the Ecole des Hautes Etudes, and by the founding of libraries and seminaries; and likewise by the establishment, in the immediate neighborhood, of schools of medicine and law. The faculties of Science and Letters of the University of Paris are installed in the New Sorbonne and *Minerva* for 1901-02 reports that their libraries contain 263,590 volumes.

At a recent date, connected more or less closely with the New Sorbonne, there were 10,000 students, 100 professorships, and many accessory positions for associates and assistants. In addition to the works above named, consult Franklin, *La Sorbonne: ses origines, sa bibliothèque,* etc. (Paris, 1875).

SORCERY. See WITCHCRAFT.

SORDEL'LO. An Italian troubadour of the thirteenth century who wrote in Provençal. He was a native of Goito, Mantua. The earliest mention of him has reference to a tavern brawl, which took place about 1220, and the last document in which his name appears is dated 1269. While living at the Court of Richard of San Bonifazio, he carried off his master's wife, Cunizza, at the instigation of her brother, Ezzolino da Romano. Soon afterwards he fled to Provence, where, with the exception of visits to Spain and Portugal, he seems to have spent the greater part of his life. Here he took part in important public events, his name appearing as that of a witness in various treaties and other documents. In his old age he returned to Italy as a knight in the train of Charles of Anjou, and received from him several castles in Abruzzo as a reward for his services. As a poet he rises little above mediocrity. His political, moral, and personal sirventes show vigor and spirit, but his love songs are purely conventional, and his didactic poem *Documentum Honoris* has no unusual merit. His great reputation depends upon Dante's treatment of him in *Purgatorio,* vi. and vii., where he becomes a type of high-minded nobility and patriotism. This conception is founded upon a sirvente on the death of Blacatz, in which Sordello imagines his patron's heart divided among the various princes who need its virtues. Dante has put into the mouth of his shade in Purgatory a similar invective. The poem of Browning which bears his name has but the slightest historical foundation. Consult: Cesare de Lollis, *Vita e poesie di Sordello di Goito* (Halle, 1896).

SOREL'. The capital of Richelieu County, Quebec, Canada, on the Richelieu River at its mouth in Lake Saint Peter, and on the Montreal and Sorel Railroad, 45 miles northeast of Montreal (Map: Quebec, C 4). It has large shipbuilding and manufacturing interests. It derives its name from the captain of a French regiment, who established a fort here in 1665. Population, in 1891, 6669; in 1901, 7057.

SOREL. A river of Canada. See RICHELIEU.

SOREL, AGNES. Mistress of Charles VII. of France. See AGNES SOREL.

SOREL, ALBERT (1842—). A French author, born at Honfleur. He became professor of diplomatic history in the School of Political Sciences at Paris in 1872. In 1896 he was made a member of the French Academy. Some of his works are *La grande falaise* (1871), *Histoire diplomatique de la guerre franco-allemande* (1875), *La question d'Orient au XVIII. siècle* (1878), *L'Europe et la révolution française* (1885), *Montesquieu* (1887), *Madame de Staël* (1890), and *Bonaparte et Hoche en 1797* (1896).

SOREL, CHARLES (c.1599-1674). A French burlesque romancer, of whose life little is known. In 1622 appeared anonymously his *Histoire comique de Francion,* first in seven, later (1641) in eleven books. This work, reprinted more than forty times in the seventeenth century, made merry with the pastoral and chivalric romances then so popular. In *Le berger extravagant* (1621), an imitation of *Don Quixote,* Sorel likewise mocked the 'ideal' romance. His *Polyandre* (incomplete, 1648) portrays the well-to-do Parisian bourgeoisie with some accuracy. Consult Körting, *Geschichte des französischen Romans im XVII. Jahrhundert* (Leipzig, 1885), and Roy, *La vie et les œuvres de Sorel* (Paris, 1853).

SORGHUM (Neo-Lat. *sorghum, sorgum,* from Sp. *sorgo,* ML. *surgum, surcum, suricum,* Indian millet, sorghum, probably of Oriental origin), *Sorghum vulgare* or *Andropogon sorghum,* var. *saccharatus.* A tall, earless maize-like grass with a terminal head of small seeds. It is supposed to be a native of Africa, but has long been cultivated in Southern Europe and China as a forage plant (see below), and for the syrup made from its sweet juice, which does not yield a profitable quantity of sugar. See SUGAR, paragraph *Manufacture.*

SORGHUM, NON-SACCHARINE. A group of varieties of sorghum, deficient in sugar. The plants, which are very leafy, grow from 4 to 8 feet high and are cultivated for food and forage. All varieties are closely allied and belong to the above-named species. The most common varieties are Kafir corn, millo maize, durra, Egyptian rice corn, Jerusalem corn, and broom corn (q.v.). They are extensively grown in Africa, India, and China for the seed, which forms a staple human food. In Europe they are sometimes planted, but they do not ripen seed in regions remote from the Mediterranean countries. In the United States they are grown as forage plants in the semi-arid Western States, where, owing to their drought-resisting qualities, they have become important crops. Soil, climatic requirements, and cultural methods are practically the same for all varieties.

Kafir corn, the most important variety for the American farmer, was introduced by the United States Department of Agriculture about 1885 and widely distributed. It has become a valuable and important crop in California, Kansas, and Oklahoma. It succeeds on a variety of soils, but the best returns are obtained on rich soils suitable for corn. Profitable yields, however, are often

obtained on land too poor for corn. The preparation of the soil consists in deep plowing and fine surface pulverization to insure best conditions for the young plants, which are at first feeble and slow to grow. The seed is sown broadcast in hills or drills after the soil becomes warm. When it is grown in hills or drills it is treated like corn, when broadcasted like hay crops. As soon as the grain is ripe the plants are cut by hand or with a corn harvester, put up in shocks, and left to cure. When the curing process is completed the heads are threshed for the seed and the stalks and leaves used as fodder. Frequently the entire plants are used for feeding. From 35 to 50 bushels of seed per acre and from 5 to 10 tons of fodder are obtained under ordinarily favorable conditions.

Millo maize requires a longer season of growth then Kafir corn, and is therefore liable to injury by frost in many localities. Durra, also sometimes called Egyptian corn, grows vigorously and stools profusely. The heads are heavy, short, and thick, and hang downward from a short curve in the upper part of the stalk. The name is often written dhoura or doura. Egyptian rice corn differs from the other varieties in stooling very little and having a smaller amount of foliage. The seeds are white, large, and sweet. Jerusalem corn produces heavy yields of grain. Its seeds are nearly free from husk and shatter easily. None of these varieties are materially affected by either plant diseases or insects. See SMUTS.

The saccharine sorghums are favorably regarded for silage and soiling purposes and for forage. Growing animals thrive upon them, and dairy cattle produce a large flow of excellent milk. The bagasse or refuse from the press in syrup-making is also fed advantageously. According to experiments 40 per cent. of the protein, 71 per cent. of the nitrogen-free extract, and 42 per cent. of the crude fibre of sorghum forage is digestible.

The average composition of sorghum products follows:

AVERAGE COMPOSITION OF SORGHUM PRODUCTS

	Water	Protein	Fat	Nitrogen free extract	Crude fibre	Ash
	Per cent.	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*
Whole plant fresh	72.7	1.4	1.7	15.2	7.4	1.6
Whole plant cured	43.6	3.9	3.3	25.8	20.2	3.2
Sorghum silage	75.5	1.5	1.2	11.9	8.0	1.9
Sorghum seed	12.8	9.1	3.6	69.8	2.6	2.1
Sorghum bagasse	11.3	3.4	1.4	50.5	30.5	2.9

Although sorghum furnishes excellent pasturage for all stock, it is especially valuable for sheep and pigs, but until the animals become accustomed to it they should have only small amounts. It is best adapted for fall and early winter feeding, since it does not keep as well as many other coarse fodders. Sorghum silage has a greater tendency to develop acidity than corn. When in good condition it is an excellent feeding stuff. The seed is a concentrated feed, and quite similar in composition to shelled corn, though regarded as somewhat inferior in feeding value. When sorghum is grown for making syrup, the seed heads are often fed whole; otherwise they are frequently left on the stalk and fed as forage. It is believed that grinding increases the digestibility of the seed. Since Kafir corn is the most important non-saccharine sorghum, and since other varieties resemble it, it is taken as a type of the group. (See table.)

COMPOSITION OF KAFIR CORN PRODUCTS

	Water	Protein	Fat	Nitrogen free extract	Crude fibre	Ash
	Per cent.	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*
Whole plant, green	76.1	2.8	0.6	11.7	7.2	1.6
Cured fodder, whole plant	10.9	3.3	2.5	47.4	30.4	5.5
Stover cured fodder (without heads)	9.0	5.8	1.7	48.2	30.1	5.2
Heads (mature)	16.2	6.9	2.9	65.2	6.8	2.0
Seed	9.3	9.9	3.0	74.9	1.4	1.5

In composition, the Kafir corn products closely resemble similar products of maize. Studies at the Kansas Experiment Station have shown that as the plant ripens there is a decrease in albuminoids, but an increase in the percentage of other constituents and in the total weight of the seed. It is believed, therefore, that the best time to harvest Kafir corn is when the crop is ripe or nearly so. The stover, which has practically the same feeding value as corn stover, should be run through a cutting machine to obtain the best results. It has been found an excellent coarse fodder for cattle. The seeds have also given very satisfactory results, though it has not been found in tests at the experiment stations to be quite equal to corn, as is sometimes claimed. To obtain the best results the grain should be ground, as otherwise the small hard seeds are not thoroughly masticated and pass through the animal undigested. According to the Kansas Experiment Station, a bushel of Kafir corn will produce 10 pounds of pork, a bushel of corn 12 pounds, an acre of the former, however, producing more pork than an acre of the latter. Animals tire of Kafir corn alone more quickly than they do of corn alone. Digestion experiments with chickens have shown that about 88 per cent. of the total organic matter, 53 per cent. of the protein, and 96 per cent. of the nitrogen-free extract of whole Kafir corn is digestible. Similar values have been obtained for the ground grain. In experiments with Kafir corn stover fed to sheep about 42 per cent. of the protein, 67 per cent. of the nitrogen-free extract, and 54 per cent. of the crude fibre was digested.

Flour, which is said to be especially good for pancakes and has also been used for bread, is ground from Kafir corn, which is, however, not extensively used as food in the United States. The seeds of the closely related durra are much

eaten by the Abyssinian and other African races, and those of other non-saccharine sorghums in India and China. Kafir corn flour or meal has the following percentage composition: Water, 16.8; protein, 6.6; fat, 3.8; nitrogen-free extract, 69.5; crude fibre, 1.1; and ash, 2.2.

Consult: *Farmer's Bulletin No. 37* of the United States Department of Agriculture; *Handbook of Experiment Station Work*, United States Department of Agriculture (Washington, 1893).

SORIA, sō'rê-ȧ. The capital of the Province of Soria, Spain, 110 miles northeast of Madrid, on the right bank of the Duero (Map: Spain, D 2). The town, still surrounded by thick walls, and dotted with many ancient palaces, presents a mediæval appearance. The church of San Pedro, its principal structure, has a Latin portal of the twelfth-century style. The bridge over the Duero is a solid mediæval structure. The town has manufactures of chocolate, leather goods, and linens. Population, in 1900, 7296.

SORITES (Lat., from Gk. *σωρείτης*, *sōreitēs*, *σωρίτης*, *sōritēs*, logical sophism formed of an accumulation of arguments, from *σωρεύειν*, *sōreuein*, to heap, from *σωρός*, *sōros*, heap). A logical term with a two-fold meaning. It is the name of a series of syllogisms so arranged that the suppressed conclusion of each preceding syllogism is a premise of the succeeding; e.g. A is B, B is C, C is D, D is E, and therefore A is E. The term sorites is also used to designate a fallacy wherein it is argued that as the addition of each single object to a collection of objects does not change the character of the collection up to a certain point, therefore such addition can be made indefinitely without altering the character of the collection.

SORLEY, sôr'lĭ, WILLIAM RITCHIE (1855—). An English educator, born in Selkirk, Scotland. He was educated at Edinburgh University and at Trinity College, Cambridge, and held a fellowship in both places. From 1888 till 1894 he was professor of logic and philosophy at University College, Cardiff; from 1894 till 1900 professor of moral philosophy in Aberdeen; and in 1900 became Knightbridge professor of moral philosophy in the University of Cambridge. His works include *Hulsean Essay on Jewish Christians and Judaism* (1881), *Shaw Fellowship Lectures on the Ethics of Naturalism* (1885), and *Mining Royalties, a Report of an Inquiry Made for the Toynbee Trustees* (1889).

SORMA, zôr'mȧ, AGNES (AGNES MITO VON MINOTTO) (1865—). A German actress, born in Breslau. She appeared first in children's rôles, at the age of fourteen, at the Stadttheater in Breslau. From 1880 to 1882 she played successively in Görlitz, Posen, and Weimar, and in 1882 was engaged by the management of the Deutsches Theater at Berlin. During the spring of 1897 Sorma visited the United States, where she appeared with success in Hauptmann's *Versunkene Glocke*, and as Nora in Ibsen's *Doll's House*. In the following year she made a second visit.

SOROCABA, sō'rô-kȧ'bȧ. A town of the State of São Paulo, Brazil, 53 miles west of the city of that name, with which it has railway communication (Map: Brazil, H 8). Coffee and sugar are produced, but the main interest centres in a live-stock fair, when the sale of horses and mules sometimes reaches 70,000. Population, about 12,000.

SOROKI, sô-rô'kê. The capital of a district in the Government of Bessarabia, Russia, situated on the Dniester, 116 miles north of Kishinev. It contains the ruins of an old castle and remnant of the Genoese settlement of Olchionia, which stood there in the twelfth and thirteenth centuries. There are numerous vineyards in the surrounding country. Population, in 1897, 15,800, chiefly Jews and Moldavians.

SOROSIS (Neo-Lat., from Gk. *σωρός*, *sōros*, a heap). The first woman's club in America, organized with twelve members in March, 1868, by Mrs. Jane Cunningham Croly, in New York City, and incorporated in January, 1869. Its object is to further the educational and social activities of women, and to bring together for mutual helpfulness representative women in art, literature, science, and kindred pursuits. The first officers, Mrs. James Parton (Fanny Fern), Mrs. J. C. Croly (Jennie June), and Miss Katie Field, with Madame Botta and the Misses Alice and Phœbe Cary as members, gave the club a literary tone, but the 83 members enrolled during its first year included, besides authors and editors, artists, teachers, physicians, and philanthropists. Meetings occur once or twice a month and are conducted by two of the ten working committees.

SORREL (OF. *sorel*, Fr. *surelle*, from OF. *sur*, sour, from OHG., AS. *sūr*, Ger. *sauer*, sour; connected with OChurch Slav. *syrŭ*, rough, harsh, Lith. *sūras*, salty, perhaps akin to Gk. *ξυρός*, *xuros*, *sour*), *Rumex*. A genus of plants of the natural order Polygonaceæ. Common sorrel (*Rumex acetosa*) is a perennial herb with erect stems one to two feet high and arrow-shaped leaves, found in meadows and pastures throughout Europe. Its leaves are used in soups and sauces, as a salad, and as a pot-herb, for which purposes it is cultivated. French sorrel, or Roman sorrel (*Rumex scutatus*), a native of France and Italy, has broader and blunter leaves, and is more frequently cultivated than common sorrel, being considered of finer flavor. Sheep's sorrel (*Rumex acetosella*) is a smaller similar plant with widely-spreading roots, on account of which it often becomes a troublesome weed in dry soils. Cultivation and the addition of lime and other fertilizers to the soil quickly eradicate it. Compare OXALIS; HIBISCUS; DOCK.

SORREL TREE (*Oxydendrum arboreum*). A tree of the natural order Ericaceæ, remarkable for its size, which contrasts with its small shrubby relatives. It grows chiefly from Virginia to Georgia, attains a height of 50 feet, a trunk diameter of 12 to 15 inches, and bears peach-like acid leaves, which are sometimes used for dyeing wool black. The principal use of the tree is as an ornamental. Its wood is of little or no use.

SORREN'TO. A town in the Province of Naples, Italy, situated on a promontory on the southeast side of the Bay of Naples, 16 miles south-southeast of Naples (Map: Italy, J 7). Its beautiful situation and mild, dry climate have made it a much frequented resort. It has a cathedral, a seminary, and a marble statue of the poet Tasso, who was born here. There is a trade in the famous wine of Sorrento, and

in olive oil and fruits. Sorrento was originally a Grecian colony. It was called *Surrentum* by the Romans, who embellished it with temples, the ruins of which still remain. Population (commune), in 1901, 8933.

SORROWS OF WERTHER (Ger. *Leiden des jungen Werther*). A romance by Goethe (1774), embodying some of the author's own experiences. Just previous to the time of its production Goethe was battling against his unrequited love for Charlotte Buff, and was greatly affected by the suicide of a young man, Jerusalem, who committed suicide because of an unfortunate love affair and a fancied slight. The recognition of the possible results in his own similar case led to the creation of Werther (representing himself) and Jerusalem, and of Lotte, typifying the object of the love of each. The romance at once created a sensation and established Goethe's fame. Its influence on sentimental natures was profound and led some to follow the hero's example, so that Goethe was obliged in a subsequent edition to add a warning note.

SORSOGÓN, sôr'sô-gōn'. A province of the Philippine Islands, occupying the extreme southeastern portion of the island of Luzon (Map: Philippine Islands, H 7). Area, 675 square miles. It is surrounded by water on three sides, and almost cut into halves by the large Bay of Sorsogón. It is traversed lengthwise by a forest-covered mountain range culminating in the volcano of Bulusan. Sorsogón is a great hemp-producing province. Its export of hemp in 1899 amounted to 14,014,639 pounds. Copra is also a staple product. The province was created by the Philippine Commission in 1901, having previously been a district of the Province of Albay. Population, estimated, in 1901, 98,650, belonging to the Vicol tribe. Capital, Sorsogón.

SORSOGÓN. The capital of the Province of Sorsogón, Southern Luzon, Philippines. It is situated at the head of the Bay of Sorsogón, 30 miles from the southeastern extremity of the island (Map: Philippine Islands, H 7). The bay, which measures 6 by 12 miles, is entirely land-locked, with a narrow entrance from the Visayan Sea; it is one of the best harbors in the archipelago, and is very favorably situated near the Strait of San Bernardino on the route from Manila to the United States. Population, estimated, in 1899, 10,720.

SORTES (sôr'tēz) **VER'GILIA'NÆ.** See SORTILEGE.

SORTILEGE (ML. *sortilegium*, divination by lot, from Lat. *sŏrs*, lot + *legere*, to read). The casting of lots. This method of division was an ancient way of distributing shares among several claimants. At the bottom is a religious idea. The choice of lots was performed in the presence of a deity, as represented by his image, and was accompanied with prayer and sacrifice, being often accomplished in the temple and by a priest. It was, therefore, presumed that the god determined the order in which the lots would fall and was responsible for the decision. The common practice was to use slips of wood, pebbles, potsherds, or arrows, which were drawn from a helmet, quiver, or pail, and in order that they should be indicative, they were usually marked in some manner. A favorite mode of forecasting was to open at random a sacred book and mark the passage on which the eyes first rested, the significance of which would serve as a token of the destiny awaiting the inquirer. As Vergil's *Æneid* came so to be used, the consultation was called *Sortes Vergilianæ*. The Scriptures were so employed by Christians, while the Arabs use the Koran and the Persians the poems of Hafiz.

SOSIA. In the *Amphitruo* of Plautus, a servant of the title character. He is made doubtful of his own identity by Mercury, who, assuming Sosia's form, plays the part of his double.

SOSTENUTO, sôs'tă-nōō'tô (It., sustained). A term used in music to indicate a sustained tone or a uniform rate of decreased speed.

SOTHEBY, sŭTH'bĭ, WILLIAM (1757-1833). An English translator, educated at Harrow and at the military academy at Angers in France. He was in the English army for a short period, but retired on his marriage in 1780. Henceforth he followed the career of a man of letters, dividing his time between his London house and Fair Mead Lodge by Epping Forest. In original composition Sotheby left nothing of value. His numerous volumes of poems and his twelve historical tragedies have long since been forgotten. He survives as the translator of Vergil's *Georgics* (1800). With less success he turned into English heroic verse the *Iliad* (1830-31) and the *Odyssey* (1834). Of some interest is his early translation (1798) of Wieland's *Oberon*.

SOTH'ERN, EDWARD ASKEW (1826-81). An English comedian. He was born in Liverpool, and was educated for the Church, but the stage was more congenial to his tastes, and he made his début in Jersey in 1849. In 1852 he came to the United States and appeared at the National Theatre of Boston in the character of Dr. Pangloss. In 1854 he joined Wallack's company and afterwards that of Laura Keene. In the character of Lord Dundreary in Tom Taylor's comedy *Our American Cousin* (1858) he made his great success. In 1864 he appeared in *David Garrick*, which was regarded as, next to Dundreary, his best part. His other chief successes were in *Brother Sam*, written for him by Oxenford (1865), Sidney Spoonbill in Byron's *Hornet's Nest*, and Fitzaltamont in *The Crushed Tragedian*, with which he appeared in London in 1878, soon after his return from a prolonged tour in America. Consult: Pemberton, *Memoir of E. A. Sothern* (London, 1890); Scott, *The Drama of Yesterday and To-day* (ib., 1899).

SOTHERN, EDWARD H. (1859—). An American actor, the second son of E. A. Sothern. He was born in London, England. In 1879 he made his début as an actor with his father in New York. His first real success was in *One of Our Girls* at the Lyceum, New York, in 1885. This was followed in 1887 by his success in *The Highest Bidder*, and later he was popular in many romantic plays. In 1900 he appeared in *Hamlet*. He married in 1896 the actress Virginia Harned. Consult: McKay and Wingate, *Famous American Actors of To-day* (New York, 1896); Strang, *Famous Actors of the Day in America* (Boston, 1900).

SOTTEVILLE-LÈS-ROUEN, sôt'vēl' lā rōō'ĕN'. A town in the Department of Seine-Inférieure, France, one mile south of the city of Rouen, of which it is a suburb (Map: France, H 2). Population, in 1901, 18,535.

SOU, sōō (OF. *sou, sol*, It. *soldo*, from ML. *solidus*, sort of coin, Lat. *solidus*, solid, firm). A former French coin, originally of gold, subsequently of silver, and then of copper; toward the end of the eighteenth century large numbers were struck in bell metal. At various times there were fourth (liard), half, two, and three sou pieces. The value of the sou was 12 deniers, or one-twentieth of a livre tournois or one-twenty-fifth of a livre parisis. The copper sou of the eighteenth century weighed 12.238 grains, and while its nominal value remained 12 deniers, it was actually worth only about two. The coinage of the sou ceased upon the adoption of the present decimal monetary system, but the word sou is popularly applied to the five-centime piece, which is one-twentieth of a franc and worth about one cent.

SOUBISE, sōō'bēz'. An ancient French family which became extinct in the male line in 1566, the female survivor marrying in 1575 Vicomte René II. de Rohan. Two sons were the offspring of this marriage, of whom the elder was Henri, Duke de Rohan (q.v.), a celebrated leader of the Huguenots. The younger son, Benjamin, Sieur de Soubise (1583-1642), served under Maurice of Nassau in the Netherlands, joined his brother in the leadership of the Huguenots, and gained his greatest distinction in the defense of La Rochelle (1627-28) against Richelieu. He died without issue and the title passed to François de Rohan, of whose descendants the best known was Charles de Rohan, Prince de Soubise (1715-87). He served in the War of the Austrian Succession and was made lieutenant-general in 1748. In the Seven Years' War he held important commands and was at the head of the French and Imperial forces in the disastrous battle of Rossbach (1757). He was made a field-marshal in 1758. In the following year he became a Minister of State. After the Peace of Paris he retired from active participation in military affairs. He had the favor of Mme. de Pompadour and afterwards that of Mme. du Barry. He died July 4, 1787, the last of the line of Soubise-Rohan. See ROHAN.

SOUDAN, sōō-dän'. A region in Northern Africa. See SUDAN.

SOUFFLOT, sōō'flō', JACQUES GERMAIN (1713-80). A French architect, born at Irancy (Yonne). In 1734 he went to Rome as a pensioner of the Academy. After studying in Italy and Asia Minor he returned to Lyons, where he soon gained distinction. At this period he either constructed or collaborated in the design of every building of importance that was undertaken in Lyons. In 1749, having become a member of the Royal Academy of Architecture, he removed to Paris. In 1772 he was appointed controller of the monuments and embellishments of Lyons, and in 1775 controller of the buildings of Paris. He is chiefly noted as the architect of the Pantheon, one of the largest and finest cupolas in existence. Among his other works are the sacristy of the Cathedral of Notre Dame and the Ecole de Droit in Paris, the Hôtel Dieu in Lyons, the Hôtel de Ville in Bordeaux, and the Cathedral of Rennes.

SOUFRIÈRE, sōō'frē-âr', LA. A volcano situated near the northern end of the island of Saint Vincent (q.v.) in the West Indies. Its height is 3700 feet. It has had three violent eruptions within the last two centuries. In 1718 there was a terrific explosive eruption which covered the whole island with débris. In 1812 another devastating outbreak took place in which a new crater was formed immediately beside the old one. During the next ninety years the volcano was dormant, the old crater being occupied by a lake. On May 7, 1902, there occurred, simultaneously with the eruption of Mont Pelée (q.v.) in Martinique, a violent outburst in which immense clouds of steam charged with hot volcanic dust rushed down the sides of the mountain in all directions with the velocity of a hurricane, while large quantities of red-hot stones were showered over the northern part of the island. The entire northern third of the island was devastated, all vegetation being destroyed and the ground covered with dust and rocks to the depth of from 1 to 25 feet. Two villages were annihilated and 1500 persons killed. On September 3d there was another outburst almost as violent as the first.

SOUL (AS. *sāwl, sāwul*, Goth. *saiwala*, OHG. *sēula, sēla*, Ger. *Seele*, soul; possibly connected with Lat. *sæculum*, generation, age). A term which is used for at least three conceptions. In the most primitive sense the soul is conceived as a refined and intangible material being, often as a sort of diaphanous double of the physical body. In a later sense the term designates the human spirit, conceived to be an immaterial (and usually an immortal) being, which is the source of human life, intelligence, and personality. In a third sense it is used by psychologists to designate the totality of psychical phenomena connected with one individual or one body. In this sense the soul is equivalent either to consciousness considered as a whole or to those factors of consciousness which may be said to constitute the ego. It is not, however, asserted to have any existence outside of or apart from consciousness.

By primitive man the soul was not carefully distinguished from the body; the conception was probably the result of observing the phenomena of death. A man is alive, he dies, and his body, which has still the same appearance, has suddenly lost all power of motion and feeling. The soul has gone out of it like a breath of air, or a phantom or a dream, or like a subtle essence pervading things. Beyond this primitive man does not seem to have gone in defining what soul means. Advance is shown among Oriental peoples. Thus the Hindus teach in their Vedas that the human soul is a portion of the Supreme Being, which fills all things. Being pantheists, most Oriental people fail in their conceptions of individual personality. Hence the Hindus hold that all finite differentiations of Brahma are ultimately absorbed. There is, therefore, only a negative belief in the soul.

Among the Egyptians transmigration provides a background for more distinct ideas. According to this theory the soul lives primarily in the body of an animal and passes from it, after wandering for 3000 years through all the species of animals, into a human body, unless the priests shorten this period. In the Book of the Dead a vague belief in immortality is foreshadowed; but it is doubtful if this belief is dissociated entirely from the corresponding idea of the survival of the body. We find traces of this uncer-

tainty and confusion specially in the earlier tradition of the Hebrews. In the later tradition, and especially under the influence of prophetism, more refined conceptions followed the preaching of ethical monotheism. A trichotomy of body, soul, and spirit appears among the later Jewish and early Christian thinkers, in which 'body' (σῶμα) is the material, 'soul' (ψυχή) and 'spirit' (πνεῦμα) the spiritual part of the human personality; but the tendency is to resolve this threefold division into a dualism in which body and soul are joined *against* the spirit. The whole weight of Christianity was thrown on the side of the soul conceived of as that part of man that is under divine law. This part was regarded as having absolute worth, inasmuch as it is the seat of the divine spirit, and is opposed to the 'flesh' (σάρξ), i.e. to human nature in estrangement from the divine. The salvation of the soul is negatively its deliverance from bondage to the 'flesh' in this broad signification, and, positively, union and communion with God, the essence of the soul's life.

We find a similar gradual distinction between body and soul in the history of Greek thought. In Homer the soul is a kind of image of the body (εἴδωλον), which escapes in death through the mouth or through an open wound. All natural objects are supposed to have souls. The Ionic philosophers, incapable of making this distinction clear, sought for some physical principle to define what they meant by the soul, and found it in water, air, fire, or the 'infinite' (hylozoism); and when later reflection added to this the notion of *reason* it was only as 'thinking air' that the soul was conceived even then. Nor did Parmenides with his absolute unity, or the Pythagoreans with their doctrine of numbers, attain a clear differentiation of body and soul; and Democritus is openly materialistic, maintaining that, inasmuch as matter is eternal, there is no need to distinguish body from that which moves it. Anaxagoras (born B.C. 499) was the first of the Greek thinkers to formulate the distinction in question in his theory of intelligence (νοῦς), which, he contended, is different from body because it is simple, mixes with nothing, is never passive, is infinite, and has absolute power over matter. Though this cannot be taken as a clear definition of the soul as an individualized thinking substance, it is an advance in thought. Socrates added to this theory of Anaxagoras the idea of the good, which he regarded as equivalent to the absolute or God, and from it derived the soul of man as a small part, clearly recognizing the distinction between it and the body, together with the implication of immortality, which, on his hypothesis of the good, was contained in it. The deeper reflection of Plato and Aristotle naturally discloses more satisfactory evidence of positive ideas. Plato in particular was much influenced by his general metaphysical theory. Thus in the *Timæus* he teaches that the soul is one of many modes of 'the one and the many,' by which he means the absolute mind and the phenomenal world of related things ruled by the *demiurgus*. The highest of these incarnations is in the stars, the next in man (*Philebus*). The soul of the world is created intelligent by God, and it is this soul that is in our bodies. As such it has the principle of movement in itself: it is self-moved; has reality (οὐσία), and partakes of the harmony and beauty of the world as created by God, and also leads to all true knowledge. According to Aristotle the soul is the formal, efficient, and final cause (ἐντελέχεια πρώτη) of the body (*De Anima*), the unity of three kinds of causality; and he distinguishes three kinds of soul, the vegetable, the sensitive, and the intellectual, which respectively represent the spiritual life of plant, animal, and human beings. As the 'final cause' of the body, man's soul cannot be indeterminate; it must have individuality to organize it, direct its movements, and lead it to its true end. Here we approach very near to the modern conception of the soul as an individualized, self-conscious, self-determining reality; but not quite, for this idea was not fully attained by Greek thought.

Among the early Christian philosophers we find a mixture of Greek and Christian ideas. The characteristics of this period show the tremendous hold which the spiritual ideas of Christianity had taken on the strongest minds. The writings of the Apologists, the Church Fathers, particularly Clement of Alexandria and Origen, while they do not reveal any systematic doctrine of the soul, are replete nevertheless with the keenest insight. The profound analysis of Augustine, however, made positive contributions to the problem. Anticipating Descartes, he maintained that it is impossible for thought to be an attribute of that which does not think; even if I doubt, the doubt itself must be an act of the soul and therefore a real fact of spiritual significance. If the soul were corporeal, its functions would be limited to the perception of body; but now it has the power of reflection, of knowledge, of love, and is, above all, conscious of itself, and therefore cannot be an attribute of extended substance merely (*De Trinitate*). The theories developed under Scholasticism are for the most part adaptations of the later Greek ideas to the necessities of Church doctrine and authority. Hence we find some inclining to take the view of Plato that the finite soul is part of a world-soul, as that idea was developed in Stoicism and later Jewish Hellenism; others incline to Aristotle's teleological conception of the soul as a cause realizing itself in the different grades of reality.

It was Descartes who brought reflection back from the region of scholastic metaphysics to the subjective side of the problem. Descartes discovered, as Augustine and William of Auvergne had discovered before him, that to doubt the existence of the soul is to contradict one's self; for doubt is a mental fact, and as such has reality. I that doubt, think; I may imagine that I have no body, but as long as I think I have real existence; I think, therefore I am (*cogito ergo sum*). If it be replied that my thinking does not imply reality then the reply is: God cannot deceive us, and His omnipotence can realize everything we conceive; therefore every *clear* and *distinct* idea we have must be real, and since I have a clear and distinct idea of myself and of my body in their distinction, it follows that soul and body *are* distinct and may exist without each other. Thought and extension are two attributes, and it is thought alone which it is impossible for us to doubt. Thus body and soul are left opposed to each other, so far, at any rate, as man is con-

cerned. Spinoza sought to obtain a unity of the two (thought and extension) and formulated the conception of an underlying soul-substance which, as God, differentiates itself in infinite and eternal modes or attributes which are characterized under the categories of thought and extension. Thus body and soul are ultimate realities of one and the same substance, the ever-changing counterparts of each other, and yet the modes of one infinite reality. Leibnitz, not satisfied with the pantheism of Spinoza, sought, in his theory of atoms or monads, to retain the rights of finite personality and things and yet to avoid the crude dualism of Descartes. All things have souls according to Leibnitz; the world consists of an infinite number of them, in all degrees of perfection. If we ask for the nature of their life, inner experience reveals to us an active, real force, namely, our souls, and this is the type of all substance; so that in the world both kinds of reality, thought and extension, consist of perceiving soul-life. With this view may be compared that of Berkeley, who carried idealism to its extreme expression in his dictum that the being of things is in their being perceived (*esse* = *percipi*).

The Empiricists, Hobbes, Locke, Hume, and Mill, developed their views of the soul along the lines laid down by Bacon. Hobbes is openly materialistic; but he is offset by the cautious psychology of Locke, who finds that inner feeling undoubtedly gives us the consciousness of self, though not the substance which underlies it, which is an unknown quantity whose real existence we can neither dogmatically affirm nor deny. These ideas Hume carried to their logical conclusion by denying any existence to the soul as a real or permanent subject: the only reality we know is the phenomenal stream of impressions and ideas. It was the merit of this analysis of Hume that it finally woke up Kant, whose views have greatly influenced recent thought. By an analysis of the human reason Kant sought to show that the real significance of the soul consists in the moral or practical activity, which an accurate knowledge of the laws of thought could do nothing successful to overthrow. If the system of Kant caused a theoretical schism between the reason as the knowing activity and the will as the moral activity, the reflections of Fichte, Schelling, and Hegel, together with the labors of the modern school of psychology, have done much to heal the breach. On the whole, therefore, we may say that the hypothesis of a soul seems to be demanded both as a ground of the unity of self-consciousness and also of the universe. It seems, moreover, to be justified, with sufficient reason, as the real principle of the harmony of the subjective and the objective. It seems also to be required as the subject of the changing states of thought, feeling, and volition, revealed in the phenomena of consciousness.

SOULE, sōōl, GIDEON LANE (1796-1879). An American educator, born at Freeport, Me. He studied at Phillips Exeter Academy from 1813 to 1816, and then entered Bowdoin College, where he graduated in 1818. Nearly all of the remainder of his life was passed at Exeter as teacher and principal. This latter office he held from 1838 until within three years of his death. The school under his management took a high rank among American fitting schools. Consult an article in the *Unitarian Review*, vol. xii. (1879).

SOULE, JOSHUA (1781-1867). A bishop of the Methodist Episcopal Church South, born at Bristol, Me. He began to preach at the age of seventeen, and was admitted to the New England Conference in 1799. He was elected book agent in 1816, and during his incumbency founded and edited the *Methodist Magazine*, since developed into the *Methodist Review*. He became bishop in 1824. When the Church divided in 1845 he adhered to the Southern section and continued in the bishopric.

SOULÉ, sōō'lā', PIERRE (1802-70). A French-American statesman, born at Castillon, France. He was trained for the priesthood at Toulouse, and afterwards studied at Bordeaux. He was involved in a conspiracy against the Bourbons in 1817, and for some time took refuge in Béarn. Later he was permitted to return to France, but in 1825 was sentenced to imprisonment for articles in a radical newspaper reflecting on the ministry. He escaped and settled in New Orleans. There he was admitted to the bar. In 1847 he was appointed to the United States Senate to fill a vacancy, and was elected for the full term in 1849. He represented extreme Southern views, and was prominent in the debates on the compromise measures of 1850. President Pierce appointed him Minister to Spain in 1853. At Madrid he became notorious for fighting several duels, one with Turgot, the French Ambassador. He favored the insurrection in Madrid in 1854 and united with Buchanan and Mason in the Ostend Manifesto (q.v.) of October of the same year relating to the annexation of Cuba. He returned to the United States in 1855. He at first opposed the secession of Louisiana, but afterwards joined the secessionists, and was arrested in 1862 for disloyalty and imprisoned. He was released on condition of leaving the country, but ran the blockade at Charleston, and for a short time served on the staff of General Beauregard. In 1863 he went to Havana, but after the close of the war he returned to New Orleans, where he died.

SOULIÉ, sōō'lyā', MELCHIOR FRÉDÉRIC (1800-47). A French dramatist and novelist, born at Foix. He was expelled from the law school in Paris on account of his radicalism. In 1824 he published a volume of poems, *Amours français*, and in 1828 his drama *Roméo et Juliette* was produced at the Odéon. In 1832 his play *Clotilde* was performed, and this was followed by several other successful pieces, the best known of which is perhaps *La closerie des genêts* (1846). Among his many novels may be cited especially his first, *Les deux cadavres* (1832), *Mémoires du diable* (1837-38), *Le maître d'école* (1839), *Eulalie Pontois* (1842), and *Saturnin Fichet* (1847-48). Consult Champion, *F. Soulié, sa vie, ses ouvrages* (Paris, 1847).

SOULOUQUE, sōō'lōōk'. Emperor of Haiti. See FAUSTIN I.

SOULT, sōōlt, NICOLAS JEAN DE DIEU, Duke of Dalmatia (1769-1851). A French marshal. He was born at Saint-Amans-la-Bastide, Department of Tarn. He entered the army as a private in 1785, rose by his soldierly qualities, and in 1794 was made a general of brigade for his conduct at

Fleurus. From 1794 to 1799 he was employed on the eastern frontier, and in the retreat after the defeat of Stockach (March 25, 1799) he prevented the annihilation of the French army. Appointed general of division (April 21, 1799), and put under Masséna, whom he ably seconded in Switzerland and Italy, he was afterwards appointed by Napoleon to one of the four colonelships of the consular guards and became an ardent supporter of the First Consul. He was created marshal of France in 1804. He justified his appointment by his brilliant achievements in the subsequent campaign against the Austrians, especially at the battle of Austerlitz (December 2, 1805), which he decided by piercing the Russian centre. He did good service in the Prussian campaign of 1806, took part in the battle of Eylau in 1807, and in the latter year was appointed governor of Berlin and created Duke of Dalmatia. Soult was next placed at the head of the Second Corps in Spain, pursued the retreating British forces under Sir John Moore, attacked them at Corunna (January, 1809), and, though repulsed, forced them to abandon their baggage and munitions of war. He then occupied Oporto and Northern Portugal, but the sudden arrival of Wellesley made him retreat rapidly to Galicia. In September, 1809, he became commander-in-chief in Spain, gained a brilliant victory at Ocaña on November 19th, and at the commencement of the following year subdued Andalusia. In attempting to succor Badajoz, which he had captured and garrisoned, he was defeated by Beresford at Albuera (May 16, 1811). After the battle of Salamanca and the advance of the British on Madrid, Soult, on the rejection of his plans for transferring the theatre of war to Andalusia, demanded and obtained his recall. In 1813 he fought in Germany, but when the news of the defeat of the French at Vitoria reached Napoleon Soult was restored to the command of the army of Spain. It was not in Spain, however, but in France, that the contest had to be waged; and the advantages were all on the enemy's side; nevertheless, by a system of military tactics which has been universally admired, he neutralized the strategy of Wellington, and reduced the campaign, during the seven months it lasted, to a mere trial of strength. He continued the struggle after the entry of the Allies into Paris, unsuccessfully opposing Wellington at Toulouse on April 10, 1814. He became an ardent royalist after the abdication of Napoleon, and was made Minister of War; but on the return of the Emperor from Elba he abandoned Louis XVIII. and joined the Imperial army. After Waterloo he was banished and not recalled till May, 1819. He was finally restored to his honors, and took an active part in politics. In 1827 he was created a peer of France, and under Louis Philippe he repeatedly held high State offices. In 1845 he retired from active duty, and in 1847 he was honored with the appointment of marshal-general of France. Soult passed the rest of his days at his residence of Soultberg, near Saint-Amans. His *Mémoires* were published, in part, by his son (3 vols., Paris, 1854). Consult also Sallé, *Vie politique du maréchal Soult* (Paris, 1834).

SOUND. See ACOUSTICS.

SOUND, RECORDING OF. See PHONOGRAPH.

SOUND, SOUNDING (OF., Fr. *sonder*, probably from Lat. *sub*, under + *undare*, to undulate, from *unda*, wave; less plausibly from AS., Icel. *sund*, Ger. *Sund*, sound, strait). The operation of ascertaining the depth of water. In shallow waters (less than 20 fathoms) the depths are ascertained with the lead and line (see LEAD, SOUNDING); in greater depths the deep-sea lead and line are used or else a sounding machine. Beyond a depth of 200 fathoms soundings are not useful for the purpose of navigating vessels; but 'deep-sea' soundings are taken in all depths in order to ascertain the shape and character of the ocean bottom and its organisms, living and dead. See DEEP-SEA EXPLORATION.

Few attempts to ascertain the depth of the ocean were made before the beginning of the nineteenth century, and it was not until toward the middle of it that the investigations were at all systematic. The disadvantges under which the earlier expeditions labored were such as to preclude not only rapid but reliable work. For the lines rope of ordinary character was used, and the sinkers employed were generally too light. The weight of the rope after it became water-soaked was very great, and its bulk, together with that of the reels, very troublesome. The inadequate sinkers caused the line to run out very slowly, and the reeling in was both laborious and tedious. Owing to the difficulty of holding a large sailing ship in a fixed position for the requisite time and the amplitude of her movements on the waves, many of the soundings were made from boats, which still further reduced the speed, especially that of preparing to cast and of reeling in. The first attempt (so far as known) to use wire for the line was that of the well-known 'exploring expedition' sent out by the United States Navy Department in 1838. The wire was of copper, about 3-32 of an inch in circumference, with soldered and twisted splices. Owing to lack of proper appliances for handling, it always broke at 500 to 1000 fathoms, and its use was abandoned. In August, 1894, Captain Barnet, R. N., made a sounding in 2000 fathoms with iron wire. This also broke, and no more attempts with it were made. Three months later. Lieut. J. C. Walsh, U. S. N., in the United States schooner *Taney*, tried to use steel wire, but his efforts were unsuccessful, the wire being too large and the sinkers too small. He reported soundings of 5700 fathoms and no bottom, but the depth was actually less than half as great.

Much work continued to be done with rope lines both before and after these experiments, but more especially afterwards. In 1840 Captain James F. Ross first noted time intervals in sounding; he also used very heavy sinkers, and his results were exceedingly accurate for those days. The question of time intervals was taken up and perfected by Lieutenant (afterwards Admiral) Taylor, and other officers of the United States Navy, and their observations were of great importance in determining the accuracy of deep-sea work before the invention of the Thomson sounding machine. For a time the United States Navy Department abandoned the use of both wire and rope, and, at the instance of Lieutenant Maury, adopted waxed flax twine, weighing only nine pounds to the statute mile. Between 1851 and 1853 much of the Atlantic was explored by United States vessels and hundreds of soundings

taken (using the twine mostly) with fairly accurate results, though, as no specimens of the bottom were obtained, they were open to question. In 1853-54 Passed Midshipman J. M. Brooke, U. S. N., brought out his cup and detachable sinker, which enabled specimens of the bottom to be obtained while using a heavy weight to keep the line taut when running out. Brooke also developed his table of 'standard casts' utilizing the time interval and weight of line out, and he much improved the sounding apparatus.

The Civil War put an end to the deep-sea work of the United States Navy for many years, but it was carried on most successfully by the British, especially by Captain (afterwards Admiral) F. P. Shortland, who improved the Brooke sounding machine, and was one of the first, if not the first, to enunciate the important rule in regard to tension on the line, viz., "A sounding line should not be permitted to run free, but should be resisted by a force equal to the weight in water of a length of the line equal to the depth to be determined." The success of the Brooke device and its modifications in bringing up specimens of the bottom and its organisms attracted the attention of naturalists and geologists, and their curiosity caused dredging in great depths to be attempted. The results of the early (1867-69) work of Count Pourtalès under the direction of the United States Coast Survey brought about renewed interest by showing, as Pourtalès says, "that animal life exists at great depths in as great an abundance as in shallow water." In 1872 the British Government fitted out the celebrated *Challenger* Expedition (q.v.) for investigating everything connected with the ocean depths. Strange to say, although Sir William Thomson had invented his sounding machine and submitted it to the British Admiralty several months before the *Challenger* was ready, it was rejected for imperfections which might have been easily corrected, and the *Challenger* sailed with her antiquated outfit of sounding material, whereby a vast amount of time was lost as well as space for supplies and specimens. The United States ship *Tuscarora* under Captain Belknap sailed from San Francisco only four months after the *Challenger*, but the United States Navy Department was wise enough to supply her with one or more Thomson machines in addition to the ordinary rope outfit. The new machines were not entirely satisfactory at the start, but were easily brought into working shape by the *Tuscarora's* officers, and after very few trials entirely superseded the old apparatus. Since that time all deep-sea work has been done by machines, and thousands of soundings have been taken to determine the location of the submarine cables which have now become so numerous.

The Thomson sounding machine is of two types, deep-sea and coasting. The latter is now used by nearly all large steamers and by many small ones. It consists of an iron-braced wooden framework or casing which incloses a steel drum about 18 inches in diameter and three inches thick. The disks forming the sides of the drum project beyond the circumference, forming a broad deep groove for carrying the wire (3-stranded galvanized wire rope is now generally used). On each side are cranks for winding in, and on one side there is a friction brake and clutch, while on the other there is a dial, showing the number of fathoms (0 to 200) out, which is operated by gearing from the axle of the drum. The sinker consists of a lead of the usual shape, weighing about 22 pounds, through which is thrust an iron rod, the whole sinker being 46 inches long from bottom of lead to top of rod. The wire rope is made fast to a fathom or two of small soft line, which is secured at the other end to an eye in the upper end of the sinker rod. The manner of obtaining the depth is independent of the length of wire out, and the depth is registered by means of a Thomson chemical tube, a Tanner-Blish tube, or the depth recorder. The Thomson tube is a slender glass tube, about two feet long, closed at one end, and filled with chromate of silver. It is placed in a slightly larger brass tube, which has holes in it to admit the sea water freely and is lashed to the sinker. The machine is installed near the stern or on the ship's rail. To sound, the sinker is lowered over the stern, the line dropped in a fair leader to insure free running, and when all is ready the brake is tripped by a movement of the crank. The sinker drops rapidly to the bottom and the moment it reaches it the line slacks perceptibly and the reel is stopped. The line is then reeled in. If the Thomson tube is used, it is removed from the brass receptacle and laid against a special scale. The sea water has forced itself in the open end to a distance depending upon the pressure (i.e. the depth); as far as it reaches the chemical in the tube is discolored, and this point falls abreast the division of the scale which corresponds to the depth of water. Since the measurement is independent of the amount of wire out, the sounding may be taken with the ship going at full speed if the depth is not too great. The Tanner-Blish is similar to the Thomson tube, except that it contains no chemical. If the tubes are kept carefully dried the distance the water has risen is easily noted; and by redrying the tubes they may be used over and over again. The depth recorder works on a similar principle, and is attached to the sinker in the same way. The pressure of the water acts against a piston which compresses a spring and carries a sliding index. When the pressure is slacking the piston returns to its initial position under pressure of the spring, but the index remains at the point of the scale to which it is pushed, so that the depth is read off at once.

The Thomson sounding machine for great depths is similar to the small one, but has a special form of brake which adjusts the tension in accordance with Captain Shortland's rule, and has of course a much greater length of line. The Sigsbee machine is much used in the United States Navy. It differs from the Thomson chiefly in having an automatic spring governor to ease the strain on the wire due to the motion of the ship; though there are other points of dissimilarity. It is the invention of Captain C. D. Sigsbee, of the United States Navy, who has done much deep-sea, depth, and current work in the Atlantic and Gulf of Mexico. See DEEP-SEA EXPLORATION; OCEANOGRAPHY.

SOUSA, sōō'zȧ, JOHN PHILIP (1854—). An American bandmaster and composer. He was born in Washington, D. C., and was educated there. He held the position of bandmaster of the United States Marine Corps at Washington from 1880 until 1892, and during that period

made the organization one of the finest military bands in America. In 1892, in conjunction with David Blakely, he formed the organization now known as Sousa's Band. His compositions, both operatic and instrumental, have been eminently successful. His ability as a composer of marches soon secured for him the popular title of 'the March King.' His compositions include the following operas: *The Smugglers* (1879), *Désirée* (1884), *The Queen of Hearts* (1886), *El Capitán* (1893), *The Bride Elect* (1897), *The Charlatan* (1898); marches: "The Washington Post," "High School Cadets," "The Liberty Bell," "Manhattan Beach," "Directorate," "King Cotton," "El Capitán," "Bride Elect," "The Stars and Stripes Forever." His collection of arranged "National, Patriotic, and Typical Airs of All Countries" has been officially adopted by the United States Navy Department, and is in the collection of service bands throughout the civilized world.

SOUSA, sō'zȧ, or **SOUZA,** MARTIM AFFONSO DE (c.1500-64). A Portuguese colonizer and administrator, born at Bragança, Province of Trasos-Montes. In 1530 he was dispatched with five ships and a force of 400 to explore the coast of New Lusitania (Brazil), of which he was appointed Governor, and to found there a colony and distribute land. It has been said that he was the discoverer of the bay which he entered on January 1, 1531, and which, supposing it to be a river, he named Rio de Janeiro. He surveyed the coast, and on January 22, 1532, founded on São Vicente Island, near the present Santos, the first Portuguese colony in Brazil. The colony of Piratininga, the present São Paulo, on the bank of the Piratininga River, was founded under his direction. In 1533 he returned to Portugal, where he received São Vicente, the foremost of the captaincies into which Brazil was divided. This he ruled as absentee proprietor.

SOUTH, Sir JAMES (1785-1867). An English astronomer, born in Southwark. He was a member of the College of Surgeons and displayed great professional abilities, but later inclined to astronomy. In conjunction with the younger Herschel (q.v.) he undertook a series of observations which were presented to the Royal Society in a memoir containing micrometrical measurements of 380 double stars, and confirming the elder Herschel's inferences regarding orbital motion. For this he was awarded the gold medal of the Royal Astronomical Society in 1826. In 1835 he removed his observatory to Passy, near Paris. Here he made a series of observations on 458 compound stars, of which 160 were new, and convinced Laplace of the reality of revolving stars. South was one of the founders of the Astronomical Society and its first president. He was knighted in 1830. He observed Encke's comet (1828 and 1838), Mauvais's (1844), and Vico's (1845). His observing a sharp occultation by Mars of a small star in Leo disproved the existence of an extensive Martian atmosphere.

SOUTH, ROBERT (1634-1716). A famous preacher of the Church of England, born at Hackney. In 1651 he became a student of Christ Church, Oxford, and was ordained in 1658. In 1660 he was made domestic chaplain of the Lord Chancellor Clarendon. In 1663 he was promoted to a prebendal stall at Westminster, and in 1670 became a canon of Christ Church, Oxford. The rectory of Islip, in Oxfordshire, was later conferred upon him, and he was chaplain in ordinary to Charles II. When the revolution of 1688 was accomplished he gave his adhesion to it, but refused perferment. A stanch adherent of the Church of England, he continued to wage unsparing war from the pulpit and with his pen against Puritanism and every other form of dissent, occasionally occupying himself with discussion more strictly theological. He is now chiefly remembered by his sermons; they are masterpieces of vigorous sense and sound English, and abound in lively and witty matter. The best edition of his sermons is that by W. G. T. Shedd (New York, 1866-71), with a memoir.

SOUTH, UNIVERSITY OF THE. An institution of learning at Sewanee, Tenn., founded in 1857 by the Protestant Episcopal Church in the South. A tract of nearly 10,000 acres was secured as a site, $500,000 was subscribed for an endowment fund, and the cornerstone of the central building was laid when the Civil War broke out. At the end of the war the pledges of an endowment could not be realized. Funds were secured to begin the institution on a small scale, largely through the efforts of Bishop C. T. Quintard of Tennessee, and it was opened in 1868 with a grammar school and an academic department. A theological department was opened about 1878, a medical department in 1892, and a law department in 1893. The college domain, mostly covered with original forest, is situated on a plateau of the Cumberland Mountains, about 1000 feet above the surrounding valleys. The permanent buildings, eight in number, stand in a domain of 1000 acres, and are valued at $350,000. The college year is divided into three terms—Trinity, Advent, and Lent. The vacation is taken from December to March. The academic department embraces 15 schools, a certificate and diploma being given in each school. The degrees conferred are B.A. (60 courses), M.A. and M.S. (15 courses of an advanced character), and C.E. The work is mostly prescribed. In theology the degrees of B.D. and Graduate in Divinity are given; in law, LL.B.; in medicine, M.D. A school of pharmacy, with the degree of Graduate of Pharmacy, and a training school for nurses are connected with the medical school. All members of the professional schools and such academic students as have passed a certain number of university examinations and have sufficient maturity in age and character are formed by the governing board into an order of Gownsmen. These are distinguished by the academic dress (the Oxford cap and gown) and enjoy certain privileges and immunities. In 1903 the faculties numbered 41, and the student body 556, divided as follows: theological, 26; medical, 227; law, 17; academic, 122; preparatory, 164. The library contained 41,000 volumes.

SOUTH AFRICA. The part of Africa south of the Zambezi River; physically it is a distinct geographic unit. With an area of 1,100,000 square miles and a seaboard of more than 3000 miles, it is commercially a single trade region. Its collective commerce is known technically as the 'Cape trade.' The business interests of every part of it are closely related to or interwoven with those of the other parts, and the best means of introducing civilization and commerce

into tropical Africa is through the gateways that connect the equatorial regions with the wide regions which white men are developing in South Africa. The colonies and protectorates which are wholly or in part in South Africa are: Portuguese East Africa, German Southwest Africa, Cape Colony, Orange River Colony, Transvaal Colony, Natal (including Zululand Province), Rhodesia (Southern), Basutoland, and Bechuanaland Protectorate (qq.v.), all except the first two belonging to Great Britain.

TOPOGRAPHY. The coasts, like those of the rest of Africa, are chiefly straight and unbroken. They are deficient in good harbors and girdled by a tempestuous ocean with a never-ceasing surf. The west shore is very different in aspect from the south and east coasts. Nearly the whole of the west coast is low and sandy and the lands behind the shore line are barren and dismal. The south and east shores, however, though on the whole as regular and unbroken as the west coast, are attractive instead of repellent in appearance, with their evergreen slopes, picturesque bays, and wooded kloofs. All the ports of the west coast are roadsteads excepting Saldanha Bay, a splendid natural harbor still undeveloped, and Cape Town, which, at enormous expense, has been made safe for shipping. None of the ports on the south coast is naturally good, but those of Port Elizabeth and East London have been made available for large trade by artificial improvements. The east coast has in Delagoa Bay the only first-class harbor in Africa, and one of the finest in the world. The port of Durban on this coast has been rendered good artificially, and the port of Beira and the Chinde branch of the Zambezi delta are also available for large shipping. Most of the interior of South Africa consists of high plateaus, elevated so far above the sea level that the influences of the temperate zone are extended hundreds of miles to the north of the Tropic of Capricorn. Johannesburg enjoys a temperate climate, while Rio de Janeiro, in nearly the same latitude, is a tropical city. The high elevation of the most of South Africa is the chief element in its geographic unity. It is estimated that the area of the region which, in respect of temperature, is well adapted to become a home of the white race, is one-fifth as large as the area of the United States (exclusive of Alaska).

The entire coastal plain is only 20 to 50 miles wide excepting where it broadens to 100 miles or more in the neighborhood of Beira and the Zambezi. Behind the plain the land begins to ascend in terraces. In the extreme south the coastal plain rises to 600 feet above the sea. Just north of it in Cape Colony are the Southern Karroo and the Bokkevelt, 1000 to 2000 feet high. Next come the Great Karroo with an average altitude of 3000 feet; then the loftiest of the Cape plateaus, the Northern Karroo, from 2700 to 6000 feet; then the diamond fields country and the wide plains of the Orange River Colony, from 4000 to 5000 feet; the still more extensive plateau of the Transvaal, from 5000 to 7000 feet; and the more diversified uplands of the Matabeleland and Mashonaland region at a little lower level, sloping gradually to the plain of the Zambezi. In the west the irregular highlands of Damaraland and Namaqualand rise steeply from the Atlantic coast plain, and merge indefinitely with the vast central plains of Bechuanaland and the dreary expanse of the Kalahari Desert, once the floor of an inland sea and now about 4000 feet above the sea level. In the east and southeast the lowlands of Portuguese East Africa and the coast plain and plateau of Natal are skirted inland precipitously by the mighty rampart of the Drakensberg and other ranges that wall in the lofty interior plateaus. Many of the mountains lining the periphery of the plateaus or rising within them have an altitude of 6000 to 10,000 feet. The culminating points appear to be the Montaux Sources, Champagne Castle, and Mount Hamilton, all three probably upward of 10,000 feet in elevation, and the last perhaps not much short of 12,000 feet.

HYDROGRAPHY. The Zambezi alone is important for navigation. Most of the rivers are small and their mouths are hopelessly blocked by sand and rocks, excepting the Buffalo River, which with great difficulty has been made available for ocean steamers to East London, near its mouth. The Zambezi is navigable for about 260 miles from the sea. The north central portion of the region is an area of interior drainage, the waters disappearing in many so-called salt pans, where evaporation leaves an incrustation of salt on the surface.

CLIMATE. There are only two seasons: summer (October to March) and winter (April to September). Except in the south and east coastal regions the low average of atmospheric humidity is a marked characteristic. Pulmonary invalids from Europe prolong their lives in the dry, bracing air of the plateaus. January is usually the hottest month, with average maximum temperatures of 82° to 100° F. July is usually the coldest month, with temperatures ranging from 20° to 10° F. The Transvaal Colony, although partly within the tropics, stands so high above the sea that the mean annual temperature is only 68.64° F., or only about 6.30° above the mean summer temperature of England. Although entirely within the tropics, the annual temperature range in Matabeleland and Mashonaland is from 36° to 86°, so that these regions are by no means tropical. The Zambezi Valley and Portuguese East Africa are low, moist, and very unhealthful. More than half of South Africa is deficient in rainfall. The semiarid region includes the entire western half of the country, which is dry because South Africa depends for rain upon the winds of the Indian Ocean, and the east coastlands and highlands receive the larger part of the precipitation, as the winds move westward. The Great Karroo and Great Namaqualand have less than 6 inches of rain in the year. With the exception of the Portuguese coastlands and the Zambezi belt, South Africa is one of the most healthful and salubrious regions in the world.

FLORA. The veldt and the karroo are the distinctive features of South Africa. The word veldt (= field) is applied to the enormous areas of rolling pasture lands found in Cape Colony, the Orange River Colony, the Transvaal Colony, and parts of Bechuanaland, covered with rough scrubby grass, mimosa, acacia, and other bushes; also to the herbage itself, as the sweet veldt and the sour veldt. The name karroo is taken from the little karroo plant, relished by sheep and

goats and the best kind of bush for the domesticated ostrich. The largest tract of karroo is a region about two-thirds as large as Scotland, in the interior of Cape Colony. All South African plains and plateaus that are intermediate between the grass and bush-covered veldt and absolute desert are karroos. Both the karroo and the Kalahari desert need only the rain that sometimes falls on them to be quickly clothed with grass and shrubs. The plant-life common to deserts, and the vegetation of the veldt and the karroo, are the distinctive features of the flora; to which are to be added the tropical vegetation which girdles South Africa along its low, hot northern and eastern fringes, and the belt of European flora, including the northern cereals and the vine, across the south end of Africa.

FAUNA. The animal life is perhaps matchless, and is certainly unsurpassed. It includes the lion, elephant, hippopotamus, rhinoceros (black and white), buffalo, zebra, numerous varieties of antelope, the giraffe, wart hog, hyæna, and jackal. The slaughter of wild animals has been reckless and ruthless all over the settled parts of the country, but there are still wide areas that are known as 'sportsmen's paradises.' In Cape Colony nearly all the domesticated ostriches in the world (260,672 in 1899) are herded on large ostrich farms (dry veldt).

GEOLOGY AND MINERAL RESOURCES. The discovery of diamonds and gold had a profound effect upon the condition and prospects of South Africa, uplifting the country in a few years from obscurity into universal notice. Gold and diamonds are the foundation of the country's prosperity. Many millions of dollars have been disbursed in wages and local expenses at the mines. (For geology, gold, and diamonds, see CAPE COLONY, TRANSVAAL COLONY, KIMBERLEY, etc.) The copper mines of Namaqualand are unsurpassed in richness of yield. The principal silver mine worked is 50 miles east of Johannesburg, 6 miles from coal fields, but indications of silver have been found in many parts of South Africa. Enormous deposits of coal and iron have been discovered in Cape Colony and Natal in close proximity. Coal is also mined in the Transvaal and the Orange River colonies, and extensive coal measures have also been found in Rhodesia, near the Zambezi. Platinum, plumbago, manganese, and the finest of marble, building stone, and lime are also among the mineral resources.

AGRICULTURE. Farmers have already followed the miners far toward the Zambezi. Scotchmen and Englishmen in Mashonaland and Matabeleland are producing the food supplies required by the settlements and mining camps. The soil is extraordinarily productive wherever rainfall is sufficient; but the chief interest is stock-raising, the country, as a whole, being better suited for pastoral pursuits than for agricultural operations. Wool is the staple source of wealth, the grasses of the veldt and the pasture plants of the karroos being well suited for growing the finest wools. Many millions of sheep are pastured in the Cape, Natal, Orange River Colony, the Transvaal Colony, Bechuanaland, etc. Angora goats (mohair) and cattle also abound. The 'Cape horse' is not handsome, but is hardy and keeps in good condition on the veldt. Across the south end of the country is a strip of fine farming land, where wheat, maize (mealies), and all the crops of the temperate zone are very successful. The best wheat is grown along the southern border of Orange River Colony. In Cape Colony vine growing, ostrich farming, and cattle raising are important industries. It is to the advantage of South Africa that its great variety of climate enables it to grow nearly every cultivated crop. Sugar-cane and tea-planting in Natal have passed beyond the experimental stage. Sugar is now exported, and the tea is of excellent flavor. Coffee and arrowroot also thrive on the moist coastlands.

MANUFACTURES. Little attention has been given to the manufacturing industries, chiefly on account of the sparsity of the white population. A large quantity of Cape wine and brandy is produced, but they are of inferior quality and are consumed chiefly by the black natives. The chief centres of the manufacturing industries are in Cape Colony, where, in 1891, there were 2230 industrial establishments employing 32,735 persons, flour mills, tobacco factories, tanneries, diamond-washing and gold and copper reduction works being most prominent; and in the Transvaal Colony, where before the war there were 69 establishments, including saw-mills, brick and lime works, and machine shops.

COMMERCE. Prominent among the 'makers' of the country are still the traders who load their heavy wagons carrying three to four tons with all kinds of goods desired by the black population, and trek from tribe to tribe, returning to town or port after many months to dispose of the ivory, horns, skins, and feathers received in exchange for their wares. The trekking trade has been the means of diverting most of commerce, even of the Zambezi region, to the southern ports. The circulation of goods is to and from the seacoast, there being little trade between town and town, as all are supplied from the seaport centres. Except during the recent war the 'Cape trade' has been steadily growing. The annual import and export traffic of the region south of the Zambezi is now over $200,000,000 a year, Great Britain controlling nearly all the exports, those which reach other countries being mainly through British channels. Gold, diamonds, and wool are the great export staples, with hides, mohair, wine, and ostrich feathers next in importance. Many of the imports (general manufactures, machinery, etc.) come from countries other than Great Britain. In 1902 the imports from the United States amounted to over $26,000,000, while the exports to it were less than $1,000,000.

TRANSPORTATION AND COMMUNICATION. In the more settled districts there are fairly good roads with substantial bridges across the rivers. Mail carts, coaches, and in some cases bullock wagons, ply between the railroad stations and all the larger towns that are not on the rail lines. There is now rail connection between all the important ports of the south and east coasts and the larger interior towns and mining districts. One may travel by rail from Cape Town to Salisbury, in Mashonaland, and thence to the port of Beira. It is confidently expected that before many years the railway system of South Africa will be connected with that of Egypt. Regular communication is maintained with Europe, America, and Australia.

POPULATION AND HISTORY. The population is only about 6,000,000, of whom only about 750,-

000 are white. For exploration and history, see AFRICA, BOERS, NATAL, TRANSVAAL, and SOUTH AFRICAN WAR.

SOUTH AFRICA COMPANY, BRITISH. See RHODES, CECIL; RHODESIA.

SOUTH AFRICAN REPUBLIC. A former republic of South Africa. See TRANSVAAL.

SOUTH AFRICAN WAR. The conflict for supremacy in South Africa between Great Britain and the Boer republics of the Transvaal and the Orange Free State in the years 1899-1902. The causes that led up to the struggle and the diplomatic negotiations that preceded its outbreak are treated under TRANSVAAL. The following account will deal exclusively with the history of military operations and the terms of peace that ended the war. On the outbreak of war, October 11, 1899, the British strength in South Africa comprised a body of about twelve thousand men in Natal; a second force (2500) at Kimberley, on the western frontier of the Orange Free State; a third (1000) at Mafeking, on the Bechuanaland border; and about 1000 men on the Rhodesian frontier. The railway crossings on the Orange River and the northern part of Cape Colony were guarded by some 5000 men. The number of Boers mobilized on the Natal frontier in the early days of October was about 20,000. On the day following the declaration of war the forces of the Transvaal and the Orange Free State entered Natal. Laing's Nek and Ingogo Heights, in the extreme northern part of the colony, were seized, and the Boers pressed down the Durban Railway and attacked the British line extending from Ladysmith to Dundee. On October 20th the British drove a Boer force from Talana Hill, near Dundee, and on the following day they routed the Boers at Elaandslaagte, but on October 30th they met with a serious reverse at Nicholson's Nek, and by November 2d the Boers, under Petrus Joubert (q.v.), had succeeded in completely investing Ladysmith, which was held by about 10,000 troops under Sir George White. At the same time Kimberley was besieged by a Boer force of 6000 under Prinsloo, and 1000 British under Col. Baden-Powell were locked up in Mafeking by Cronje (q.v.) at the head of 6000 men. The unfortunate beginning of the war aroused great alarm in Great Britain, and preparations were made for carrying on a struggle which it now became apparent was to be of a nature far more serious than had been anticipated. Large reinforcements were dispatched to South Africa under the command of Sir Redvers Buller, who, at the head of 16,000 men, was intrusted with the task of relieving Ladysmith, while Lord Methuen with 9500 was to make his way to Kimberley from the south, and a force of some 5000 men under General French and 4500 men under General Gatacre were sent to operate against the Boers in the north of Cape Colony. On November 23d Lord Methuen defeated the Boers at Belmont, and on the 25th he won a victory at Enslin or Graspan, but on the 28th he suffered severely in his attempt to cross the Modder River near its junction with the Riet, and on December 11th was decisively defeated by Cronje in an attempt to storm the Boer position at Magersfontein. On December 10th General Gatacre met with a serious setback at Stormberg Junction, in Cape Colony. The most obstinate fighting, however, occurred around Ladysmith, and at Colenso on December 15th the British encountered a severe reverse at the hands of the Boer riflemen.

This succession of disasters spurred on the British authorities to greater exertions. In the latter part of December Lord Roberts of Kandahar was ordered to Africa as commander-in-chief, with Lord Kitchener of Khartum as his chief of staff. The fighting thus far had revealed on the part of the British officers great ignorance of the nature of the country and of the enemy. The Boers were all excellent marksmen and many of them were mounted, thus combining the rapidity of cavalry with the stability of infantry. The British, on the contrary, were handicapped by the absence of cavalry, and for want of adequate transport facilities were compelled to cling to the lines of railway, thus narrowing greatly their field of operations. Before the end of January, 1900, the English forces in South Africa were estimated at about 130,000 men. Lords Roberts and Kitchener arrived at Cape Town on January 10th, and a month's time was devoted to organizing the newly landed troops and establishing the transport and train on an adequate basis. The cavalry was made an important arm and much attention was devoted to the mounted infantry, composed of volunteers from Australia, New Zealand, and Canada. The new plan of campaign provided for the invasion of the Orange Free State by the main army under Lord Roberts, which, after relieving Kimberley, was to advance upon Bloemfontein. At the same time three smaller forces setting out from Cape Colony were to advance northward across the Orange River and to converge on Bloemfontein. The Boer forces thus crowded up in the northern part of the Orange Free State were then to be driven across the Vaal and cooped up in the mountains of Eastern Transvaal, where the united English strength might easily crush them. No attempt was made greatly to reinforce the troops operating around Ladysmith, for it was thought that a successful advance on Bloemfontein and Pretoria would compel the Boers to raise the siege of that town. At Ladysmith, meanwhile, desperate fighting had taken place during the month of January. On the 6th the Boers made a fierce assault on the redoubts to the south of the town, but were repulsed. On the 11th Sir Redvers Buller began a great flanking movement westward along the Tugela River, with the object of compelling the Boers to abandon their position on the north side of the stream and south of Ladysmith. On the 18th a division under General Warren crossed the Tugela, and on the night of the 23d-24th stormed Spion Kop, which was considered the key of the enemy's position. While encamped on the hill, however, the British were exposed to a murderous fire from the surrounding hills, and on the evening of the 24th were compelled to abandon the position, with the loss of 1700 men. On the 27th General Warren recrossed the Tugela.

Lord Roberts's advance on Kimberley began on February 11th. He had under him about 23,000 infantry, 11,000 mounted men, and 98 guns. On the 13th of February the cavalry under General French forced the passage of the Modder River, and on the 15th entered Kimberley. Cronje, who was now in danger of

being cut off from Bloemfontein, abandoned his position at Magersfontein, and retreated rapidly to the northeast. He was pursued by the British cavalry and mounted infantry, and from the 16th to the 18th carried on a fierce rear-guard fight. On the 19th he was finally brought to a standstill at Paardeberg, on the Modder River. There the Boers intrenched themselves in the bed of the stream. From the 19th to the 27th the Boer position was bombarded by the British artillery, and Cronje's men found shelter largely by burrowing into the banks of the river. The British lines were finally advanced within eighty yards of the Boer position, and on the morning of the 27th Cronje surrendered with 4000 men and six guns. The British advance on Bloemfontein was quickly begun, the cavalry and mounted infantry operating in advance and on the wings, the infantry holding the centre. On the flat level of the veldt the British superiority in numbers was decisive, and the Boers could make no effective stand. On March 7th they offered battle at Poplar Grove, some 60 miles west of Bloemfontein, but were outflanked and driven from behind their intrenchments. On March 10th a hard fight occurred at Driefontein, about 30 miles from Bloemfontein. On March 13th Roberts entered the capital, President Steyn having fled on the preceding day to Kroonstadt. For more than a month and a half Lord Roberts remained at Bloemfontein before resuming the advance upon Pretoria, the chief reason being the lack of horses for the mounted troops. The Boers for a time made no attempt at any demonstration in force, but contented themselves with carrying on an active guerrilla warfare which inflicted considerable loss on the British. On May 1st the British began the advance on Pretoria. On May 12th they entered Kroonstadt after encountering the Boers under General Louis Botha on the Vet River May 5th, and on the Zand River on the 10th. From Kroonstadt the British army advanced in the form of a crescent forty miles across, driving the Boer forces before them. The Vaal River was crossed between the 24th and 27th of May, Johannesburg was entered on May 31st, and on June 5th Pretoria was occupied. President Kruger fled to Machadodorp, while General Botha with about eight thousand men took up a strong position fifteen miles east of the capital. On June 11th-12th he was attacked by the British advance guard and slowly driven back. On July 23d Lord Roberts set out from Pretoria for the final campaign.

In Natal, meanwhile, General Buller, on February 5th, had made a third attempt to cross the Tugela and to break through the Boer lines. He failed, and on the 7th was driven back across the river. On the 14th the fourth and final dash for Ladysmith was begun. The Boer positions at Horsar Hill, Cingolo, Monte Cristo, Hlongwane, and Colenso were taken between the 14th and the 20th; the Tugela was crossed on the 21st; Peter's Hill, the key of the enemy's position, was taken on the 27th; and on the following day the British cavalry entered Ladysmith. General Buller's forces advanced northward into the Transvaal, where they coöperated with Lord Roberts in the final campaign. On May 18th Mafeking, the last of the three towns invested by the Boers at the outbreak of the war, was relieved.

In the Eastern Transvaal the main Boer force under General Botha was rapidly driven into the mountains bordering on the Portuguese frontier. The Boers made a desperate stand at Bergendal, August 27th, but were driven from their position by General Buller. At Spitzkop, southeast of Lydenberg, General Botha fought the last set battle of the war on September 8th. The Boers were defeated, and the greater part of them, about 3000 in number, crossed into Portuguese territory on September 14th and surrendered to the authorities there. On October 19th President Kruger sailed for Holland from Lourenço Marques on a Dutch man-of-war.

From this time until the termination of the war in May, 1902, the struggle on the part of the Boers took on the form of a desperate resistance waged by the guerrilla bands against immensely superior forces and inevitable defeat. It was the task of the British under Lord Kitchener, who succeeded Lord Roberts in the command of the British forces, November 29, 1900, to pacify the country they had overrun, and for this purpose was employed a plan of campaign adapted to the conditions under which the conflict was now to be fought out. Flying columns traversed the Orange Free State and the Western Transvaal in an effort to hunt down the Boer commandos, which, under leaders like Christian De Wet and Jacob Hendrik De la Rey (qq.v.), displayed sufficient ability to cause the British forces much annoyance, if not actual harm. De Wet especially, evinced splendid talents as a partisan leader, and his astonishing rapidity of movement, boldness in attack, and marvelous good fortune in eluding capture served to make the end of the South African War dramatic.

The activity of the Boers was limited to the repeated capture of isolated outposts or of comparatively small detachments of the enemy, whom, however, they were invariably compelled to release for absolute lack of facilities to keep them captive. At times, indeed, the danger of a rising among the Dutch inhabitants of Cape Colony seemed imminent, as when a number of Boer commandos entered Cape Colony in the winter of 1900-01, and threw the inhabitants of Cape Town into alarm, but probably the leading motive that actuated the Boer leaders in continuing their resistance was the hope of foreign intervention as the result of some untoward event. To a less degree they may have depended on the strong sentiment of opposition to the war which prevailed among a large portion of the English people. The struggle ultimately resolved itself into a campaign of so-called 'attrition' on the part of the English, a process, that is, of steadily weeding out the enemy by the unceasing pursuit and capture of one Boer commander after another. The task of the British was made more difficult by the active assistance rendered the Boers by the non-belligerent population, and because of this concentration camps were established in the Transvaal, Cape Colony, and the Orange River Colony, into which were gathered all Boer non-combatants, as well as those British loyalists who desired the protection of the authorities. The high rate of mortality that prevailed among the children in the concentration camps aroused bitter criticism of British methods in the foreign press.

The uselessness of protracting the struggle was recognized by a number of the Boer leaders be-

fore the beginning of 1902, and negotiations for peace were begun in January of that year. The British Government declined to take into consideration the question of the independence of the Boer States, and the articles of peace as signed at Pretoria on May 30th were substantially those offered by the Government in 1901. By the terms of the treaty the Boers in the field agreed to lay down their arms and to acknowledge Edward VII. as their lawful sovereign, on condition that no burgher should be deprived of his liberty or property, or be subjected to civil or criminal proceedings, for acts committed during the war. It was provided that the Dutch language be taught in the public schools and the use of it permitted in the courts. Military administration in the colony was to be succeeded by civil rule at the earliest opportunity, to be followed by the ultimate establishment of representative government. No special tax was to be imposed on landed property to defray the expenses of the war. The number of Boers who surrendered after the conclusion of peace was more than 20,000.

Figures issued by the War Office showed that the English forces engaged in South Africa during the war numbered nearly 450,000, of which number 9940 were in South Africa on August 1, 1899. The reinforcements after that date dispatched to South Africa from Great Britain included nearly 247,000 regular troops and 110,000 volunteers, militia and yeomanry. The number of volunteers from the British colonies was nearly 31,000, and more than 52,000 men were raised in South Africa. The casualties, as given by the War Office, were 1072 officers and 20,973 men dead or missing, and 3116 officers and 72,514 men sent home as invalids. The cost of the war in money was placed by the authorities at £206,224,000. The Boer enlistment from first to last, according to estimates made by the Red Cross Society, did not exceed 75,000. Their casualties were placed at 3700 killed or dead of wounds, and 32,000 prisoners.

SOUTH AMBOY. A borough in Middlesex County, N. J., on the Raritan River and Bay, directly opposite Perth Amboy, and on the Pennsylvania, the Central of New Jersey, and the Raritan River railroads (Map: New Jersey, D 3). A long drawbridge connects it with Perth Amboy. The borough is important as the centre of a region containing large quantities of sand and clay. Pottery, terra-cotta, asphaltum, and brick are the most important manufactures. Coal is extensively shipped from this port by the Pennsylvania Railroad. The government is vested in a mayor, elected biennially, and a unicameral council. South Amboy was incorporated in 1898. Population, in 1890, 4330; in 1900, 6349.

SOUTH AMERICA. See AMERICA.

SOUTHAMPTON, sŭth-hămp'ton. A civic county, municipal and Parliamentary borough, and seaport, in the south of Hampshire, England, 79 miles southwest of London (Map: England, E 6). The town occupies a peninsula at the head of Southampton Water, between the estuary of the Test or Anton on the west and south and the mouth of the Itchen on the east.

The Domus Dei, or God's house, dates from the end of the twelfth century, and is one of the oldest hospitals in England. In the vicinity are the picturesque ruins of Netley Abbey, a Cistercian foundation of the thirteenth century, and the Netley Military Hospital, accommodating 1,000 patients. Southampton was incorporated by Henry I., and received several privileges confirmed by subsequent monarchs. Henry VI. constituted the town a county in itself, and its area included a 'little' place called Portsmouth. The guild merchants controlled affairs and the municipal transactions are recorded in the famous 'oak book,' the most treasured object in the town archives. The Mayor is Admiral of the Port and chairman of the town council's twenty committees. The town has owned its markets since its incorporation, and the water supply since 1420, and its slaughter houses since 1698. It receives a fine revenue from corporate property and harbor dues, and owns Southampton Common, 300 acres in extent. The borough's boundaries were extended in 1895, since when much economic progress has been made. Artisans' dwellings and a municipal lodging house have been built, sewage and draining works carried out, and an electric lighting plant and street railways acquired. The town maintains a large isolation hospital, fine public baths, a free public library, a cemetery, and extensive parks, and makes abundant provision for technical instruction.

Yacht and ship building and engine-making are actively carried on, and there is an extensive general trade. Southampton is a fashionable summer resort. It owes its importance to its sheltered harbor and to the phenomenon of double tides, which prolong high water for three hours. (See ENGLISH CHANNEL.) There is considerable traffic between Southampton and the Channel Islands and French coast, and also a

large cattle trade with Spain and Portugal. Its docks include five large dry docks, two tidal basins (16 and 18 acres in area), and a closed dock. An average of 11,500 vessels enter, and clear a gross tonnage of 5,441,000 annually.

Southampton supplanted the ancient *Clausentum*, which stood one mile to the northeast, and its foundation is ascribed to the Anglo-Saxons. A great part of it was burned by the combined French, Spanish, and Genoese fleets in 1338, and in the following year its defenses were strengthened. Population, in 1901, 105,000. Consult Davis, *History of Southampton* (Southampton, 1883).

SOUTHAMPTON. Another name for the English county of Hampshire (q.v.).

SOUTHAMPTON, HENRY WRIOTHESLEY, third Earl of (1573-1624). An English statesman and the patron of Shakespeare. He was born at Cowdray House, near Midhurst, was educated at Saint John's College, Cambridge, and studied law at Gray's Inn. He was early attached to Queen Elizabeth's suite, and received the dedications of various poets, including Shakespeare, who in 1593 addressed to him *Venus and Adonis* and the following year *The Rape of Lucrece*. Southampton is also supposed by some to be the anonymous patron of Shakespeare's *Sonnets*. He was a friend of the Earl of Essex, whom he accompanied in the expedition to Cadiz and afterwards to Ireland. He took part in Essex's insurrection and was attainted and condemned to death. Elizabeth commuted the sentence to imprisonment for life, and the penalty was reversed by Parliament early in the reign of James I. In 1605 he became active in the colonization of America, and was Governor of the Virginia Company from 1620 until its dissolution in 1624. In 1621 he was imprisoned in the Tower for opposing the arbitrary measures of Charles I. After his release he commanded a regiment for the Dutch against the Spanish, and both he and his son died of fever contracted in the Netherlands.

SOUTHAMPTON INSURRECTION. See TURNER, NAT.

SOUTHARD, sŭth'ĕrd, SAMUEL LEWIS (1787-1842). An American legislator and Cabinet officer, born at Basking Ridge, N. J. He graduated at Princeton in 1804, and was admitted to the bar in 1809. In 1811 he settled in Flemington, N. J. From 1814 to 1819 he was a justice of the Supreme Court of New Jersey, and in 1821 was elected to the United States Senate. In that body he was in 1821 a member of the joint committee on the Missouri Compromise. In 1823 he resigned to become Secretary of the Navy, and he held this position throughout J. Q. Adams's administration. In 1830 he was elected Attorney-General of New Jersey and in 1832 Governor. From 1833 until soon before his death, he was again a member of the United States Senate. He attained high rank in the Senate, and was looked upon as one of the most influential Whig leaders in the nation. In the 27th Congress (1841-43) until his resignation he was president *pro tempore*, and he presided over the body after the death of William Henry Harrison had called Vice-President Tyler to the Presidential chair. He published *Reports of the Supreme Court of New Jersey 1816-20* (1820); *Centennial Address* (1832); and *Discourse on William Wirt* (1834).

SOUTH AUSTRALIA. A State of the Commonwealth of Australia occupying the central part of the continent, and bounded on the north by the Timor and Arafura Seas, east by Queensland, New South Wales, and Victoria, south by the Indian Ocean (Great Australian Bight), and west by Western Australia (Map: Australia, F 5). It crosses the continent from the north to the south coast in a band for the most part 550 to 700 miles wide, with a length of 1850 miles. Its area is 903,690 square miles. It is divided into South Australia proper and the Northern Territory, the latter having an area of 523,620 square miles.

PHYSICAL FEATURES. The State has no sharply differentiated geographical divisions. It is, as a whole, a vast plain of no great elevation, in some places lying even at or below sea-level. A mountain range but slightly exceeding 3000 feet in its highest summits runs north from Cape Jervis, near Adelaide, and minor ranges or isolated hills are found in the interior and northern portions, becoming quite rugged, though not high, in the extreme north. The State has practically no drainage system. The Murray enters the southeastern corner, but from its mouth in Encounter Bay to the western boundary not a single river reaches the ocean. In the interior there are a number of river courses, which are dry for a great part of the year, and even in the wet season are lost in marshes or salt lakes. The extreme northern portion, however, is comparatively well watered. In the great depression north of Spencer Gulf there are a number of large lakes, several of them being 100 miles in length. They are brackish and shallow, being reduced during the dry season to marshes or mud-flats covered with salt crusts.

CLIMATE, SOIL, AND FLORA. Considering the fact that the State has a range of nearly 27 degrees of latitude, its climate is remarkably uniform. It is in general very hot and dry; the temperature even on the south coast may remain at 110° or 115° for several days at a time. The annual rainfall in the southeast, at Adelaide, is about 24 inches, but may in some years fall to 15 inches. In the interior it is always very scanty, but on the north coast it is more abundant, sometimes reaching 60 to 70 inches. Rain is generally confined to the winter, which is mild and pleasant. There are considerable areas of good agricultural and pastural land in the south. The interior consists largely of treeless plains, in some parts absolutely barren, stony or sandy, or covered with a dry scrub, but here and there producing good pasture grass during the wet season. Large areas are covered with spiny grass unfit for pasture. Trees are found only near the mountains or larger river courses, but the hilly region east of the southern range is well timbered. The flora is not so rich as that of the eastern States. The main timber trees are Eucalyptus and Acacia, with some pines, while Pandanus and palms are found in the north.

GEOLOGY. The greater part of the surface is covered with recent formations, Cretaceous in the east, but in the main Tertiary. There are, however, numerous outcrops and some extensive areas of ancient rocks. Thus the mountain region from Spencer Gulf northward consists mainly of Silurian strata. Granite crops out in numerous places in the mountains of the interior, and the extreme northern portion, between the Roper and

Victoria rivers, is a complex of granites and metamorphic and Paleozoic rocks, with numerous intrusions of trap and recent volcanic rocks. The Paleozoic limestones are very rich in copper, and argentiferous lead, bismuth, and gold are also found. Iron exists in large quantities, but it cannot be worked, as there are no coal beds.

MINING. Copper is the chief mineral mined, the average annual output being a little less than 100,000 hundredweight between 1894 and 1900 and the value in the latter year £371,920.

AGRICULTURE. South Australia ranks second among the Commonwealth States in acreage under cultivation. It amounted in 1900-01 to 3,279,406 acres. Of this, 1,913,247 acres were under wheat, the chief source of wealth. In the same year there were 15,352 acres of barley, 27,988 of oats, 341,330 of hay, 35,323 of green fodder, 6628 of potatoes, and 31,841 of minor crops, including fruits. Vine cultivation is a prosperous industry, the area having increased from 12,314 acres in 1891 to 20,158 in 1901, the wine production in the latter year amounting to 1,388,847 gallons. The small rainfall confines farming mainly to the southeastern part of the State. The disposal of the public land by perpetual lease has become common. The State has adopted the policy of repurchasing large estates and leasing them to farmers. Some progress has been made in irrigation, the water being drawn from both rivers and artesian wells. The number of sheep declined from about 7,000,000 in 1890 to 5,283,247 in 1901. Cattle increased during that period, being 472,428 in 1901. In that year there were 179,352 horses.

MANUFACTURES. In 1901 there were 17,513 persons employed in 1047 factories. The manufacturing industry is confined mainly to production for local consumption, or of food products, especially flour, for export.

COMMERCE. Almost from the beginning railroads were constructed and operated by the Government, and in 1901 all but 14 miles of the 1916 total mileage belonged to the State. The greater part of this was in the southeast, only 166 miles being in the Northern Territory. The Government realizes a profit of about 3 per cent. upon its railways. The imports and exports are of about equal value and have each amounted for more than a decade to about eight million pounds sterling in annual value. Adelaide, the chief port, ranks third among the Australian ports. Less than half the exports are of domestic produce. The most valuable export is wool, after which rank wheat and flour, and minerals. The other Australian States and the United Kingdom handle nearly all the trade.

GOVERNMENT. The Governor is appointed by the British Government. The Executive Council is composed of six members. The Legislature consists of a Legislative Council of 18 elected members and a House of Assembly of 42 elected members. The State has extended the right of suffrage to women. The Northern Territory is administered by a commissioner delegated by the State. Adelaide (q.v.) is the capital.

FINANCE. There is a progressive land and income tax. The tax levy is increased upon land held by absentees. The State also collects death duties and stamp duties. The total revenue in 1902 was £2,667,560, and the expenditure £2,650,876. The customs revenue for the fiscal year 1901-02 was £605,000. The public debt in 1902 amounted to £27,272,545, the bulk of which is represented by assets of productive public utilities.

STATE ACTIVITIES. The Government has been very progressive with enterprises that are generally left to private initiative. The telegraph and telephone lines, including the transcontinental line from Adelaide to Port Darwin, the postal system, and water works are owned and operated by the Government. The State has tried to foster industries by the establishment of produce depots, and by performing the function of agent in the marketing of produce; and also by the establishment of cyanide works and smelters. A State bank supplies capital to farmers on easy terms. Laws have been passed to secure the compulsory settlement of industrial disputes.

POPULATION. The population increased from 14,600 in 1840 to 319,145 in 1890 and 362,604 in 1901. The majority are in the southeastern part of the State. Only 4096 persons were reported in the last census for the Northern Territory. Nearly the whole population is of British origin. In 1901 Adelaide and its suburbs had about 162,200 inhabitants and Port Pirie 7983.

RELIGION. In 1901 the membership of the principal churches was: Church of England, 106,987; Roman Catholic, 52,193; Methodist, 90,125; Lutheran, 26,140; Baptist, 21,764; Presbyterian, 18,357; and Congregationalist, 13,338.

EDUCATION. Primary education is free, and is compulsory between the ages of 7 and 13. Religious instruction may be given, but not during ordinary school hours. In 1901 there were 69,115 scholars enrolled in the State schools. There is a secondary school for girls at Adelaide, and fees are charged. All other secondary schools are private or denominational. In 1901 there were 11,310 scholars enrolled in private schools. The University of Adelaide and a number of technical schools are aided by the State.

HISTORY. The explorations of Flinders in 1802 and of Sturt in 1830 first called attention to South Australia. Its real settlement was due to an association formed to put into operation the colonization theories of Edward G. Wakefield (q.v.); but its early application for a charter, in 1831, was rejected, and it was not until 1835 that permission was given for the formation of the province on condition that no expense should attach to the home Government. A year later settlers landed and founded the town of Adelaide. South Australia became a crown colony in 1841. The early basis for the prosperity of South Australia was agricultural, though in 1841 galena deposits were discovered and in 1842 copper. The population was 19,000 in 1844 and 92,500 ten years later, and the exports increased from £100,000 to £1,300,000 during the same period. The Torrens land system was adopted in 1858. A separate colonial constitution dates from 1856, the year of the opening of the first railway from Adelaide to its port. The explorations of Eyre in 1840 opened up the cattle region of the interior, and those of Stewart in 1859-62 the way to the Indian Ocean. The Northern Territory was annexed in 1863. The telegraph line, opened in 1872, followed substantially the line of Stewart's explorations and gave Australia cable communication with the rest of the world.

Brown, *A Record of the Mines of South Australia* (Adelaide, 1899); Gill, *Bibliography of South Australia* (ib., 1888).

SOUTH BEND. The county-seat of Saint Joseph County, Ind., 86 miles east by south of Chicago, Ill.; on the Saint Joseph River, and on the Lake Shore and Michigan Southern, the Chicago and Grand Trunk, the Indiana, Illinois and Iowa, the Terre Haute and Indiana, and other railroads (Map: Indiana, C 1). Notre Dame, two miles north of the city, is the seat of the University of Notre Dame (q.v.), a Roman Catholic institution opened in 1842, and of Saint Mary's Academy. Saint Joseph's Academy is within the city limits. Noteworthy are the court house, city hall, Oliver Hotel, Epwerp Hospital, Saint Joseph's Hospital, and the Northern Indiana Medical and Surgical Institute. South Bend is the centre of a rich farming section, and is an important industrial city. In the census year 1900 its various industries had an invested capital of $18,156,638 and an output valued at $14,-236,331. The Studebaker Wagon Works and the Oliver Plow Works are among the most noted concerns of their kind in the world. There are lumber and flouring mills, foundries and machine shops, wood-turning plants, and manufactories of shirts, sewing machines, agricultural implements, toys, patent medicines, woolens, and paper and wood pulp. The government is vested in a mayor chosen every two years and a unicameral council, and in administrative officials nearly all of whom are appointed by the mayor. The city spends annually for maintenance and operation about $306,000. The water works, which represent an expenditure of $457,974, are owned by the municipality. Population, in 1890, 21,-819; in 1900, 35,999.

The site of South Bend was occupied by the Miami and Potawatami Indians and was a favorite resting place for French traders and explorers. In 1824 Alexis Coquillard established a trading post here; in 1831 a town was laid out, which in 1835 was incorporated; and in 1865 South Bend was chartered as a city.

SOUTH BETH'LEHEM. A borough in Northampton County, Pa., 56 miles north by west of Philadelphia; on the Lehigh River, opposite Bethlehem, and on the Lehigh Valley and the Philadelphia and Reading railroads (Map: Pennsylvania, F 3). Lehigh University (q.v.), a non-sectarian institution opened in 1866, occupies a site overlooking the borough. Noteworthy are the Bishop Thorp Seminary for Girls and Saint Luke's Hospital. South Bethlehem is known for its iron and steel manufactures. The total capital invested in the various industries in the census year 1900 was $8,713,185, and the value of their output was $10,964,911. There are the large establishment of the Bethlehem Iron Company, and brass works, zinc works, and manufactories of silk, knit goods, brick, etc. Population, in 1890, 10,302; in 1900, 13,241.

SOUTH'BRIDGE. A town, including two villages, in Worcester County, Mass., 20 miles south by west of Worcester; on the Quinebaug River, and on the New York, New Haven and Hartford Railroad (Map: Massachusetts, C 3). It has manufactories of spectacles and eyeglasses, shuttles and shuttle-irons, knives, and cotton and woolen goods. The government is administered by town meetings. Population, in 1890, 7665; in 1900, 10,025. Originally a part of Charlton and popularly called 'Honest Town,' Southbridge became a parish in 1801 and was incorporated as a town, under its present name, in 1816. Consult Davis, *A Historical Sketch of Sturbridge and Southbridge* (Brookfield, 1856).

SOUTH CAR'OLI'NA (popularly called the 'Palmetto State'). A South Atlantic State of the United States. It lies between latitudes 32° 4′ and 35° 19′ N., and between longitudes 78° 28′ and 83° 18′ W., and is bounded on the north by North Carolina, on the southeast by the Atlantic Ocean, and on the southwest by Georgia. It is triangular in shape, with a base measuring 190 miles in a straight line fronting the ocean, and an apex 240 miles inland. Its area is 30,570 square miles, of which 30,170 square miles, or 19,308,800 acres, are land surface. It ranks thirty-sixth in size among the States.

TOPOGRAPHY. South Carolina is divided about equally between the coastal and Piedmont plains, the line of division running nearly parallel with the coast and presenting an abrupt transition between the distinctive features of the two regions. The coast presents first a continuous firm, sandy beach from the northern boundary to Winyah Bay. South of that point it becomes more and more broken by inlets and estuaries, and is fringed with sandy islands (the Sea Islands), inclosing irregular lagoons lined with salt marshes. The coastal plain, extending 100 miles inland, is low, being everywhere less than 500 feet above the sea, and consists in general of a light sandy soil. Large areas are swampy, and pine forests predominate. Along its western margin runs a particularly sandy belt known as the Sand Hills or Pine Barrens, consisting of loose sand dunes partly covered with pine forests. To the west of this belt the land rises abruptly to the upland or Piedmont Plain, which rises gradually from an altitude of 500 feet at its eastern margin to 1000 feet in the extreme northwest. Here the Blue Ridge, whose crest forms the northwestern boundary, rises abruptly 2000 feet higher, Mount Pinnacle, the highest point in the State, being 3436 feet.

HYDROGRAPHY. Several large rivers traverse the State from northwest to southeast, all the larger ones rising in the mountains of North Carolina. They are the Great Pedee, which, with the Little Pedee and the Lynches, flows into Winyah Bay in the north; the Santee, formed by the Wateree and the Congaree, traversing the centre; and the Savannah, marking the entire boundary between South Carolina and Georgia. The rivers cross the upland or Piedmont Plain as rapid and turbid streams; they generally have falls or rapids as they descend from the hard upland rock over the 'fall line' into the alluvial coastal plain. In the latter they become clear and sluggish, frequently overflowing wide areas. The larger rivers are navigable for steamers to the 'fall line,' and at the line they furnish considerable water-power.

CLIMATE. The climate is mild, resembling

that of Southern Europe. It is especially healthful in the uplands and pine barrens, but unhealthful in the low swamp regions. The mean annual temperature for the State is 61°; the mean for January is 44.6°, and for July 79.5°. The maximum is about 106°, and a temperature of 1° was observed in the northwestern highlands in 1900. Snow in measurable amounts generally does not fall on more than two or three days in a year, except in the mountains, where there is a considerable snowfall. The average annual rainfall is 47 inches, fairly evenly distributed both as to localities and seasons, though there is a maximum in summer and a minimum in autumn. Hurricanes visit the coast occasionally, and sometimes do considerable damage. In 1886 the State suffered from a severe earthquake which caused great destruction at Charleston.

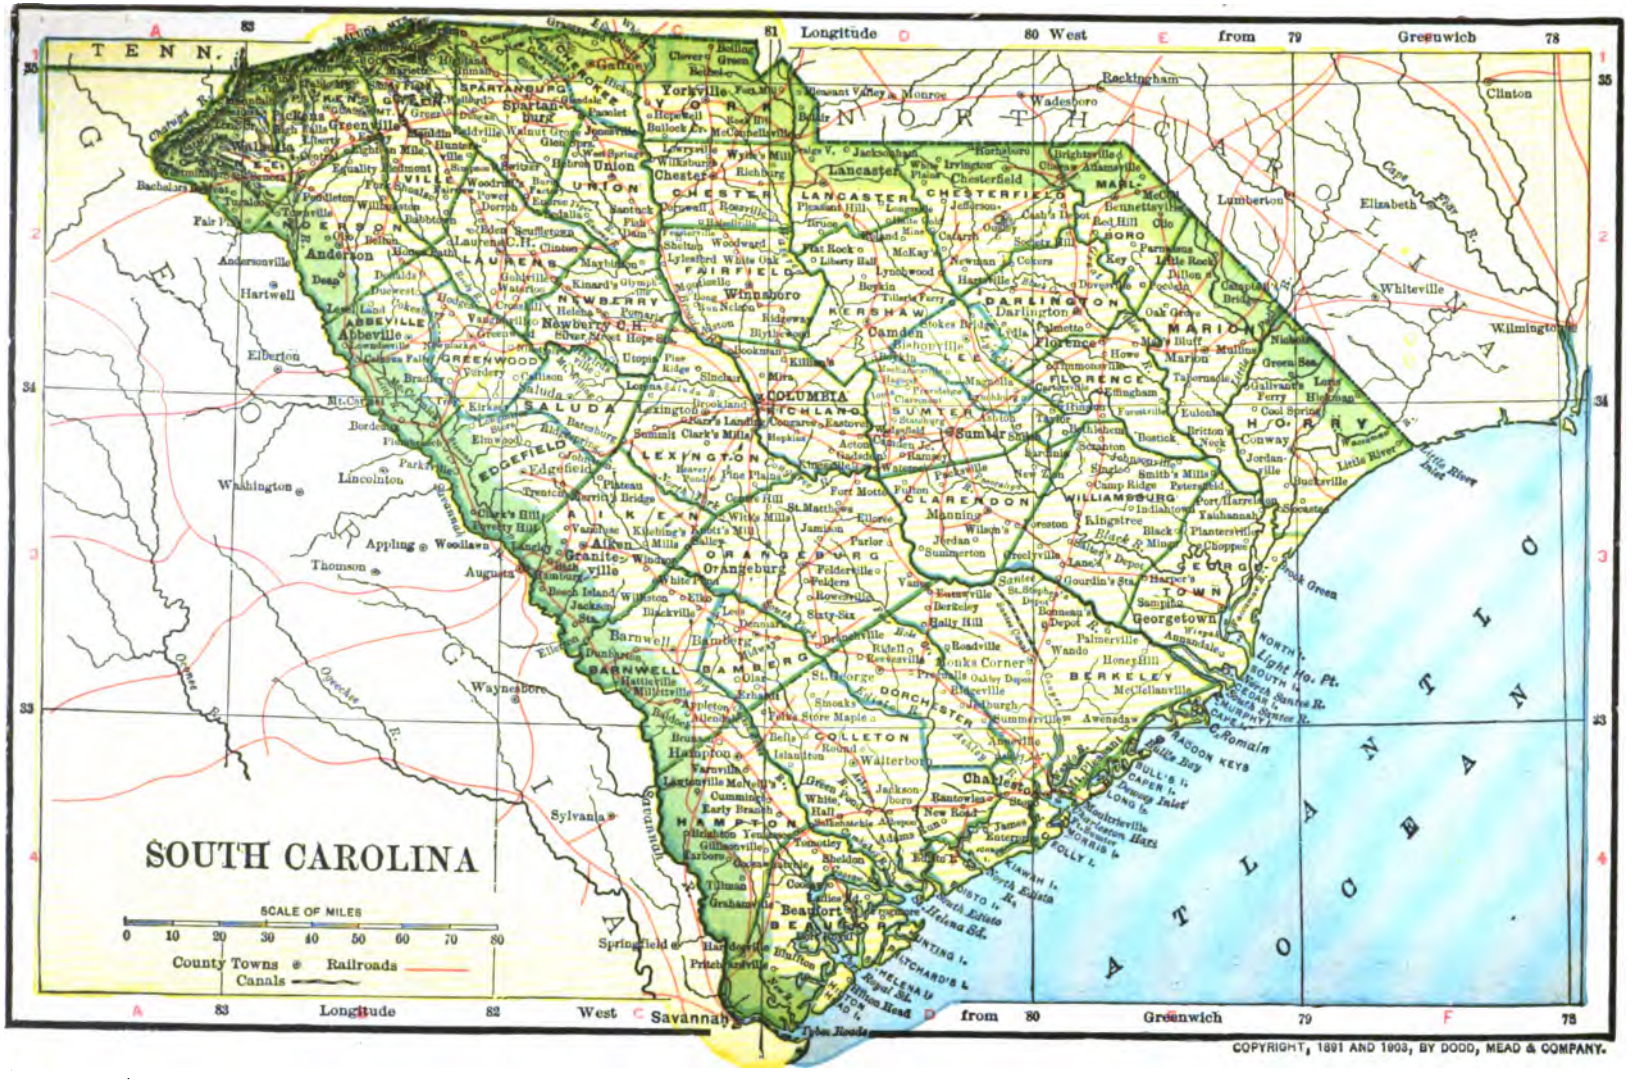
FLORA. The coast islands present a distinct semi-tropical aspect, the palmetto, live oak, and magnolia being here the characteristic plants. In the coastal plain the long-leaf pine is the predominating species in the great forests, covering the sandy regions, while the cypress grows in the swamp lands. In the upper pine belt, except in the sand hills, oaks and hickories begin to appear, and these, together with elms, maples, chestnuts, and other deciduous trees common to the Northern States, predominate in the upland. The persimmon, locust, and plane tree grow in this State. Wild grapes are abundant, as well as strawberries and fruit shrubs and trees common to the Eastern States.

For FAUNA, see paragraph under UNITED STATES.

GEOLOGY AND MINING. South Carolina is nearly equally divided between the most ancient and the most recent of geological systems, the division corresponding to the topographical division into the Piedmont and coastal plains. The western half or Piedmont Plain belongs to the great Archæan belt, which flanks the eastern slope of the Appalachians. Granite predominates here, with gneiss and mica-slate in the higher regions. The eastern half belongs to the coastal plain formation, consisting of unindurated Tertiary and recent sands and clays. The granite industry is the most important of the mining industries, the output having increased rapidly from $37,820 in 1897 to $996,084 in 1901, the production in the latter year having been exceeded in only four States. Limestones are also quarried, but the mineral next in importance is rock phosphate, used as an artificial fertilizer, in the production of which the State ranked first until 1894, when larger beds were exploited in Florida. The product in 1893 was 502,564 long tons, valued at $2,157,014; in 1901 it had decreased to 321,181 tons, with a value of $961,840. Clay products rank next in value. Gold and silver are mined in small quantities, and the iron ores, though existing in considerable quantities, are but little worked.

FISHERIES. In 1897 there were 2139 persons engaged in the fisheries, of whom 1865 were employed on inshore or boat fisheries. The figures for the yield for that year were $210,456. The most valuable species are oysters, whiting, shad, and sea-bass.

AGRICULTURE. In 1900, 72.4 per cent. of the land area was included in farms, and of this 41.3 per cent. (5,775,741 acres) was improved—a large increase over all earlier years. The average size of farms in 1900 (90 acres) was only one-sixth as large as the average size in 1850. In 1900, 36.7 per cent. of the farms were let for cash rent, and 24.3 per cent. share rent. Considerably over half of the farms are operated by negroes, and only 18.2 per cent. of these properties are owned by them. In probably no State is the cotton crop so predominant as in South Carolina. In area it annually exceeds every other crop and is several times as important as any other crop with respect to value. The acreage in 1900 was larger than for any other census year, as was also the number of bales produced (881,422), the crop being nearly three times as great as in 1850. Of the total area of cotton, 23,902 acres were in the sea-island variety.



Corn, the second crop in importance, made large gains in the decade 1890-1900. During that period there was also a revival in wheat culture and a decrease in the cultivation of oats, but neither crop is of great importance. Rice is the only other cereal worthy of mention. It has been grown in South Carolina since 1700, and the State took first rank in its cultivation until 1861. The increasing destructiveness of the freshets since the deforestation of the mountain slopes has greatly hampered the growth of the industry. However, in the decade 1890-1900 it almost regained the ground which it had lost in the preceding ten years. The State is now exceeded by Louisiana alone in rice production. The acreage in hay increased 264.3 per cent. in the decade 1890-1900. Considerable attention is given to the raising of peas, and tobacco and sweet potatoes are products of some importance. The area devoted to tobacco in 1900 was 65 times as great as in 1890. The following table shows the acreage of the leading crops:

CROPS	1900	1890
Cotton	2,074,081	1,987,469
Corn	1,772,057	1,345,990
Oats	222,544	308,056
Wheat	174,245	115,510
Rice	77,657	42,238
Dry peas	143,070	.....
Hay and forage	106,124	29,132
Sweet potatoes	48,831	46,086
Tobacco	25,993	394

STOCK-RAISING. In 1890-1900 there was a large increase in the number of all kinds of domestic animals except sheep. There is a smaller number of all varieties of live stock (except mules) than in 1850—less than half as many cattle and less than one-fifth as many sheep. The following table shows the number of domestic animals on farms:

ANIMALS	1900	1890
Dairy cows	126,684	107,184
Other cattle	216,214	161,109
Horses	78,419	59,888
Mules and asses	117,616	86,306
Sheep	52,436	79,421
Swine	618,995	494,696

MANUFACTURES. Prior to 1880 the manufacturing industry had been quite insignificant. Its growth has since been rapid. The total value of products increased 90.7 per cent. from 1880 to 1890, and 84 per cent. in the following decade, being estimated in 1900 at $58,748,731. The

NOTE.— Lee County (D 2), with Bishopville as county seat, has been established, since the census was taken in 1900, from parts of Sumter, Darlington, and Kershaw counties.

wage-earners engaged in manufactures in the latter year numbered 48,135 (3.6 per cent. of the total population), of whom 8,560 were children under 16 years of age. The State's abundant supply of raw materials, its excellent water-power, facilities for transportation, and low cost of living, are greatly to the advantage of the manufacturing industry. The recent development is confined largely to manufactures of cotton. Absolute increase in value of cotton products between 1890 and 1900 exceeded that in any other State, and gave South Carolina first rank among the Southern States and second in the Union. In 1900 the amount of cotton used by the local mills was considerably over half the total yield of the State. The manufacture of cottonseed oil and cake also made a marked gain in the decade 1890-1900. The State's supply of phosphate rock and cottonseed meal has given rise to the manufacture of fertilizers, and Charleston is the second largest manufacturing centre of this product in the country. Flour-milling scarcely meets the local demand.

The following table shows the figures for the leading industries:

INDUSTRIES	Year	Number of establishments	Average number wage-earners	Value of products, including custom work and repairing
Total for selected industries in the State	1900	1,640	39,066	$48,041,940
	1890	1,169	15,565	21,927,098
Increase, 1890 to 1900	.....	471	23,501	$26,114,842
Per cent. of increase	.....	40.3	151.0	119.1
Per cent. of total of all industries in the State	1900	43.6	81.2	81.8
	1890	49.1	68.4	68.7
Cotton goods	1900	80	30,201	29,723,919
	1890	34	8,071	9,800,798
Fertilizers	1900	22	1,772	4,882,506
	1890	20	1,102	4,417,658
Flouring and grist mill products	1900	556	281	2,347,790
	1890	512	630	2,083,126
Lumber and timber products	1900	729	4,585	5,207,184
	1890	352	2,590	2,146,750
Lumber, planing mill products	1900	53	490	1,016,328
	1890	27	370	711,838
Oil, cottonseed, and cake	1900	50	734	3,103,425
	1890	17	416	927,772
Rice, cleaning and polishing	1900	18	112	973,132
	1890	6	143	315,056
Turpentine and rosin	1900	132	886	787,656
	1890	201	2,243	1,524,100

FORESTS. It is estimated that the woodland covers 20,500 square miles, or 68 per cent. of the State's area. In the Piedmont region the hard woods predominate. South of this region lies an extensive belt of yellow pine. Cypress covers the low coast lands. Lumbering made little progress prior to the decade 1890-1900. The increase for that period is shown in the above table. The greater part of the timber cut is of the yellow-pine variety. The value of planing-mill products is increasing, but the manufacture of turpentine and rosin is decreasing in consequence of the exhaustion of the timber from which the product is obtained.

TRANSPORTATION AND COMMERCE. The coast waters and navigable rivers offer excellent advantages for water transportation. The Savannah River is navigable for 158 miles; the Santee, for its entire length; the Pedee, for 120 miles; the Congaree, nearly to the city of Columbia; and the Wateree, to Camden. Railroad mileage has increased from 973 miles in 1860 to 1427 in 1880, 2289 in 1890, and 2919 in 1900. The railroads are mostly owned or controlled by three large systems—the Southern, the Seaboard Air Line, and the Atlantic Coast Line. A considerable foreign trade, principally exports, passes through the port of Charleston, which ranks tenth among the Atlantic coast ports.

BANKS. The State Bank of South Carolina had an exceptionally successful career. It was established in 1812 to remedy the financial disturbances caused by the impending war with England. It was entirely under State control, and its president and directors were chosen by the Legislature. The capital was furnished by the State and the bank was the repository for all State funds. All State expenditures were paid through the medium of the bank. It was free to do a regular banking business, but its debts could not exceed twice the capital exclusive of deposits. Branch banks were established at Columbia, Camden, and Georgetown. The work of the bank is best illustrated by the official report of 1848, which showed that it had received and paid out State moneys to the amount of $28,000,000 without any loss. In 1852 its charter was renewed and it continued to do a most satisfactory business until 1870, when it was put in liquidation. The following table gives the State banking statistics as reported as to principal items in 1902:

	National banks	State and stock savings banks
Number	18	46
Capital	$2,048,000	$2,269,000
Surplus	691,000	451,000
Cash, etc	510,000	708,000
Loans	8,346,000	9,400,000
Deposits	5,810,000	9,828,000

GOVERNMENT. The Constitution now in force was ratified in convention December 4, 1895. Voters must have resided in the State two years, in the county one year, in the polling precinct four months, and must have paid all taxes collectible during the previous year. A residence

of only six months in the State, however, is required of ministers and of teachers in the public schools. Every elector must enroll once in ten years, but enrollment may be secured in any year for those not previously registered. It was required of those registering prior to January 1, 1898, that they should be able to read any section of the State Constitution or understand and explain it when read to them. Those applying for registration after that date must be able to read and write any section of the State Constitution or to show that they own and have paid all taxes collectible during the previous year on property in the State assessed at $300 or more. The capital is Columbia.

LEGISLATURE. There are 124 Representatives elected upon the basis of population from county districts every two years. Each county elects a Senator, who serves four years. Elections are held on the Tuesday after the first Monday in November of even years. Revenue bills must originate in the Lower House. Sessions of the Legislature are held annually.

EXECUTIVE. A Governor, Lieutenant-Governor, Secretary, Comptroller-General, Attorney-General, Treasurer, Adjutant and Inspector-General, and Superintendent of Education are elected for terms of two years each. The Lieutenant-Governor and president pro tem. of the Senate are in the line of succession to the Governorship in case of vacancy. The Governor is given the usual pardoning power and the authority to call extra sessions of the Legislature. The Governor's veto of a bill or of any item of an appropriation bill may be overridden by a two-thirds vote of each House. An act of the Legislature becomes a law if not returned within three days.

JUDICIAL. The Supreme Court consists of the Chief Justice and three associate justices, who are all elected by the General Assembly for terms of eight years. The State is divided into judicial circuits and for each a judge is elected by the General Assembly to serve for four years. There are two circuit courts, namely, a Court of Common Pleas and a Court of General Session. There is a Court of Probate at Charleston.

FINANCES. The debt of South Carolina at the outbreak of the Civil War amounted to but $3,814,862 and the State was on a firm financial basis. In 1867 the debt had increased to about $5,500,000. This debt was increased until in 1870 it reached $6,314,000. At this time there were also outstanding against the State bonds to the amount of $20,827,608 and a railroad debt of $6,787,608. The financial condition of this period is also shown by the fact that in 1872-73 appropriations aggregating $2,418,872 had been made, while the receipts from all sources were but $1,719,728. An act authorizing an annual tax sufficiently large to pay the interest on the State debt failed to have the desired effect. In 1880, however, it was enacted that holders of consolidated bonds, stock, or interest-bearing coupons which were due and unpaid before July 1, 1878, might exchange them for new bonds with interest at 6 per cent. and in every respect equal to the value of the bonds, stock, or interest coupons surrendered. This proved to be an efficient remedy, and the credit of the State was restored. In 1880 the public debt was $7,175,454 and in 1902 it had been reduced to $6,514,674. In the latter year the total receipts were $3,976,659 and the expenditures $3,783,605, which, together with the money on hand at the beginning of the year, left a total cash balance of $430,797.

STATE DISPENSARY. The State abolished the old saloon system for the sale of liquors and substituted in its place a State dispensary system. At the dispensaries sealed packages of liquor containing not less than one-half pint are sold, but cannot be opened at the dispensary. Profits accruing are divided between the State, county, and municipality. In 1902 the dispensaries sold liquors (exclusive of fresh beer) to the amount of $2,406,213, and purchased liquors to the amount of $1,664,870. The total net earnings were $566,898. Of this amount $443,198 was divided equally between towns and counties, and $142,755 was paid into the school fund.

MILITIA. In 1900 there were 236.767 men of militia age. The militia in 1901 numbered 3029.

POPULATION. The population increased from 249,073 in 1790 to 502,741 in 1820; 668,507 in 1850; 703,708 in 1860; 705,606 in 1870; 995,577 in 1880; 1,151,149 in 1890; and 1,340,316 in 1900. In the last year the State ranked twenty-fourth in population. There were 44.4 persons to the square mile. Only one other State in the Union had a smaller foreign-born population, this element numbering only 5528 in 1900. South Carolina ranks fourth in negro population, it having been increased from 688,934 in 1890 to 782,321 in 1900. The number of towns exceeding 4000 inhabitants increased from 4 in 1890 to 16 in 1900, constituting in the latter year 11.7 per cent. of the total population. In 1900 the largest cities were as follows: Charleston, 55,807; Columbia, 21,108; Greenville, 11,860; and Spartanburg, 11,395. South Carolina sends 7 members to the National House of Representatives.

RELIGION. The Methodist Church is the largest, followed closely by the Baptist. These two represent the bulk of the church membership of the State.

EDUCATION. South Carolina has a negro population greatly in excess of the white, and has consequently had to deal with most serious problems in the matter of providing adequate educational facilities. The considerable success attained is shown by the decrease in illiteracy. In 1900, 35.9 per cent. of the total population above ten years of age could not read, as against 55.4 per cent. in 1880. The percentage of illiteracy among the native whites is only 13.6, as compared with 52.8 for the colored population; but the colored illiteracy has been reduced from 78.5 per cent. in 1880. The length of the school term is short, but is becoming longer. In 1901 the average term for the white schools was 21.17 weeks, for the negro schools 14.12 weeks. No compulsory attendance law has been passed. The State Governor appoints the State Board of Education. This board appoints the county boards, and the latter in turn appoint the trustees in the small districts. Educational progress is seriously handicapped by a lack of financial support and the resulting inadequacy of teachers' wages. In 1901 white teachers received an average annual wage of $188.91 and the negro teachers $80.30. The new Constitution increased the State school tax from two to three mills, and in the school year 1900-01 the receipts from this source amounted to $520,294. In 1900-01 the expendi-

ture for white schools was $726,825 and for negro schools $211,287. Any school district may levy special taxes for schools, but only a small number have availed themselves of this privilege. In 1900 there were 281,891 pupils enrolled and 201,295 in average attendance. There were 2422 male and 3142 female teachers. Normal school education for females is provided by the State at the Winthrop Normal and Industrial College at Rock Hill. The State provides higher education for both sexes at the South Carolina College (q.v.), located at Columbia. There are also a number of small denominational and coeducational colleges. Of the nine colleges and seminaries for females Converse College, a non-sectarian institution at Spartanburg, is the largest. The State has an agricultural college at Clemson College, at which also courses in civil, electrical, mechanical, and textile engineering are given.

CHARITABLE AND PENAL INSTITUTIONS. The State Hospital for the Insane and the State Penitentiary are at Columbia, and the State Institution for the Deaf and Blind at Cedarspring, near Spartanburg. The State maintains convict farms.

HISTORY. In 1562 Jean Ribaut (q.v.), acting for Admiral Coligny, attempted to form a colony of French Huguenots at Port Royal. The colony, however, was abandoned the next year, and other attempts were made farther south. Charles I. granted in 1630 to Sir Robert Heath all the territory between 31° and 36° extending from sea to sea. No settlement was made, and in 1663 Charles II. granted the same to eight Lords Proprietors, favorites at Court. In 1665 the limits were extended to 29° and 36° 30′. Full proprietary rights were given, but the Proprietors were to legislate "by and with the advice, assent, and approbation of the freemen." Permission to grant religious freedom was given, and subinfeudation was allowed. The terms to settlers were at first liberal, but in 1669 the attempt was made to put into effect the 'Fundamental Constitution' drawn by John Locke. (See NORTH CAROLINA.) An expedition consisting of 200 persons under William Sayle settled upon the Ashley River in 1670. A 'parliament' consisting of the five deputies of the Proprietors and twenty members elected by the freeholders was established in 1671. In 1680 the settlement was removed to the present site of Charleston. Immigration was rapid, and by 1700 the colony contained 5500 inhabitants.

The colony was turbulent from the beginning. It refused to adopt the Fundamental Constitutions, quarreled over the quit-rents, and in 1693 secured the right of initiative in legislation. In May, 1704, the Proprietors ordered the enforcement of the Test Act requiring conformity to the Church of England, but an appeal to the Whig House of Lords led to the annulment of the Test Act in the colony in 1706, though the Church was still established. The colony was divided into North and South Carolina in 1710. The Yemassee Indians, instigated by the Spanish at Saint Augustine, attacked the settlements in 1715, and the Proprietors refused to grant aid. When appeal was made to the Crown it was shown that no aid could be given unless the government was vested in the King. Numerous other grievances led to the assembling of a convention which assumed the powers of government, and James Moore (q.v.) was chosen to act as Governor until the King's pleasure was known. The Royal Governor, Sir Francis Nicholson, arrived in 1721 and in 1729 the Crown purchased the proprietary rights. From this time the assembly never relinquished a single right it gained, and before the Revolution claimed all the rights and privileges of the British Parliament. The first printing press was set up in 1730, and the *South Carolina Gazette* was established two years later. The colony joined Oglethorpe's unsuccessful expedition against the Spaniards in 1740, and was occupied with Indian troubles in 1755, 1760, and 1765. The Cherokees ceded their lands in 1755, and the Scotch-Irish began to fill them up. The colony was prompt in its resistance to the Stamp Act, and troops were quartered in Charleston. It agreed to the non-importation agreement in 1769-70, and sent money and supplies to Boston in 1774. Delegates were sent to the Continental Congress in 1774 and the Provincial Congress met January 11, 1775. At the second session in June, 1775, troops were voted, and Lord William Campbell tried in vain to restore royal authority. In March, 1776, sovereignty was claimed and a government was established. Fort Moultrie (q.v.) was unsuccessfully attacked by the British June 28th. Several battles (among them Camden, King's Mountain, Cowpens, and Eutaw Springs) were fought during the Revolution within the State. Famous leaders of irregular bands of patriots were Sumter and Marion. Charleston was captured by the British in 1780, and held until 1782. The State adopted the Federal Constitution May 23, 1788, Columbia was made the capital in 1790, and a new constitution was adopted which gave the Legislature practically all power. The differences between the sections began to be apparent. The eastern part of the State had the wealth and was strongly Federalist. The western part had the population and was strongly Anti-Federalist. In 1808 a compromise was effected which lasted until 1868. By its terms the Lower House of the Legislature was to consist of 124 members, 62 to represent population and 62 wealth. Each district was given as many Representatives as it had sixty-seconds of population and wealth. With the adoption of this compromise State politics practically ceased.

The State early became dissatisfied with the tariff policy of the general Government, and as early as 1828 the 'South Carolina Exposition' was adopted by the Legislature. On the passage of the Clay Tariff Bill in 1832, a convention was called which declared, November 24th, that no duties should be collected after February 1, 1833. President Jackson was resolved to enforce the law, but an actual conflict was averted by a compromise. (See CALHOUN, JOHN C.; NULLIFICATION.) On the election of President Lincoln in 1860, a convention was called on December 20th, which unanimously passed an ordinance of secession. The attack on Fort Sumter in April, 1861, precipitated the Civil War. (See CIVIL WAR.) The State furnished 60,000 soldiers to the Confederate armies, though her voting population was only about 47,000. Charleston withstood the Federal attacks until February, 1865, when the Confederates were finally compelled to evacuate it. South Carolina suffered from Sherman's march northward. A provisional Governor was appointed at the close

of the war and a new constitution adopted. On the refusal of the State to ratify the Fourteenth Amendment, a military government was established. In 1868 another constitution allowing negro suffrage was adopted and the State was re-admitted June 25th. The next years were a carnival of official crime and corruption. Illiterate negroes and carpetbaggers filled the highest offices and the debt increased from $5,407,306 in 1868 to $20,333,901 in 1873. The campaign of 1876 was of unexampled bitterness. Intimidation and bloodshed were called into play. Both sides claimed the victory, and there were for a time rival State governments. When President Hayes withdrew the Federal troops from the State the Republican claimant, Governor Chamberlain, gave up the contest and Wade Hampton (q.v.) was recognized as Governor. Several of the State officers were tried on charges of malfeasance and sentenced to varying terms of imprisonment. Since this time, by various methods, the negro majority in the State has been kept powerless in all elections. A severe earthquake, of which Charleston seemed to be the centre, destroyed property valued at $5,000,000, August 31, 1886. In 1893 a great storm on the coast caused the loss of more than 1000 lives. The growth and development of the Farmers' Alliance led to the capture of the Democratic Party in 1890, when B. R. Tillman was elected Governor after a campaign of bitterness second only to that of 1876. In 1901-02 the South Carolina Interstate and West Indian Exposition was held at Charleston. In national elections the State has been always Democratic, except in 1792, when the Federalists secured the electors, and during the Reconstruction period, 1868-76, when the vote was given for the Republican candidates. See ELECTORAL COMMISSION.

GOVERNORS OF SOUTH CAROLINA

UNDER THE PROPRIETORS

Sir John Yeamans, Lieutenant-General and Gov.		1665
William Sayle		1669-70
Joseph West (acting)		1670-72
Sir John Yeamans		1672-74
Joseph West		1674-82
Joseph Morton		1682-84
Richard Kyrle		1684
Robert Quarry (acting)		1684-85
Joseph West		1685
Joseph Morton		1685-86
James Colleton		1686-90
Seth Sothell (Southwell)		1690-91
Philip Ludwell		1691-93
Thomas Smith		1693-94
Joseph Blake (acting)		1694
John Archdale		1694-96
Joseph Blake		1696-1700
James Moore (acting)		1700-02
Sir Nathaniel Johnson		1702-08
Edward Tynte		1708-09
Robert Gibbes (acting)		1709-12
Edward Craven		1712-16
Robert Daniel (acting)		1716-17
Robert Johnson		1717-19
James Moore (chosen by convention)		1719-21

UNDER THE CROWN

Sir Francis Nicholson		1721-25
Arthur Middleton (acting)		1725-30
Robert Johnson		1730-35
Thomas Broughton (Lieutenant-Governor)		1735-37
William Bull (acting and Lieutenant-Governor)		1737-43
James Glen		1743-56
William Henry Littleton		1756-60
William Bull, 2d, (Lieutenant-Governor)		1760-61
Thomas Boone		1761-64
William Bull, 2d, (Lieutenant-Governor)		1764-66
Lord Charles Greville Montagu		1766-68
William Bull, 2d, (Lieutenant-Governor)		1768
Lord Charles Greville Montagu		1768-69
William Bull, 2d, (Lieutenant-Governor)		1769-71
Lord Charles Greville Montagu		1771-73
William Bull, 2d, (Lieutenant-Governor)		1773-75
Lord William Campbell		1775

SOUTH CAROLINA COLLEGE. A nonsectarian, coeducational college in Columbia, S. C., chartered in 1801 and opened in 1805. It

was closed in 1863 and was reopened in 1866 as the University of South Carolina. In 1878 the university was divided into two branches; one the South Carolina College, the other Claflin College, for negroes, at Orangeburg. Its charter was again amended in 1887 and 1890, and in 1894 women were admitted to all courses. It has a system of accredited schools, the certificate of which admits students without examination. The college has a department of law. In 1902 the students numbered 215, with a faculty of 18. The library contained 33,783 volumes. Its income was $35,454.

SOUTH CAROLINA INTER-STATE AND WEST INDIAN EXPOSITION. An exposition held in Charleston, South Carolina, from December 1, 1901, to June 2, 1902. The site chosen covered an area of about 250 acres. The principal buildings were: Administration, Agriculture, Art, Auditorium, Commerce, Cotton Palace, Fisheries, Machinery, Mines and Forestry, Negro, Transportation, and Women's. The larger buildings were constructed in the Spanish Renaissance style of architecture, and were finished in staff, coated with a dull white tint that gave the name of Ivory City to the grounds. There were also State buildings erected by Illinois, Maryland, Missouri, New York, and Pennsylvania, city buildings representing Cincinnati and Philadelphia, and special structures devoted to the exhibits of Cuba, Porto Rico, and Guatemala. The grounds were adorned with statuary, among them six original historical groups, situated in the Court of Palaces, and including "The Aztec," by Louis A. Gudebrod; "The Negro," by Charles A. Lopez; and "The Huguenot," by Miss Elsie Ward. The total attendance was 674,086; the cost of the exposition was $1,250,000, while the receipts were $313,000.

SOUTH'COTT, JOANNA (1750-1814). A religious visionary, born at Gittisham, in Devonshire, England, of humble parentage. In youth she was a domestic servant, chiefly in Exeter. In 1792 she declared herself to be the woman driven into the wilderness, the subject of the prophecy in Rev. xii., and began to claim the gift of prophecy. She gave forth predictions in prose and verse, and, although very illiterate, wrote numerous letters and pamphlets. When over sixty years of age she imagined that she was destined to give birth miraculously to a second Shiloh or prince of peace. Her writings include *The Strange Effects of Faith* (1801), with continuations (1802-20); books of *Prophecies and Visions* (1803); *Letters* (1804); *The True Explanation of the Bible* (1804-10); the *Book of Wonders* (1813-14). Consult her *Memoirs* (London, 1814).

SOUTH DAKO'TA. Popularly called the 'Coyote State.' A north central State of the United States, lying on either side of the middle Missouri, between latitudes 42° 28′ and 45° 57′ north and between longitudes 96° 26′ and 104° 3′ west. It is bounded on the north by North Dakota, on the east by Minnesota and Iowa, on the south by Nebraska, and on the west by Wyoming and Montana. With the exception of an irregular salient angle in the southeast between the Missouri and Big Sioux Rivers, and a reëntering angle in the northeast formed by Lakes Bigstone and Traverse, the boundaries of the State are straight lines running along meridians and parallels, and forming a rectangle 200 miles wide and 380 miles long. The area is 77,650 square miles, of which 76,850 square miles, or 49,184,000 acres, are land surface. South Dakota ranks twelfth in size among the States.

TOPOGRAPHY. The State lies within the region of the Great Plains, and, broadly considered, consists of a rolling upland plain sloping gradually from an altitude of 3500 feet in the west to about 1400 feet in the southeast. The entire State lies above 1000 feet, with the exception of a very narrow belt along the shores of Lakes Bigstone and Traverse in the extreme northeastern corner. The eastern half is smooth, with the broad, gently sloping valley of the James River traversing it from north to south. In the western half denudation by running water has been very active compared with atmospheric erosion, so that numerous buttes and ridges remain to show the former level of the plateau. In the southwestern part the effect of denudation is especially shown in the remarkable region known as the Bad Lands. They consist of a labyrinth of deep ravines, steep hills, and precipitous bluffs of white clay carved out by rapid erosion, and are in parts almost destitute of vegetation. The most prominent diversifying feature of the State, however, is the elliptical, dome-like uplift of the Black Hills, rising near the western boundary between the two forks of the Cheyenne River, and covering about 5000 square miles. The highest point is Harney Peak, with an altitude of 7216 feet.

HYDROGRAPHY. The Missouri River traverses the State in a winding course from the middle of the northern boundary to the southeastern corner, forming for some distance a part of the southern boundary. Its valley is comparatively narrow, and rises in terraces (which are more abrupt on the eastern bank) to the general level of the plain, which lies 200 to 300 feet above the stream. The western tributaries, chief of which are the Grand, Moreau, Big Cheyenne, and White Rivers, flow nearly due east in similar narrow terraced valleys. On the other hand, the two eastern tributaries, the James and the Big Sioux, flow southward parallel with the main stream, and their valleys are broad and gently sloping. In the eastern half of the State there are numerous glacial lakes, none of which, however, are of great size except the above mentioned Lakes Bigstone and Traverse on the northeastern boundary.

CLIMATE, SOIL, AND VEGETATION. South Dakota, occupying almost the very centre of the continent, has, of course, a continental climate with great extremes of temperature. The mean annual temperature is 44.3° F. The mean for January is 15° and for July 72.2°, while the absolute extremes may rise to more than 115° above or fall to more than 40° below zero. But the heat of summer and the cold of winter are much more endurable than the more moderate temperatures of the Eastern States, owing to the dryness of the atmosphere, which renders the climate bracing and pleasant. The winter is often tempered by the dry and warm chinooks, but occasionally, though fortunately not often, the State is visited by blizzards—severe northern gales laden with fine floating snow. The snowfall is less than that of New York or New England. The average annual rainfall for the State is 20 inches, being 30 to 40 inches in the eastern third, 20 to 30 inches in

the centre, and 15 to 20 inches in the west, where it is insufficient for agriculture. The other parts of the State also suffer occasionally from drought. The soil in the greater part of the State is of excellent quality, and when sufficiently watered is rendered highly productive. In the east there is a subsoil of glacial till covered with a dark alluvial loam rich in nitrogen and again covered with many inches of black vegetable mold. A large part of the west has also a fine alluvial soil, but large areas here are stony and barren. The bottomlands of the Missouri and the terraced floors of its valley are very fertile. The State is as a whole a treeless prairie country. Forests are found only in the Black Hills above an altitude of 4000 feet, where there is a good growth of pine. Here and there along the river valleys there are more or less extensive groves of cottonwood, ash, elm, and maple.

GEOLOGY. Although the geological structure of the State is nearly homogeneous over the greater part of its area, there is nevertheless found represented every age from the Archæan to the Pleistocene except the Devonian. There are two Archæan nuclei, one in the east and one in the west. The former is a broad tongue of Sioux quartzite belonging to the Huronian system and extending westward to the James River from the neighborhood of Sioux Falls. To the north near Bigstone Lake is a smaller area of Laurentian granite. In the centre of the Black Hills is exposed the core of schists, slates, and granite. This is surrounded by narrow bands forming the denuded sections of the upturned Paleozoic strata, successively Potsdam sandstone of the Cambrian, Silurian limestone, and a broader band of Carboniferous limestone. Around this appear the sand and limestones, clays and marls of the Jura-Trias, and the whole is enveloped in the Cretaceous strata which cover four-fifths of the area of the State. The principal members are the Colorado marls, clays, and limestones covering nearly the whole of the eastern half, the Laramie formation occupying the northwestern quarter, and the Dakota sandstone underlying the valley of the James. The southwestern quarter of the State is covered with Miocene clays and conglomerates. Igneous rocks in the form of dikes of diabase and porphyry occur in both the eastern and western Archæan areas. The Pleistocene age is represented by the immense sheet of glacial drift covering the eastern half of the State to a line nearly coinciding with the Missouri River, and veiling the older formations. West of this line the Pleistocene deposits consist of aqueous drift.

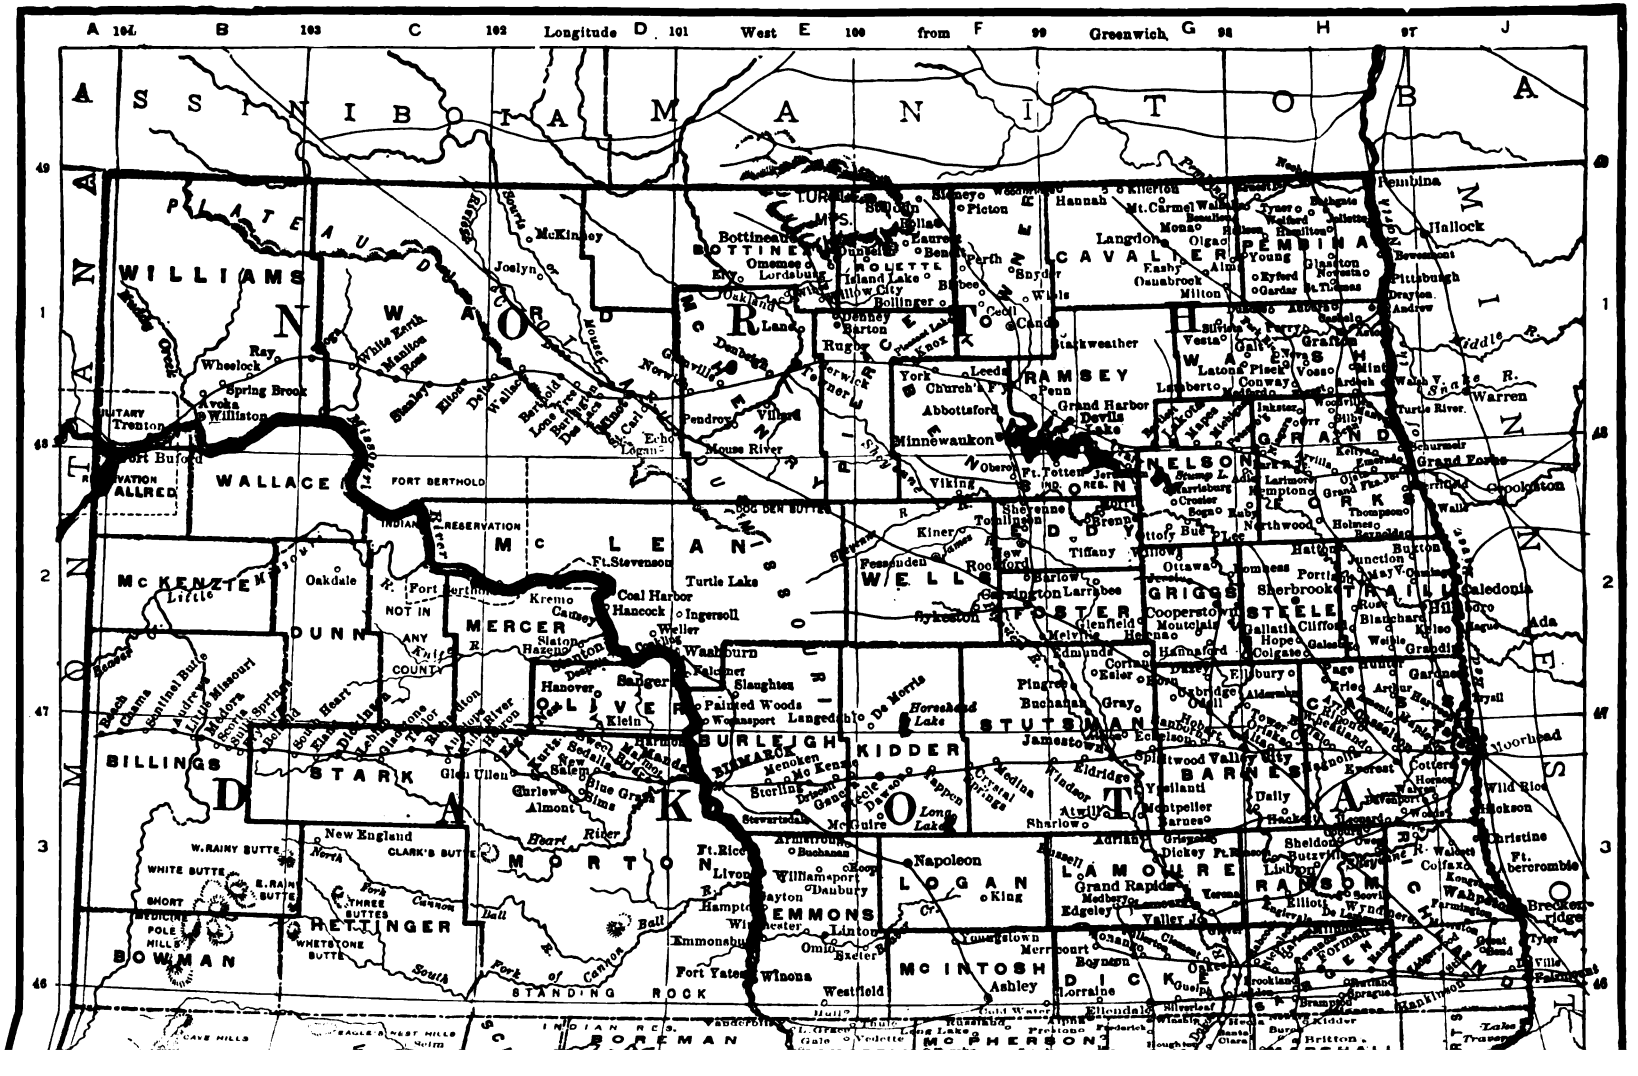
MINING. The mineral wealth of the State appears chiefly in the Archæan area of the Black Hills, where there are more or less extensive deposits of copper, gold, silver, argentiferous lead, iron ores, manganese, nickel, tin, mica, and some graphite. The Triassic clays contain beds of gypsum, and beds of lignite as well as reservoirs of natural gas have recently been found. The Archæan and Paleozoic areas also yield a great variety of building and ornamental stone such as the red quartzite or jasper in the east. The Dakota sandstone of the James Valley is especially noticeable as a water-bearing stratum supplying powerful artesian wells. The mining activities consist mainly of quartz gold mining carried on in the southwest corner of the State. Difficulties in securing water have operated against the development of gold-mining, but elaborate and expensive schemes have been undertaken to secure adequate water supplies, and the output of gold is becoming larger. The value of the product increased from $4,006,400 in 1893 to $6,479,500 in 1901. The granite production in 1901 was valued at $99,941. Limestone and sandstone are also quarried. Portland cement was produced in 1900 to the value of $76,000, and clay products in the following year represented a value of $59,365.

AGRICULTURE. Agriculture is almost wholly confined to the eastern half of the State. Facilities for irrigation are not extensive. In 1899, 43,676 acres were irrigated, principally from the tributaries of the Cheyenne River. In 1900, the total farm area was 19,070,616 acres, or 38.8 per cent. of the State's land area. Of the farm land 59.2 per cent. was improved, and about two-fifths of this amount was brought under improvement in the decade 1890-1900. South Dakota is one of the few States in which the size of farms is increasing, the average size in 1890 being 227.2 acres, and in 1900, 362.4 acres. In 1900, 3.4 per cent. of the farms were rented on the cash system, and 18.4 per cent. on shares. South Dakota is in the great wheat belt, and the cultivation of this crop has rapidly advanced until the State ranks among the first wheat States in the Union. The acreage in corn is also rapidly increasing, but the production of this crop is largely confined to the southeastern section. Oats are grown throughout the farming region, as is also barley, the latter crop being three times as great in 1900 as in 1890. The State stands third in the area devoted to flax. The acreage in hay and forage increased 47.1 per cent. in the decade 1890-1900. Potatoes are the principal vegetable grown. The following table embraces the leading crops:

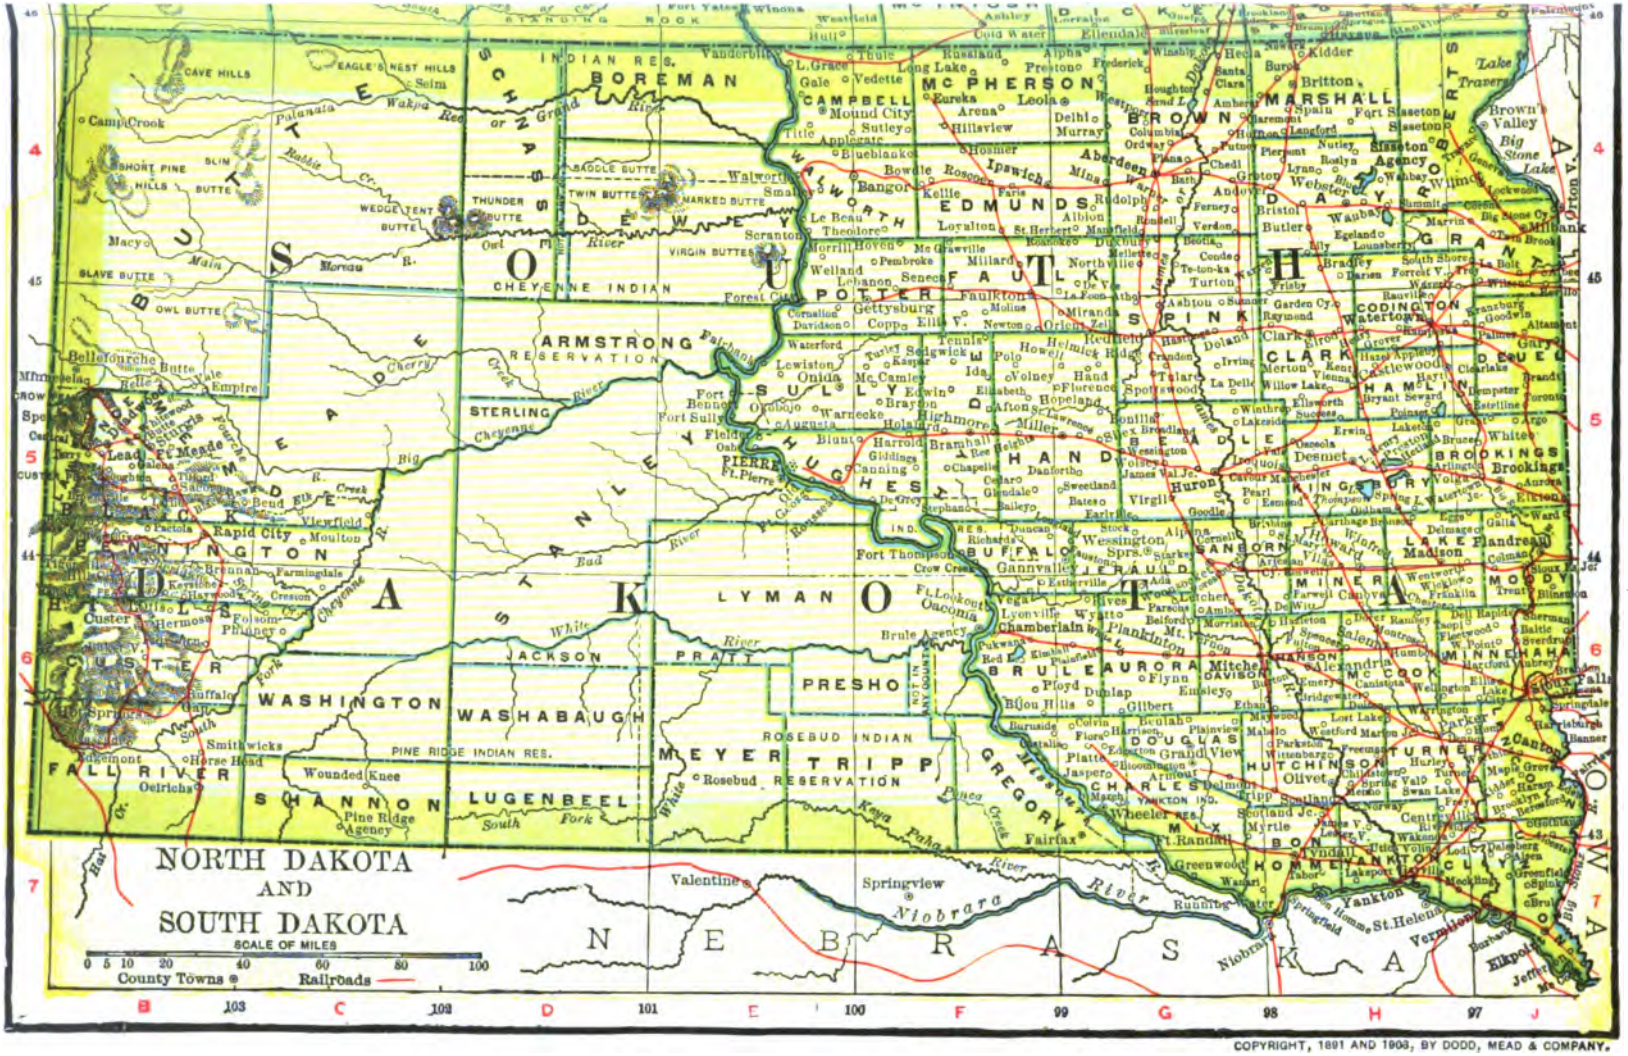
CROPS	1900	1890
Wheat	3,984,659	2,259,846
Corn	1,196,381	753,309
Oats	691,167	580,289
Barley	299,510	97,370
Rye	39,253	9,229
Flaxseed	302,010	354,951
Hay and forage	2,287,875	1,554,913
Potatoes	33,567	35,440

STOCK-RAISING. The State has excellent grazing facilities. The number of cattle in 1900 was more than twice as great as in 1890, and there was a large increase in the number of horses, sheep, and swine, as shown in the following table:

ANIMALS	1900	1890
Dairy cows	270,634	210,240
Other cattle	1,276,166	477,679
Horses	480,768	250,305
Mules and asses	6,999	7,671
Sheep	507,338	238,448
Swine	823,120	590,465



MANUFACTURES. Manufactures are limited mainly to neighborhood industries. In 1900, $7,578,895 was invested as capital and 3121 persons were engaged as wage-earners in the manufactures of the State.



TRANSPORTATION. The railroads are confined to the region east of the Missouri River and to the mining region in the southwest corner, there

being no line crossing the State from east to west. Railway construction was greatest in the decade 1880-1890. The mileage in the latter year was 2610, which figure had increased in 1900 to 2961 miles. The Chicago, Milwaukee and Saint Paul, the Great Northern, and the Chicago and Northwestern have the greatest mileage.

BANKING. In 1872 the first national bank was organized in Yankton. In the following twenty years banks multiplied, and in 1889, when division came and the Territory was organized as a State, South Dakota had 33 national and over one hundred private banks, which figures included also the banks organized under the general incorporation law. This rapid organization of small banks was due to the high rate of interest on mortgages, often amounting to 14 per cent. and 15 per cent. The bad crops of 1889-91 reduced the value of real estate, made foreclosure of many mortgages necessary, and caused the failure of many banks. The necessity of some regulation of the banking business became evident, and in 1891 the first banking law of the State was passed, making the shareholders responsible for an amount equal to their stock in addition to their actual investment, allowing dividends on net profits only, etc. Between 1890 and 1900 the national banks diminished both in number and in the volume of transactions, and the State banks have now the larger part of the business. The condition of the banks in 1902 is shown in the following table:

	National banks	State and private banks
Number	47	229
Capital	$1,958,000	$2,579,000
Surplus	253,000	398,000
Cash, etc	791,000	1,552,000
Deposits	10,899,000	17,089,000
Loans	8,409,000	12,574,000

GOVERNMENT. The State Constitution was adopted by popular vote in October, 1889. Proposed amendments must secure the approval of a majority of the members elected to each House, and a majority of the electors voting at a popular election. Upon the approval of two-thirds of the members elected to each House and a majority of the people voting at a popular election the Legislature shall call a constitutional convention. Voters must be citizens, or foreigners who have declared their intention of becoming citizens and have resided in the United States one year, in the State six months, in the county thirty days, and in the election precinct ten days. Pierre is the capital.

LEGISLATIVE. The Legislature convenes on the first Tuesday after the first Monday of January in the odd years. It consists of a Senate of 45 members and a House of 87 members. The people have the right to propose measures, which the Legislature must submit to a vote of the electors. The people may further require that, with certain exceptions, any laws enacted must be submitted to the people, and not more than five per cent. of the electors are required to invoke these initiative or referendum rights. The Governor's veto does not extend to matters referred to the people.

EXECUTIVE. The executive power is vested in a Governor and Lieutenant-Governor, elected for two years, the latter being, *ex officio*, president of the Senate. The Governor has a veto power on legislation, which may be overridden by a two-thirds vote of both Houses. He may veto items of an appropriation bill and approve the rest. The other officers are a Secretary of State, Auditor, Treasurer, Superintendent of Instruction, Commissioner of School and Public Lands, and Attorney-General—all holding office for two years.

JUDICIAL. There are five Supreme Court judges, elected for four years. The State is divided into judicial court districts, in each of which a judge is elected for four years.

FINANCES. The larger part of the public debt was incurred in 1883-89, before the admission to Statehood, and for the construction of hospitals, normal schools, and college buildings. At the time of admission the debt amounted to $710,200 in 4½ per cent. and 5½ per cent. bonds, but in addition South Dakota was obliged to pay to North Dakota in settlement of accounts more than $150,000. The Constitution limited the borrowing power of legislation to $100,000, but this limit was soon reached. In 1892 the debt was more than one million dollars, and in 1895 $1,562,800, of which $424,000 were in warrants. In 1902 the bonded indebtedness was $417,500 and the outstanding warrants were $250,000, making a total debt of $667,500. The income in the beginning came mainly (almost 85 per cent.) from a State tax. Later the sale and lease of public lands developed into an important source of income, which by a special provision of the Constitution must go into the permanent school fund, while the interest on deferred payments must be devoted to current school expenses. During the fiscal year 1901-02 the total income was $2,174,257, and the total expenditure $2,098,620, almost 60 per cent. of which was for school purposes. There was a balance of $840,525 in the treasury, of which $633,000 lay in the school fund.

MILITIA. In 1900 there were 87,505 men of militia age. The organized militia in 1901 numbered 949.

POPULATION. The population in 1890, according to the first State census, was 328,808, and the figure increased in 1900 to 401,570. In the latter year South Dakota ranked thirty-seventh in population. The foreign-born population was 88,508, among whom the Norwegians, Germans, Russians, and Swedes were the most numerous. There were 9293 Indians taxed and 10,932 not taxed. There were only 5.2 persons to the square mile in the State. There are five towns having (1904) more than 5000 inhabitants each. In 1900 Sioux Falls had a population of 10,266, Lead City 6210, Yankton 4125, Aberdeen 4087, and Mitchell 4055. South Dakota sends two members to the National House of Representatives.

RELIGION. The Catholic Church includes about one-thirteenth of the inhabitants. The Lutherans are the strongest Protestant denomination.

EDUCATION. In 1900 only five per cent. of the population over ten years of age were illiterate. There were then 129 days in the school year. Owing to the large scattered rural population, the educational difficulties have been extreme. In 1900 there were only 176 graded schools, as against 3191 ungraded, the former being almost wholly in the towns. Only the towns have high

schools. In 1900 there were 96,822 pupils enrolled, of whom 68,000 were in average attendance. There were in that year 1172 male and 3630 female teachers. The average monthly wage received was $33 for the male teacher and $30.25 for the female teacher. The cost of the public schools was $1,598,757, of which $1,026,126 was paid as salaries to teachers and superintendents. The most important source of financial support is the district tax. The State has the advantage of large Congressional land grants, which aggregated 2,823,320 acres. There are four State normal schools located respectively at Aberdeen, Madison, Spearfish, and Springfield. Higher education is provided at the State University, situated at Vermillion, and at the following denominational co-educational institutions: Huron College (Presbyterian), at Huron; Dakota University (Methodist Episcopal), at Mitchell; Redfield College (Congregational), at Redfield; and Yankton College (Congregational), at Yankton. There are a school of mines at Rapid City and an agricultural college at Brookings.

CHARITABLE AND PENAL INSTITUTIONS. A State insane asylum is situated at Yankton, a school for the deaf at Sioux Falls, an institution for the blind at Gary, and a soldiers' home at Hot Springs. The State penitentiary is at Sioux Falls, and the Reform School at Plankinton.

HISTORY. The State was formed on the division of Dakota Territory and was admitted to the Union November 3, 1889. (For early history, see NORTH DAKOTA.) The convention which met July 4th adopted the 'Sioux Falls Constitution,' framed in 1885, with a few necessary changes. A prohibitory amendment was adopted at the first election in October, 1889, but, on account of the 'original package decision' of the United States Supreme Court, did not go into effect. The Sioux Indians by treaty ceded large tracts of land, which were opened for settlement in February, 1890. Other reservations were opened in 1892 and 1895.

GOVERNORS OF SOUTH DAKOTA

Arthur C. Mellette	Republican	1889-93
Charles H. Sheldon	"	1893-97
Andrew E. Lee	Populist	1897-1901
Charles N. Herreid	Republican	1901—

D., 1889); Beadle, *Dakota* (Saint Paul, 1889); Finerty, *War Path and Bivouac* (2d ed., Chicago, 1890); Todd, "Hydrographic History of South Dakota," in *Geological Society of America Bulletin*, vol. xiii. (Rochester, 1902).

SOUTH DAKOTA, UNIVERSITY OF. A co-educational State institution at Vermillion, S. D., organized in 1882, and maintained almost wholly by appropriations of the Legislature. Its endowment consists of 86,000 acres of land, yielding in 1902-03 an income of $5600, the total income of the university being $60,000. The tuition is $6 per semester, except to students who have served in the Spanish War, who are exempted from tuition charges. The university has established a loan fund for the assistance of needy students. Military science and tactics form part of the course. The degrees conferred are those of Bachelor of Arts, Law, Commerce, and Music. The estimated value of the property under control of the university in 1903 was $300,000, its grounds, buildings, and equipment being valued at $295,000. The institution carries on the State geological survey. The faculty in 1903 numbered 34 and the students 450, distributed as follows: College of Arts and Sciences, 150; Law, 30; Music, 50; Commerce, 40; Engineering, 30; Preparatory, 150. The library contained about 8000 volumes.

SOUTHDOWN. An English breed of sheep, bred for their superior mutton. See SHEEP.

SOUTH DOWNS. A ridge of hills in England. See under DOWNS.

SOUTHEND-ON-SEA, sŭTH'*ĕnd*-. A municipal borough and seaside resort in Essex, England; at the mouth of the Thames, 42 miles east of London (Map: England, G 5). It is a popular holiday and residential resort of Londoners. The town owns fine municipal buildings, promenade piers, a concert pavilion, electric street railways, pleasure grounds, and a cemetery, and maintains technical schools, a sanatorium, and an isolation hospital. Population, in 1901, 28,850.

SOUTHERN CROSS. A famous constellation near the South Pole. Of its four principal stars, one, the southernmost, is of the first magnitude; two, the eastern and northern, of the second; and one, the western, of the third. The stars are not arranged very accurately in a cruciform position; and, on the whole, it must be said the constellation is much overrated.

SOUTHERN CROSS, ORDER OF THE. The highest Brazilian order, founded by Dom Pedro I. in 1822, in commemoration of his accession to the throne. The order has four classes, and until 1889 the members received pensions. The decoration is a white enameled cross of five arms, with a wreath of coffee and tobacco leaves. The effigy of Dom Pedro on the medallion is surrounded by the inscription *Petrus I., Brasiliæ Imperator.* On the reverse is a cross composed of nineteen stars, with the words *Bene Merentium Præmium.* The decoration is suspended from a crown and is worn on a blue ribbon.

SOUTHERNE, sŭTH'ĕrn, THOMAS (1660-1746). An English playwright. He was born in Ireland, and was educated at Trinity College, Dublin. Entered at the Middle Temple in London, he abandoned law to write for the stage, his first play being *The Loyal Brother, or the Persian Prince* (1682). His two best known pieces are the tragedies of *The Fatal Marriage* (1694), which was afterwards revised by Garrick, and *Oroonoko, or the Royal Slave* (1696), founded on a novel of the time and remarkable as including one of the earliest English condemnations of the slave trade.

SOUTHEY, *south'ĭ or* sŭTH'ĭ, CAROLINE ANNE (1786-1854). An English poet, daughter of Capt. Charles Bowles, a retired officer. She was born at Lymington, Hampshire. After the death of her mother (1816) and the loss of her property, she turned to literature. She sent the manuscript of a narrative poem, *Ellen Fitzarthur* (published 1820), to Robert Southey, who approved of it. A correspondence followed which led to marriage (1839). In the meantime Miss Bowles wrote *Tales of the Factories* (1823) in verse; *Solitary Hours* (1826) in verse and prose; *Chapters on Churchyards* (1829), a group

of tales which gained for her wide attention; and *The Birthday* (1836), a poem recalling Cowper. She also collaborated with Southey on a poem entitled *Robin Hood* (never completed). Soon after her marriage, Southey's mind completely broke down, and she passed three miserable years. After his death (1843), she lived in retirement. Consult the interesting *Correspondence of Robert Southey with Caroline Bowles*, ed. by Dowden (Dublin, 1881).

SOUTHEY, ROBERT (1774-1843). An English poet and miscellaneous writer, born August 12, 1774, at Bristol, where his father was a linen-draper. Southey passed much of his boyhood with an aunt at Bath, read through her library, containing Spenser, Sidney, Shakespeare, and many other writers, and tried his own hand at the drama. In 1788 he was sent to Westminster School, from which he was expelled four years later, on account of an essay against flogging. Aided by an uncle living at Lisbon, he entered Balliol College, Oxford (1792), where he remained for only two years. He met Coleridge in 1794; and in conjunction with another friend, Robert Lovell, they formed a socialistic scheme, which they called 'pantisocracy.' They were to take wives and emigrate to the banks of the Susquehanna. They all married sisters, but the scheme went no further. After secretly marrying Edith Fricker, at Bristol (November 14, 1795), Southey immediately left to visit his uncle at Lisbon. On returning (1797) he studied law at Gray's Inn, but soon abandoned the pursuit. He settled with his wife first at Westbury, between Bath and Salisbury, and then at Burton, in Hampshire; and after another trip to Portugal and a short period at Bristol, he joined Coleridge at Keswick in the Lake district (1803). Here at Greta Hall he passed the rest of his life amid his books. Besides the income from his pen, which eventually became large, he received, between 1796 and 1806, an annuity of £160 from a school friend named Wynn. Its place was soon filled by a Government pension of the same amount, to which was added, in 1835, another pension of £300. In 1813, then as strongly conservative as he had once been republican, he was appointed poet laureate. In this capacity he wrote *The Vision of Judgment* (1821), an apotheosis of George III. in hexameter verse. The incident is made memorable by Byron's brilliant parody under the same title. Southey's wife died in 1837, and two years later he married Caroline Anne Bowles. His mind was already giving way and soon became a blank. He died at Keswick, March 21, 1843, and was buried in the Crosthwaite churchyard. A recumbent statue was placed in the church. When a schoolboy Southey formed the plan of a series of narrative poems on the mythologies of the world. Under the inspiration of this idea, subsequently modified, he wrote a number of epics, comprising *Joan of Arc* (1796); *Thalaba, the Destroyer* (1801), an Oriental tale; *Madoc* (1805); *The Curse of Kehama* (1810), founded on Hindu legend; and *Roderick, the Last of the Goths* (1814). Though they contain many noble passages and interesting experiments in versification, they are in the main only rhetorical. His prose is best represented by *Letters from England by Don Manuel Alvarez Espriella* (1807), a view of England from the assumed standpoint of a Spanish gentleman; *The Doctor* (1834-37), containing the nursery classic, "The Three Bears," the lives of Wesley (1820) and of Nelson (1813); and his delightful letters. Of his other miscellaneous work may be cited *History of Brazil* (1810-19), part of a contemplated history of Portugal; *History of the Peninsular War* (1823-32); *Colloquies on Society* (1829), unnecessarily ridiculed by Macaulay; *Naval History* (1833-40); and a revolutionary drama, *Wat Tyler* (written in 1794, and surreptitiously published in 1817). As a conservative in religion and politics Southey sustained many bitter attacks from the leaders of rising liberalism. In unflagging literary industry he was one of the most notable figures of his time. His prose, far more than his poetry, is a contribution of permanent value to English letters.

Consult: The *Life and Correspondence*, by his son, Rev. C. C. Southey (London, 1849-50), containing the fragment of an autobiography; *Selections from Southey's Letters*, ed. by Warter (ib., 1856); *Correspondence with Caroline Bowles*, ed. by Dowden (Dublin, 1881); Dennis, *Southey: Story of His Life*, an excellent selection from letters (Boston, 1887); *Southey*, a memoir and estimate by Dowden, "English Men of Letters" series, new ed. (New York, 1895); and poems with memoir by S. R. Thompson, in the "Canterbury Poets" series (London, 1888).

SOUTH FORELAND. See FORELAND, NORTH AND SOUTH.

SOUTH GEORGIA, jôr'jâ. An island in the South Atlantic Ocean belonging to Great Britain, and situated in latitude 54° 30′ S., longitude 37° W., 800 miles east by south of the Falkland Islands (Map: World, Western Hemisphere, P 17). Area, about 1600 square miles. The island consists of mountains of Archæan formation from 6000 to 8000 feet high. Several permanent glaciers exist in the deep gorges on the mountain slopes, and the climate is damp and chilly. The lower slopes are covered with grass, but the flora is poor. The island is uninhabited. It was discovered in 1675 by Laroche.

SOUTH HADLEY. A town in Hampshire County, Mass., three miles northeast of Holyoke, on the Connecticut River (Map: Massachusetts, B 3). It is the seat of Mount Holyoke College (q.v.) and has a public library. There are manufactures of writing paper, brick, fertilizers, and lumber product. The government is administered by town meetings, held annually. Population, in 1890, 4261; in 1900, 4526.

SOUTH HOLLAND. A province of the Netherlands, bounded on the north by North Holland, and on the west by the North Sea (Map: Netherlands, C 3). Area, 1166 square miles. Population, in 1899, 1,144,448, more than half of whom lived in the larger cities. The capital and largest city is Rotterdam. The Hague also is in this province.

SOUTHINGTON, sŭTH'ĭng-tŏn. A borough in a town of the same name, in Hartford County, Conn., 20 miles south of Hartford; on the New York, New Haven and Hartford Railroad (Map: Connecticut, D 3). It is engaged principally in manufacturing pocket cutlery, general and carriage hardware, carriage bolts, tools, and wood screws. Population, in 1900, 3411. Originally a part of Farmington and called Panthorn, South-

ington was settled about 1697 and became a separate parish in 1724. It was incorporated as a town in 1779. The borough of Southington was incorporated in 1889.

SOUTH KEN'SINGTON, NATIONAL ART SCHOOLS OF. The schools of South Kensington (London) were founded in 1852 for the application of art to industry. The nucleus of an art industrial museum was also formed. (See SOUTH KENSINGTON MUSEUM.) The central school for the systematic training of art teachers and students in all departments of design was afterwards established at South Kensington. Aid is furnished in the teaching of art in elementary schools, in night classes for artisans, and in regular schools of art. The same body controls the provincial schools connected with South Kensington, which have grown extensively in number since their first establishment. Many national, local, and free scholarships are also open to British subjects.

SOUTH KENSINGTON MUSEUM. An important London museum, under the charge of the Department of Science and Art of the Committee of Council on Education. It was opened in 1857 and is contained in buildings at Brompton, South of Hyde Park. It includes the extensive Museum of Ornamental or Applied Art, one of the most valuable in the world, with 45,000 works of modern and mediæval art and numerous reproductions; the National Gallery of British Art; the Art Library, with 70,000 volumes and nearly 200,000 engravings, drawings, and photographs; the India Museum (q.v.); the National Art Training Schools; and the Royal College of Science. It maintains as a branch the Bethnal Green Museum for the benefit of the working classes in the East End. The museum is visited annually by about 2,000,000 persons.

SOUTH KINGSTOWN, kings'ton. A town, including West Kingston, the county seat, and several other villages, in Washington County, R. I., 23 miles south of Providence; on the New York, New Haven and Hartford, and the Narragansett Pier railroads (Map: Rhode Island, B 4). The Rhode Island College of Agriculture and Mechanic Arts is in the village of Kingston; also a public library with 7000 volumes. Other noteworthy features include the Narragansett Library, at Peacedale, and the Robert Beverly Hale Memorial Library at Matunuck. Matunuck is a popular watering place. South Kingstown is a rich farming district and also has fishing interests. The leading manufactured products are woolens and worsteds. The first power loom in the United States was established at Peacedale in 1814. Population, in 1890, 3415; in 1900, 4972.

SOUTH McAL'ESTER. A town of the Choctaw Nation, Indian Territory, about 85 miles southwest of Fort Smith, Arkansas; at the junction of the Missouri, Kansas and Texas and the Choctaw, Oklahoma and Gulf railroads (Map: Indian Territory, H 4). There are extensive coal mines. The town is engaged in coke-making and is a centre for wholesale trade. There are cotton gins, a large cotton compress, iron foundries, brick plants, a flour mill, etc. Population, in 1900, 3479.

SOUTH MOUNTAIN, BATTLE OF. A battle fought September 14, 1862, during the Civil War, at Crampton's Gap and Turner's Gap in the South Mountain range, near Sharpsburg, Md., between a Confederate force of about 18,000 under the immediate command of Generals McLaws and D. H. Hill, and a Federal force of about 28,000 under the immediate command of Generals Franklin and Reno. The two forces formed parts respectively of the Army of Northern Virginia, under Lee, and the Army of the Potomac, under McClellan. The Confederate troops, who had the advantage of position, resisted with great stubbornness the advance of the Federals, but were finally driven back, and on the 16th the Army of Northern Virginia and the Army of the Potomac met at Antietam (q.v.). The loss of the Federals in killed, wounded, and missing was about 1800; that of the Confederates about 2600.

SOUTH NOR'WALK. A city in the town of Norwalk, Fairfield County, Conn., 14 miles west by south of Bridgeport; at the mouth of the Norwalk River, on Long Island Sound, and on the New York, New Haven and Hartford Railroad (Map: Connecticut, B 5). Its beautiful situation, on rising ground overlooking the Sound, makes it a very attractive residential city. There are two libraries; the Public and the Roth and Goldschmidt. South Norwalk has a good harbor, and a large coastwise trade is carried on. Its manufactures include hats, locks, and various iron products. The government is vested in a mayor, elected annually, and a unicameral council. The water works and electric light plant are owned and operated by the municipality. (For history, see NORWALK.) Population, in 1900, 6591.

SOUTH OMAHA, ō'mȧ-hȧ. A city in Douglas County, Neb., adjoining Omaha; on the Missouri River, and on the Union Pacific, the Chicago, Rock Island and Pacific, the Burlington and Missouri River, and other railroads (Map: Nebraska, J 2). It has a public library. South Omaha ranks third among the cities of the United States in its slaughtering and meat-packing interests, being surpassed only by Chicago and Kansas City. In the census year 1900 the five establishments connected with that industry had an invested capital of $15,635,418 and an output valued at $67,716,724. The city government, under the revised charter of 1901, is vested in a mayor, elected biennially, and a unicameral council, and in administrative officials, the majority of whom are appointed by the mayor, with the consent of the council. The board of education, however, is chosen by popular vote and the fire and police board by the State Governor. South Omaha was settled in 1882 and was incorporated in 1886. Its rapid growth dates from the establishment in 1884 of the Union Stock Yards. Population, in 1890, 8062; in 1900, 26,001.

SOUTH OR'ANGE. A village in Essex County, N. J., 4 miles west of Newark; on the Delaware, Lackawanna and Western Railroad (Map: New Jersey, D 2). The main portion is picturesquely situated on a gentle eminence facing Orange Mountain. It is a residential suburb of Newark and New York. Seton Hall College (q.v.), a Roman Catholic institution, was opened here in 1856. The village has a public library and a handsome town hall. Population, in 1890, 3106; in 1900, 4608. South Orange was settled about 1670, and until erected

into a township, in 1861, was a part, first of Newark, and then, after 1806, of Orange. Consult Whittemore, *Founders and Builders of the Oranges* (Newark, 1896).

SOUTH'PORT. A municipal borough and watering place in Lancashire, England, at the mouth of the Ribble Estuary, 15 miles southwest of Preston (Map: England, C 3). It is a handsome town, with fine public buildings and institutions. There are artificial lakes and marine parks on the shore for bathing and model-yacht sailing. Southport owns the gas and electric lighting works, markets, and cemeteries, and maintains a free library, art gallery, and technical schools. Its rise dates from 1830. Population, in 1891, 41,400; in 1901, 48,000. Consult Stephenson, *Southport* (Southport, 1898).

SOUTH PORT'LAND. A city in Cumberland County, Me, on Casco Bay, opposite Portland, with which it is connected by ferry and four bridges, and on the Boston and Maine Railroad (Map: Maine, C 8). It is the seat of the State School for Boys, formerly known as the State Reform School. Noteworthy are the Government fortifications, the town hall, Masonic Building, and the Soldiers' Monument and grounds. The city has iron works, acid works, ship railway and machine shops, etc. The government is vested in a mayor, chosen annually, and a unicameral council. South Portland was a part of Cape Elizabeth until 1895, when it was set off as the town of South Portland. In 1889 it was chartered as a city. Population, in 1900, 6287.

SOUTH SEA. A name formerly applied to the Pacific Ocean.

SOUTH SEA CHESTNUT. See INOCARPUS.

SOUTH SEA COMPANY, THE. An English commercial company incorporated in 1711. It was a financial scheme organized by the Lord Treasurer Harley for the purpose of extinguishing the national debt, which then amounted to £10,000,000. The company assumed the debt on condition of receiving from the Government an annual payment of £600,000 for a certain number of years and a monopoly of trade to the South Seas. It also secured from the Spanish Government the contract of supplying the Spanish-American colonies with slaves, and proposed to engage in whale fisheries. On the strength of its purely prospective profits, the value of the company's stock increased enormously. In the spring of 1720 it proposed to assume the entire national debt, which was at that time over thirty millions, on being guaranteed five per cent. per annum for seven and a half years. At the end of this time the debt might be redeemed, if the Government chose, and the interest reduced to four per cent. The directors used every means to increase the value of the stocks, until in the beginning of August, 1720, the shares were quoted at 1000, when the chairman and some of the principal directors sold out. This flagrant conduct and the failure of Law's Mississippi Scheme in France opened the eyes of the public, and at the end of 1720 the crash came. Thousands of innocent stockholders were ruined. Parliamentary investigation revealed a scandalous complicity on the part of a number of the Cabinet. By the able manner in which he afforded relief to the unfortunate stockholders, Sir Robert Walpole (q.v.), the new Chancellor of the Exchequer, acquired great popularity. The directors were deprived of their ill-gotten gains and almost one-third of the original capital was saved for the stockholders. Consult: Mackay, *Memoirs of Extraordinary Popular Delusions* (London, 1852); Coxe, *Memoirs of Sir Robert Walpole* (London, 1802).

SOUTH SHET'LAND ISLANDS. An Antarctic archipelago lying about 600 miles south of Cape Horn, between 61° and 63° 20′ south latitude, and 54° and 63° west longitude, and separated from Graham's Land and Louis Philippe Land by the Bransfield Strait (Map: Antarctic Regions, A 4). The islands are twelve in number, the chief of which are George, Livingston, Smith, Deception, Elephant, and Clarence. The total area is about 880 square miles. They were discovered in 1599 by Dirk Gherritz. The region was explored by Sir John Ross in 1842, and in 1893 by Laskar in the *Jason*, who determined the coast-line of Graham's Land to the 69th degree south latitude.

SOUTH SHIELDS. A seaport of England. See SHIELDS, SOUTH AND NORTH.

SOUTH VICTORIA LAND, or VICTORIA LAND. A portion of the Antarctic land regions, whose coast extends in a north and south direction between latitudes 71° and 79° south, and along the 170th meridian east of Greenwich, the meridian of New Zealand. It is a mountainous country, falling in steep snow-crowned cliffs to the sea, and rising in Mount Melbourne to a height of over 14,000 feet. It also contains the volcanoes of Erebus and Terror, the latter 11,000 feet high. Several hundred miles inland is the Magnetic South Pole. Victoria Land was discovered by Ross in 1841, and explored and mapped by Borchgrevink in 1899.

SOUTHWARK, sŭTH'ẽrk. A Parliamentary borough in London (q.v.), on the southern side of the Thames.

SOUTH'WELL. A town of the Newark Parliamentary division of Nottinghamshire, England, 27 miles by rail southwest of Lincoln. The magnificent mediæval Minster of Saint Mary, founded on the site of a church said to have been erected by the first Archbishop of York in 630, still retains its three towers. The building is cruciform, the towers, nave, and transept are twelfth-century Norman, and the choir is a beautiful example of the English Gothic. It was renovated in 1882. Population, in 1901, 3160.

SOUTHWELL, ROBERT (c.1561-95). An English poet and martyr, son of Richard Southwell, of Horsham Saint Faith's, in Norfolk. Having studied at Douai and at Paris, he went to Rome, where he was received into the Order of Jesuits (1578), and ordained priest (1584). He was immediately sent to England as a missionary, where he became chaplain to the Countess of Arundel (1589). As a native-born subject ordained to the Roman Catholic priesthood, he was guilty of treason. He was not molested, however, till 1592, when he was arrested. After three years' imprisonment, with frequent tortures, he was tried, condemned, and executed (February 21, 1595). During his residence in England, Southwell wrote and circulated, usually in manuscript, several Catholic tracts, and a considerable body of choice verse (published after his death). His most ambitious poem is the long popular

Saint Peter's Complaint in 132 six-line stanzas; his best is perhaps the brief *Burning Babe*. Consult his *Poetical Works*, ed. by Turnbull (London, 1856); *Complete Poems*, ed. by Grosart ("Fuller's Worthies Library," ib., 1872); and *A Four-fould Meditation* (not in Grosart), ed. with bibliography by Edmonds (ib., 1895).

SOUTH'WICK. A town in Durham, England, 1 mile northwest of Sunderland (Map: England, E 2). It has shipbuilding industries, glass works, and potteries. Population, in 1901, 12,640.

SOUTH'WORTH, EMMA DOROTHY ELIZA [Nevitte] (1819-99). An American novelist, born at Washington, D. C. She wrote tales for the *National Era* of Washington, in which she published her first novel, *Retribution* (1849), and she wrote nearly sixty popular novels. They dealt principally with Southern life and were highly wrought in color and emotion, but had little literary value. A uniform edition of her works was brought out in 1872 at Philadelphia.

SOUVESTRE, sōō'vĕs'tr', EMILE (1806-54). A French novelist and dramatist. His best works, *Les derniers Bretons* (1835-37), *Le foyer Breton* (1844), deal with his native Brittany. More noted is the sentimentally cheerful *Philosophe sous les toits* (1851).

SOVEREIGN. An English gold coin of the value of a pound sterling, the standard weight of which is 123.374 grains troy. The sovereign is worth approximately $4.85.

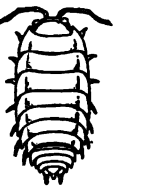
SOVEREIGNTY (OF. *sovrainte*, Fr. *souveraineté*, from OF. *sovrain*, *soverain*, *suverain*, *souverain*, from ML. *superanus*, principal, supreme, from Lat. *super*, above, over). Several uses of the term sovereignty must be distinguished. Of these the principal are internal sovereignty and external sovereignty. Internal sovereignty touches the relation between a State and its citizens or subjects; external sovereignty relates to the position of a State among other States. The essence of internal sovereignty is supremacy over subjects; that of external sovereignty is independence of other States.

INTERNAL SOVEREIGNTY. Under the head of internal sovereignty another distinction is made between what is termed 'legal' sovereignty and 'political' sovereignty. Political sovereignty is the ultimate controlling power resident in any political society. Legal sovereignty is the organized power which at any given time must be regarded as legally supreme. Political sovereignty arises out of the very nature of the State as an organization for the purposes of social control. A supreme power enabling the State to preserve a form of public order, protect the community, and otherwise promote the general welfare is necessary to the life of organized society, and its absence is anarchy. Political sovereignty, then, is that power in the State the will of which is ultimately obeyed. At any given time this supreme will may or may not be accurately expressed by the existing legal or governmental authority.

Legal sovereignty refers to the supreme power of the State as embodied in some legal or governmental organ or agency. Thus the King in Parliament is termed a sovereign body in England; a Constituent Convention is so called in France; or a king in some cases is called the sovereign. This legal sovereign may not, although it generally does, represent the actual sovereignty in the State, but it is none the less supreme from the legal or governmental point of view. For example, the political sovereignty may actually belong to the mass of the people while the legal sovereignty may be vested in an aristocracy or a monarch; and, on the other hand, the actual power may be vested in a few while the government is democratic in form. Again, the legal sovereign, as for example the Parliament in Great Britain, may pass a law opposed by the majority of the people, but the enactment is none the less law and legally enforceable until repealed, or until the Government is overthrown by a revolution.

The *origin* of sovereignty has been explained in various ways by different schools of political philosophy. It has been asserted that the ruling authority holds by divine appointment or sanction; that the right to rule is a property right descending as other property in regular line of succession; that the sovereignty is created by a voluntary contract either between ruler and ruled or between independent individuals, as in the social contract (q.v.); that sovereignty is the prerogative of superior force and belongs to the strongest claimant. In modern times it is generally believed that sovereignty is a product of political necessity arising out of the essential nature of political association, and the tenure of the particular holders of the political sovereignty is a result of historical evolution. This process has thrown the supreme power in most civilized States into the hands of the mass of the people.

CHARACTERISTICS OF SOVEREIGNTY. In the narrower sense, sovereignty is generally regarded as absolute. There is no limitation of a legal or governmental character upon the exercise of its power. Legally speaking, all governments, whether monarchical, aristocratic, or democratic in form, are absolute. There are physical and moral limitations upon it, but, so far as the legal organization is concerned, there is no other organization or association within the limits of the State which can resist in any legal way the commands of the sovereign. In the broader sense of the term, political sovereignty is not absolute, since the ruling element in the State, however powerful, is never strong enough to be absolute in all things. It is also pointed out by some authorities that there may be and actually are legal limitations on the sovereign power. Thus in the United States there is no legal way of depriving the States of their equal suffrage in the Senate without their consent (Const., Art. v.), and in Germany the special rights of the States are likewise protected (Art. lxxvii.). It has also been strongly urged that the self-limitation of a State through its own Constitution gives rise to inviolable rights against the supreme power, and that therefore, although limited only by its own act, the sovereignty of a State should be regarded as legally limited, and hence not absolute in character.



Furthermore, sovereignty in the narrower sense of the term is indivisible. There cannot be two sovereign powers acting on the same territory in an organized State. Two supreme powers having jurisdiction over the same persons and things would be logically impossible in a unified State. One must be sovereign and the other subordinate. Both cannot be the highest, the supreme authority. The King cannot be half-sovereign and

the people half-sovereign, nor in a federal system can the various members of the union be partly sovereign and the central authority also partly sovereign. What seems like the division of sovereignty in a 'federal State' is, on closer analysis, found to be either the actual sovereignty of the political society as a whole, as in the United States, or the complete sovereignty of a number of independent States, associated for certain common purposes, as in the Confederate States. The practical difficulty arises from uncertainty as to the degree of centralization in the given system.

The *location* of sovereignty has been a vexed question, especially in connection with the rise of modern constitutionalism. The sovereignty of the King and that of the people have been stoutly and ingeniously defended by the partisans of court and commonalty. In general the theory of popular sovereignty has triumphed, although in Germany the doctrine of State sovereignty has been accepted as a compromise. There the State, including both King and people, is declared to be the repository of supreme power by most publicists. The location of sovereignty has also been a subject of discussion as well as actual warfare in Germany and the United States, and in both instances decision has been against the individual States. See STATES' RIGHTS.

EXTERNAL SOVEREIGNTY. States possessing certain powers, such as that of negotiating treaties, declaring war, and regulating their internal administration, are called sovereign powers and are the parties to international law, entitled to its rights and privileges and liable to its duties and responsibilities. In international law sovereignty is not regarded as absolute, since no State is wholly independent of the other members of the family of nations. Some States frequently receive commands from and are practically in subjection to other nations, but are nevertheless treated as sovereign powers for the purposes of international law. Such are Turkey, Servia, and Egypt. Moreover, in international law, sovereignty is generally looked upon as divisible in nature. Certain States are termed half-sovereign or semi-sovereign. A State may yield up its right to negotiate with other powers, or the right to make war, or may surrender the control of a large part of its internal administration, and yet remain in the eyes of international law at least a semi-sovereign State. We may thus have a State which is sovereign internally—that is, over its own subjects—and at the same time subordinate to the commands of some other State externally, as was Madagascar. In fact, the territorial expansion of the Great Powers has given rise to a variety of complicated relations between strong and weak States, such as the protectorate, suzerainty, and the 'sphere of influence,' which make exceedingly difficult the logical application of the conventional idea of sovereignty, and, indeed, can be explained only by reference to the category of international law.

In recent years it has been maintained that sovereignty has no place among the concepts of political science, and should properly be eliminated from its terminology. Sovereignty and absolutism are regarded as identical in nature, and it is declared that constitutionalism, federalism, and imperialism alike require that this concept, born in the days of the struggle with feudalism, should now be abandoned. Other publicists maintain that a State may exist as a State although devoid of the attribute of sovereignty. There may be, in other words, a non-sovereign State, of which such communities as Bavaria and Saxony would be types. Such 'States' possess true political power, governing in their right, and not by delegated authority, but are to be classed as non-sovereign States, inasmuch as they are subordinate to the Empire as a whole. The same position has been claimed for the members of the American Union by Woodrow Wilson.

SOW-BUG.

SOW-BUG. A small carnivorous crustacean of the family Oniscidæ, the species of which live under logs in the woods and in similar places. It is an isopod. See CRUSTACEA; ISOPODA; and compare GRIBBLE.

SOWER, sour (or **SAUR**), CHRISTOPHER (1693-1758). An early American printer and publisher, born at Laasphe, near Marburg, Germany. After receiving a university education, and studying medicine at Halle, he emigrated to Pennsylvania in 1724, and in 1731 settled at Germantown. There in 1738 he set up a printing press and began the publication of an almanac in German, which was continued by his descendants for sixty years. In 1739 he issued the first number of *Der Hoch-Deutsch Pensylvanische Geschichte-Schreiber*, a quarterly magazine, the first of the sort published in Pennsylvania. In 1743 he published a quarto edition of Luther's translation of the Bible in German, which was, with the exception of Eliot's Indian Bible, the first to be published in America. He continued his activity in publishing both English and German works, and in connection with that business established a type foundry, the first in America, a paper mill, and an ink factory. He is also generally credited with being the inventor of cast-iron stoves.

SOWERBY (sou'ĕr-bĭ) **BRIDGE.** A manufacturing town in the West Riding of Yorkshire, England, 3 miles southwest of Halifax. Its chief buildings are Christ Church, dating from 1526 and rebuilt in 1819, the town hall, and municipal offices. The town owns the gas works, slaughter houses, and public baths. Woolens are manufactured. Population, in 1901, 11,500.

SOW THISTLE (AS. *sugu istel*, from *sugu*, sow + *istel*, thistle), *Sonchus*. A genus of about 30 species of Old World plants of the natural order Compositæ. Several species have been introduced in the United States. The common sow thistle (*Sonchus oleraceus*) is a somewhat branching annual weed 2 to 3 feet tall, with small yellow flowers, common in richly cultivated soils. The tender tops and leaves are much used in Northern Europe as greens. The field sow thistle (*Sonchus arvensis*) is a perennial with large yellow flowers and found in similar soils. The Alpine blue sow thistle (*Lactuca alpina*) is a native of the mountainous parts of Europe.

SOXHLET, zōks'lĕt, FRANZ (1848—). A German agricultural chemist, born at Brünn, Austria, and educated at Leipzig. In 1879 he was appointed professor of agricultural chemistry at the Polytechnic Institute in Munich and superintendent of the principal Bavarian agri-

cultural experiment station. There he became distinguished for his experiments in the chemistry of milk and its action. He put forth a new theory of the formation of butter and devised a method of extracting fats by means of ether. His investigations, embracing such subjects as the difference between human and bovine milk, the sterilization of milk, and the determination of the percentage of fat contained therein, the organic changes of tissue in the sucking calf, the varieties of sugars, and the formation of fats from carbohydrates, are all valuable.

SOY BEAN (Jap. *si-yan*, Chin. *shi-yu*, soy), *Glycine hispida*. An upright bushy annual leguminous plant 2½ to 4 feet tall, a native of Asia, where it has long been cultivated, especially in China and Japan, and whence it has been introduced into Europe and America. The name soy is derived from the Japanese *shoyu*, a food prepared from the seeds. The numerous varieties in cultivation vary principally in the color, shape, and size of the seed and the length of the growing period. Besides its use as a forage plant (see below) this crop is also frequently grown as a soil-improver on soils deficient in nitrogen. It thrives best under conditions favorable to corn culture and on soils of medium texture well supplied with potash, phosphoric acid, and lime, although it also gives good returns on light poor soils. If planted for hay or fodder the seed is sown broadcast or closely in drills in the spring when the soil has become thoroughly warm; if for the beans, in drills about three feet apart and cultivated like corn. When used for hay, ensilage, or green fodder the crop is cut when the plants are in bloom, when harvested for the seed, before the pods become ripe enough to burst and scatter the seeds. From eight to ten tons of green forage are obtained from an acre. About 40 bushels of seed per acre is considered a satisfactory yield, but sometimes from 75 to 100 bushels are obtained. Insect enemies and plant diseases do not seem to be troublesome.

Soy-bean hay cut at the proper season and well cured has a high feeding value, but since the stems become woody and the leaves fall off badly, the crop is put into the silo either alone or mixed with corn ensilage. The seed, being a very concentrated feed, is usually ground and mixed with other feeding stuffs. Fed alone or with other materials the meal is quite thoroughly digested; experiments with sheep showed that 91 per cent. of the protein and 84 per cent. of the total organic matter was assimilated. Similar values of the seed were 87 and 85 per cent.

Though the soy bean is eaten more extensively in China and Japan than in any other countries, so far as can be learned it is never eaten there as a vegetable, but as more or less complex food products of which natto, tofu, miso, yuba, and shoyu are commonly made in Japan and similar products in China. The composition of these foods is given in the following table:

COMPOSITION OF FOOD PRODUCTS MADE FROM SOY BEANS

SOY-BEAN FOOD PRODUCTS	Water	Protein	Fat	Nitrogen free extract	Fibre	Ash
	Per cent.	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*
Fresh tofu	89.00	5.00	3.40	2.10	.....	0.50
Frozen tofu	18.70	48.50	28.50	2.60	.....	1.70
Natto	15.32	41.42	23.65	15.05	1.48	3.08
Yuba	21.85	42.60	24.62	7.65	.....	2.82
White miso	60.70	5.70	24.40		12.60	6.60
Red miso	60.40	10.08	18.77		8.25	12.50
Shoyu (soy sauce)	63.29	8.31	5.10		.....	19.45

Most of these soy-bean products, which have been popular from ancient times, are fermented. The cell walls and other carbohydrate materials are broken down, the cell contents rendered more accessible to the digestive juices, and at the same time peculiar and pleasant flavors are developed.

The statement is frequently made that the Orientals live almost exclusively upon rice, eating little or no meat. It is not, however, generally known that the deficiency of protein in the rice is made up by the consumption of large quantities of these soy-bean products, which are said to take the place in the Japanese dietary of meat and other animal nitrogenous foods too costly to be eaten by the populace. They are eaten in some form by rich and poor at almost every meal. A large number of dietary and digestion experiments have been made in Japan in which soy-bean preparations formed a considerable part of the food consumed. Generally speaking, the nitrogen was well assimilated. The beans are sometimes used for bread-making, and when roasted as a substitute for coffee.

SOYER, swä'yā', ALEXIS BENOÎT (1809-58). A French cook and writer on cookery, born at Meaux-en-Brie. After the Revolution of 1830 he went to England, where he became chief cook to the Duke of Cambridge. In 1837 he became chef at the Reform Club. In 1847 on a Government appointment he proceeded to Ireland, where a serious famine prevailed, and there erected and conducted a large number of kitchens from which food was served at half the regular price. In 1855 he went to the Crimea, where, in conjunction with Florence Nightingale, he directed reforms in the dietaries of the military hospitals. This work he continued after his return to England at the close of the war, with the result that a radical dietary reform both in the hospitals and in the ordinary barrack rations was effected. He wrote extensively on cookery, among his published works being: *The Gastronomic Regenerator* (1846), *The Modern Housewife* (1849), *A History of Food in All Ages* (1853), *A Shilling Cookery Book for the People* (1855), *Soyer's Culinary Campaign with the Plain Art of Cookery for Military and Civil Institutions* (1857), *Instructions for Military Hospitals* (1860). Consult also Volant and Warren, *Memoirs of Alexis Soyer* (London, 1858).

SOYESHIMA, sō-yĕsh'ĭ-mȧ, TANÉOMI. A Japanese statesman and scholar, born at Saga, in the Province of Hizen, in Kiushiu, and educated in the local school for samurai. In 1866

at Nagasaki he came under the influence of Guido F. Verbeck (q.v.), an American missionary, by whom he was taught, particularly in the New Testament and the Constitution of the United States. Giving his special attention to the study of law, he was in 1868 made a commissioner by the new Government for framing laws and later an Imperial councilor. In 1871 the Mikado sent him to Russian Siberia to settle the boundary question concerning the island of Saghalien, and in the following year he was an ambassador to the Emperor of China regarding Loo-choo. As Minister of Foreign Affairs he was instrumental in releasing the Chinese coolies from a Peruvian vessel at Yokohama and thus ending the coolie traffic. (See MACAO.) On his return to Japan he resigned his office because of differences on the Korean War question, but in private life continued to be influential in agitation for constitutional government, and later was invited to reënter the Cabinet. He revisited China in 1876, was welcomed and lauded by the mandarins for his scholarship, and became a trusted private adviser of the Emperor, especially in his library.

SO'YOTS. A people of the Sayan-Altai region, Mongolian in race, usually classed with the Samoyeds. They are of rather low stature, with brachycephalic head form. They are at present a mixed people, with the anthropological type of the Samoyed most prominent. They are hunters and nomads, and number some 35,000 or 40,000 in the Chinese Yenesei basin.

SOZ'OMEN (Gk. *Σωζομενός, Sōzomenos*), HERMIAS SALAMINIUS. A Church historian of the fifth century. He came from a wealthy family of Palestine and spent at least a part of his life as a lawyer at Constantinople. He wrote a history of the Church, covering the period from 323 to 439. The latter portion, dealing with the years from 423 to 425, is lost. He follows Socrates, but has some independent material, especially upon monastic matters. The work was edited by Hussey (Oxford, 1860), and there is an English translation by Hartranft (New York, 1891).

SPA, spä. A famous watering place in the Province of Liège, Belgium, 20 miles southeast of the city of Liège (Map: Belgium, D 4). It is attractively situated in a hilly region. The waters of the Pouhon spring are largely exported. It is in an inclosure erected to commemorate the visit of Peter the Great in 1717. The *Etablissement des Bains*, a handsome modern structure, is in the Place Royale adjacent to the Casino. There are noted manufactures of woodenware, which is stained brown by being steeped in the mineral waters. Population, in 1900, 8192. Spa gained prominence in the sixteenth century and reached its greatest popularity in the eighteenth century, when it was the favorite resort of the European nobility. It declined in importance after the French Revolution, but is rapidly regaining its former prestige. About 15,000 people visit the place annually. 'Spa' as applied to mineral springs originated in the name of this town.

SPACE (OF., Fr. *espace*, from Lat. *spatium*, space; connected with *spes*, hope, OChurch Slav. *spěti*, to result, Lith. *spėti*, to have leisure, AS. *spōwan*, OHG., *spouan*, to succeed, Skt. *sphay*, to fatten). A term denoting the physical basis for dimension and magnitude. From ancient times it has occupied a large place in philosophical discussions. Parmenides and Plato make it equivalent to non-being. Leucippus, on the contrary, recognizes its reality. Space of course is presupposed as a fundamental reality in all materialistic atomism. Aristotle defines place as limit, thereby committing himself to the denial of empty space. In modern philosophy the nature of space is one of the central questions. Descartes considered it one of the two attributes of reality, and Spinoza followed him in making it one of the two known attributes. Leibnitz cannot recognize space as an original attribute of his monads, else they become material and not spiritual. Space is therefore only the order of possible coexistent phenomena of sense. When thought clarifies away the obscurities of sense space is no longer left as a relation in which realities stand to each other. Natural science, however, and materialism have vigorously maintained the ultimate reality of space. Berkeley practically reduces space to time and Hume makes it the disposition of colored points. Kant taught that space is a form of perception; phenomena appear in space simply because the mind gives them a local habitation, and, he argues, we may not say that things in themselves are spatial. He tries to prove the *a priori* character of space from its inevitableness in our experience; and according to his view whatever is *a priori* must be of subjective origin. Hegel regards it as 'the first or immediate characteristic of nature,' and yet it is an abstract characteristic, not an independent entity. At the present time there are advocates of almost all theories that have in the past been broached. There are transcendentalists (Kantians); there are realists, who attribute an independent reality to space as if it were a vessel to be filled with objects; there are those who believe that our idea of space is so full of contradictions that it has no ultimate value; and there are those who believe it is a real quality of experienced objects and a real relation between such objects, but who refuse to attribute to it an existence entirely apart from the objects it qualifies or correlates. The last mentioned view seems to be in closer agreement with the facts than any of the others. According to this view pure space is an abstraction having no actual existence. Space is always in experience the figure of some object or the distance between some objects, or in some way an attribute or a relation, not a self-existent thing. The question of the origin of our spatial ideas is psychological. A question that has always been much mooted is that as to the finitude or the infinity of space. Kant tried to cut the Gordian knot by denying the reality of space as a thing in itself, whereby he thought to be able to say that the whole trouble was removed. Space is, therefore, for Kant neither infinite nor finite, but there is no limit to our power to produce space. It is indefinitely producible. Taking, however, the view that space is a real but not an independent element in the objective world, the question as to the infinity of space becomes one to be answered only on the basis of induction (q.v.); and, if we may judge from past experience, we should say that there is no definite indication that experienceable spatial objects are limited. But the data are not sufficient for a dogmatic judgment. But even if an end of perceptible objects were found imagination would add further objects, and thus remove the limits. See Baumann, *Die Lehre vom Raum, Zeit*

und Mathematik in der neuen Philosophie (Berlin, 1868-69); Deichmann, *Das Problem des Raumes in der griechischen Philosophie bis Aristoteles* (Leipzig, 1893); Hodgson, *Time and Space* (London, 1865); Lechalas, *Etude sur l'espace et le temps* (Paris, 1896); Saleta, *Exposé sommaire de l'idée d'espace* (ib., 1872); also consult the metaphysical works of Kant, Hegel, Lotze, Bradley, Bowne, Hobhouse.

SPACH, späch, Ludwig Adolf (1800-79). An Alsatian historian, born and educated at Strassburg. In early life he was a tutor and traveled extensively. He was Librarian of the Department of Bas-Rhin, Alsace, and head of the prefect's cabinet (1840), and in 1872 became honorary professor at Strassburg. His writings include *Moderne Kulturzustände im Elsass* (1873-74); *Dramatische Bilder aus Strassburgs Vergangenheit* (1876); *Zur Geschichte der modernen französischen Litteratur, Essays* (1877). Spach, under the pseudonym Louis Lavater, also wrote the novels *Henri Farel* (1834), *Le nouveau candide* (1835), and *Roger de Manesse* (1849).

SPADEFOOT. A 'toad' of the family Pelobatidæ, prominently characterized by the inner bone of the ankle (tarsus) being covered with a hard, sharp-edged horny sheath, which forms an effective tool for digging. Three species belong to Western Europe and the Mediterranean region, of which the best known is *Pelobates fuscus*,

FOOT OF A SPADEFOOT.
Under surface of a left foot, showing the 'spade' (a).

which makes deep holes in the sand, where it hides during the day, coming out to hunt at night. The very numerous eggs are laid in strings in water, and the tadpoles grow to a disproportionately large size, shrinking greatly when they change into young toads. American representatives of the family are several species of the genus Scaphiophus, one of which (*Scaphiophus solitarius*), common from New Jersey southward in all suitable places, is renowned for the remarkably loud noise it makes when calling in the spring. Other species are found in Mexico. Consult: Gadow, *Amphibia and Reptiles* (London, 1902); Abbott, *A Naturalist's Rambles About Home* (New York, 1884).

SPAETH, spāt, Adolph (1839—). A German-American theologian, born at Esslingen and educated at Tübingen. In 1864 he came to the United States and for ten years was pastor of a church in Philadelphia. He then became professor of New Testament exegesis in the theological seminary of the Lutheran Church at Philadelphia. He published the American edition of Bücher's *Hand-Konkordanz* and his own *Saatkörner* (1893).

SPAGNA, spä'nyȧ, Lo (c.1480-c.1530). A Spanish painter domiciled in Italy, known as Giovanni lo Spagnuolo or Giovanni di Pietro. Although one of the most distinguished pupils of Pietro Perugino, with whom—and with his own fellow pupil Raphael—he has often been confused, little is known of this Raphaelesque painter, save that he was born in Spain, was established in Umbria after 1500, studied under Pintoriccino, and was made head of the Painters' Guild of Spoleto in 1517. His chief works are in Assisi, Perugia, Spoleto, and Todi. In the National Gallery in London there is also a fine example, "The Agony in the Garden," and at Caen is the "Marriage," long attributed to Raphael, and a "Saint Jerome."

SPAGNOLETTO, spä'nyȯ-lĕt'tȯ, Lo. The familiar name of the painter Jusepe de Ribera (q.v.).

SPAHIS (Fr. *spahi*, from Hind., Pers. *sipāhī*, soldier, horseman, from Pers. *sipāh, supāh*, army). Native Algerian cavalry, originally formed from the Turkish spahis serving in the country when it was conquered by the French. The uniform is like that of the Arabs. The natives cannot hold any rank higher than captain.

SPAHR, spär, Charles Barzillai (1860-1904). An American author and journalist, born at Columbus, Ohio. He was educated at Amherst College, at Leipzig, and at Columbia University. In 1886 he became an associate editor of *The Outlook*. His publications include "Essay on the Present Distribution of Wealth in the United States" (1896), in the *Library of Economics and Politics*, and *America's Working People* (1900).

SPAIN (Sp. *España*, from Lat. *Hispania*). A kingdom occupying about six-sevenths of the area of the Iberian peninsula. Lying between latitudes 36° and 44° N. and longitudes 9° 15′ W. and 3° 20′ E., it is bounded by France, the Atlantic (in the north the Bay of Biscay), Portugal, and the Mediterranean. At the extreme south the narrow strait of Gibraltar separates it from Morocco. Its continental area is 192,004 square miles. Including the Canary and Balearic islands and the small possessions on the north and west coasts of Africa, its total area is 194,783 square miles. The gorges of the Miño (Minho in Portuguese), the Guadiana River, and the cañons of the Duero (Douro) and Tagus (Sp. Tajo) constitute to a great extent a natural demarcation between Spain and Portugal.

Topography. The predominating natural feature of Spain is the great Iberian tableland which occupies the middle and much of the northern portion of the peninsula—a very compact, lofty, and mainly treeless plateau sloping as a whole to the west. The surface of the tableland rises from 1000 to 3000 feet above the sea, and in its highest part, on the edge of the Iberian Mountains, which wall in Castile on the east, it is 3500 to 5000 feet high. This lofty plateau is crossed by many mountain ridges called sierras, the most important of which are the Castilian Mountains in the centre of the kingdom (Sierra de Guadarrama and Sierra de Gredos), which divide the extensive high plains of Old Castile from those of New Castile. The northern limits of the tableland are the Cantabrian Mountains, the western continuation of the Pyrenees, and the southern limits are the Sierra Morena, which is nothing more than the steep edge of the plateau separating Castile from Andalusia. The highest mountains of the tableland are those of the central region, such as the Plaza Almanzor (8730 feet) in the Sierra de Gredos, and the Pico de Peñalara (7890 feet) in the Sierra de Guadarrama; but these summits rise scarcely 5000 feet above the general level of the plateau. Some of the depressions between the mountain ranges are narrow valleys drained by many

rapid rivers, and communication across the sierras from valley to valley is difficult.

The long unbroken chain of the Pyrenees forms a mighty barrier on the side of France. They form a wall of exclusion over which no highways have been built, the mountains being circumvented only by roads at their extreme ends. The highest peak of the Pyrenees (which is situated on the Spanish side of the boundary) is the Pico de Aneto (Pic d'Anethou), whose summit is about 11,160 feet above the sea. The Sierra Nevada, in the extreme south, close to the coast, attains an elevation of 11,420 feet, in Mulahacén, the highest mountain in Europe (regarding the Caucasus as not belonging to Europe) outside of the Alps.

The alternation of mountain and river valley in Spain is very conspicuous—first the Cantabrian Mountains and the Duero River in the north; then in succession the Guadarrama Mountains and the Tagus, the Toledo Mountains and the Guadiana, the Sierra Morena and the Guadalquivir, with the Nevada Mountains, in the south. The coast throughout nearly its whole extent is bordered by mountains, giving it a very rugged character, and there are few openings that may be converted into good harbors. The coasts are further impaired for shipping by dangerous currents which tend to throw vessels on the shore. Barcelona has the only really first-class harbor. Spain contains two great low plains. One is the plain of Aragon in the northeast, through which flows the Ebro, which drains the greater part of Northeastern Spain. This plain extends between the Pyrenees and the Iberian Mountains, and is walled in from the Mediterranean by the Catalonian Mountains. The other is the Andalusian plain in the southwest, traversed by the Guadalquivir River and extending between the Sierra Morena and the Sierra Nevada. These plains, like the narrow and comparatively short coastal plains, are among the most fertile regions of Europe, but are of small extent compared with the wide-spreading tableland.

HYDROGRAPHY. All the long rivers, excepting the Ebro, empty into the Atlantic, as the main water parting is nearer to the Mediterranean than to the ocean. Most of the rivers are for the greater part of the year very deficient in water and not navigable, and, therefore, of small value for shipping. They lie too far below the general level to be of much use even for irrigation. The Miño, Duero, Guadiana, and Tagus are not navigable in Spain, though they are useful for commerce to some extent in Portugal. Of the 800 miles of waterways in Spain only 300 miles are available the year around. The Guadalquivir, which flows through a part of the Andalusian plain, is the deepest river in Spain; vessels ascend it as far as Seville, and small boats reach Cordova. It draws most of its water supply from the high mountains of Andalusia. The Miño and Duero flow across the plateau of Old Castile; the Tagus, the longest of the rivers, courses through New Castile. These rivers with the Guadiana flow in deep rocky valleys. The Ebro reaches the Mediterranean through a tortuous gorge. With its largest tributaries, which bring much water from the slopes of the Cantabrian Mountains and the Pyrenees, it is of great value for irrigating the fertile low lands of Aragon. There are no important lakes, the small lake of Albufera, near Valencia, being the largest.

CLIMATE AND SOIL. Spain has almost a continental climate notwithstanding the great length of its coast line. The range of temperature between summer and winter and the diurnal variations are great and rapid. Spain has often been misconceived as a land of eternal spring, in which groves of olives and oranges thrive. The climatic conditions adapted for these fruits are found, however, only in the coast districts, and in Andalusia, in the extreme south, and Galicia in the northwest. The summers of the tableland are so hot that nearly all the rivers are dried up and the earth becomes so parched and unproductive that whole villages are sometimes compelled to migrate. The nearness to the Sahara, across the narrow Mediterranean, exposes the southern part of the country to intense heat. On the other hand, the height of the tableland causes the winter temperature to be low. At Madrid, in the centre of the peninsula, there is often skating in winter, although in summer the temperature may rise to 107° F. in the shade, making the climate of Madrid the most extreme in Western Europe. On the southern coast, by contrast, the mean temperature in January is 55°, and frost and snow are extremely rare. The mean temperature at Malaga, on the south coast, is in summer 77° and in winter 57°; at Barcelona, in the northeast, on the Mediterranean, the summer and winter means are respectively 77° and 50°, and at Madrid, in the centre, 75°, and 44.6°. The climate is also one of the driest in Europe, and has been made still drier by the destruction of the forests. The rainfall is very small, only 8 to 12 inches per annum in the interior. The evil of deficient precipitation is increased by the fact that, as in all Mediterranean lands, the largest rainfall is in the winter months after the growing season. Irrigation is, therefore, the basis of agriculture. The soils need only moisture to make them very fertile. The hot south wind of Andalusia, known as the Solano, and the cold north wind, called the Gallego, are peculiar to Spain.

FLORA. The vegetation is that of Central Europe. It is, however, very monotonous on the whole, for the number of plants capable of supporting great extremes of temperature is naturally limited. Herbs and shrubs predominate on the plateau, but a greater variety of plants is found in ascending from the plains to the mountain summits. Woods are met with only on the slopes of the mountains, where chestnut trees and oaks of various species occupy the lower zone and conifers extend to the tree limit. The elm is found in many river valleys, and is planted with success in some cities. The poplar is one of the cultivated trees, and the beech forms large forests on some of the mountain slopes. The vine flourishes on stony soil, and the olive tree is an important element in the national wealth. The cork tree, from which the bark may be stripped every ten years, is found in Granada and southwest of the Pyrenees, and also in various other districts. Esparto, or alfa, and rushes, largely used for baskets and mats, are grown on the coast and in the interior; sugar cane is cultivated in Andalusia and Valencia; European and Mediterranean fruits and nuts, such as apples, pears, oranges, lemons, almonds, chestnuts, and

figs, grow in abundance; the southern provinces also raise maize and rice; and Spain is the chief saffron-producing country in the world.

FAUNA. The remnants of the forests still harbor wolves, lynxes, wildcats, foxes, and even wild goats. The bear is now rare. Deer, hares, and other game abound, and wild boars of great size and strength are hunted in the oak forests.

GEOLOGY AND MINERAL RESOURCES. The tableland is a very ancient and much altered block of the earth's crust, chiefly composed of Archæan and Paleozoic rocks, for the most part of Cambrian, Silurian, and Devonian formation. On the north and south margins of the tableland two younger land masses were upheaved into lofty bordering ranges, the Pyrenean-Cantabrian on the north, and the Andalusian on the south. The Pyrenees are an example of a young folded mountain system built up of parallel belts usually in a northwest and southeast direction. The crust folds of the Andalusian system have a low outer zone of folded Mesozoic and Tertiary strata and a lofty inner girdle, in which the Archæan and Paleozoic rocks rise high above the Mediterranean. Spain had the reputation till the discovery of America of being the richest metal-producing country in the world. It is the most metalliferous land of Europe, not excepting the Ural mining district. The rapid development of mining has been impeded by insufficient fuel and defective means of communication; but the chief reason for the inferior condition of the mining industries is found in the lack of enterprise and skill among the Spaniards. Foreign capital and energy have brought about most of the development in recent years, and the greater part of the ore is exported to foreign countries in its raw state. The rich iron ore and the copper ore go to England and Germany, and Spanish gold and silver ores are melted at Freiberg in Saxony. The great iron fields of North Spain have been chiefly tributary to Great Britain, whose iron-makers have imported from first to last about 100,000,000 tons of this ore, chiefly through the port of Bilbao. It is especially desired in Great Britain and Germany because it is hematite of the best steel grade. These mines along the Bay of Biscay are now nearly exhausted, but iron of excellent quality is also found in considerable quantities in Andalusia, the Sierra Morena, and Leon. In 1903 a fresh source of oxide of iron ore, discovered 85 miles from Malaga, began to enter into commerce.

Nearly every province contains coal measures, the resources of the country being estimated at 13,000,000,000 tons. Coal is worked chiefly in Asturias, Leon, and Lérida, but the amount mined is comparatively small and the railroads, even in the coal-producing provinces, burn English coal. The quicksilver mines of Almaden are the richest in the world. Spain produces more lead than any other country of Europe, and lead-mining in recent years has given new life to Granada, most of it being obtained from the mines of the Alpujarras (q.v.) and those of Linares in Jaén. Copper is found in inexhaustible quantities on the Rio Tinto, in Southern Spain, where mines have been worked by British and German capital since 1873. The ore is also mined in Murcia, Oviedo, Jaén, and Zamora. Salt is chiefly obtained by evaporation of sea water at Cadiz, Valencia, and the Balearic Islands, though Catalonia and New Castile abound in rock salt. Among the other important minerals are sulphur, soda, saltpetre, alum, graphite, and potter's clay. Mineral springs are numerous, the best known being the thermal sulphur springs of Mombuy, in Catalonia. In 1901 there were in Spain 2291 productive mines employing 87,409 workmen. The output of raw minerals in the same year was valued at $26,960,328. The quantities and values of the more important minerals produced in 1901 (the peseta being valued at 14.28 cents) were as follows:

CRUDE MINERALS	Tons	1,000 pesetas
Iron	7,906,517	40,833
Coal	2,556,591	28,932
Copper	2,672,365	45,756
Lead	174,326	13,666
Silver-lead	207,188	33,578
Quicksilver	28,367	5,200
Zinc	119,708	4,029
Manganese	60,235	1,008
Salt	345,090	3,000

AGRICULTURE, LIVE STOCK, AND FISHERIES. Spain's largest interests are agricultural, over half the people living by farming, which supplies about two-thirds of the exports. In general the husbandry of Spain is of an antiquated character. Farm methods and implements are primitive, and the special disadvantages are that much of the land is owned by the nobility in large holdings, the taxes are high, and communications poor. Four-fifths of the area is classed as productive; 33.8 per cent. is devoted to general agriculture and gardening, 3.7 to vineyards, 1.6 to olive-growing, 19.7 to natural grasses, and 20.8 to fruit. Pasturage is abundant, even the great plains of the dry tableland being covered in summer with aromatic herbage on which sheep thrive, while in winter the flocks are driven down to the lower districts, especially to Estremadura. Although about 250,000 of the holdings are in large estates, the subdivision of the soil has been rapidly advancing in recent years. As in all countries in which winter rains prevail, irrigation, as stated above, is necessary during the rainless months. Artificial watering in a wide belt along the Mediterranean coast transformed a great area into a region of remarkable fertility. These lands are called huertas or gardens. All available fertilizers, including street sweepings, are used, with the result that no land in the world is more productive than the huertas. Here are produced southern fruits, vegetables, sugar cane, maize, and other crops requiring abundant moisture. Only about nine per cent. of the country, however, is artificially irrigated. The Government in 1900 took steps to enlarge the agricultural area by the construction of reservoirs and irrigation canals. The plans adopted for the irrigation system cannot fully be carried out for many years. Lands now irrigated in the valleys of the Ebro and Tagus are yielding twelve times as much fruit as the dry lands.

The most profusely watered and the best cultivated region is Valencia, where three or four crops are harvested every year. The level parts of Catalonia, Murcia, and Andalusia are also very fertile, while Asturias and Galicia, though less productive, are carefully cultivated. A

large part of the dry lands of the interior is untilled, though where subterranean waters are near the surface wheat and other cereals are grown. In good years the northern provinces export cereals, though the wheat crop does not always meet the home demand. A region extending widely around Valladolid is called the granary of Castile. The swampy lands bordering the Gulf of Valencia yield fine crops of rice. Oats are little grown; rye is the chief breadstuff in the part of Spain fronting on the Atlantic; and barley is grown for cattle food.

The areas in acres devoted to the cereal crops in the year of 1901 were as follows: Wheat, 9,172,196; barley, 3,301,115; rye, 1,968,989; oats, 944,198; maize, 1,156,126; rice, 84,463.

The most important branch of husbandry is the cultivation of the vine, and wine at times forms as much as a third of the total exports. As much as 700,000,000 gallons is sometimes produced, but most of the wines are poorly made. In the African climate of the south are produced the famous wines of Malaga, Alicante, and Jerez (Sherry). These wines are highly valued both for medicinal and table purposes. Besides wine Valencia, Malaga, and Alicante also export great quantities of raisins and grapes. The most profitable crop of the huertas is fruits. Oranges and lemons thrive best along the Gulf of Valencia and in the Balearic Islands. Large quantities of the peel of the bigarade or bitter orange are sent to Holland to be used in the manufacture of the liqueur Curaçao. Olives and olive oil are large products, though somewhat less important than oranges in the export trade. No other country produces so much olive oil as Spain, and most of the product is consumed at home. The industry is chiefly developed in the southern provinces, Seville supplying the greater part of the olives for table use, while the oil comes from Cordova. As a large amount of the home product is poorly made, much of the oil is refined in France; but efforts have been made in recent years to improve the quality of the oil, so that it may compete in foreign markets with French and Italian oils. Leguminous vegetables, a staple article of food in Spain, are raised in sufficient quantity to provide a surplus for export. Esparto, which thrives in droughty lands, grows in the southeast and is sent in large quantities to England. Tobacco is cultivated, but much is also imported; the tobacco industry, which is a Government monopoly, is an important source of revenue. Hemp and flax are grown chiefly in the northern provinces.

Though the area in forests is said to comprise 7,500,000 acres, the timber supply is deficient and large quantities must be imported from Scandinavia and North America.

The breeding of domestic animals was once of great importance in Spain, but the industry has retrograded. The most famous domestic animal is the fine-fleeced merino sheep, now not so numerous as formerly. Though Spain raises more sheep in proportion to population than any other country of Europe, the number has been reduced from 23,000,000 to 16,500,000 since 1890; and the famous fine-wool merinos have been largely replaced by coarse-wool breeds. In the mountain districts about 2,600,000 goats are reared for their milk, flesh, and skins. A single peasant in Sierra Nevada sometimes owns as many as 3000 or 4000 goats. The best horses, originally of Arab stock, are raised in Andalusia and Asturias; but horse-breeding is much neglected in favor of the highly prized mule, the kingdom containing only about 400,000 horses. On the other hand, there are 1,521,000 mules and asses, which are bred with great care in most parts of Spain. The number of cattle amounts to barely 2,217,000 head. They are most numerous on the pastures of the northwest, where the rain from the Atlantic is abundant. To this region dairy farming is confined. The wild cattle specially raised for bull-fighting are obtained from the Sierra Guadarrama and the Sierra Morena. Hogs, about 2,000,000 in number, are reared chiefly in the mountainous parts of the kingdom, especially in the north and in Estremadura. Silkworm culture is only one-tenth as large as half a century ago, and is chiefly confined to the regions around the Gulf of Valencia. The yield of cocoons in 1901 amounted to 2,190,000 kilograms. Most of the raw silk is sold to France and large quantities of silk goods are imported. The sea fisheries are important. The home industry does not begin to supply the demand and much fish is imported from Norway. The total number of boats engaged in the industry in 1892 was 14,726; fishermen, 67,197. The chief catches are sardines, tunny, and cod.

MANUFACTURES. The manufacturing industries do not supply the home demand. Catalonia has always been the home of the greater part of Spanish manufactures. Next in order come those districts of Galicia, Asturias, and Vizcaya in which water power abounds and also a few towns in the interior, such as Madrid, Seville, and Toledo. Barcelona, in Catalonia, is the leading manufacturing town and the chief seat of the textile, metal, paper, and leather industries and lace-making. The cotton industry, which is improving on the whole eastern coast, depends for its patterns upon France and England and does not satisfy the home demand. The silk industry of Valencia, Murcia, and Andalusia and the woolen industry of Barcelona, Alicante, and Burgos also fail to supply the local consumption. Cordova, once famous for its horse-hide leather (Cordovan leather), no longer leads in the leather industry. The manufacture of tobacco is carried on extensively in the royal factories of Madrid, Valencia, Seville, and other towns, about 50,000 families being supported on the wages disbursed. Alcoy manufactures much cigarette paper, and paper-making is steadily growing in importance. The metal industry is most flourishing in Catalonia and the northern provinces near the largest sources of iron, but meets the domestic demand in no department. In the iron and steel industry, however, Spain is making every effort to supply the entire home demand. Large wire mills have been erected, and in 1903 the largest plant for the production of all classes of steel was completed at Badalona. Gold and silver wares are produced in large quantities in Madrid, Toledo, Seville, and Barcelona; and Gijón, Seville, and Madrid are noted for their glass and porcelain. In the manufacture of cotton goods 2,614,500 spindles and 68,300 looms were employed in 1901; the woolen manufactures used 662,000 spindles and 8800 looms; about 150 paper mills make printing, packing, writing, and cigarette paper; 47 mills produce beet, and 22 cane sugar, the total output in 1901 having been

86,243 tons. Under Government encouragement the production of the sugar beet is growing. More than 30 factories make glass; about 33,000 tons of corks are manufactured every year; and there are over 60 mills for expressing olive oil. The pickling of green olives is an important branch of industry; in addition to the large home consumption, some 6000 to 7500 tons are annually exported. There are about 400 factories engaged in sardine-canning, with about 16,500 workmen.

COMMERCE. The trade consists chiefly in the export of raw produce and the import of the larger part of the manufactures consumed. Wine, minerals, and fruits form the larger part of the exports. The imports are chiefly confined to cotton, coal, foodstuffs, textiles, lumber, and machinery. The domestic trade is seriously hampered by natural and artificial obstacles. The rivers are navigable only to a very small extent, the canal system is very deficient, the different provinces are separated from one another by lofty mountains, the common roads are very poor, and excessive rates are charged for freightage by rail. Spain's commerce with foreign lands is chiefly maritime, and England and France are the most important factors in it. The imports and exports, exclusive of gold and silver bars, in three years were as follows:

EXPORTS

DESCRIPTION	1900	1901	1902
Raw materials	$42,413,783	$43,563,968	$45,666,832
Manufactures	24,431,365	21,344,998	20,516,587
Food supplies	37,788,873	32,839,108	39,114,447
Total	$104,634,021	$97,748,074	$105,297,866

The following table shows in greater detail the various classes of goods which entered into the import and export trade, including precious metals, in two years, in pesetas (average value, 14.28 cents):

DESCRIPTION	Imports		Exports	
	1900	1901	1900	1901
	Pesetas	Pesetas	Pesetas	Pesetas
Stone, minerals, glassware, and pottery	106,480,129	112,686,699	159,124,433	150,298,509
Metals and their manufactures	45,849,988	34,952,014	101,422,310	98,912,374
Drugs and chemical products	76,340,119	79,996,894	20,154,902	20,651,895
Cotton and its manufactures	94,211,048	108,225,041	34,056,899	29,001,152
Other vegetable fibres and manufactures	25,224,672	23,396,478	1,308,698	922,467
Wool and hair and their manufactures	27,061,270	26,466,035	9,780,502	11,636,039
Silk and its manufactures	25,280,134	24,333,578	4,979,960	5,071,664
Paper and its applications	11,345,657	11,582,591	8,463,849	8,305,112
Timber and its manufactures	60,846,964	61,716,512	60,658,103	47,715,308
Animals and their products	82,320,185	70,867,651	65,498,346	61,478,108
Machinery, vehicles, and vessels	135,198,181	97,553,930	792,952	797,322

Other articles (special)	31,443,631	42,574,855	.....	.....
Total	874,805,812	846,776,949	753,589,499	692,070,584

The following table shows the distribution of the more important foreign trade in two years:

COUNTRY	Imports from (1899)	Imports from (1900)	Exports to (1899)	Exports to (1900)
	Pesetas	Pesetas	Pesetas	Pesetas
France	144,564,896	137,386,661	213,666,360	187,750,220
Great Britain	240,687,682	246,107,975	279,340,901	274,801,514
United States	119,558 539	105,834,020	13,195,777	17,415,050
Germany	64,543,730	77,792,154	25,436,218	31,804,682
Belgium	35,349,215	43,017,270	28,213,103	25,046,872
Russia	46,043,435	42,663,843	1,867,944	2,679,615
Italy	23,200,446	24,015,794	15,524,072	23,199,680
Sweden and Norway	21 091,476	24,783,175	2,702,859	2,482,547
Portugal	26,594,170	37,271,048	29,627,197	32,385,749
Argentina	24,843,715	30,553,983	13,042,623	12,607,616
Cuba	21,375,477	5,335,477	73,778,216	56,796,054
Philippine Islands	21,181,983	15,849,846	11,653,148	22,374,782
Porto Rico	9,751,437	3,227,480	13,042,623	12,607,616

Cotton, petroleum, staves, and lumber are the chief imports from the United States. The United States sales of raw cotton to the mills in the Barcelona manufacturing district averaged 267,093 bales in the three years 1900-1902. Wine, fruits, and cork wood are the chief exports from Spain to the United States. The following table shows the value of the total trade with the United States in three years:

	1900	1901	1902
Imports into Spain	$13,399,680	$15,480,288	$15,511,987
Exports from Spain	5,950,047	5,409,301	8,270,546

IMPORTS

DESCRIPTION	1900	1901	1902
Raw materials	$59,589,346	$61,146,277	$63,068,206
Manufactures	44,654,776	37,566,175	34,892,771
Food supplies	19,883,248	19,790,997	16,062,014
Total	$124,127,370	$118,503,449	$114,022,991

TRANSPORTATION AND COMMUNICATIONS. Much of the domestic trade is carried by coasting vessels, as Spain possesses more than 100 harbors large and small on its two seas. The home merchant marine is inferior, and most of the shipping is under the British and French flags. The merchant marine in 1900 comprised 449 steamers of 430,966 tons net and 693 sailing vessels of

110,968 tons net; total, 1142 vessels of 541,964 tons. In 1901 18,241 vessels of 14,503,348 tons entered and 17,118 vessels of 14,302,589 tons cleared from the Spanish ports. There is excellent communication with the chief Atlantic and Mediterranean ports of Europe and with the Philippine Islands and Cuba, and regular steamer service between New York and Barcelona and the north and south coast ports of Spain. New Orleans has regular steam communication with Barcelona and Bilbao. The most important Spanish ports are Barcelona, Cadiz, Malaga, Bilbao, Santander, Alicante, and Valencia. The railroad system connects all the chief towns with one another and unites Spain with France by two routes around the ends of the Pyrenees. Madrid is the centre of the Spanish broad-gauge railroad system. In 1900 the length of the railroads open for traffic was 8315 miles.

BANKING. The chief financial institution is the Bank of Spain. Its note issue up to 1,200,000,000 pesetas is guaranteed by a metallic reserve of one-third the amount of the issue, half of which must be in gold. If the note issue exceeds this amount it must, up to 1,500,000,000 pesetas, be guaranteed by metallic reserves of at least 40 per cent. in gold and 60 per cent. of the remainder in silver. For issues exceeding 1,500,000,000 and up to 2,000,000,000 pesetas, 50 per cent. must be guaranteed in gold, and 70 per cent. of the remainder in silver. On January 21, 1903, the notes in circulation amounted to 1,634,504,000 pesetas; capital and reserve, 170,000,000; deposits and accounts current, 617,431,000; property, 11,305,000; portfolio, 1,542,825,000; cash in hand, 901,924,000.

FINANCE. The revenue of Spain in 1901 amounted to $170,998,000 and the expenditure to $174,752,000. Revenue is raised by direct taxes on land, trade, mines, Government salaries, etc.; indirect taxes are derived from imports, articles of consumption, tolls, and bridge and ferry dues; other sources of revenue are the tobacco monopoly, the lottery, mint, and receipts from the sales and rentals of national property. The detailed estimates of revenue and expenditure for 1903 were as follows:

REVENUE

	Pesetas
Direct taxes on land, trade, mines, Government salaries, registration, etc	421,967,930
Indirect taxes, customs, excise, etc	328,710,000
Tobacco monopoly, lottery, mint, and minor sundries	164,870,000
National property: Revenue	19,997,797
" " Sales	2,770,000
From the public treasury	12,862,500
Total	951,178,227

EXPENDITURE

	Pesetas
Civil list	9,200,000
Cortes	1,838,085
Public debt	409,092,054
Various	1,365,900

" Finance	16,500,845
Tax-collecting	29,076,099
Colonial	2,000,000
Total	948,661,898

In 1901 the outstanding debt amounted to $1,727,994,620 bearing interest at 4 and 5 per cent. Details of the outstanding debt on March 31, 1902, are as follows:

	Pesetas
Recognized debt to the United States	3,000,000
External 4 per cent	1,226,878,704
Perpetual internal 4 per cent	5,903,208,270
Redeemable internal 5 per cent	1,190,085,000
Convertible internal, Cuba and Philippine	87,009,000
Guarantee stock	2,000,000,000
Total	10,410,180,974

GOVERNMENT. The present Constitution of Spain was proclaimed June 30, 1876. It declares the government to be a constitutional monarchy with the executive power vested in the King. The King is forbidden to alienate or exchange Spanish territory, or to admit foreign troops into the realm, or to make treaties of alliance, of commerce, or of subsidy or such as impose burdens on Spaniards, or to abdicate the crown in favor of a successor without special authorization by the Legislature. The sovereign is declared to be inviolable and irresponsible. He is aided by ministers who countersign all his official acts and who thereby assume the responsibility for them. Since the abolition of the Colonial Department in 1899 the Ministry has been organized as follows: President of the Council; Minister of Foreign Affairs; Minister of Justice; Minister of Finance; Minister of the Interior; Minister of War; Minister of Marine; Minister of Agriculture, Commerce, and Public Works; Minister of Education. The Ministers have seats in the national legislature and are permitted to take part in the debates.

The legislative power is vested in the King and a Cortes composed of a Senate and a Chamber of Deputies, the two Houses having substantial equality of powers in legislation. The Senate is composed of three classes of Senators: First, those entitled to seats in their own right (*Senadores de derecho propio*); secondly, 100 life Senators nominated by the Crown from certain designated classes; and thirdly, 180 Senators elected by communal and municipal delegates and by the provincial estates, the Church, the universities, learned societies, etc., and by the largest taxpayers. The first two groups must not exceed 180 members. Senators by right embrace the adult sons of the King and those of the immediate heir to the throne; Spanish grandees who have an annual income of at least $12,000; captain-generals of the army, admirals of the navy, the patriarch of the Indias and the archbishops, and the presidents of the councils of State, of war; of the navy, of the Supreme Court, and of the tribunal of accounts. One-half the elective Senators retire every five years; and all retire whenever the King dissolves the Senate. The Chamber of Deputies is composed of 431 members chosen for a term of five years by popular election. Eighty-eight Deputies are elected by general ticket in 26 districts, provision being made for minority representation. The members are apportioned on the basis of one to every 50,000 of the inhabitants. They must be twenty-five years of age. By a law of 1890 all male Spaniards twenty-five years of age who are in the full enjoyment of their civil rights and who have been citizens of a municipality for at least two years are qualified voters. The Depu-

ties receive no compensation for their services and are disqualified from holding office while serving in the Parliament. Annual sessions of the Parliament are held; it is summoned by the King, and may be prorogued or dissolved by him, subject to the limitation that the new Cortes must be summoned within three months after the dissolution of the old. The sessions are public; each Chamber regulates its own procedure, and is the judge of the election and qualification of its own members. Both Senators and Deputies are responsible only to their respective Chambers for any words spoken in debate or votes cast. They are also privileged from arrest except in case of flagrant crime. The seat of government is Madrid.

For purposes of local government Spain is divided into provinces and communes, each with its own elected assembly. The Ayuntamiento or elected assembly of the commune consists of from 5 to 39 Regidores and is presided over by an Alcalde chosen from the body of the Ayuntamiento, except in some of the large towns, where he is appointed by the King. The term of the members of the Ayuntamiento is four years, one-half the membership being renewed biennially. The provincial deputations meet once a year and are represented during the interval by a permanent committee. These two local assemblies have entire control of the local government in their respective jurisdictions and are free from interference of the central Government except when they exceed their powers to the detriment of the general interest.

The judiciary consists of a Supreme Court of Cassation, which sits at Madrid; a number of district courts or *audiencias* immediately under the jurisdiction of the Supreme Court; tribunals *de partidos* below the audiencias; justices of the peace; and municipal courts. The audiencias serve as courts of appeal in civil matters and as courts of first and last resort for crimes and certain misdemeanors. The tribunals *de partidos* have jurisdiction in first instance of civil causes and in first and last resort of misdemeanors. They also have appellate jurisdiction in cases decided by the inferior courts. The *partido* is divided into circumscriptions, usually two, in each of which is a *juez de instrucción*, with civil and criminal jurisdiction in cases assigned to them by the higher courts of a Minister. The circumscriptions are subdivided into communes, in each of which is a municipal judge with jurisdiction of petty offenses.

COLONIES. The colonial possessions of Spain are confined to Africa and are represented in the following table:

POSSESSIONS	Area, sq. miles	Population
Rio de Oro and Adrar	243,000	100,000
Bata (Rio Muni) and Cape San Juan	9,000	302
Fernando Po, Annobón, Corisco, Elobey Chico, Elobey Grande	850	23,709
Total	252,850	124,011

The Rio de Oro Colony and Adrar are administered by the Governor of the Canary Islands. The national expenditure on account of the above possessions far exceeds the revenues derived from them. About $300,000 had to be provided by the Spanish Government to supply the deficiency for 1902, the revenues being only about $19,000. For an account of the colonies, see the respective headings.

WEIGHTS, MEASURES, AND MONEY. Spain maintains the double gold and silver standard. The unit of coinage is the peseta, nominally worth 19.3 cents or 1 franc, but actually valued at an average of about 14.28 cents. The value of the money coined in Spain from 1868 to 1901 was: gold, 920,537,615 pesetas; silver, 1,285,010,511 pesetas. Metric weights and measures were introduced in 1859, but in addition to these the old Spanish weights and measures are still largely used.

DEFENSE. See ARMIES and NAVIES.

POPULATION. The population of Spain proper by the census of 1900 was 18,607,674, with a density of 95.5 inhabitants to the square mile. In 1850 it was about 14,000,000. The population in 1900 consisted of 9,087,821 males and 9,530,265 females. Emigration from Spain is chiefly to Brazil, Uruguay, and Argentina, the emigrants in 1900 numbering 63,020. The cities with a population of over 90,000 each are: Madrid, the capital, 539,835; Barcelona, 533,000; Valencia, 213,530; Seville, 148,315; Malaga, 130,109; Murcia, 111,539; Cartagena, 99,871; and Saragossa, 99,118. The following table gives the area and population of each of the 49 provinces according to the census of 1900:

PROVINCE	Area, sq. miles	Population, 1900
Alava	1,175	96,385
Albacete	5,737	237,877
Alicante	2,185	470,149
Almería	3,360	359,013
Avila	3,042	200,457
Badajoz	8,451	520,246
Baleáres (Balearic Islands)	1,935	311,649
Barcelona	2,968	1,054,541
Burgos	5,480	338,828
Cáceres	7,667	362,164
Cadiz and Ceuta	2,834	452,659
Canarias (Canary Islands)	2,807	358,564
Castellón	2,496	310,828
Ciudad-Real	7,620	321,580
Córdoba (Cordova)	5,299	455,859
Coruña	3,051	653,556
Cuenca	6,636	249,696
Gerona	2,264	299,287
Granada	4,928	492,460
Guadalajara	4,676	200,186
Guipúzcoa	728	195,850
Huelva	3,913	260,880
Huesca	5,848	244,867
Jaén	5,203	474,490
León	5,936	386,083
Lérida	4,690	274,590
Logroño	1,946	189,376
Lugo	3,814	465,386
Madrid	3,084	775,034
Malaga	2,812	511,989
Murcia	4,453	577,987
Navarra (Navarre)	4,055	307,669
Orense	2,694	404,311
Oviedo	4,205	627,069
Palencia	3,256	192,473
Pontevedra	1,695	457,262
Salamanca	4,829	320,765
Santander	2,108	276,003
Segovia	2,635	159,243
Sevilla (Seville)	5,428	555,256
Sória	3,983	150,462
Tarragona	2,505	337,964
Teruel	5,720	246,001
Toledo	5,919	376,814
Valencia	4,150	806,556
Valladolid	2,922	278,561
Vizcaya (Biscay)	836	311,361
Zamora	4,097	275,545
Zaragoza (Saragossa)	6,726	421,843
Total	194,800	18,607,674

RELIGION. The national Church is the Roman Catholic, and in few countries has it so powerful an influence. The whole population adheres to that faith excepting about 30,000 Protestants, Jews, and others. The Constitution requires the nation to support the clergy and religious buildings and institutions, the State expending for these purposes annually about 41,000,000 pesetas. Only restricted and private liberty of worship is permitted to Protestants. In 1884 there were 32,435 priests, 18,564 churches, 11,202 other buildings of a religious character, 1684 monks, and 14,592 nuns. The religious Orders are numerous and influential, and many of them have schools and teach industries of all kinds.

EDUCATION. Instruction was almost entirely neglected until quite recent times. The older generations of the poorer classes are, for the most part, unable either to read or to write. The middle schools and the once famous universities are far inferior in their standards to corresponding institutions in most European countries. Spaniards seldom learn any language but their own, excepting the nobility, who usually can converse in French. In 1889 68.1 per cent. of the population could neither read nor write, though by the law of 1857 education was made compulsory. Improvements in the educational system have been in progress for some years. It is now under charge of a Minister of Education with a council. The public primary schools are supported chiefly by the municipalities, with a small contribution from the Government; and the average sum now spent on primary education (most of the children being educated free) is about $5,000,000 a year. By a law passed in 1902, the schools are now regularly inspected, and rules regarding sanitation, discipline, and the appointment of qualified teachers are enforced under Government authority. In 1901 there were 25,340 public schools, with 1,617,314 pupils, and 6181 private schools, with 344,380 pupils. The secondary schools, of which there must be one in every province, prepare for the universities and are largely attended, but they are still regarded as inefficient. There are nine universities, with about 16,000 students, the largest being at Madrid, which has upward of 5000 students. The Government also supports special schools for instruction in engineering, agriculture, fine arts, music, and other branches. The sum set apart in the budget of 1903 for education was 43,122,259 pesetas.

ETHNOLOGY. The perspective of Spanish ethnology extends back to the Chellean Epoch, implements of that type having been dug up in the ancient alluvium at San Isidro and other stations near Madrid. Solutrean implements were found in the grotto of Altamira, Province of Santander. In the same grotto Magdalenian implements and characteristic objects in bone were discovered, and relics belonging to this epoch come from the Basque Provinces, from the basin of the Ebro, and from Catalonia. In historic times all the great divisions of the Caucasian race have mingled their blood in Spain in greater or less proportion—Hamite, Semite, Teuton, Celt, and Mediterranean. The fundamental type bears the name of Celtiberian, and is a result of a mixture of the earliest long-headed Mediterraneans and the later-coming brachycephalic Celts producing a cranial index of 76-79. Keane and Ripley call attention to the uniformity of this index in Spain and in Britain, associated with tall stature and blondness in the latter, with dark color and low stature in the former. Spain has been invaded in historic times by Phœnicians, Carthaginians, Romans, Visigoths, Vandals, Arabs, and Moors. It is generally believed that these conquerors modified the original type but little, simply because many of them were already short of stature, dark in skin, hair, and eyes, as well as dolichocephalic.

HISTORY. Spain, the *Iberia* of the Greeks, and the *Hispania* (q.v.) of the Romans, is supposed to have been originally inhabited by a distinct race called Iberians, upon whom, however, a host of Celts appear to have descended from the Pyrenees. In the earliest times of which we have any record, these two races had already coalesced and formed the mixed nation of the Celtiberians, who were massed chiefly in the centre of the peninsula, in the western districts, and on the north coasts. In the Pyrenees and along the east coast were to be found pure Iberian tribes, while unmixed Celtic tribes occupied the northwest. On the south and east coasts were Phœnician, Carthaginian, Rhodian, and other colonies. In the second half of the third century B.C. a large territory was brought under subjection to Carthage by Hamilcar Barca (q.v.), who, according to Roman tradition, founded the city of Barcelona. After the death of Hamilcar, in B.C. 228, the Carthaginian interest was advanced, and the power of Carthage further strengthened by Hasdrubal (died B.C. 220), son-in-law of Hamilcar, who founded Carthago Nova (the modern Cartagena) and concluded a treaty with the Romans whereby it was stipulated that he should not advance his standards north of the Iberus (Ebro). Hannibal (q.v.), son of Hamilcar, after the death of Hasdrubal attacked and destroyed Saguntum (q.v.), in B.C. 219, and thus initiated the Second Punic War. (See CARTHAGE; ROME; HANNIBAL.) After the Romans had driven the Carthaginians from the peninsula, in B.C. 206, the country was made into two Roman provinces (B.C. 197), *Hispania Citerior*, including the eastern and northern districts, and *Hispania Ulterior*, including the southern and western districts. The conquest of the native tribes proved an arduous task for the Romans. (See LUSITANIA; NUMANTIA.) It was not till B.C. 19 that the Cantabri and Astures in the extreme north of the country laid down their arms to Augustus. Under Augustus the peninsula was divided into the three provinces of Hispania Tarraconensis, Bætica, and Lusitania. (See HISPANIA.) From the time of the establishment of the complete supremacy of the Romans till the death of Constantine the condition of Spain was eminently prosperous. Its fertile fields formed for a considerable time the granary of Rome, and from its metal-veined sierras an immense amount of treasure in gold and silver flowed into the Roman coffers.

In A.D. 409 hordes of barbarians, Alans, Vandals, and Suevi crossed the Pyrenees and swept over and desolated the peninsula. About 414 the Visigoths invaded the country, and their King, Athaulf, who acknowledged a nominal dependence on the Roman Emperor, established the Gothic monarchy in Catalonia. (See GOTHS.) The best known of the kings were Wallia (415-

419), who greatly extended the Gothic monarchy, making himself master of a great part of Aquitania (where a century later the Visigoths were overcome by Clovis); Euric (465-485), who, besides increasing his territory, introduced and enforced a body of laws, and did much for the advancement of civilization in Spain; Leovigild (569-586), who effected the subjugation of the Suevi; Wamba (672-680), who built a fleet for the protection of the coasts; and Roderic (q.v.), who was killed at Jerez de la Frontera in 711, in battle with the Arabs (Saracens). The battle of Jerez gave the Arabs almost undisputed mastery of nearly the whole of Spain, as well as of Septimania (Languedoc) in France. The remnant of the Goths betook themselves to the highlands of Asturias, Burgos, and Biscay, where they maintained their independence.

The Arabs held Spain for the first few years of their rule as a dependency of the Province of North Africa; but after the downfall of Musa (q.v.) the country was governed (717) by *emirs* appointed by the Caliph of Damascus. These emirs were intent upon the extension of their conquests into Gaul, to the neglect of the rising power of the Goths in Asturias. Their northward progress was arrested in the battle of Poitiers by Charles Martel (q.v.) in 732. The *walis*, or local governors of districts and provinces, frequently rebelled against the emir, and drew swords against each other. Within a period of forty years no fewer than twenty emirs had been called to the direction of affairs; but a revolution at Damascus, which unseated the Ommiads, and placed the Abbassides in possession of the caliphate, put an end to this state of misrule in Spain. The last of the emirs, Yusuf, was in favor of the Abbassides, but the walis and alcaydes, being chiefly of the Ommiad faction, invited one of this family, Abd-er-Rahman, who was in concealment among the Zeneta Arabs in Barbary, to become an independent caliph in Spain. (See OMMIADS.) Thus was founded (756) the *Emirate of Cordova*. By 778 the Franks had wrested from the Arabs all their possessions north of the Pyrenees and northeastern Spain to the Ebro. The latter acquisition, subsequently denominated the *Spanish March*, was for a time alternately in the hands of the Moslems and dependent upon France.

During the early period of Arab-Moorish domination the small independent Kingdom of Asturias, founded by Pelayo (q.v.), grew in power and extent. Alfonso the Catholic, son-in-law of Pelayo, conquered nearly all of Galicia and recaptured Leon, together with Salamanca and other cities. Alfonso the Great (866-910) by his victories greatly extended the Asturian dominions, which soon after his reign figure as the Kingdom of Leon. In the course of the ninth century Navarre struggled into existence as a separate State. The Kingdom of Leon was for a long time distracted by bitter and bloody strife among the members of the royal line, and with its neighbor, Navarre, would have fallen an easy prey to the powerful Ommiads had not the latter directed their chief attention to the subjugation of Morocco. During this relaxation of the constant warfare between Moors and Christians another independent State, Castile, an offshoot from Leon, came into existence, at first under the rule of the famous Count Fernán González. In 1033 it was erected into a kingdom. Castile, from its central position, and consequently greater facilities for expansion, soon became the most powerful of the Spanish States. A considerable part of Aragon was wrested from the Moors by Sancho the Great of Navarre (1000-35), and at his death this part of his dominions passed as a separate kingdom to his son Ramiro, who added to it the districts of Sobrarbe and Ribagorza, and a considerable extent of country which he conquered from the Moors. In 1151 the territory of the counts of Barcelona (Catalonia) was united with Aragons. The last Christian kingdom to be founded in the Iberian Peninsula was Portugal (q.v.).

The Ommiads ruled Mohammedan Spain for about 275 years. The greatest of this dynasty was Abd-er-Rahman III., who ruled from 912 to 961, and who in 929 assumed the title of Caliph. His capital, Cordova (q.v.), was the greatest city in Europe except Constantinople, and was unrivaled in the splendor of its edifices. The civilization of Spain during the Moorish supremacy was far in advance of that of the rest of Europe. At the great Mohammedan universities medicine and mathematics were cultivated, and Aristotle was studied there long before he was well known to Christian Europe. An extensive literature was developed, the caliphs themselves often being poets and authors of note. Commerce and agriculture were fostered, and the stranger marveled at the splendid system of irrigation, which made the country like a garden. The Moorish fleets controlled the Mediterranean and carried on an extensive trade. For the art which was developed in Spain by the Moors, see MOHAMMEDAN ART.

The Ommiad dynasty came to an end in 1031, and a number of independent Moorish kingdoms were formed—Cordova, Seville, Toledo, Lisbon, Saragossa, Tortosa, Valencia, Murcia, Badajoz, and others of less note. The kings of Castile and Aragon did not fail to benefit by this disruption of the Mohammedan realm, for by well-directed and unremitting attacks they subdued some States and rendered others tributary. A few years more might perhaps have destroyed the Moorish domination in Spain had not the rulers, hard pressed by Alfonso VI. of Leon and Castile, who in 1085 conquered the Kingdom of Toledo (New Castile), applied for aid to the ruler of the sect of the Almoravides (q.v.) in Morocco. The Almoravides crossed over to Spain, but after defeating the Christians they turned their arms against the Spanish Moors, and by the beginning of the twelfth century the Almoravide sovereign was acknowledged the ruler of Mohammedan Spain. The power of the Almoravides was extinguished by the Almohades (q.v.), a fanatical sect who passed over from Morocco just before the middle of the twelfth century, and conquered the territories of the Mohammedans. In a great battle fought on the plains of Tolosa (*las navas de Tolosa*), in 1212, the kings of Castile, Navarre, and Aragon broke the Almohade power in Spain. Soon nothing was left out of the wreck of the Almohade realm but the Kingdom of Granada, which was forced to acknowledge the overlordship of Castile. This last Moorish kingdom rose to great splendor.

Prominent among the late Castilian monarchs were Ferdinand III., who extended the dominions of Castile far into Andalusia, conquering Cordova in 1236 and Seville in 1248; Alfonso X., the Wise, famous as a legislator, writer, and patron of learning; Alfonso XI.; Peter the Cruel; and Isabella, whose marriage with Ferdinand the Catholic (1469) brought about the union of Castile and Aragon in 1479. Among the sovereigns who raised Aragon to the position of an important power and extended its dominion beyond the bounds of the Iberian Peninsula were James I. (1213-76), who conquered Valencia and the Balearic Islands; Pedro III. (1276-85), who obtained Sicily (1282); James II. (1291-1327), who annexed Sardinia; Alfonso V. (1416-58), who conquered Naples; and Ferdinand V., the Catholic (1479-1516), who became the ruler of the whole of Spain. The mediæval history of Castile and Aragon is marked by a vigorous development of constitutionalism as embodied in the assertion of their power by the estates of the realm. (See CORTES.) In both kingdoms the cities enjoyed great political freedom, of which they were gradually deprived after the consolidation of Spain into a single monarchy.

The union of Castile and Aragon enabled the Christians of Spain to undertake the subversion of what remained of Moorish dominion in the peninsula. In 1482 Ferdinand and Isabella entered upon a war for the subjugation of the Kingdom of Granada, and at the beginning of 1492 the sovereigns made their entry into the Moorish capital. All Spain, with the exception of Navarre, was now practically one power. The shrewd policy of Ferdinand the Catholic, who followed the tendency of the age and strengthened the royal power at the expense of the privileges both of the feudal nobility and the people, enabled Spain to grow in external power and influence, and to assume a military preëminence among the countries of Europe. In Italy the arms of Spain, under Gonsalvo de Córdova, triumphed over those of France. In 1512 Ferdinand made himself master of Navarre, with the exception of the district north of the Pyrenees, and thus completed the unification of Spain. The discovery of the New World by Columbus and his successors under Spanish auspices in the closing years of the fifteenth century made Spain the pioneer colonial power, and for a considerable period the greatest. The expulsion of the Jews from the Spanish dominions in 1492 deprived them of a large body of industrious citizens. In 1516 Charles I. (from 1519 Holy Roman Emperor as Charles V.), the grandson of Ferdinand and Isabella, and of Maximilian of Austria and Mary of Burgundy, inaugurated the Hapsburg dynasty on the throne of Spain. He was the ruler of the Netherlands, which became part of the Spanish realm, and he acquired the Duchy of Milan (embracing most of Lombardy), which was made a Spanish possession. Mexico and Peru, whose mines poured the precious metals into Spain in an inexhaustible supply, were acquired during his reign. Charles was the most powerful Christian monarch of his time. His reign was taken up with endless contests with the French, and, as German Emperor, with efforts to suppress Protestantism, as well as with war against the Turks. (See CHARLES V., HOLY ROMAN EMPEROR.) His son Philip II. (q.v.) (1556-98), who succeeded to the Spanish possessions of the House of Hapsburg, prepared the way by his narrow and bigoted policy for the decline of Spain. He developed the Inquisition, which had been introduced by Ferdinand and Isabella, into a powerful engine for the repression of religious and political dissent, and his attempt forcibly to root out the Reformation in the Netherlands brought about a rising which resulted in the severance of the Dutch provinces from Spain. With England he waged long wars, which were disastrous to the Spanish naval power. (See ARMADA; DRAKE.) In 1580 Philip II. conquered and annexed Portugal. The Spaniards took possession of the Philippines in his reign. Under Philip III. (1598-1621), in whose reign the Moriscos were expelled, and under Philip IV. (1621-65), in whose reign the Dutch Netherlands were definitively given up and Portugal reasserted its independence, the decadence of the nation proceeded at a rapid rate. The male line of the Hapsburgs became extinct in Charles II. (1665-1700) and the conflicting claims to the throne produced the war of the Spanish Succession (see SUCCESSION WARS), in which England and Holland were allied with Austria, Prussia, the German Empire, and Savoy against Louis XIV. to prevent the aggrandizement of France by the acquisition of Spain as an appanage of the House of Bourbon. When the rival Austrian claimant became Emperor and head of the Austrian dominions as Charles VI., in 1711, a similar objection existed to his obtaining the throne of Spain, and the allies conceded the succession to Philip of Anjou, who had been proclaimed King of Spain as Philip V. in 1700, and was confirmed by the Peace of Utrecht in 1713. This was the beginning of the Bourbon dynasty in Spain. Spain emerged from the War of Succession stripped of the Belgian Netherlands, Naples, Sicily, Sardinia, and her Lombard territories. She had to cede Gibraltar to the English, who had captured it in 1704.

A few years later Spain, whose policy was at this time directed by Alberoni, made an effort to recover some of her lost possessions, but her aggressions were promptly met by the Quadruple Alliance of 1718 between Great Britain, France, Austria, and Holland, and the schemes of the able Prime Minister came to naught. In the War of the Polish Succession, however, Don Carlos, son of Philip V., wrested the Two Sicilies from Austria and established the Bourbon dynasty there.

Philip was succeeded by his son, Ferdinand VI. (1746-59), in whose reign numerous reforms were introduced in the administration. Ferdinand was succeeded by his half-brother Charles III. (1759-88), who, on ascending the Spanish throne, relinquished the Two Sicilies to his son, Ferdinand IV. Charles brought into Spain from his Italian domains a new spirit, and initiated reforms in the internal administration, foreign policy, and economics of the State. As a result of the Seven Years' War, in which Spain joined France, Florida was ceded to Great Britain and Louisiana acquired from France (1763). In 1767 the Jesuits were expelled from the Spanish dominions. In 1779 Spain became the ally of France in the war against England, and in 1783 she recovered Florida, which in 1819 was ceded

to the United States. Charles IV. (1799-1808) was incapable of continuing his father's vigorous policy. He was under the control of the notorious Godoy (q.v.), the Queen's favorite, who played into the hands of Napoleon for his own profit. In March, 1808, the King abdicated in favor of his son, Ferdinand, and the latter was compelled to renounce his claims to the crown in favor of his father, who then handed his right over to Napoleon. The latter then conferred the Spanish crown upon his brother Joseph Bonaparte. Deserted by their rulers, the Spanish people organized resistance, declared for Ferdinand VII., and refused to recognize the Bonapartes. A supreme junta of leading Spaniards was established at Seville and subordinate juntas were formed in each of the provinces.

It was the obstinate resistance of Spain and the efficient work of the supporting English armies in the Peninsular War that first checked Napoleon and showed Europe that he was not invincible. (See PENINSULAR WAR.) Meanwhile the Spanish colonies in America revolted, and after a fierce warfare of sixteen years the Spanish dominion on the American mainland was completely extinguished (1826). After the expulsion of the French King, Ferdinand VII. returned to Spain and entered Madrid May 14, 1814. The liberal Constitution of 1812 enacted by the Cortes was at once abrogated, the religious Orders were restored to their earlier predominance, the Cortes were abolished, and the Inquisition was reëstablished. A popular reaction aided the King and his Ministers in this course. A liberal revolution in 1820 restored the Constitution of 1812 and instituted a Cortes which was notable for its extreme liberalism. The Inquisition was abolished and the privileges and exemptions of the Church were invaded. The clergy and the peasants opposed the revolution, but it was received with favor by the army and the educated classes. In 1822 the Holy Alliance (q.v.) took note of the Spanish situation, and France was commissioned to suppress the liberal movement. A French army of nearly 100,000 men invaded the peninsula and the Spanish forces were entirely unable to meet the attack. On May 24, 1823, the French entered Madrid, established a regency, drove the Cortes from Seville to Cadiz and out of the country, and restored Ferdinand, who had been declared of unsound mind by the Cortes. The King at once revoked all of the liberal measures, except the abolition of the Inquisition. Repression and wholesale punishment followed. The French army remained in occupation until 1827. Bermudez, the Prime Minister, adopted finally a moderate policy, but this satisfied neither absolutists nor liberals. The clerical party guided by the Apostolic Junta rallied around Ferdinand's brother, Don Carlos, as the representative of extreme absolutism and clericalism, and a number of insurrections were started by the Junta in his interest. In 1831 Ferdinand, having no male heir, decreed the revival, on behalf of his daughter Isabella, of the old law admitting female succession. Ferdinand died in 1833 and Queen Maria Christina became Regent for her daughter Isabella II. The Carlists proclaimed their candidate as Charles V., and there was an immediate division of parties in the kingdom into Carlists and Cristinos. The Queen Regent was compelled to turn to the liberals for support. A royal charter, in lieu of a constitution, was promulgated in 1834, but it did not give real popular government, and the Ministry and the Chambers were both under the control of the Crown. Civil war broke out and the Carlists were at first successful. An alliance was concluded by the Regent with England, France, and Portugal, for the purpose of maintaining the crowns of Spain and Portugal against the pretenders, Carlos and Miguel (qq.v.). The death of Zumala-Carreguy (q.v.), the only Carlist leader of ability, and the accession to the command of the Government forces of General Espartero (q.v.) turned the tide. Maroto, the Carlist commander, concluded the convention of Vergara with the Government in 1839 and returned to his allegiance with his army. By this treaty Navarre and the Basque Provinces, which had been the strongholds of Carlism, were confirmed in their ancient privileges. Espartero defeated the remnants of the Carlists in Catalonia, and Don Carlos went into exile, handing over his pretensions to his son.

In the meanwhile the struggle for a liberal constitution was being waged in the kingdom, and a revolutionary movement at the palace of La Granja in 1836 forced Maria Christina to swear to the Constitution of 1812. In 1840 Espartero, the liberal leader, was made the head of the Ministry on his own terms. Maria Christina resigned the regency October 12, 1840, and the Cortes made Espartero Regent and guardian of Isabella and her sister. The Regent's firm government made enemies, and in 1843 a revolutionary movement, headed by Narvaez and Prim (qq.v.), drove him from power. In November, 1843, Isabella was declared of age and assumed the crown, with Narvaez, the leader of the Moderates (Moderados), as Prime Minister. Maria Christina was recalled and the Constitution modified on reactionary lines. Narvaez exercised practically dictatorial powers until 1851. Parties gradually readjusted themselves, the old Absolutists, with whom the Moderates tended to assimilate, grouping themselves about Queen Isabella and her mother, and the liberal elements joining the Progressists. In March, 1851, a concordat was arranged with the Pope by which all ecclesiastical affairs were to be canonically regulated and all religions but Catholicism were forbidden in the kingdom, the Church in return yielding its secular jurisdiction and recognizing the sale of church lands. A Cabinet of personal supporters was made up by the Queen mother. They attempted in 1852 a modification of the Constitution in the direction of absolutism. This led in 1854 to a new outbreak. A coalition of the more liberal Moderates under Narvaez and Progressists under O'Donnell was formed and was joined by Espartero, now again recognized as one of the Progressist leaders. Maria Christina left the country and a Government was formed with Espartero as President of the Council and O'Donnell as Minister of War. The latter was now at the head of a new party, the Liberal Union, which favored a liberal constitutional monarchy. In the coalition Government the Progressists were at first the dominant factor, but before the new Constitution of 1855 was promulgated they lost control. There were republican risings in the northeast and Carlist risings in the northwest, and the suspen-

sion of popular liberties by the Government, while engaged in the suppression of these revolts, gave an opportunity to O'Donnell and his party. Their control was short-lived, and in 1856 Queen Isabella appointed a Moderate Ministry under Narvaez, which adopted a reactionary policy. In 1858 the Queen recalled O'Donnell and he held office for five years. A war with Morocco (1859-60) had no result except to test the efficiency of the Spanish army. Spain joined France in the ill-advised Mexican expedition, but Prim, in command of the Spanish forces, signed a convention with Juarez and refused to support the French. Napoleon III. was indignant with his ally, and in Spain there was bitter discussion of Prim's course. The Progressists made it a handle for a partisan attack on the Government and the Moderates also took a hostile attitude. The O'Donnell Government, which had added vastly to the national debt, went down in 1863.

With the passing of the Liberal Union there was a gradual return to absolutism. The Miraflores Government, which succeeded that of O'Donnell, attempted to govern constitutionally, but the absolutist pressure in Court circles was too strong, and this Ministry gave way to successors more pliable. The Government really fell into the hands of the *camarilla*, a group of personal favorites who had influence with the Queen. The Liberal groups were forced more and more into a hostile and revolutionary attitude. Castelar (q.v.), then a professor in the University of Madrid, raised his eloquent voice against the extravagance of the Crown and was supported by the university. The Government attempted to suppress such agitation. The Cortes was dissolved in 1866 and Marshal Serrano (q.v.), president of the Senate, was sent into exile. Narvaez, who had represented all shades of political opinion at different times, was now called to the head of affairs and maintained a strong Government, which was really a military dictatorship, until his death in 1868. An open revolt, headed by Prim, failed, but a little later Prim, Serrano, and Admiral Topete (q.v.) began a better organized and better supported revolutionary movement. The fleet at Cadiz under Topete declared for national sovereignty. Serrano marched toward the capital, defeated the Government forces at Alcolea on September 28, 1868, and on October 3d entered Madrid, already in a state of insurrection. Isabella in the meanwhile escaped into France and the revolution was accomplished.

A provisional government was established by the revolutionists under the presidency of Serrano. A liberal monarchical constitution was put through by a combination of Republicans under Castelar and Progressists under Prim, and was promulgated June 6, 1869. Serrano was made Regent, with Prim as Prime Minister. Carlists, Republicans, and Constitutional Monarchists all aspired to profit by the upheaval in the government. Several foreign princes were invited to take the crown—among them Prince Leopold of Hohenzollern, whose candidacy (July, 1870) gave rise to irritation between France and Germany, and in a measure provoked the Franco-German War. At last, in December, 1870, Amadeus, Duke of Aosta, son of King Victor Emmanuel, accepted the crown (see AMADEUS I.), but before his arrival in Madrid Prim, the king-maker, was assassinated. King Amadeus thus lost a strong support, and he abdicated February 11, 1873, after a brief and uncomfortable reign, distracted at the end by a great rising in favor of the young Don Carlos (Charles VII.) and disturbed by an insurrection in Cuba, which had broken out in 1868. A republic was then declared. Figueras was the first president of the Ministry, with Castelar as Minister of Foreign Affairs. A constituent Cortes was summoned in June, and prepared a constitution making Spain a federal republic. Several Ministries attempted vainly to cope with the situation, which, in addition to the Carlist insurrection in the north, was complicated by the risings of the Intransigentes (see INTRANSIGEANTS) and Internationals in the cities of Andalusia, Murcia, and Valencia. On September 7th Castelar was made President of the Executive with dictatorial powers, and the Cortes adjourned until January, 1874. The wise and positive course of Castelar in enforcing order and recognizing conservative interests displeased the extremists, and when the Cortes reassembled a vote of lack of confidence was passed. Castelar resigned, and Serrano became nominally President of the Executive, but in reality a military dictator. He carried on with vigor the war against the Carlists, but he had hardly secured recognition for his Government from the European powers when Gen. Martinez Campos (q.v.) proclaimed Alfonso XII., son of Isabella, King (December, 1874). The army declared for Alfonso. The Serrano Government, of which Sagasta (q.v.) was then Prime Minister, gave way, and Cânovas del Castillo (q.v.) headed a provisional government. Alfonso, then seventeen years of age, assumed the government on January 14, 1875, guided by Cânovas del Castillo. The Carlist revolt was completely suppressed in 1876. Don Carlos went into permanent exile, and Navarre and the Basque Provinces were deprived of their ancient privileges and *fueros* (q.v.). A constitution of a decidedly illiberal character was adopted in 1876, and its provisions were enforced with severe literalness by the Ministry of Cânovas del Castillo. By 1878 order had been reëstablished throughout most of Cuba. Martinez Campos, who was sent to the island to put down the insurrection, came back in 1879 an advocate of a reform policy toward Cuba, and attempted to form a Ministry on that issue, but failed and went into the opposition. Much of his programme, including abolition of slavery in the Antilles, was carried out by Cânovas del Castillo. In 1881 a more liberal régime was inaugurated under Sagasta.

The government under the restored monarchy was nominally in the hands of a Ministry responsible to the majority in the Cortes, but personal factions and rivalries disintegrated parties to such an extent that this was not so in practice. There were two leading parties—Conservatives, and Liberals or Constitutionalists, both upholding the constitutional monarchy. The remnant of the Carlists could do little but agitate. The Republicans lacked a leader, since Castelar had given up the republican programme as impracticable. Cânovas del Castillo returned to power in 1884, after having been out of office for three years. On November 25, 1885, Alfonso XII. died, and his widow, Christina, who was pregnant, became Regent of the kingdom, the Pre-

miership being intrusted to Sagasta. On May 17, 1886, Christina gave birth to a son, who became King as Alfonso XIII. Sagasta governed with vigor, energetically repressing military uprisings, and brought about the enactment of a measure providing for universal suffrage. A Conservative Ministry under Cánovas del Castillo was in office from July, 1890, to December, 1892. The succeeding Liberal Ministry under Sagasta was unpopular because of its attempt to apply needed economies and its severe measures to repress anarchism, which had become rampant in Catalonia. In 1895, when a new revolt broke out in Cuba, the Conservatives returned to power under Cánovas del Castillo. The army officers were dissatisfied with the growth of the civil power and restive under the criticism of an increasingly independent press. Premier Cánovas del Castillo was assassinated in 1897, and Sagasta took his place at the helm, in time to face the problems of a war which was already imminent. The Cuban revolt, which consumed the flower of the Spanish army, and in the effort to suppress which the most cruel military measures were instituted, produced complications which led in 1898 to a conflict with the United States. (See CUBA; SPANISH-AMERICAN WAR; UNITED STATES.) This unequal struggle was brought to a close by a treaty of peace negotiated at Paris, December 10, 1898, by which Spain relinquished her sovereignty in Cuba, Porto Rico, and the Philippine Islands. Later the Caroline, Pelew, and Ladrone Islands were sold to Germany.

The military party under Weyler (q.v.) made the peace treaty an issue, and forced Sagasta out of office. A Conservative Ministry headed by Silvela came in but resigned in October, 1900, and a reconstruction was effected under General Azcarraga on distinctly military lines. A congress of the Spanish-American States was held in Madrid in November, 1900, at the instance of the Sociedad Unión Ibero-Americana, for the purpose of establishing more cordial relations with these offshoots of the older Spain. Anti-clerical disturbances in 1901 pointed to a growing spirit of liberalism and independence. A new government was organized under Sagasta, March 6, 1901, and adopted a stern attitude toward the religious Orders. King Alfonso XIII. came of age May 17, 1902, and the regency was terminated. For several months Sagasta retained office with great reluctance, and on December 6, 1902, the Ministry retired and an entirely new Cabinet was constituted by Silvela.

SPALATIN, spä'lâ-tēn', GEORG BURCKHARDT (1484-1545). A German reformer and friend of Luther. He was born at Spalt, near Nuremberg, and studied law and theology at Erfurt and Wittenberg. In 1508 he was ordained priest. He became one of the trusted advisers of the Elector Frederick the Wise of Saxony. He continued to enjoy Court favor after the death of Frederick, and was made Canon of Altenburg in 1525. He wrote biographies of the electors Frederick the Wise (ed. by Neudecker and Preller, Weimar, 1851) and John the Constant, *Christliche Religionshändel* or *Religionssachen* (extracts from which were published as *Annales Reformationis* by Cyprian, Leipzig, 1818), and a history of popes and emperors of the Reformation period. Many of his manuscripts are still unpublished. Consult Seelheim, *Georg Spalatin als sächsischer Historiograph* (Halle, 1876).

SPALATO, spä'lâ-tō. A seaport of Dalmatia, charmingly situated on a peninsula in the Adriatic Sea, 74 miles southeast of Zara (Map: Austria, E 5). High mountains lie to the north

and east. Fort Grippi is on the east. The harbor, protected by a long mole, is ample and safe. In the vast and remarkable palace of Diocletian, to which the town owes its name, the Emperor lived after abdicating. The remains are interesting—the loggia, with its red columns, and a ruined rotunda, both being especially noteworthy. The old town, with its narrow streets, is mostly inclosed in the confines of the palatial ruins. The new town, with wide thoroughfares, lies to the west. The cathedral is an attractive octagonal structure of Roman origin. Spalato has a naval school, an episcopal seminary, a Serbo-Croatian national Realschule and Gymnasium, and a public garden. Spalato exports olive oil, fruit, and especially wine. A railroad connects the town with Sebenico and Knin. There are manufactures of wool and silk. Population, in 1900, 27,198, mostly Serbo-Croatians.

SPALDING, spâl'dĭng, JOHN FRANKLIN (1828-1902). An American bishop of the Protestant Episcopal Church. He was born at Belgrade, Me., educated at Bowdoin College, and at the General Theological Seminary, New York. Ordained priest, he was first stationed at Saint James's, Old Town, Me. In 1873 he was consecrated Missionary Bishop of Colorado, with jurisdiction in Wyoming. Later the missionary territory became a diocese and was divided. His principal publications are: *The Church and Its Apostolic Ministry* (1887); *The Threefold Ministry of the Church of Christ* (1864; 2d ed. 1887); *The Best Mode of Working a Parish* (1888); *Jesus Christ the Proof of Christianity* (1891).

SPALDING, JOHN LANCASTER (1840—). An American Roman Catholic bishop. He was born at Lebanon, Ky., and educated at Mount Saint Mary's College, and at the University of Louvain, Belgium; was ordained priest in 1863; was appointed secretary and chancellor of the diocese of Louisville (1869), and of Peoria (1877). He took a prominent part in various social and educational movements, and his position as an authority in the former class of questions was recognized by his appointment in 1902 as a member of the President's commission to investigate the coal strike. Among his works are: *Education and the Higher Life* (1890); *Things of the Mind* (1894); *Means and Ends of Education* (1895); *Thoughts and Theories of Life and Education* (1897); *Opportunity and Other Essays and Addresses* (1900); *Socialism and Labor* (1902); *Religion, Agnosticism, and Education* (1902).

SPALDING, MARTIN JOHN (1810-72). An American Roman Catholic bishop. He was born near Lebanon, educated at Saint Joseph's, Bardstown, Ky., and in Rome, where he was ordained priest in 1834; became Coadjutor Bishop of Louisville in 1848; Bishop 1850, succeeded Dr. Kenrick as Archbishop of Baltimore in 1864. He published *Early Catholic Missions in Kentucky* (1846), *Lectures on the General Evidences of Christianity* (1847; 4th ed. 1866), *Life of Right Rev. B. J. Flaget*, his predecessor at Louisville (1852), *History of the Protestant Reformation* (1860). Consult his *Life* by his nephew, Bishop J. L. Spalding (Baltimore, 1872).

SPALLANZANI, späl'lân-zä'nê, LAZZARO (1729-99). An Italian naturalist. He was born at Scandiano, and educated at Modena and Bologna. In 1754 he became professor at Reggio, in 1761 at Modena, and in 1768 professor of natural history at Pavia. He was distinguished in experimental physiology, where he showed the falsity of the doctrine of the spontaneous generation of life, demonstrated the physiology of digestion, and the true nature of the spermatic fluid and of the spermatozoa. His works are: *Opuscoli di fisica animale e vegetabile* (1780); *Expériences pour servir à l'histoire de la génération des animaux et des plantes* (1786); *Viaggi alle Due Sicilie ed in alcune parti degli Apennini* (1792).

SPANDAU, spän'dou. A town in the Province of Brandenburg, Prussia, situated at the confluence of the Havel and the Spree, nine miles west-northwest of Berlin (Map: Prussia, E 2). Through extensive improvements in its fortifications and the construction of numerous detached forts Spandau has been made a stronghold of the first rank for the protection of Berlin. In the citadel, which is also used as a Government prison, is kept the Imperial military reserve fund. Spandau has an infantry rifle-practice school, an artillery construction bureau, and a Gymnasium. The State ammunition, rifle, and artillery works are located here. The city owns the gas works. Its manufactures include porcelain, woolens, and military tents. The town is the shipping centre for a large trade between Berlin and Hamburg. There are fisheries and important horse and lumber markets. Spandau received municipal privileges in 1232 and was strongly fortified in the fourteenth century. Population, in 1900, 65,014.

SPANDREL. The flat wall space comprised between the extradoses of two adjoining half-arches and a horizontal line or molding touching, or nearly touching, their crowns; or, at the end of an arcade, and in structures having arches set between vertical piers or pilasters or columns, the space included between such vertical feature, the adjacent half-arch, and the molding or line immediately above the arches. This space is approximately triangular, and in decorative architecture offers an admirable field for decoration. It may be adorned with figures in relief, as in Roman triumphal arches, or with medallions, as in the Ospedale degli Innocenti at Florence and many other Renaissance buildings; with surface enrichments in color or with incised surface carving. In certain types of steel arched bridges the spandrels are formed by series of columns or other supports for the upper chord of the truss or the roadway. The term is also applied in the engineering of steel-skeleton buildings to the rectangular space between two columns from the head of a window to the sill of the window next above it.

SPANGENBERG, spăng'en-bĕrk, AUGUSTUS GOTTLIEB (1704-92). A bishop of the Moravian Church. He was born at Klettenberg, Prussia, and educated at Jena. In 1732-33 he was a member of the theological faculty of the University of Halle. He then allied himself with the United Brethren and was sent to the West Indies and North America as a missionary, receiving in 1735 a grant of land near Savannah, Ga., and establishing a colony there. The Moravians made him bishop in 1744 and for nearly twenty years

he exercised his jurisdiction principally in America. In 1760 he was called to the supreme council of the sect; four years later was appointed supreme inspector in Upper Alsatia, and in 1789 was made president of the general directory. He died at Berthelsdorf, Saxony. His principal work is *Idea Fidei Fratrum, oder kurzer Begriff der christlichen Lehre in den evangelischen Brüdergemeinden* (1782), translated into English by Benjamin La Trobe. Consult Ledderhose, *Leben Spangenbergs* (Heidelberg, 1846; Eng. trans., London, 1855).

SPANIEL (abbreviation of OF. *chien espagnol*, Fr. *chien épagneul*, Spanish dog, from Sp. *Español*, Spanish, from *España*, Spain). A short-legged, long-haired variety of the domestic dog. Two groups may be made: (1) Hunting spaniels, (2) fancy or toy spaniels. The first contains the field spaniel, clumber, cocker, Norfolk, Sussex, and the English and Irish water dogs; the second has the King Charles, Prince Charles, Ruby, Blenheim, and the Japanese spaniels. All the spaniels are exceedingly close hunters on a ground scent, and although for rapidity of action and range they have been largely supplanted by the pointer and setter, they are unsurpassable in a rough, tangled country. They neither 'point' nor 'set,' but (except the clumber) give tongue when their nose has discovered the game. The difficulty with them is to keep their eagerness in control. They will not only find game, but will retrieve it, especially from water. The chief characteristics of all varieties are length of body and shortness of legs, which in modern dogs has been greatly exaggerated, a great abundance of beautiful silky coat, and a placid disposition.

FIELD SPANIEL AND COCKER. Although of different origin, these may well be considered together. Both in form are long and low, with shapely, gracefully carried heads, and straight strong front legs. The coat is straight, dense, and silky, heavily fringing the ears, the back of the legs, and the toes. The color most preferred is solid black. The cocker usually weighs from 18 to 24 pounds, while the field spaniel is twice as heavy.

THE CLUMBER. This is a large dog weighing up to 65 pounds, with a predominance of white in its color. It takes its name from the seat of the Duke of Newcastle, who introduced the breed into England from the kennels of the Duc de Noailles of France, early in the eighteenth century. Unlike other spaniels, these hunt in silence. They are handsome, grave-looking dogs. Their heads are massive, and marked with a furrow between the eyes. The nostrils are large, open, and flesh-colored; the eyes large and deeply set, and show a 'haw.' The coat is not very long, except the profuse 'featherings,' properly lemon and white with few markings. The tail is usually docked. The Sussex spaniel is a variety of clumber which must be a rich golden liver color. It is faster in the field, and, although not mute, is less noisy than any other kind. The Norfolk is another variety of this type which arose in the English county of that name as a pheasant dog. In the days of hawking this spaniel was the falconer's special assistant. See Plate of DOGS.

IRISH WATER SPANIEL. This dog is of very ancient lineage and great value as a retriever. Its general appearance is that of a large spaniel, with a top-knot of hair falling down over the eyes. The tail tapers like that of a pointer; the face is long and the hair on it is quite free from curling, although that on the body is closely curled, and the small, dark amber eyes are set flush and have no eyebrows. The color is a rich dark liver, and the weight from 50 to 60 pounds.

TOY SPANIELS. The best known of the small pet or 'fancy' spaniels is the King Charles—a black and tan breed, which was maintained pure-blooded for many generations with jealous care by the dukes of Norfolk. In early times they were broken to hunt. Now they are only pets. They are in the main simply miniature spaniels, weighing from 7 to 10 pounds, with eyes large, wide apart, and level, and ears long, drooping, and silky. The Blenheim resembles the King Charles, but its ears are shorter and it differs in color, being a pure pearly white, with bright chestnut or ruby red markings, evenly distributed in large patches. Both the ears and cheeks are red, with a blaze of white between them, in the centre of which is one small red spot. The breed derives its name from the estate of the first Duke of Marlborough, by whose family it was bred. They were in those days trained for the hunt as well as highly prized in the house. The Prince Charles, Charles I. spaniel, or tricolor, resembles the Blenheim, except that where the Blenheim is red he is black, and he has no 'blaze.' The 'ruby' is a King Charles spaniel, with a black nose, and is wholly red. The Japanese spaniel is pure white, parti-colored with black or red or lemon, and of very small size. It may weigh 8 to 12 pounds, or only one pound, as do some of the 'sleeve-dogs,' so called in Japan because they may be carried in the coat sleeve. The Japanese spaniels have a very compact body, large, highly arched head, and their dark eyes are set high and wide apart. The nose is short and pug-like; the legs are slender; and the tail is well feathered and carried in a tight curl over the back. They are very alert and affectionate. A similar dog is highly esteemed in China, especially when solid fawn or silver in color.

Consult authorities cited under Dog; also Spicer, *Toy Dogs* (London and New York, 1903).

SPANISH-AMERICAN LITERATURE. THE COLONIAL PERIOD. Spanish-American literature owes almost nothing to the few fragments of Nahua and Inca literature that survived the destruction of hieroglyphs by the Spanish conquerors. The early literature centres largely around the City of Mexico. (See MEXICAN LITERATURE.) As subsidiary literary centres, Bogotá, Quito, Lima, and Guatemala became noted during the later colonial era.

The subject matter of intellectual colonial effort consists largely of the preparation of grammars and dictionaries of native languages (Menéndez y Pelayo in *La ciencia española* gives a list of fifty-nine of the principal ones), and of catechisms and sermons in both Spanish and the native vernacular. This work was largely utilitarian in object, and, save for the occasional translation of some fragment of native hieroglyphs, is merely of philological interest. Another branch of literary activity was the writing of the history of the conquest and early settlement of America, or the compiling of materials for that purpose. During the later colonial period works

on natural and political science began also to appear. The remaining literary effort, directed toward what is generally called pure literature, produced a few works of merit (so recognized by the mother country), which were of importance in the further literary development of America. These writers (largely ecclesiastics, though occasionally some *conquistador* handled the pen equally well with the sword), described the conflicts of the Spaniards with the natives, as did the Chilean epic poet Pedro de Oña (born c.1571) in his *Araucano domado* and Pedro de Peralta y Barnuevo (d. 1760; of Spanish birth) in his *Lima fundada;* or they depicted the beauties of natural scenery and the happenings of agricultural life, as did the Guatemalan Rafael Landívar (1731-93), in his bucolic Latin poem, *Rusticatio Mexicana;* or they collected the materials for history and wrote excellent accounts of the pacification and settlement of America, as did Juan de Velasco, of Ecuador, in his *Historia del reino de Quito*, and the Jesuits Ovalle and Rosas in Chile. Fr. Juan de Barrenechea y Albis, of the latter country, in his *Restauración de la Imperial* (1693), made a solitary attempt at novel-writing. There appeared also some worthy attempts at devotional writing, both in prose and verse, such as the *Sentimientos espirituales* of Sor Francisca Josefa de la Concepción (d. at Tunja, 1742), and *La Cristiada* of Diego de Hojeda (who lived in Lima early in the seventeenth century). Juan de Castellanos (sixteenth century), of New Granada, in his *Elegias de varones ilustres*, not only celebrated in hendecasyllabic verse the deeds of the early explorers of America and of his native viceroyalty, but also achieved the doubtful distinction of writing the longest poem in the language. The crowning glory of New Granada, however, lies in the intellectual movement which, under the leadership of José Celestino Mutis (1732-1808), the "illustrious patriarch of botanists of the New World," and the many-sided José de Caldas (1741-1816), became memorable in the Spanish-American scientific literature of the latter half of the eighteenth century. During this same period the Ecuadorean Antonio de Alcedo (died 1812) produced his *Diccionario geografico-histórico de las Indias occidentales* (1786-89), a translation of which, by G. A. Thompson, with numerous additions, was published in London (1812-15).

THE PERIOD OF INDEPENDENCE. The revolutionary days of the early nineteenth century, which, in Spanish America, substituted the radical philosophy and sentiment of the progressive French branch of the Latin stock for the unswerving loyalty and religious mysticism of the conservative Spaniard, did not wholly release American writers from dependence upon Peninsular schools of thought. It is true that through translation and imitation it is possible to trace the influence of Byron, of Hugo, of Heine, and of the other great leaders of the romantic school of literature; but in the majority of cases these and other writers are introduced to Spanish America indirectly, and above all through the writings of the Spanish romanticist Zorilla, who has exerted a most profound influence upon American authors. The one great bond that unites the separate republics and, though perhaps unwillingly, keeps them in touch with the thought of the mother country, is the 'sonorous Castilian language,' which its best writers have preserved in all its grammatical and rhetorical purity of diction; but to which they have given a buoyancy and flexibility lacking in the original, and a greater freedom of thought and a more revolutionary and virile spirit that together have rendered this 'offshoot of French art and of Latin culture' a vigorous literary product.

During the early decades of the nineteenth century themes suggested by the revolutionary conflict, in which so many of the writers took an active part, naturally formed the greater portion of the literary output. The period which followed is marked by literature of a more contemplative and personal tone. Within recent years there has arisen the new school of 'Creolism,' whose devotees show in the faithful portrayal of native customs, generally of a rustic character, many elements of rugged strength that promise well for the originality of future literature. During the century there has also occurred a shifting of literary centres in South America. Lima, Quito, and Bogotá have been relegated to a secondary rank, while Buenos Ayres, early brought under the direct influence of the French romantic school, and Caracas, influenced as profoundly by Zorilla and his followers, and Santiago, at present the centre of the most inspiring literary productions of the South American continent, far outstrip their rivals of colonial fame.

The chief literary figure of Latin America is that of Andrés Bello (q.v.), whose mastery of Castilian is illustrated in his many-sided career and whose reputation as a poet rests chiefly upon his georgic *La agricultura en la zona tórrida*. José Antonio Maitín (1792-c.1859), an other native of Venezuela, was one of the first of the ardent followers of Zorilla. Rafael María Baralt (1810-1860), in his *Historia antigua y moderna de Venezuela*, in style and method compares favorably with the best of modern Spanish historians, and also ranks high as a linguist and poet. Among others who have shed lustre on the literary reputation of Venezuela are the members of the gifted Calcaño family; the lyricist Jacinto Gutierrez Coll (1836—), made famous by his *A mi angel guardián* and *Sueño de amor;* Francisco de Sales Perez (1836—), whose *La vida del campo* is a faithful portrayal of the customs of his native *llanos;* and the present day Diaz Rodriguez, whose artistic romance, *Sangre patricián*, recalls the Italian D'Annunzio. Colombia was the home of the lyric poet José Eusebio Caro, whose *Lara* (published in 1834) marked an important literary period in the history of his native land. His associate, Julio Arboleda (died 1862), essayed in *Gonzalo de Oyón* a notable attempt at epic-writing, but achieved a greater success in his brilliant romance *Casimiro el Montañés*. The realistic poet José Joaquin Ortiz is favorably known because of his masterpiece, *Los colonos*. The most noted Spanish-American novel, *María*, is the work of the Colombian Jorge Isaacs; while the *Historia de la revolución de Nueva Granada* (1827) of José Manuel Restrepo is but one of the many historical works that have brought honor to the northern republic. Her southern neighbor, Ecuador, boasts of the statesman poet José Joaquín de Olmedo (1782-1847), whose *Canto de Junín* is the most stirring of revolutionary poems, but

whose work has been rivaled by the more recent verse of Juan Leon Mena, famous also as a critic and for his novel *Cumanda*, and Julio Zaldumbide, a poet of the contemplative school. Lima, in Peru, was the home of the political satirist Felipe Pardo de Aliaga, famous also for his dramas, *Frutos de la educación* and *Una huérfana en Chorillos*. From the middle of the century Peruvian writers have largely followed the Spanish school of romantic literature, and one of the most inspiring of this class of writers is Fernando Velarde, whose collected poems, *Flores del desierto*, appeared in 1848. José Arnaldo Marquez (1825-81) is regarded as the leading lyric poet of modern Peru. The *Noche de dolor en las montanas* of Numa Pompilio Llona (born 1832) is one of the best poems of recent Spanish-American literature. In fiction *El Padre Orani* of Narciso Aréstegui occupies a prominent place, and the dramatists Corpancho and Segura take a high rank. As under the political régime of viceroyalty days, Bolivia has continued to be in a literary sense the appendage alternately of Peru and of Argentina, but the lyric poetry of Ricardo J. Bustamante (born 1821) and the *Ensayo sobre la historia de Bolivia* of Manuel José Cortés (1811-65) have received favorable notice, as has also the *Ultimos dias coloniales en el Alto-Peru* (1896), written by Gabriel René-Moreno.

Chile, long the most backward of the South American republics, was greatly aroused by the long residence of Bello and by the coming of many exiled Argentines. Of the succeeding generation the publicist and poet Arteaga Alemparte (1835-1880) achieved a poetic triumph in his hymn *Al Amor*. Isaias Gamboa, in his *Poemas* (1902); the rare and strange Antonio Bórquez Solar, in his *Campo lírico* (1900); and Carlos Walker Martinez in *Poesías* (1894) and *Romances Americanos* (1899) exhibit an elevation of thought and a beauty of versification unequaled elsewhere in Spanish-America and hardly surpassed in Europe. Chilean writers of history and political science, among whom are reckoned Arana and the Amunâteguis, likewise enjoy an international reputation, while *Alberto el jugador*, a novel by Rosario Orrego de Uribe, and *Contra la marea*, by Alberto del Solar, attest the worth of her writers of fiction.

With the dawn of independence the classic translations and imitations of Valera, Quintana, and Cienfuegos inaugurated the literary history of Argentina, a history which includes that of her neighbor, Uruguay. In Argentina Estéban Echeverría, one of the first American lyricists, known for his *La cautiva*, introduced romanticism directly from the French, and liberated the thought of his own countrymen. His fellow citizen José Rivera Indarte produced the stirring poem *El festín de Baltasar*, and his pupil Juan Maria Gutierrez the lyrics *Recuerdo* and *A mi caballo*. Following these came a host of littérateurs, with centre at Buenos Ayres, or, in time of political proscription, at Montevideo, whose work in poetry and prose has greatly influenced the political thought and literature of their own and neighboring republics, and has rendered famous the names of the historian Vicente Fidel Lopes, the dramatist José Marmol (author also of the novel *Amalia*), and the poet José Hernandez, whose *Martín Fierro* has been the most widely sold poem of the southern continent. The *Flores silvestres* of the dramatist Francisco Javier de Acha, of Uruguay, have also met with a favorable reception, and the *Libro extraño* of Francisco Sicardi is one of the best of recent novels. The *Historia Argentina* (1894) of Mariano A. Pelliza is a monumental work of great merit. In the department of criticism the *revistas* of Buenos Ayres have occupied a leading place, and one of their most famous contributors was Juan Bautista Alberdi, whose *Escritos póstumos* appeared during the last decade. Bartolomé Mitré's *Historia del general Belgrano* is one of the most successful attempts at biographical history that the century has produced. During recent years the prevailing commercialism of the Plata valley has undoubtedly exerted a pernicious effect upon its literature. Central America, in addition to a number of political writers, has contributed to the field of letters the satirist José Batrés y Montúfar, and the writers of fables García Goyena and Matías Córdoba of Guatemala.

SPANISH-AMERICAN WAR. The war between Spain and the United States in 1898. After more than a century of unrest in the island of Cuba, and intermittent struggles between the Cubans and their home Government, when the increase of bloodshed, starvation, and general devastation had attracted world-wide attention, and when the rights of American citizens had been systematically disregarded by the Spanish authorities, the United States decided to interpose its friendly offices. After the 'Ten Years' War' (1868-78) in Cuba, there had been a period of comparative peace (see CUBA), but in February, 1895, the Cubans again rebelled, and the Spanish Government resorted to repressive measures of unusual severity and cruelty. The island was devastated, famine and death were everywhere, American interests suffered greatly, and the condition of affairs fast became intolerable. On April 6, 1896, Secretary of State Olney represented to Spain that American commerce was being greatly damaged, and that the Cubans were threatened with 'absolute impoverishment,' and vaguely offered the friendly offices of the United States, his 'offer,' however, falling short in definiteness to that of a resolution passed, on April 4th, by the American Congress. Olney's offer was immediately declined by Spain, and in December, 1896, President Cleveland, in his annual message, spoke of 'higher obligations' than those due to Spain, which would devolve upon the United States if conditions should grow worse in the island and if Spain's inability to deal

successfully with the insurrection should become manifest. In Congress feeling was much more radical, and the President's 'timidity' was vigorously criticised. President McKinley, at the outset of his administration, devoted special attention to the situation in Cuba. In May, 1897, Congress appropriated $50,000 for the relief of the Cubans, and on May 20, 1897, the Senate passed a resolution recognizing the belligerency of Cuba, which, however, was never acted upon by the House. Meanwhile, the activity of Cuban agents in the United States caused almost constant diplomatic friction between the two governments. A new Ministry under Sagasta in Spain made an effort to ameliorate conditions, and on October 6, 1897, recalled Captain-General Weyler, who had been held responsible for much of the Spanish cruelty to the Cubans, General Blanco being sent out in his stead. Stewart L. Woodford, of New York, had been sent as United States Minister to Spain, with special instructions to urge that country to establish civil order in Cuba, and to announce that the United States could not view with indifference the indefinite prolongation of the existing conditions. The representations of the American Minister were met with promises from Spain to give Cuba local autonomy and to ameliorate the conditions which the war methods had created. In view of these assurances, the President, in his annual message of December, 1897, recommended to Congress the postponement of action until Spain had been given ample opportunity to redeem her promises. On December 24th an appeal was issued by Secretary Sherman in the President's name, calling for contributions for the relief of the Cuban *reconcentrados*. This appeal met with a hearty response. At the opening of 1898 the Government began to concentrate its naval forces, and to accumulate war supplies. The tone of the press and the expressions of public opinion generally showed that the nation was ready for war. The relations with Spain were further strained on February 8th, when a Cuban sympathizer purloined from the mail a letter from the Spanish Minister at Washington, Señor Dupuy de Lome, addressed to a Spanish editor, and containing severe strictures on President McKinley and his policy. The Minister at once admitted that he had written the letter and resigned. The prompt disavowal on the part of Spain of any sympathy with the Minister's conduct closed the incident so far as official circles were concerned. On the evening of February 15th the battleship *Maine* (Captain Charles D. Sigsbee), which had been sent to Cuba on the representation of Fitzhugh Lee, the American Consul at Havana, but not for unfriendly purposes, according to official announcement, was blown up in Havana harbor and 266 of the crew killed. The United States and Spain at once appointed separate boards of investigation. Congress immediately appropriated $50,000,000 for national defense. On March 28th the American commission reported. It attributed the catastrophe to the explosion of a submarine mine in the harbor, but in view of the lack of evidence declined to fix responsibility. Public opinion, however, at once decided that the Spanish officials in Cuba were responsible for the disaster. On the day before the report of the *Maine* commission, the President made overtures to Spain for a cessation of hostilities and a peaceable settlement of difficulties. He tendered his good offices in the negotiation of peace and proposed a dissolution of the concentration camps and the relief of the suffering Cubans by the United States through the mediation of Spanish officers. In reply, Spain offered to leave the peace negotiations to the Cuban Parliament appointed to meet on May 4th, and to cease hostilities when the Cuban insurgents asked for it. Spain added that the concentration orders had been revoked, agreed to a joint relief of distress, voted $600,000 for that purpose, and offered to arbitrate the *Maine* case. The President regarded this reply as unsatisfactory and announced his intention of submitting the whole matter to Congress in the forthcoming message. Meanwhile, in anticipation of the war, American inhabitants left Cuba, the Cuban Government declared against interference on the part of the United States, the Cuban 'junta' demanded recognition of independence before intervention, and Spain on April 10th declared a general armistice. On the following day the President's message, describing the situation in Cuba and giving an account of the state of diplomatic relations with Spain, was laid before Congress. The President did not favor the recognition of Cuban belligerency or independence, but advocated intervention as a neutral. At all events, he declared, the war in Cuba must be ended, and he accordingly asked Congress for authority to use the army and navy to secure the formation of a Cuban government capable of discharging its international obligations and maintaining internal order. Congress promptly replied by a joint resolution declaring the people of Cuba free and independent, demanding the surrender of all Spanish authority over the island, and directing as well as empowering the President to enforce the resolution by the army and navy. Congress further declared that the United States was not "to exercise sovereignty, jurisdiction, or control over said island except for the pacification thereof." The President signed the measure, and on April 20th sent the ultimatum to Spain, fixing the hour of noon, April 23d, as the last date for a satisfactory reply. This was a practical declaration of war, for the Spanish Government had already announced its intention to oppose the policy outlined in the President's message. Both Powers at once defined their attitude on questions of international law, and preparations that had been going on in both countries were quickened, the United States devoting special attention to the equipment of the navy.

Almost immediately the Spanish Minister demanded his passports and the American Minister at Madrid was notified by the Spanish Government that diplomatic relations between the two nations had ceased. On April 23d President McKinley called for 125,000 volunteers and ordered the North Atlantic squadron to blockade Havana and other Cuban ports. Formal declaration of war by Spain on the 24th and by the United States on the 25th inst. were followed by the proclamations of neutrality by Great Britain and other foreign Powers.

The first gun of the Spanish-American War was fired (April 23d) by the U. S. S. *Nashville* across the bows of the *Buena Ventura*, a Spanish merchantman, and the first action occurred on the 27th, when three vessels of the United States

Navy under Captain Sampson bombarded the defenses of Matanzas.

Spain had an army of 60,000 men distributed throughout Cuba, and had fleets near that island and in the Philippines. Commodore Dewey, U. S. N., commanding the Asiatic squadron, then in Chinese waters, had completed the equipment and coaling of his ships, when the cable brought him orders to "proceed to the Philippine Islands; commence operations at once against Spanish fleet; capture vessels or destroy." Entering the harbor of Manila (April 30th) under cover of darkness, with his fleet (131 guns, 1678 men), made up of the *Olympia* (flagship, Captain C. V. Gridley), the *Baltimore* (Captain N. M. Dyer), the *Raleigh* (Captain J. B. Coghlan), the *Boston* (Captain F. Wilder), the small cruiser *Concord* (Commander A. Walker), the gunboat *Petrel* (Commander E. P. Wood), the revenue cutter *Hugh McCulloch*, and two colliers, he attacked the ships of Admiral Montojo, ten in number (120 guns, 1796 men), supported by land batteries. The action, which lasted from 5.41 A.M. (with an interruption of three hours) till 12.30 P.M., ended in the destruction of the Spanish vessels and the silencing of the fortifications. The American casualties were 6 wounded; Spain admitted a loss of 634 killed and wounded.

The mobilization of the United States land forces proceeded rapidly, and on May 25th a second call was made—for 75,000 volunteers. While camps of instruction were established near Tampa and Chickamauga, the Navy was watching the seacoast and preparing the way for a combined attack by the land and naval forces upon Cuba.

In the meanwhile the movements of a Spanish fleet of four cruisers and three torpedo-boat destroyers under Admiral Cervera, which sailed from Saint Vincent on April 29th, for some time puzzled the Americans. But finally (May 29th) the Spanish ships were discovered by Commodore Schley (q.v.) at anchor in the Bay of Santiago, and a carefully organized blockade of the bay was planned and rigorously conducted by Admiral (then Captain) Sampson, the commander of the American fleet in Cuban waters, who had arrived at Santiago and had superseded Schley in actual command on June 1st. In Sampson's fleet was the *Oregon* (Captain Charles E. Clark), which to join the fleet had made a wonderful trip from Puget Sound to Key West between March 6th and June 4th. A daring attempt by Lieutenant R. P. Hobson (q.v.) on June 3d to lock the door upon Cervera's fleet, by sinking the collier *Merrimac* in the entrance to the harbor, was only partially successful. The harbor of Guantanamo was occupied as a coaling station by the Americans after several collisions with the Spanish troops.

Finally, an expedition consisting of 32 transports bearing 819 officers and 15,058 enlisted men under Major-General Shafter, U. S. V., left Tampa, June 15th. The force was composed almost entirely of regulars—18 regiments of infantry, 6 regiments of cavalry (dismounted), 1 battery of engineers, 4 batteries of light artillery, 2 batteries of siege guns, and 1 balloon detachment—together with 1 regiment of cavalry and 2 regiments of volunteer infantry (subsequently increased to 4 regiments).

General Shafter's instructions from his Government were to "go with your force to capture garrison at Santiago and assist in capturing the harbor and fleet." Arriving off Guantanamo (June 20th), he communicated with the Cuban forces (5000 strong) under General Garcia, whose coöperation was secured. It was estimated that there were about 12,000 Spanish soldiers in Santiago and vicinity. A plan having been agreed upon between the United States land and naval forces, a landing was effected (June 22d) at Daiquiri of 6000 men, and on the three following days the remainder of Shafter's troops disembarked there and at Siboney, without opposition. The rainy season having set in increased the natural difficulties of an advance over a soft clay surface, covered with a tough undergrowth, interspersed with cow-paths in lieu of roads. The Spaniards had withdrawn to their intrenchments near Santiago, protected by an entanglement of barbed wire.

Although orders had been issued to the American advance to await the completion of the disembarkation and landing of supplies, the leading division under General Wheeler (June 24th) attacked the Spanish troops at Las Guasimas and after a sharp engagement dislodged them, with casualties of 68 Americans and 36 Spaniards. When the preparations had been completed for a general advance, the United States troops on July 1st, having taken up positions on the slopes of the hills in front of Santiago with a detachment of Cubans protecting their flanks, opened fire with a field battery, which, using black powder, became a target for the Spanish gunners. A battery of rapid-fire guns, however, did much execution. The character of the ground, the absence of roads, and the stout resistance of the garrison of El Caney (q.v.) retarded the advance of a part of the American force under General Lawton, but by sundown Shafter's troops were in full possession of the line of hills along the San Juan River, one and a half miles from the city. These engagements were fought chiefly by regulars, but efficient services were rendered by the First Volunteer Cavalry, popularly known as the "Rough Riders," under Colonel Leonard Wood and Lieutenant-Colonel Theodore Roosevelt. The following day was utilized by both sides in strengthening the lines and by the Americans in bringing up ammunition and rations. The exposed position of the American forces rendered an immediate advance or temporary withdrawal necessary.

On the morning of Sunday, July 3d, Cervera, taking advantage of the operations on land, had sought to escape from the harbor of Santiago. The appearance of the leading ship was the signal for every ship in the American squadron to close in upon the fugitives with a hot fire, which was returned with spirit, but without material effect. Within two hours the six Spanish ships were totally destroyed, with a loss of about 350 men killed and about 1700 men and officers captured, including Admiral Cervera. Early in the morning Sampson in his flagship *New York* had started for Siboney, where he had planned to hold a conference with General Shafter, and Schley was thus left as the ranking officer. At the beginning of the battle, however, Sampson, about ten miles away, started back, arriving before the battle was over. During the battle the Americans lost only one man killed and ten wounded. The seven American vessels engaged had a total

of 225 guns, while the Spanish fleet had only 146; the weights of metal the two fleets could throw per minute were 6720 and 4827 pounds respectively. On the same day as that on which the naval battle occurred General Shafter notified the Spanish commander, Toral, that unless he surrendered by the morning of the 4th, the city would be shelled. After several communications had passed between these officers, and the request of foreign consuls for an extension of time had been complied with, a final demand brought the truce to an end on the 10th and the joint attack by ships and troops was resumed. On the 11th another demand upon the besieged was made, culminating on July 15th in articles of capitulation providing for the surrender of all forces, material, and territory of the district of Santiago, and the transportation of all Spanish soldiers to Spain. The Spanish forces in the captured territory numbered 23,500 and of these 10,000 defended the city. Their losses aggregated nearly 1000, while the Americans killed and wounded numbered 1614, of whom 114 were officers. The American regulars bore the brunt of the action. On Sunday (July 17th) at noon the Stars and Stripes were hoisted in the plaza of Santiago. On July 27th General Miles, U.S.A., at the head of an expedition landed at Ponce, Porto Rico, and a few days later formally took possession of the island. On the 25th General Merritt arrived at Manila to assume command of 20,000 United States troops, of which the advance guard had already been sharply engaged with the Spanish forces stationed there. On August 7th Admiral Dewey and General Merritt united in a demand for the surrender of the city and the islands. This being refused, a combined attack was made, and 7000 regular and 4000 volunteer Spanish soldiers fell into the hands of the Americans, who lost 50 men killed and wounded. Meanwhile, the Filipinos had been organized by Aguinaldo, who subsequently conducted hostilities against the American troops for the purpose of gaining independence. See PHILIPPINE ISLANDS.

On July 26th Spain made overtures for peace through the French Ambassador at Washington, M. Cambon, who was authorized to act as Minister Plenipotentiary for Spain during the coming negotiations. On August 12th the peace protocol and preliminary arrangements were concluded. It was provided that the final treaty should be made by a commission to meet at Paris not later than October 1st. The representatives of the United States were William R. Day (chairman), Senator Cushman K. Davis, Senator William P. Frye, Whitelaw Reid, and Senator George Gray. After prolonged discussions and threatened failure, the treaty was signed on December 10th. It was ratified by the United States Senate on February 6, 1899, signed by the Queen Regent of Spain on March 17th, and final ratifications were exchanged on April 11th. Diplomatic relations were soon resumed. By the treaty, Porto Rico and the other Spanish West Indian Islands, Guam in the Ladrones, and all of the Philippines were ceded to the United States, which in return agreed to pay $20,000,000 and to yield some temporary commercial privileges in the Philippines. The political status of the inhabitants of the new possessions was to be determined by the new Government.

The finances for the war were provided by special taxes. On June 13, 1899, an act was approved for that purpose. Internal taxes were increased and a stamp tax imposed on certain papers and articles. A popular loan was also negotiated. This war tax continued in force until March 2, 1901, when a reduction was made, and on April 14, 1902, the remainder was repealed. The total expenses for the war from the opening to October 31, 1898, were estimated at $165,000,000. During that period the lives of 2910 American soldiers were lost, all but 306 from disease. The enormous death rate in the camps brought out serious charges of maladministration against the War Department that culminated in the appointment of a committee of investigation, which after a thorough examination of charges reported in general in favor of the department, laying most of the blame upon the want of preparation at the time war broke out. For further details concerning the results of the war, see UNITED STATES; CUBA; PORTO RICO; PHILIPPINE ISLANDS.

SPANISH-AMERICAN WAR, NAVAL AND MILITARY ORDER OF THE. A patriotic and hereditary society organized in New York City on February 2, 1899. It admits to membership any man of good repute who served on the active list, or performed active duty as a commissioned officer, regular or volunteer, in the United States Army, Navy, or Marine Corps, during the war with Spain, or in the subsequent insurrection in the Philippines, or who participated in the war or insurrection, prior to April 1, 1901, as a naval or military cadet, or as an officer in the Revenue Cutter Service on any vessel assigned to duty under the control of the Navy Department.

SPANISH BARBER, THE. A comedy by George Colman, the elder, produced in 1777, based on Beaumarchais's famous comedy *Le barbier de Séville.*

SPANISH BAYONET. See YUCCA.

SPANISH FLY. See BLISTER-BEETLE.

SPANISH FOWL. The black Spanish fowls constitute one of the oldest varieties of domestic poultry, and are renowned for their exceptionally fine laying qualities. The white face is a distinguishing feature, and should be long, smooth, free from wrinkles, rising well over the eyes in an arched form, extending toward the back of the head and to the base of the beak, covering the cheeks and joining the wattles and ear-lobes. The color of the plumage is rich, glossy black, and any gray is considered a serious defect. Shanks

and toes are blue, or dark leaden blue. The comb is single, and bright red in color; wattles, bright red, except the inside of the upper part, which is white; ear-lobes, pure white.

SPANISH FRIAR, THE. A drama by Dryden, produced in 1681, written against the Roman Catholic priesthood. Two plots, one serious, the other comic, are combined in the story, connected by Dominick, the friar, a fat amusing rascal.

SPANISH GYPSY, THE. (1) A romantic comedy by Middleton, assisted by Rowley, printed in 1653. Two stories are combined, one from Cervantes's *Fuerza de la Sangre* and the gypsy tale from his *La Gitanilla*. (2) A long dramatic poem by George Eliot (1868). A duke of mediæval Spain is about to marry Fedahua, a beautiful girl, who discovers that she is the daughter of the gypsy chief Zarco. The call of race and duty conquers, followed by a tragic renunciation of her love.

SPANISH LANGUAGE. A Romance language, evolved out of Latin in the Iberian Peninsula and carried by Spanish colonists to the Canaries, the Antilles, the Philippines, Mexico, portions of the United States, Central America, the greater part of South America, and a few places on the coast of Africa, and by the Jews into Turkey and other regions in which they settled after their expulsion from Spain. In the Iberian Peninsula the boundaries of the Spanish-speaking domain do not coincide exactly with those of the political division called Spain, since within the latter are contained Galicia, whose inhabitants speak a Portuguese dialect, a Basque-speaking district in the north, and a Catalan-speaking region in the east. The inhabitants of the Balearic Islands speak a Catalan dialect. Probably not far from 50,000,000 persons at present use Spanish as their native tongue, the majority being in the New World. Five principal dialects are distinguishable in the language as spoken in the mother country: Asturian, Leonese, Aragonese, Andalusian, and Castilian. Castilian has become the standard literary speech.

Castilian has the five simple vowels, *a, e, i, o, u*, a variety of diphthongs, and a few triphthongs produced by the union of a strong vowel (*e, o, a*) with two weak vowels (*i, u*). Examples of the diphthongs and triphthongs are *iu* in *viuda*, 'widow;' *ui* in *ruido*, 'noise;' *ai* in *baile*, 'dance;' *eu* in *deuda*, 'debt;' *io* in *Dios*, 'God;' *iai* in *estudiáis*, 'you study.' The diphthongs *ie* and *ue* are especially common as representatives of a Latin short *e* or *o;* compare Latin *bĕne* and *fŏrum* with Spanish *bien* and *fuero*. Qualitative distinctions in vowels (open and close *e* and *o*) exist, but are not so marked as in certain other Romance languages (e.g. Italian and French). In assonance (rhyme of vowels without that of the consonants) these qualitative distinctions are not regarded; open and close *e* may therefore rhyme together, as may also open and close *o*, and, furthermore, final unaccented *i* and *u* may rhyme respectively with *e* and *o* similarly situated. Although *liaison*, strictly speaking, is not a feature of Spanish pronunciation, yet in rapid speech the vowel ending one word may be merged into the same vowel of the immediately following word, provided this latter be syntactically allied to it (e.g. *mi querida amiga* may become *mi queridamiga*, with a possible compensatory lengthening of the *a*). The consonant sounds are *p;* a bilabial spirant written both *b* and *v* (the more frequent sound of these letters); a labial stop written both *b* and *v* (the value of these characters where they follow an *m* of the same word or an *n* at the end of the preceding word, as in *también* and *en vida;* the sound is that of the usual English *b*, the sound of the English *v* not existing in Spanish); *f; w* (written *u* in hiatus); *m; t; d* (both *t* and *d* are articulated farther forward in the mouth than the corresponding English sounds, and *d* has a decided tendency to become everywhere the interdental spirant); a voiceless spirant that is interdental or nearly so (written *c* before *e* or *i*, and *z* before a consonant, at the end of a word, or before any vowel, though rarely now before *e* or *i;* e.g., *celo*, 'zeal;' *cielo*, 'heaven;' *zapato*, 'shoe;' *raiz*, 'root;' the value is about that of *th* in the English *breath*); a voiced spirant, interdental or nearly so (written *d*, which has this sound especially between vowels, as in *lado*, 'side;' or when preceded by a vowel and followed by *r*, as in *padre*, 'father,' or at the end of a word, as in *abad*, abbot; the value is about that of *th* in the English *breathe*); *l;* a palatalized *l* (written *ll* and pronounced nearly like the *li* of *filial*); *n;* a palatalized *n* (written *ñ*, and pronounced like the *ni* of *pinion*); a simple tongue-trilled *r* (never slurred); a reënforced form of the same sound (written *rr* between vowels and *r* at the beginning of a word, or after *s, l,* or *n* within a word, e.g. *perro*, 'dog;' *reo*, 'criminal;' *israelita*, 'Israelite;' *honra*, 'honor'); a voiceless *s* (with the value of the English *ss*); *y* (written both *i* in hiatus and *y*); *k* (written *c* before *a, o,* and *u*, or before a consonant and in the final position, and *qu* before *e* and *i*—*carro*, 'car;' *frac*, 'frock coat;' *acto*, 'act;' *querer*, 'to like;' *quién*, 'who'); *g* (the so-called hard sound of English *g* in *game, get;* written *g* before *a, o, u,* and *gu* befor *e, i*—*gato*, 'cat;' *guerra*, 'war'); a velar or guttural spirant (with approximately the value of *ch* in Scotch *loch* and German *nach;* written *j* in all positions and *g* frequently before *e, i*—*jamás*, 'never;' *gente*, 'people;' some observers find also a voiced form of this spirant, but it is usually voiceless); a velar *n* (with the value of English *ng* in *sing;* written *n* before a guttural or palatal, as in *banco*). It is the general rule that the Spanish written characters represent actual sounds; but *u* is frequently used before *e* or *i* as a sign that a preceding palatal consonant has the 'hard' or stop value, as in *que* or *guerra; j* is silent in the singular noun *reloj;* and in a few words like *usted* a final *d* may not be pronounced. The simple *h* is generally not pronounced, though before the diphthong *ue* it may have a slight aspiration. In the conjunction *y* (= 'and') the sound is that of the vowel *i*. An aversion to the doubling of consonants is a distinguishing feature of Spanish spelling; *c* and *n* alone may be doubled, as in *acción*, 'action,' and *innoble*, 'ignoble,' and these combinations must be pronounced as double sounds wherever they occur; *ll* and *rr* are properly not doubled consonants, and they figure as individual signs in the alphabet. Among the combinations of consonants may be mentioned *ch*, like *ch* in the English word *church;* e.g. *chico*, 'little.' According to the Academy the written *x* is a double

consonant equivalent to *ks;* but before a consonant there is a rather widespread tendency to pronounce it like a simple *s*. In older Spanish *x* was a much more common character than now and had the value of our *sh*. By a decree of the Spanish Academy issued in 1815, *x* with the value of *sh* has been displaced in favor of *j*, pronounced as described above. The matter of accentuation is governed by strict rules of the Academy. Words ending in a consonant not *n* or *s* regularly stress the last syllable; e.g. *verdad*, 'truth;' *amar*, 'to love.' Words ending in *n* or *s* or in a vowel regularly stress the syllable before the last; e.g. *aman*, 'they love;' *hijos*, 'sons.' Words infringing these rules and all words stressed on a syllable not the last or second last must bear a written acute accent on the stressed syllable, as *nación*, 'nation;' *cortés*, 'courteous;' *médico*, 'physician.' If a diphthong or a triphthong occur in the stressed syllable the stress will fall upon its strong element (*a*, *e*, or *o*), and where the diphthong consists of two weak elements (*i*, *u*) the second of the two will have the stress.

In its chief grammatical usages Spanish accords with French, Portuguese, Italian, and the other Romance languages. A decided peculiarity is the use of the preposition *á*, 'to,' before the direct object of a verb, when that object represents a person, e.g. *veo á mi amigo*, 'I see my friend.' Like Portuguese, Spanish has two verbs 'to have' (*tener* and *haber*, the latter used as an auxiliary in conjugation) and two verbs 'to be' (*estar* and *ser*), and in each case the functions of the verbs are distinct. With *estar* and the gerund of a principal verb there may be formed a very useful periphrastic conjugation corresponding to the English progressive form, thus, *Juan está estudiando*, 'John is studying.' Instead of the four conjugations of Latin there are but three in Spanish; furthermore, regular verbs of the Spanish second conjugation and the Spanish third conjugation differ in only four forms, viz. the present infinitive, the first and second persons plural of the present indicative, and the second plural of the imperative. There are certain radical-changing verbs which, though perfectly regular as to their endings, change their root vowels *e* and *o* under the accent, and, in some cases where they are not accented, to the diphthongs *ie* and *ue* respectively, or, going a stage farther, to the simple vowels *i* and *u*. The subjunctive mood persists with much more vigor than in most modern languages; besides the usual present and imperfect tenses, it has a second imperfect form (called also the conditional subjunctive), which is properly a descendant of the Latin pluperfect indicative, and upon occasion may still be used as an indicative pluperfect or aorist in Spanish, and also a future tense. Auxiliaries are used to form the compound tenses, as in the sister Romance tongues, but, contrary to the custom in French and Italian, it is 'to have' (*haber*) and not 'to be' that forms the perfect tenses of reflexive verbs, thus, *se ha lisonjeado*, 'he has flattered himself.' The neuter gender survives in the case of the singular of the definite article *lo*, of the demonstrative words, *esto*, *eso*, *aquello*, and of the objective pronoun of the third person *lo*. These neuter forms occur only in indefinite and general constructions, and then the neuter article, always accompanied by an adjective (or an adverb), forms abstract expressions, thus, *lo bueno*, 'the good' = 'goodness.'

Latin, of course, forms the basis of the Spanish vocabulary, but there is an admixture of words from other sources. There are doubtful traces of words from pre-Romance languages, such as Iberian and Celtic and the speech of the Punic invaders and colonists. Despite trading relations, no permanent acquisitions seem to have been made from Greek until after the Roman conquest. The Visigothic invasion brought a few Germanic words, and that of the Arabs brought in a host of Oriental words, many of which are easily detected by the prefixed Arabic article *al*. In the eleventh century many lexical elements came from beyond the Pyrenees with the entrance of French soldiers, ecclesiastics, and colonists, and an infusion of Italian elements was occasioned by Aragonese domination in Italy and by the great vogue of Italian poetry in the Spanish Peninsula during the fifteenth and sixteenth centuries. Colonial relations have led to the introduction of a few terms from Indian and other sources; and learned influences have constantly increased the stock of borrowings from Latin, Greek, and French.

Traces of written Spanish are found in Latin deeds and grants as early as the eighth century, but the first really important Spanish document is one of the eleventh century, containing a series of glosses, and literature in Spanish does not begin until the twelfth century, in so far as the extant documents are concerned.

BIBLIOGRAPHY. The second decade of the eighteenth century saw the founding of the Spanish Academy, and the results of its activity were a *Diccionario de la lengua castellana* (Madrid, 1726-39), an *Ortografía* (1742), and a *Gramática* (ib., 1771; new ed. 1895). An abridged edition of the *Diccionario* was produced in 1780, and has been repeatedly revised (13th ed., ib., 1899). Among the many dictionaries, grammatical treatises, etc., may be mentioned: Salvá, *Nuevo diccionario de la lengua castellana* (7th ed., Paris, 1865); Domínguez, *Diccionario nacional, ó gran diccionario clásico de la lengua española* (15th ed., Madrid, 1882); Barcia, *Primer diccionario general etimológico* (ib., 1881-83); De Eguilaz y Yanguas, *Glosario etimológico de las palabras españoles de origen oriental* (Granada, 1886); Dozy and Engelmann, *Glossaire des mots espagnols et portugais dérivés de l'arabe* (2d ed., Leyden, 1869); Cuervo, *Diccionario de construcción y régimen de la lengua castellana* (Paris, 1886 et seq.); Lopes and Bensley, *Nuevo diccionario inglés-español y español-inglés* (ib., 1900); Velazquez de la Cardena, *New Pronouncing Dictionary of the Spanish and English Languages* (rev. ed., New York, 1900); Bustamante, *Dictionary of the Spanish and English Languages* (Paris, 1897); Bello and Cuervo, *Gramática de la lengua castellana* (6th ed., ib., 1898); Knapp, *Grammar of the Modern Spanish Language* (New York, 1882); Ramsey, *Text-Book of Modern Spanish* (new ed., ib., 1902); Garner, *Spanish Grammar* (ib., 1901); Edgren, *Elementary Spanish Grammar* (ib., 1899); Baist, "Die spanische Sprache," in Grolber, *Grundriss der romanischen Philologie*, vol. i. (Strassburg, 1888).

SPANISH LAW. The most widely extended branch of the civil law (q.v.). Even if Portuguese law, which is an offshoot of mediæval Spanish law, be left out of the reckoning, Spanish law prevails to-day over a wider area and governs a larger population than any other system except the English. Spanish law, in its Castilian form, was introduced into all the Spanish colonies. In Mexico, in Central America, and in all of the South American States, except Brazil (which is governed by Portuguese law), the law of Castile still forms the historical basis of the legal order. Modern Spanish law, as codified in the later decades of the nineteenth century, obtains in Cuba, in Porto Rico, and in the Philippines.

HISTORY. (1) *Pre-Roman and Roman Periods.*—in mediæval Spanish law, some legal historians find traces of Iberian, Celtic, and Phœnician customs; but for all practical purposes the history of Spanish law begins with the conquest and civilization of the peninsula by the Romans. Until the fifth century of the Christian Era the rule of the Roman law was as complete in Spain as in any other province of the Roman Empire. The laws of Malaga and Salpensa, preserved in inscriptions dating from A.D. 82 or 83, are among the most valuable sources of our knowledge of Roman municipal law.

(2) *Visigothic Period.*—A new and important element was introduced in the fifth century by the German conquest of the peninsula. In the Visigothic kingdom, which existed until 711, the conquered Roman population retained, for nearly two centuries, their own law in matters that concerned themselves only. A special compilation of Roman law, the so-called Breviary of Alaric (q.v.), was drawn up for their use, A.D. 506. From the name of the royal official who attested the copies of this compilation, it is generally described in Spanish legal literature as the Breviary of Anianus. The Visigothic conquerors, however, lived by their own customs and laws; and to these, in case of conflict, the Roman law gave way. Their law also was put in written form. The so-called Lex Antiqua Visigothorum (palimpsest in the Bibliothèque Nationale, Paris) is ascribed by some authorities to King Euric (A.D. 466-c. 485), by others to King Leovigild or to King Reccared, a century later. The written law of the Visigoths was developed from reign to reign, with an increasing infusion of Roman law, civil and ecclesiastical. The assemblies which approved these laws were practically Church councils; they consisted wholly or chiefly of prelates. About the middle of the seventh century the Breviary of Alaric was deprived of legal authority, and the Romanized Lex Visigothorum became the general law of the peninsula. The form in which this code has come down to us is practically that which it received in the reign of King Reccessuinth (649-672). In the eighth and following centuries the Visigothic code was frequently described as the Liber Judicum, or Forum Judicum, or (in the vernacular) Fuero Juzgo. To the Visigothic period belongs a Spanish collection of council decrees and Papal decretals, the so-called Hispana, which was much used in Western Europe and became one of the most important sources of the canon law (q.v.).

(3) *Mediæval Period.*—The Moorish conquest and occupation of the peninsula (A.D. 711-1492) left few permanent traces upon Spanish law. The Christians who lived under Mohammedan rule retained not only their religion, but, in matters concerning themselves alone, their laws also. This was the case even with the so-called 'Mozarabs' who accepted the speech of the conquerors, as is shown by the existence of an Arabic translation of the Hispana and by Arabic notes on the Visigothic code. As the peninsula was gradually reconquered and the Christian States of Northern Spain, the Moors who remained enjoyed similar privileges; but the general expulsion of the 'Moriscos' (A.D. 1609-14) left Catholic Christianity and Gothic-Roman law in complete dominion. In Christian Spain, however, as in other parts of Europe, the development of the law during the Middle Ages was particularistic. The Visigothic code remained, in theory, applicable, but its rules were superseded by local, provincial, and class customs and laws (fueros, q.v.). The Spanish cities obtained charters of self-government (cartas pueblas) and developed independent city laws earlier than in the cities in the rest of Europe. The earliest town law that has come down to us is that of Leon (1020). At the close of the fourteenth century there was scarcely a town of any consequence that had not its own fuero. In the open country, the tenants and serfs of the Crown, of the Church, and of the nobles lived by different manorial customs. The earliest fueros of provinces or kingdoms represented the legal customs of the nobles; one of the most interesting of these is the Fuero Viejo of Castile (1212). In the thirteenth century attempts were first made to combine the general rules of provincial and town law in 'general fueros' of the various kingdoms, issued by the kings with the approval of the estates. Such were the Fuero Real (1255) and the Ordenamiento de Alcalá (1348) in Castile; the Fuero de Huesca (1247) and the Observancias (1437) in Aragon; and the Fueros Generales of Navarre (1237) and of Valencia (1239). The revival of the study of the law-books of Justinian in the twelfth and following centuries resulted in Spain, as elsewhere, in more or less 'reception' of Roman Imperial law. (See CIVIL LAW.) In Catalonia, in Valencia, and in Navarre the law-books of Justinian, as interpreted by the Italian commentators and taught in the Italian and Spanish universities, were received as subsidiary 'common law.' In Aragon and in Castile they were not so received, in bulk; but in Aragon the new jurisprudence influenced legislation, and in Castile it produced an essentially Roman code, the celebrated Siete Partidas. In its first form (so-called Spéculo or Setenario) this code dates from c.1260, but it did not obtain legal force until 1348. It was to be applied only when the general laws of Castile and the special fueros still in force furnished no rule; but in practice, through the influence exercised upon the courts by the doctrines of the universities, the Partidas to some extent supplanted the purely Spanish sources.

(4) *Modern Period.*—The union of Castile and Aragon (1479), the conquest of Granada (1492), and the annexation of Navarre (1512) established the modern Kingdom of Spain. In the new Spain, however, the provinces that had been

separate kingdoms retained a considerable degree of autonomy. Each of them kept its separate parliament (Cortes) and in each of them the law was developed by provincial legislation. In each of them compilations of the laws were made from time to time. In Castile the most important legislative products were the Ordinanzas Reales (1485), the Leyes de Toro (1505), the Nueva Recopilación (1567), and the Novísima Recopilación (1805-7). After the parliaments had ceased to play an important part some of the new laws promulgated by the kings were made applicable to all Spain, but no serious efforts to establish a common national law of marriage, it does not derogate from the penal code was adopted in 1822; another in 1848; another, which is still in force, in 1870. The existing code of criminal procedure dates from 1882. A code of civil procedure was promulgated in 1855 and revised in 1881. In 1885 a commercial code was adopted. The attempts to unify the civil law encountered obstinate resistance, because of the attachment of the provinces to their ancient fueros. The law of real property was transformed, early in the century, by the abolition of feudal tenures and of entails, and an important law requiring the registration of conveyances, mortgages, etc., was adopted in 1861 (revised in 1871). Civil marriage was introduced in 1870. In 1888 a general civil code was adopted (revised in 1889), but this code has not given Spain a common law, for, except as regards the law of marriage, it does not derogate from the laws previously in force in Navarre, Aragon, Catalonia and the Balearic Isles; i.e. it has, in these provinces, only subsidiary force. In Catalonia the Roman law, civil and canon, is still subsidiary law. In the rest of the peninsula, however, the code of 1888-89 has replaced the older laws.

SPANISH COLONIES. From the early part of the sixteenth century many laws were issued concerning the colonies. The earliest compilation of these laws was made in Mexico, in 1563, by Vasco de Puga. In 1570 was published, in Spain, a collection of Orders in Council affecting the colonies, and a fuller collection was made early in the seventeenth century. In 1680 a code of colonial laws was published—Recopilación de las leyes de las Indias. (This was repeatedly revised, the last edition dating from 1841.) This code dealt chiefly with administrative matters, to some extent with crimes and penalties, hardly at all with private law. In matters not covered by special colonial legislation the laws of Castile had been applied from the beginning, and this practice was expressly sanctioned in the Laws of the Indes, II., i., 2 and II., xv., 66.. In the early part of the nineteenth century (1810-26) all the Spanish colonies of Central and South America achieved their independence. These republics have adopted codes of their own. The earliest Spanish American civil code was that of Bolivia (1831). The most important is that of Chile, which has served as a model for several other Central and South American codes. All these codes, like the Spanish code of 1888-89, show the influence of the Code Napoléon. (See CODE.) In Cuba, Porto Rico, and the Philippines the Spanish codes of the nineteenth century are still in force.

BIBLIOGRAPHY. SPANISH: *Histories of Spanish Law*, by Sempere (1847), Marichalar y Manrique (1863), Falcón (1880), Moret (1893), Antequera (1895). That by Hinojosa (1887) deals with the earlier periods only, till A.D. 711. Systematic works on the older Spanish law by Sala (1803, and many subsequent editions) and De la Serna y Montalbán (1841, 13th ed. 1881). *Commentaries* on the civil code of 1888-89 by Manresa y Navarro, Falcón, Sanchez Román, and Scævola. The last is the most voluminous. *Dictionaries* (i.e. encyclopædic works in alphabetical order) by Escriche (1876), Sanchez de las Matas (1883), and Alcubilla (1895). The last is in 9 vols. with annual appendices. In English there are no works of value except translations of texts, as selections from *Las siete partidas* (New Orleans, 1820). The Spanish codes and the more important Spanish laws in force in our insular dependencies are published by the United States War Department. In German: a history of Spanish law by Brauchitsch (1852). In French: translations of the codes; also Lehr, *Eléments de droit civil espagnol* (Paris, 1880, 1890).

SPANISH LITERATURE (called also Castilian literature, since the dialect of Castile is the dominant and literary speech of Spain). Literature in the Spanish tongue began only when the process of reconquest restored to the Christian Spaniards a considerable portion of their ancestral domain. This first literature was epic song reflecting the warlike spirit of an heroic age. Very little of the Old Spanish epic poetry has been preserved to us in anything like its original form. The only considerable remains are some poems on the Cid, of which one, the *Poema del Cid*, is the oldest extant monument of Spanish literature, some fragments of a poem or of poems on the Infantes of Lara, and a learned poem on Fernán González. But allusions and records in the Chronicles and elsewhere lead us to believe that there once existed epics now lost. It was the *juglares* or minstrels who popularized and developed Spanish epic tradition, according to the theory of Gaston Paris, at first singing only the heroes celebrated by the French *jongleurs*. It was quite natural that the French tales dealing with Charlemagne's wars against the Spanish Arabs should most impress the Spaniards; and it was equally natural that the Spanish *juglares* should seek to make native heroism play some part in the conflicts with the Moors. This they did by inventing the figure of Bernardo del Carpio to supplant the French hero Roland. The traditions concerning Bernardo are preserved for us only in the prose accounts of the Chronicles, especially the *Crónica general* of Alfonso the Wise; but the Chronicles drew upon the poems of the *juglares* for the matter that they contain.

We come to a thoroughly domestic tradition in the story of Fernán González, Count of Castile (932-970), with whom began the actual though not the nominal independence of that region. An extended poetic account of his active life we owe to a monk of the monastery of San Pedro de Arlanza. This work was written in the second half of the thirteenth century, but we now possess it only in a late manuscript of the fifteenth century, which is incomplete. The *Crónica general*, however, affords us the substance of what must have been the second part of the poem. A purely Spanish tradition is found again in the tragic story of the seven Infantes of Lara (or

Salas), done to death through the perfidy of their uncle and aunt, and later avenged by their Moorish half brother, Mudarra. Here, also, the legend is preserved by the *Crónica general*, which has, in this case, absorbed many verses of the Old Spanish poems on the subject without wholly obliterating their rhyme and metre. By good fortune we still possess two of the Old Spanish poems dealing with the story of the doughtiest of all the native heroes, the Cid (q.v.), an historical personage of the eleventh century. The *Poema del Cid* has survived in but a single and incomplete manuscript of the fourteenth century, and, besides, its versification is in an exceedingly corrupt state. There are two main divisions (or *cantares*); the first begins with Rodrigo's exile from Castile, and ends with the conquest of Valencia and the marriage of his two daughters to the unhistorical Infantes of Carrión; in the second, the necessity of punishing the Infantes for their abuse and desertion of their spouses brings the Cid to the Court of Castile and affords an opportunity for completely reconciling him and his liege lord. The poem ends with a second marriage of the Cid's daughters, who, now wedding the princes of Barcelona and Navarre, make the Cid an ancestor of the later royal house of Spain. An imaginative account of the Cid's youth is found in the poem termed the *Crónica rimada*, a document of the thirteenth century relating particularly Rodrigo's slaying of Count Gormaz and the marriage of the youthful slayer to the Count's daughter, Ximena.

Much greater than the bulk of the heroic poetry preserved is that of Old Spanish religious, didactic, and narrative verse. The greater part of this verse is in the form of quatrains of alexandrines, with a single rhyme in the stanza (the so-called *cuaderna vía*). There is no knowledge of the existence of this learned poetry before the thirteenth century, but in the first half of that period it is found fully developed in a mystery play, in translations from the French or Provençal, and in poems. The mystery play, which is incomplete, is *El misterio de los reyes magos*. It is an outgrowth of the liturgical dramas or offices of the Church. No other important remains of the early Spanish drama have been discovered. Of the matter composed in *cuaderna vía* a large proportion is due to the cleric Gonzalo de Berceo, who is the first Spanish poet that we know by name. He flourished in the first half of the thirteenth century. Most of his productions deal with religious subjects. There is now attributed to him furthermore a long poem dealing with profane matter, the *Libro de Alexandre*, which relates in some 2500 stanzas the life of Alexander the Great.

With the end of the thirteenth and the beginning of the the fourteenth century the use of the *cuaderna vía* began to yield to prose in didactic composition. Contemporary with this change appeared the first true poet in Spanish literature, Juan Ruiz, who is known as the Archpriest of Hita. He belonged to the reign of Alfonso XI. (1312-50), and he was imprisoned by his superiors because of his evil life; but, like the French poet Villon, he sang with the true note of passion. In his *Cantares* (called by him *El libro de buen amor*) he recounts his erotic adventures, interspersing here and there many fables, descriptions of his disputes with Love (Don Amor), an account of a lesson which Venus, wife of Don Amor, gave him, etc.

Spanish prose, at first clumsy and labored, earliest appeared in law codes and official documents. The first use of Spanish prose for chronicle purposes is seen in the two *Anales Toledanos* put together before 1250. Between 1217 and 1223 were written certain genealogies and translations from Latin chroniclers were made in following years. Under the direction of Saint Ferdinand was begun the encyclopædic *Septenario*, which his son, Alfonso, completed, and there was planned a codification of Castilian laws. The prose thus formed, employed largely for didactic and historical works, was applied to fiction in the framework tales of Juan Manuel. Alfonso X., the Wise, wrote, or had written under his direction, many works dealing with the science of the time. Great value attaches to the so-called *Crónica general*, in which, availing himself of earlier Latin chronicles, he dealt with the history of his land from the earliest times down to the period of his own accession.

Moralizing works and collections of sententious sayings drawn from Arabic sources or written in imitation of them became rife both in Alfonso's time and in the ensuing period. One of the Arabic moral anthologies thus introduced into Spanish was the very popular *Bocados de oro*, which lived on in the poetical aphorisms of Sem Tob and Santillana.

Sancho IV. (1284-95), the successor of Alfonso X., inherited his father's love for letters, and by his direction there were prepared translations from Latin, French, and Provencal. The interesting translation, the *Gran conquista de Ultramar*, dealing with the Crusades, preserves the substance of French literary monuments now lost. This and other translations show a broadening interest in foreign literature, further exemplified in an early fourteenth-century version of the prose *Tristan*. To the first half of the same century may be ascribed the first independent example of Spanish prose fiction, the *Caballero Cifar*, and possibly also the *Amadis*, for the chivalrous romance seems already to be beginning its long period of popular favor.

Literature was not especially favored by Sancho's immediate successor, but a monarch of intellectual force appeared again in Alfonso XI. The most important of the works which were prepared under his direction was a series of chronicles that should close the gap between his own time and the period with which the *Crónica general* of Alfonso X. ended, a work which formed the basis of the *Poema de Alfonso XI.* Don Juan Manuel (1282-1345), a nephew of Alfonso X., played a more direct part in the development of letters at this time, being, like his uncle, one of the greatest prose writers in early Spanish literature. The most interesting and important of his many treatises is the famous framework of tales called the *Conde Lucanor* or *Libro de Patronio*, in which Count Lucanor, seeking advice from his tutor, Patronio, is answered by the latter with moralizing tales conveying the necessary counsel. The contents of the fifty-one tales comprise historical or pseudo-historical elements relating to Spain, matters of personal experience, Arabic traditions, besides elements drawn from Phædrus, the *Calila et Dimna*, the Barlaam story, and above all the general European stock

of stories; and all are told in an original and unpretentious style.

With the middle of the fourteenth century, an artificial form of the lyric continuing the tradition of the Troubadour poetry of Galicia, and called Court poetry—because it was mainly cultivated by versifiers attached to the royal Court—began to take the place of importance formerly occupied by epic, religious, and didactic verse. There was a transition period of some duration, however, so that the greatest development of the Provençalized lyric did not come until the reign of John II. (1407-54), and then there flourished by its side a humanistic literature bearing the impress of the Renaissance movement and an allegorical poetry that derived from the works of Dante and other Italian poets. As time went on, the Provençal Galician Court poetry passed out of vogue and the lyric measures of Italy became predominant everywhere throughout Spain. Spanish prose, already given considerable flexibility by Alfonso the Wise and Juan Manuel, becomes in the second half of the fourteenth century the medium of translation from the classics of antiquity, and, even more than the verse of this time, teems with Latinisms. Much more attractive than the verse already mentioned is the epic ballad, which was much cultivated during the period preceding the Golden Age (1550-1700) of Spanish literature; here and there may be found examples of a charming popular lyric.

Pedro Lopez de Ayala (1332-1407), who held important offices at the courts of King Pedro the Cruel and of Henry of Trastamare, was one of the last writers of his time to make any large use of the *cuaderna vía*. This form prevails in his satirical and didactic *Rimado de palacio*, in which he assails the social, political, and other abuses of his time. In the second part of the poem, he inserts, here and there, plaints, laments, and songs to the Virgin, which are lyric in their nature and are composed in various measures. These mark Ayala as one of the earliest of the Court poets who imported into Castilian that form of the lyric which, following Provençal rules, had long been cultivated in Galician. During the reign of Pedro the Cruel the Rabbi Santo of Carrión (Sem Tob) prepared his *Proverbios morales*. This collection constitutes one of the most important Hebrew contributions to Spanish literature, and it introduces a *genre* which is later to be attempted by such writers as Santillana and Pérez de Guzmán. Seriousness of purpose, lacking in the Court poetry, is present in the Dantesque allegory and vision introduced into Spain, soon after 1400, by Imperial, a native of Seville, but of Genoese origin. The serious moralizing tendency is also visible in the *Doctrina* of Pedro de Veragua and especially in the noted *Danza de la muerte* (Dance of Death), which seems to be the work of the middle of the fifteenth century. The highest point reached by culture in the reign of John II. is seen in the literary works of Santillana, of Fernán Pérez de Guzmán, of Mena, and of Rodríguez del Padrón. To Fernán Pérez we owe the *Claros varones de España* (a panegyric in verse), versified *Proverbios*, and allegorical and lyrical poems, besides historical works in prose; Rodríguez has left us ballads and a little verse in the conventional Court manner, besides a prose tale. Iñigo López de Mendoza, Marquis of Santillana (1398-1458), is probably the most impressive literary figure of the fifteenth century. He was one of the first to imitate Horace in Spain, he imported the sonnet from Italy, and he furthered the influence of Dante by copying the latter's allegorical methods in his *Comedieta de Ponza*, his *Coronación de Mossén Jordi*, and his *Infierno de enamorados*. In certain other poems he displays a didactic and a satirical bent, as in his *Proverbios*, his *Diálogo de Bias contra Fortuna*, and his *Doctrinal de privados*. The most interesting and certainly the most entertaining element of his poetical work is that represented by his love songs, such as the *serranillas*. In prose he himself prepared a *Carta al Condestable de Portugal*, in which he appears as the first true historian of Spanish literature. The influence of Dante, as well as that of Lucan, is obvious in the allegorical *Laberinto* (also called the *Trecientas*, from the original number of its stanzas) of Juan de Mena (1411-56), and to him are due likewise a poetical eulogy of Santillana, entitled *La coronación*, and the moralizing *Coplas de los siete pecados mortales*. Of other noteworthy poets of this time there can be mentioned here only Gómez Manrique (died 1491) and Jorge Manrique (died 1479); the latter is remembered for his noble *Coplas* on the death of his father.

During the reign of Henry IV. (1454-74) there appeared no slight amount of political satire, the chief instance being among the *Coplas de Mingo Revulgo*. Of ballads (*romances*) Spain has been exceedingly productive; in broadsheets or in collections (*romanceros*), there were published during the final years of the fifteenth century, and during the sixteenth century, a very large number dealing with subjects drawn from the real or legendary history of Spain and of France, etc., as well as with subjects chivalrous and erotic.

In Spanish prose of the fifteenth century, the humanistic work already begun in Italy was zealously carried on. There was much translation of the classics of antiquity and of the modern Latin writings of Boccaccio and others. Ecclesiastical Latin authors also received some share of attention, and works were introduced from the French, Catalan, and Italian, those of Boccaccio being particularly popular for translation purposes. The influence of all these translations—and especially those from Plutarch, Livy, and Valerius Maximus—manifested itself in the development given to the writing of history. López de Ayala continued the official chronicle of the realm (*Crónicas de los reyes de Castilla*); García de Santa María, Fernán Pérez de Guzmán, and Diego de Valera (1412-86) worked upon the *Crónica del rey Juan II.*; the last named writer and Enríquez del Castillo dealt with the reign of Henry IV. in the *Memorial de diversas hazañas;* and Fernando del Pulgar and Andrés Bernáldez prepared the account of the reign of Isabel I. There also appeared a multitude of chronicles dealing with the lives of individual personages. No little interest attaches to the *Crónica Sarracena* of Pedro de Corral, which gives the whole legendary history of Roderick the Goth.

In French stories of a pseudo-historical nature the Spaniards had very early begun to take a serious interest; and these stories, particularly those treating the *matière de Bretagne*, were to play an important part in connection with the development of prose fiction in Spain. The Court poetry of the reign of John II. (first half of the

fifteenth century) is full of references to Arthur and his knights of the Round Table, to Merlin, and to the Quest of the Holy Grail. Charlemagne and Roland are still named along with the heroes of the Round Table, but they obviously have no longer the same living interest.

With the *Caballero Cifar*, of the first half of the fourteenth century, we have the first independent work of fiction in Spain, and this was followed perhaps a generation later by one of the most famous of all modern romances, the *Amadis de Gaula*. (See AMADIS OF GAUL.) This important Spanish work may lay claim to no small amount of originality; it accepts the elements at the basis of the French courtly romance, but it develops them in its own way, for, though retaining the traditional service of woman and quest of adventure, it stresses the virtuous qualities of the hero no less than his courtliness, something that the French romances had not done. In the form in which we possess it, the *Amadis* is due to García Ordoñez de Montalvo, who completed his redaction of it between 1492 and 1504. By him we are told that he had simply rid its first three books of the errors and imperfections introduced into it by earlier redactors and by scribes, that he borrowed and improved the fourth book, and that he himself added the whole fifth book, the *Sergas de Esplandian* (or Exploits of Esplanadian), in which he deals with the history of the son of the hero, Amadis. The *Amadis* was the forerunner of many similar romances which enjoyed enormous vogue in the sixteenth century.

In imitation of Boccaccio's *Fiammetta*, which had been translated about the middle of the fifteenth century, the tale was now attempted in Spain; noteworthy instances are Rodriguez del Padrón's *Siervo libre de amor* and *El cárcel de amor* of Diego de San Pedro. Novelistic and didactic in its manner is the *Trabajos de Hércules* of Enrique de Villena (1384-1434). One of the most original and entertaining works of the whole period appeared in 1438; this is a satire on womankind by Alfonso Martínez de Toledo, chaplain to John II. and archpriest of Talavera, entitled *De los vicios de las malas mujeres*, but also called the *Corbacho*. Of decided interest for the study of folk-lore are the Hebrew-Spanish and the *aljama* documents, in which the Jews and the Moors, writing in Spanish, but using their Hebrew and Arabic characters, created a rather considerable literature of their own. Many of the documents in question belong to the fifteenth century, and especially the most important of them all, the *Poema de José*, which gives a Mohammedan version of the story of Joseph.

The sixteenth century ushers in the classic age of Spanish letters, that period which extends into the second half of the seventeenth century and is generally known as the Golden Age. The influence of Italy and the Renaissance, which had been so strong during the preceding century, persists, but, contrary to what happened in other European lands, it does not tend to bring about any dissolution of continuity as between the old and the new. The ancient Church remains unaffected and the humanistic paganism of the Renaissance gets no foothold in Spain. In lyric verse Italian forms prevail, but the subject matter is only partially affected by influences from without. A realistic movement, marked by a strict application of keen powers of observation, guides the development of the novel, which is perfected by Cervantes in the reign of Philip II. The ballad continues to be a favorite form and it contributes to the rise of the drama. The drama, giving fullest expression to the national and religious ideals of the Spaniard, constitutes the greatest glory of the Golden Age.

Already, in the fifteenth century, Santillana had imitated the structure of the Italian sonnet, but in this innovation he had had no followers; it remained for the Catalonian Boscán (c.1493-c.1542) to establish Italian verse methods in Castilian. A better poet than Boscán is his friend and companion in the work of innovation, Garcilaso de la Vega (1503-36). Petrarch is the chief model of the lyric poet, but so far as content is concerned, the love lyric of Petrarch did not differ very materially from that already cultivated by the Spaniard; the real innovation was a formal one. Moreover, the older Castilian measures were not cast aside; even those who favored most warmly the use of the imported forms continued to employ the domestic forms. A third leading representative of the movement was Diego Hurtado de Mendoza (1503-75); elements of refinement still lacking in the art of the three poets mentioned were added by writers such as Fernando de Acuña (c.1500-80), Gutierre de Cetina (c.1520-60), and the Portuguese Gregoria Silvestre (1520-70). In the second half of the sixteenth century the followers of Garcilaso formed two main groups, the school of Seville and the coterie at Salamanca; minor groups were those at Granada and in Valencia and Aragon. The head of the school at Seville was Fernando de Herrera (1534-97), who is noted both for the purity of his style and the richness of his diction, best exhibited, perhaps, in his hymns on the battle of Lepanto and on the tragic fate of the Portuguese King, Dom Sebastian. The most important member of the Salamancan group was the charming poet Luis de León (1527-91), whose religious and mystic strains have never ceased to please. Allied to him in spirit are the other mystic poets San Juan de la Cruz (1542-91) and Malón de Chaide. The religious lyric may be seen at its best in the *Romancero espiritual* of Valdivielso (died 1636) and in the *Rimas sacras* of Lope de Vega; its vogue began to decrease when that of the conceptism of Ledesma and his fellows began to grow. An overstressing of the importance of the formal side of things and an undue straining of the means necessary to the attainment of perfection of style led, in the early years of the seventeenth century, to the adoption of the kind of lyric mannerism which is known in Spain as *culteranismo*, and which is paralleled by the Marinism of Italy, by the Euphuism of England, and by the préciosité of France. Luis de Góngora (1561-1627) was the founder of this artificial style, which is therefore often called Gongorism. Its characteristics of bombast, obscurity, and general extravagance are fully exhibited in the so-called *Soledades* of Góngora. Even contemporaries of so high an order of talent as Lope de Vega and Francisco Gómez de Quevedo (1580-1645), who at first opposed the Gongoristic movement, later adopted many of its methods. As a poet, Quevedo was most successful in his satires, which are full of the spirit of Juvenal. The lyric

poets of the seventeenth century were legion: Mira de Amescua, Estéban Manuel de Villegas (1596-1669), Jacinto Polo de Medina, Francisco de Borja, Príncipe de Esquilache (1581-1658), and the dramatist Calderon were but a few of them. With the facilities now provided by the printing press, it became possible to make extensive collections of the ballads (*romances*), which, previous to the end of the fifteenth century, seem to have survived only through oral tradition.

There appeared during the *siglo de oro* more than two hundred poems belonging to the category of the artificial epic. Of these the most important deal with subjects appertaining to the national history; many treat religious matters, and many others are of the class of the chivalrous epic. They are mainly written in octaves, only occasionally in blank verse (*versos sueltos*). Chief among the epics of an historical character is the *Araucana* of Alfonso de Ercilla (1533-94), written by a soldier who here gives the results of his experience in the wars of the Spaniards with the Araucanian Indians. The historical value is still of a high degree in the *Elegías de varones ilustres de las Indias* (first part printed 1589) of Juan de Castellanos, and the *Argentina* of Centenera. The imagination plays a larger part than the historical fact in the *Austríada* of Juan Rufo (1547-c.1600). In the period of greatest dramatic productivity the historical epic gradually wanes in importance; the *Nápoles recuperada* of Francisco de Borja (1651) is one of the last. A place apart is occupied by the *Amantes de Teruel* (1616) of Salas, which the author pretended to be an historical account of the tragic fate of the famous lovers. The Vergilian epic was made known to many by the *Eneida* of Hernández de Velasco (1557); after the appearance of Boscán's *Fábula de Leandro y Hero*, mythological episodes from classic antiquity were made the theme of poems by Hurtado de Mendoza, Lope de Vega, Montemayor, Góngora, etc. The Italian epic of the *Cinquecento* was transplanted to Spain, and was made the subject, not only of verse translations, but also of amplifications and continuations, some of these latter dealing with Spanish history or legend. A religious epic deserving of note is Azevedo's *Creación del mundo* (1615), being remarkable in that, imitating the *Semaine* of Dubartas, it shows a resumption of literary relations with France. The mock heroic of Greece and Italy finds an echo in Juan de la Cueva's *Batalla de ranas y ratones*, Villaviciosa's *Mosquea* (1615), and Lope de Vega's *Gatomaquía*.

The tendency to fill Spanish prose with Latinisms, so strong in the preceding period, now yields to a feeling which finds a native dignity in the mother tongue. Juan de Valdés, in his *Diálogo de la lengua* (c.1535), initiated the scientific study of the grammatical and stylistic peculiarities of Castilian. Comparative perfection of form is attained in Mariana's *Historia de España* (1601, etc.), the first thoroughly good account of Castilian history based on the study of documents. In his *Agudeza y arte de ingenio*, Baltasar Gracián (c.1601-58) gave the lawbook of that system of literary mannerisms termed conceptism: he also got the attention of contemporaries and posterity by his aphoristic and sententious sayings of various kinds. Religious literature of a mystic and ascetic nature must occupy an important place in the annals of the time; it is best represented by the writings of Luis de León, San Juan de la Cruz (Saint John of the Cross), Malón de Chaide, Luis de Granada, and Santa Teresa de Jesús (Saint Theresa, 1505-82).

Preceding the period of activity of Cervantes, we have the continuation of the chivalric novel; the pastoral novel; the narrative form as exhibited in the *Celestina;* and the earliest of the picaresque novels. Of the posterity of the *Amadís*, the unsurpassable type of the romance of chivalry, are a number of continuations dealing with the adventures of Florisando, Lisuarte of Greece, Perión of Wales, Amadis of Greece, and similar heroes. Hardly less a favorite than the *Amadís* was an imitation of it entitled *Palmerín de Oliva* (1511), which in its turn was made the subject of other continuations and imitations. The books of chivalry prepared the way for the pastoral romance, introduced into Spanish by Jorge de Montemayor (c.1515-61), who founded his *Diana* on the *Arcadia* of the Italian Sannazaro. For contemporaries a good deal of the interest in the *Diana* and its kindred depended upon the personal allusions conveyed by the characters and in the dialogue. The *Tragicomedia de Calisto y Melibea* (later termed the *Celestina*) was published at Burgos in 1499, and appeared in an amplified form at Salamanca in 1500. Although it is called a tragicomedy, it cannot in its present form have ever been capable of scenic representation, and it is certainly more a novel than a play. On account of its spirited action and of the development which the *Celestina* gave to the handling of dialogue and the delineation of character, it exerted an influence upon later dramatists and novelists both. It soon provoked continuations and imitations, and a connection may even be traced out between it and the *Dorotea* of Lope de Vega. The realistic tendencies evinced in the *Celestina* are equally pronounced in the first of the picaresque novels, the anonymous *Lazarillo de Tormes* (1554), long ascribed to Diego Hurtado de Mendoza. In this novel we follow the career of a rogue (*pícaro*), who, beginning as the guide (*lazarillo*) of a blind beggar, deceives him, and, passing into the service of other personages representing various ranks of life, shows himself no less ready to beguile them. There is no attempt at palliation of the truth; it is a picture of the bald and iniquitous fact that is presented to us in the *Lazarillo* and its successors.

Realistic fiction of the *siglo de oro* culminates in the magnificent *Don Quijote* of Miguel Cervantes de Saavedra (1547-1616), a novel in which the matter-of-fact philosophy of Sancho Panza stands in sharp contrast with the grotesque idealism of his master. It is not improbable that Cervantes wrote the book in order to destroy the vogue of the chivalrous romances, although it may be urged that their popularity was already on the wane and that at the most he simply gave them the *coup de grâce*. *Don Quijote* (usually *Don Quixote* in English) has become one of the world's imperishable books. The first part of it was published in 1605; the second part was hurriedly prepared for the press in 1615, in order to baffle the designs of a certain Avellaneda, who had published a spurious sequel to the novel in 1614. Cervantes had much less success in an-

other novel, the *Persiles y Sigismunda* (published posthumously), but that he could handle the shorter tale with skill is proved by his *Novelas ejemplares*. Among those who cultivated the tale after the time of Cervantes were Lope de Vega, Tirso de Molina (in his *Cigarrales de Toledo*, 1621), Montalbán (*Para todos*, 1632), María de Zayas, Solórzano, Salas Barbadillo, and Luis Velez de Guevara (with his famous *Diablo cojuelo*, 1641, the source of Lesage's *Diable boiteux*). Quevedo (1580-1645) was the foremost of the prose satirists of the age; in his witty and sarcastic *Sueños, cartas del caballero de la tenaza*, etc., he cries out against abuses with which bitter personal experience had made him acquainted.

As a literary form the drama had been practically unrepresented since the end of the twelfth century; but now, at the end of the fifteenth century, it was to revive and receive an unsurpassed development. Juan del Encina (c.1468-1534) begins the new order. Encina spent some years in Italy; hence an Italian influence on his work is not improbable. The comic elements in some of the pieces may show an influence of the French *farce*. Disciples of Encina were Lucas Fernández, who employs the terms *'farsa'* and *'comedia'*; the Portuguese Gil Vicente; and Torres Naharro, whose art shows considerable progress over that of the master. In his plays we meet for the first time with a division into acts. The pieces of the foregoing authors were intended for the refined audiences of the Court; those of Diego Sánchez (c.1530-47) seem to have been meant for performance amid more popular surroundings. Italian influence is unmistakable in the *comedias* of Lope de Rueda, an actor (c.1540-66), famed for his short and witty *pasos* or *entremeses*. The Latin tragedy is obviously imitated in the first really important Spanish tragedy, the *Numancia* of Cervantes. Avendaño in 1533 first adopts the division into three acts instead of five. Juan de la Cueva (1550-1607), the first Spanish dramatist to deal with incidents taken from the national history, adopted a division into four acts.

But by common consent there is awarded to Lope de Vega (1562-1635) and to his younger compeer Pedro Calderon de la Barca (1600-81) supremacy among the many gifted dramatic authors. Inventive beyond conception and amazingly prolific in production, Lope is known to have composed over 1500 plays, irrespective of a number of *autos* (one-act plays of a religious and allegorical nature), *loas* (preludes), and *entremeses* (interludes); of these pieces about 500 are still extant. The number of enduring masterpieces among his pieces is remarkably large, especially in the case of his historical dramas, such as *El mejor alcalde el rey* and *Los Tellos de Meneses*; and we even still find hardly less interesting and powerful than they such a play as the *Estrella de Sevilla* and not a few of his *comedias de capa y espada* or plays dealing with every-day life. Lope's disciples included Mira de Amescua (c.1578-1641), Luis Vélez de Guevara (1570-1644), Montalbán, and Ruiz de Alarcón (died 1639). Alarcón wrote the comedy *La verdad sospechosa*, the model of Corneille's *Menteur*. In talent, Lope was most nearly approached by the cleric Gabriel Téllez (1570-1648; known also by the pseudonym Tirso de Molina).

After Lope's death Calderon reigned on the stage. Though less inventive, Calderon paid more attention to details of form, simplifying somewhat the multitudinous metrical forms in use in the drama. In philosophic insight he was inferior to Lope, yet in *La vida es sueño* ("Life is a Dream") he cannot really be deemed unsuccessful in his endeavor to give dramatic reality to one of the most transcendental of ideas. He first gave great importance on the boards to the *pundonor* (the point of honor) as an actuating impulse of the Spaniard's life, and he gave its greatest development to the stock figure of the *gracioso* or clown. He devoted no little attention to the type of religious play called the *auto sacramental*. Of his followers, two were men of distinguished talents: Francisco de Rojas Zorrilla (1607-c.1660), who produced the excellent play, *Del rey abajo ninguno*, and Agustín Moreto (c.1618-1669), to whom we owe *El desdén con el desdén*.

Swift and deep was the decline in Spanish letters that followed the *siglo de oro*, and it went hand in hand with a decay in things national and political, which the advent to the throne of the French Bourbon house could do little to check. By the opening years of the eighteenth century Gongorism had thoroughly vitiated lyric verse, the novel had become unimportant, and the stage was controlled by dull or absurdly fantastic imitators of the older national drama. Not a single Spanish writer of the first order made his appearance during the first three decades of the eighteenth century, and during that period the only event of importance was the establishment in 1714 of the Spanish Academy (La Real Academia Española), whose Dictionary appeared in 1726-39. With the fourth decade came a new movement, the chief object of which was to chasten popular taste by the introduction of foreign æsthetic canons, particularly those of France. The impulse to the new movement was given by Ignacio de Luzán (1702-54), a man of great talent and greater culture, who set forth in his *Poética* (1737) the principles that ought to govern poetic production. Luzán preached that the various literary genres should not be intermingled and that the Spanish drama should be subjected to the French system of unities. The doctrines which he thus laid down were taken up and applied by his disciples Nassare (1689-1751), Montiano (1697-1765), the author of two tragedies, and by Luis José Velázquez (1722-72), in his *Orígenes de la poesía castellana* (1749). In his *Teatro crítico* (1726-29) and in his *Cartas eruditas y curiosas* (1742-60), Benito Feijóo (1676?-1764) first made known to a large part of the Spanish nation many of the scientific developments and discoveries of the age. José Francisco de Isla (1703-81), in his amusing though rather long-winded novel, *Historia del famoso predicador, Fray Gerundio de Campazas* (1758), ridiculed unmercifully the extravagance, ignorance, and pedantry that characterized most of the pulpit eloquence of his time. Isla is also famous for his attempt to appropriate to Spanish literature the *Gil Blas* of Lesage.

A party headed by García de la Huerta (1734-87) strove, but ineffectually, to curb the growing tendency to imitate French models. On the other hand, the followers of Luzán formed a strong school, known as the Salamancan school. The foremost member of this new school was Juan

Meléndez Valdés (1754-1817). His little volume of lyrics shows more true poetic sentiment than anything that had preceded them since the days of the masters of the sixteenth and seventeenth centuries. Of considerable merit were Iglesias (1748-91), best known for his *letrillas;* Cienfuegos (1764-1809), whose lyrics come nearest to those of Meléndez in the expression of genuine feeling; and Diego González (1733-94). It was in the drama that the imported French classicism was to have its real triumph. To be sure, one writer of more than average ability, Ramón de la Cruz (1731-c.95), still kept alive the traditions of the Spanish stage of the Golden Age in his humorous little plays called *sainetes*, but, on his side, Ramón de la Cruz stood alone. It was only natural that men of taste, like Nicolás Fernández Moratín (Moratín the Elder, 1737-80) and the dramatist statesman Jovellanos (1744-1811), should, in their love for moderation and order, seek to elevate the fallen stage by adopting for their own compositions the rigid principles of the French theatre. But neither of these became a favorite with the masses, and it remained for Leandro Fernández de Moratín (1760-1828), the son of Nicolás, to compose dramas governed by the French rules, that could captivate Spanish audiences. Moratín the Younger brings us over the threshold of the nineteenth century; still he belongs properly to the eighteenth century. An enthusiastic admirer of Molière, he both imitated and translated plays of that great dramatist. But Moratín was more than a mere imitator or translator; for his mastery of dialogue, his pure style and his faithful description of the manners of his time show in him a talent of the highest order. Although he carefully applied the French system of unities, he did not disdain certain elements of the home stage. Thus, he divided his plays into three acts instead of five, as the French and classic Latin rules would have exacted, he employed the popular *romance* verse in a number of pieces, and, above all, he made a skillful use of the element of intrigue that had been so prominent in the dramas of the Golden Age and has ever remained dear to the Spanish heart. It was this happy blending of the spirit of romantic intrigue with the cold precision of French rules that made his masterpiece, the *Sí de las niñas* (1806), obtain at once the popularity that it has never since lost, and constitute it the only masterpiece produced for the Spanish stage since the days of Lope and Calderon.

Spanish literature of the nineteenth century begins with the patriotic poets, Manuel José Quintana (1772-1857) and Juan Nicasio Gallego (1777-1853), whose lyrics voice the sentiments of a party sprung up to combat the French invader. Quintana was the Tyrtæus of the struggle against the Napoleonic arms, and he attained his greatest success in the heroic ode (*Al armamento de las provincias contra los Franceses* and *A España después de la revolución de Marzo, 1808*). His friend Gallego is also seen at his best in the burning patriotic lyric, and although the bulk of his verse is slight, he was a good literary artist. The classic influence still dominated Quintana and Gallego, and is no less clearly marked in the members of a poetical coterie which from its centre may conveniently be termed the School of Seville. The members of this school, of whom the chief were Manuel María de Arjona (1771-1820), José María Blanco (1775-1841, known in the history of English literature as Blanco White), Alberto Lista (1775-1848), and Félix José Reinoso (1772-1841), sought to reform the prevailing bad taste by setting up the authority of a respectable classic tradition. They contributed efficaciously to the restoration of a proper æsthetic sense in Spanish literary aims, and they also helped to improve the purely formal side of Spanish verse by developing rhyme and metre.

In the thirties of the nineteenth century the romantic movement began to appear in the Spanish Peninsula, somewhat belated, indeed, but none the less sweeping in its effects. Two elements contributed to the establishment of romanticism in Spain: (1) the influence of foreign literatures; and (2) the influence of the older national literature, and in particular of the drama of Lope and Calderon and of the *romances*. Even this latter influence did not make itself felt until foreigners had aroused Spain to a realization of the worth of her dramatists of the Golden Age and of her ballads. Many of the young writers of the early part of the nineteenth century had opposed the despotic administration of Ferdinand VII., had been obliged to flee the land, and, going to France and England, they had had some contact with the romantic movements of those countries. The romantic writers whom political considerations did not force to abandon their native region founded, about 1830, a club called the *Parnasillo*, which, as the Cénacle had done in France, was to herald the new ideas.

In the lyrics of Manuel de Cabanyes (1808-33; *Preludios de mi lira*, 1833) there is no tinge of romanticism; but a transition stage is visible in the writings of Martínez de la Rosa (1789-1862), in the main a man of classic tastes, yet who in two plays, the *Aben-Humeya* and the *Conjuración de Venecia* (1834), entered into the domain of romanticism. José de Lazza (1809-37) in his novel *El doncel de Don Enrique el Doliente*, and in his play *Macías*, showed similar romantic tendencies. The triumph of romanticism was insured by the performance in 1835 of the drama *Don Alvaro* of Angel de Saavedra (1791-1865), one of the writers whom Ferdinand's tyranny had compelled to seek a refuge in England and France. The romantic principles to which he gave effect in this work governed also the composition of his lyric *El faro de Malta*, and of his epic poem *El Moro expósito*, in the latter of which he revived the Old Spanish legend of the Infantes of Lara. In the person of José de Espronceda (1810-42), the author of the magnificent though fragmentary poem *El diablo mundo*, and of the *Estudiante de Salamanca*, there are represented both the romantic element of revolt against social and literary conventions, which in England is strongly marked in the person of Byron, and that element of Bohemianism which characterizes so many of the French romanticists. Lyric supremacy is disputed with Espronceda by José Zorrilla (1817-93), who is, however, more justly celebrated for his treatment of legendary material from the Spanish Middle Ages than for his purely lyric endeavors. In the *Don Juan Tenorio* he gives a modern version of the story at bottom of the *Burlador de Sevilla*,

a drama of the Golden Age. The Cuban poetess Gértrudis Gómez de Avellaneda (1816-73), who spent most of her life in Spain and there became famous, had affiliations with the romantic school. Her lyrics owe no small amount of their inspiration to Chateaubriand, Lamartine, and Hugo; her novels reflect the methods of Dumas the Elder and George Sand. Sentimentalism appears in two well-known dramas, the *Trovador* of Antonio García Gutiérrez (1813-84), on which Verdi's opera is founded, and the *Amantes de Teruel* of Juan Eugenio Hartzenbusch (1806-80), a play which gave new life to an old Spanish story of true love that did not run smoothly.

The passing of the romantic movement becomes evident after the beginning of the fifth decade of the century. The fertile playwright Manuel Bretón de los Herreros (1796-1873) had temporary connections with it, but he gained his repute mainly as a writer of lively dramas of manners, although in his masterpiece, the comedy entitled *Escuela del matrimonio* (1852), he paved the way for the coming psychological drama of Ayala and Tamayo y Baus. Adelardo López de Ayala (1828-79) gives us, in his mercilessly sociological play *El tanto por ciento* (1861), a detailed analysis of the modern greed for wealth that has stifled the nobler instincts of man and made him capable of the basest treachery; and in his *Consuelo* (1878) he makes another powerful attack upon the positivism and the lack of idealism in our modern life. The psychological development is also obvious in the work of Manuel Tamayo y Baus (1829-98). In *Lo positivo* (1862) he treats the positivism of the modern world with no less severity than does Ayala, and in his chief play, *Un drama nuevo* (1867), he portrays the slowly growing and finally all-pervading power of marital jealousy.

The particular glory of the second half of the nineteenth century in Spain has been the rise and growth of a new novelistic literature. To the development of this a considerable impetus was given by the essay on manners, which had already been handled with skill by Larra in the first half of the century, and was now taken up by Estébanez (1799-1867), and by Ramón de Mesonero Romanos (1803-82), who has left us excellent descriptions of life in older Madrid. These essayists on manners prepared the way for the tale of manners and the novel of manners (*novela de costumbres*). The former was cultivated, though with no brilliancy, by Antonio de Trueba (1821-89); the latter was written, in a way to attract attention and applause, by Cecilia Böhl von Faber de Arrom (1797-1877), familiar still by her *nom de guerre* Fernán Caballero. A thoroughly delightful figure appeared in the person of the short-lived story-teller and poet Gustavo Adolfo Bécquer (1836-70). All his work is permeated by the highly subjective qualities that are more common in Northern Europe. His tales are all of a legendary cast and are everywhere actuated by the instinct of mystery.

Pedro Antonio de Alarcón (1833-91) is most felicitous in the composition of the short tale of manners or adventure of the type; he is less successful in the more ambitious novel, although the less lengthy among the novels, particularly the *Sombrero de tres picos* and the *Capitán Veneno*, continue to delight and amuse their readers. An incomparably greater artist is Juan Valera y Alcalá Galiano (born in 1824), whom a protracted career in the diplomatic service of his country has made one of the most cosmopolitan and cultured of moderns. In his novels Valera differs from the majority of his contemporaries in that he consciously tends toward idealism, whereas they seek rather to render the living fact. The novel of manners has been raised to a higher level than ever before by José María de Pereda (born 1834), who, in his chief works, has portrayed life on the mountains and at the seaside in a way hardly to be excelled for detail and charm of description. The *Don Gonzalo González de la Gonzalera* and the *Sotileza* show Pereda in the fullness of his power; where he leaves the scenes of rustic life and ventures into the city and the fashionable whirl, as in the *Pedro Sánchez*, he is still a master novelist, but he treads on uncertain ground. The work of Benito Pérez Galdós (born 1845) from first to last has been marked by tendencies frankly revolutionary. One of the most admirable and important divisions of his labors has been the composition of the collection of novels forming the *Episodios nacionales*, but it is by his psychological novels that Galdós has attracted most attention abroad. At least two other novelists of the first rank must be mentioned here, Armando Palacio Valdés (born 1853) and the remarkable woman Emilia Pardo Bazán (born 1851). Both have had tendencies toward a naturalism not unlike that which has so profoundly affected the French novel of the second half of the nineteenth century.

In the recent period we meet with only two poets of importance, Ramón de Campoamor y Campoosorio (1817-1901), who will continue to be pleasantly remembered for his philosophical and humoristic *Doloras* and a few descriptive poems; and Núñez de Arce, the virile author of the *Gritos del combate*. The latter has had disciples both at home and in Spanish America, but none of them have displayed superior talent. Criticism has flourished, principally through efforts of Marcelino Menéndez y Pelayo (born in 1856), who in his *Historia de las ideas estéticas en España* (1884-91) has raised a noble monument to the glory of his country.

BIBLIOGRAPHY. The best collection of the Spanish classics is Rivadeneyra's *Biblioteca de autores espanoles* (71 vols., Madrid, 1846-80), embracing texts of Spanish masterpieces from the earliest times down to the opening of the nineteenth century; note also *Colección de escritores castellanos* (106 vols., ib., 1882-96); Ochoa, *Colección de los mejores autores españoles* (60 vols., Paris, 1837-60); and *Colección de autores españoles* (48 vols., Leipzig, 1860-86). For the history, consult: Baist, "Die spanische Litteratur," in Gröber's *Grundriss der romanischen Philologie* (Strassburg, 1894-97); Ticknor, *History of Spanish Literature* (4th ed., Boston, 1871); Fitzmaurice-Kelly, *A History of Spanish Literature* (New York, 1898); Bouterwek, *Geschichte der spanischen Poesie und Beredsamkeit* (Göttingen, 1804), continued by Brinckmeier, *Die Nationallitteratur der Spanier seit Anfang des 19. Jahrhunderts* (ib., 1850); Lemcke, *Handbuch der spanischen Litteratur* (Leipzig, 1856); Klein, *Geschichte des spanischen Dramas* (ib., 1871-75); Schack, *Geschichte der dramatischen Litteratur und Kunst in Spanien* (Berlin, 1846;

supplement, Frankfort, 1855); id., *Poesie und Kunst der Araber in Spanien und Sizilien* (Stuttgart, 1877); Schäffer, *Geschichte des spanischen Nationaldramas* (Leipzig, 1890); Balaguer, *Historia de los trovadores* (Madrid, 1888); Menéndez y Pelayo, *Calderon y su teatro* (ib., 1881), *La ciencia española* (ib., 1889), *Estudios de crítica literaria* (ib., 1895), *Antología de poetas líricos castellanos* (ib., 1890 et seq.); De Puymaigre, *Les vieux auteurs castillans* (Paris, 1888-90); Menéndez Pidal, *La leyenda de los Infantes de Lara* (Madrid, 1896); Cotarelo y Mori, *Iriarte y su época* (ib., 1897).

SPANISH MACKEREL, or SIERRA. Any of several mackerels of southern waters, especially *Scomberomorus maculatus*, a slender, compressed, fusiform fish, bluish green above, a beautiful satiny white below, with yellowish spots on the back and sides, weighing usually from two to four pounds, although sometimes much larger. They are natives of tropical seas, but they range along the Atlantic coast from Brazil to Cape Cod. They are among the very finest of fish for the table. A California species of high quality for the table is the Monterey Spanish mackerel (*Scomberomorus concolor*), the male of which is steel blue, without spots on its silvery sides, while the female has dusky cloudings and two series of dark spots along the sides. The 'Spanish mackerel' of England is a typical mackerel, known in the United States as 'chub mackerel' (q.v.). Compare MACKEREL; and see Plate of SPANISH MACKERELS.

SPANISH MOSS. See BROMELIA.

SPANISH MUSIC. Spanish music has always been imitative. At first the influence of the great school of the Netherlands predominated. This period was followed by a prevalence of Roman influence, especially that of Palestrina. The sixteenth century may be regarded as the time when music in Spain was at its height, for then it boasted Morales, whose compositions are still sung at Rome, and the great Vittoria, the master who most closely resembles Palestrina. With the appearance of Italian opera, Spanish composers not only imitated the Italians, but actually wrote Italian operas. With Wagner's innovations Spain was again ready to adopt the new tendencies. At this juncture the name of Pedrell deserves special mention. Stimulated by the attempts of Russian, Scandinavian, and Bohemian composers to establish a national school of music, Pedrell chose for his operas national subjects. His most ambitious undertaking is a trilogy, *Los Pireneos*, somewhat after Wagner's *Nibelungen*. The rise of the Spanish drama in the seventeenth century exerted a beneficial influence upon lighter music. The earlier musical dramas of the Florentine school had no overture. Instead, a *madrigal* was sung before the curtain rose. The Spaniards adopted this custom for their purely dramatic representations, so that before very long even the most serious tragedies were preceded by such 'curtain-raisers.' These were called *cuatros de empezar*, and were always performed by the women of the company to a harp accompaniment. At first the *cuatros* were choruses for four voices; but with the rise of the monodic style polyphonic writing was abandoned and an action was introduced. When the 'curtain-raisers' had been developed so far, they were called *tonadillas*. This custom of beginning all dramatic representations with a *tonadilla* was adopted by the Italians, who called the tonadilla *intermezzo*, and soon developed this latter into the *opera buffa*. (See INTERMEZZO.) Then the Spaniards again imitated the Italians; and the result was the development of the *tonadilla* into the *zarzuela*. This was a kind of comic opera, operetta, or vaudeville, generally in two acts and with spoken dialogue. The name is derived from the castle of Zarzuela, where, in the seventeenth century, the first representations of this kind took place. This form has always been very popular in Spain, and about 1850 Hernando gave it a new impetus. Among the numerous composers who devoted their talents to this form, four deserve mention: Oudrid, Gaztambide, Barbieri, and Arrieta.

But for originality and characteristic traits we must turn to Spanish folk-music. Here we notice that the real folk-songs are almost exclusively used as accompaniments to dances. The limitations of the national instrument, the guitar, influenced the melodies and rhythms to a great extent, rendering the latter more attractive than the former. Of the old folk-songs composed in the time of the Troubadours a great number have been preserved in literary collections called *cancioneros*, but the music has been lost. The music of the folk-songs of the fifteenth and sixteenth centuries, however, has been transcribed from the actual performances of blind singers, who even now, as formerly, wander from town to town. The melodies of Andalusia, which are in all respects superior to those of the northern provinces, show undoubted traces of Moorish influences, as shown by the elaborate embellishments of the notes of the melody, peculiar intervals foreign to European scales, and a strange combination of distinct rhythms in the several parts. This foreign element has always attracted composers, who by this means have succeeded in creating a local atmosphere in their works. In this connection it is only necessary to mention the names of Bizet (*Carmen*), Massenet (*Le Cid, La Navarraise*), Weber (*Oberon*), and Moszkowski (*Boabdil*). The best known Spanish dance-forms are the bolero, cachucha, fandango, jota, malagueña, rondeña, and seguidilla, which are accompanied by the guitar and castanets. Consult: Soriano-Fuertes, *Musica española hasta el año 1850* (Madrid, 1857); Juan F. Riaño, *Critical and Biographical Notes on Early Spanish Music* (London, 1887); A. Soubies, *Histoire de la musique. Espagne* (Paris, 1900).

SPANISH NEEDLES. See BUR-MARIGOLD.

SPANISH POLITICAL PARTIES. See SPAIN; POLITICAL PARTIES, section on *Spain*.

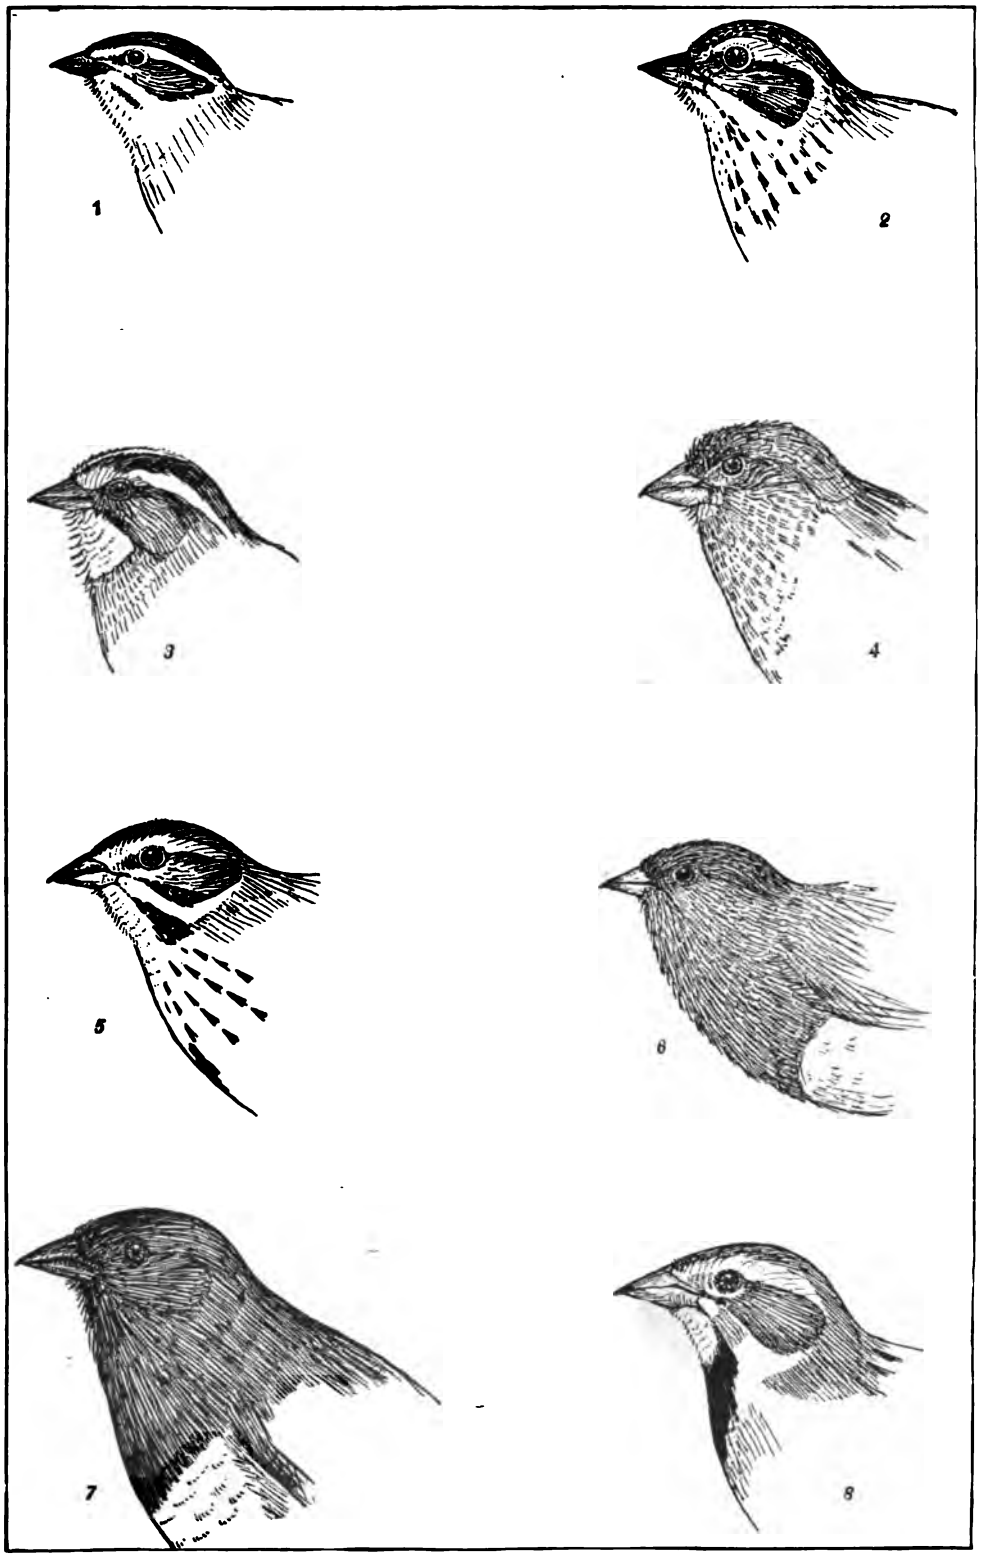
SPANISH SUCCESSION, WAR OF THE. See SUCCESSION WARS.

SPANISH TOWN. A town in Jamaica, British West Indies, on the Cobre River, about 10 miles west of Kingston (Map: West Indies, J 6). It was founded by Diego Columbus in 1525 and was the capital of Jamaica until 1871. Population, over 5000.

SPANISH WAR VETERANS. A patriotic society incorporated in Washington, D. C., on November 2, 1899. It admits to membership any soldier or sailor of the regular and volunteer army and navy and marine corps of the United

States who honorably served during the war with Spain or the war in the Philippines. The National Auxiliary of this order admits to membership mothers, wives, sisters, and daughters of members, and other women, as nurses, who rendered species service during the war.

SPANKER. A fore-and-aft quadrilateral sail set on the mizzenmast of ships and barks (qq.v.). It was formerly called the driver.



SPAR (AS. *spær*, Ger. *Spar*, gypsum). A term which is used by miners to denote any bright crystalline mineral, and which has been adopted by mineralogists in the names of a number of minerals, as calcareous spar, fluor spar, etc., in which, however, it has no proper generic significance.

SPARIDÆ (Neo-Lat. nom. pl., from Lat. *sparus*, from Gk. *σπάρος*, gilt-head, sort of fish). An important family of spiny-rayed fishes, to which belong the porgies, sheepshead, scup, etc. (qq.v.). The body is elongate, with the dorsal side more or less elevated. The scales are rather large. There is a single dorsal fin, the anterior portion being spinous. The family contains about 100 species. They are shore fishes, carnivorous in habit, most common in the tropical seas.

SPARKS, JARED (1789-1866). An American historian, editor, and educator, born at Willington, Conn. He graduated at Harvard College in 1815. Here, after teaching school, he was (1817-19) tutor in mathematics and natural philosophy. During this time he studied theology and (1817-18) edited the *North American Review*. From 1819 to 1823 he was pastor of a Unitarian church in Baltimore; in 1821-23 he edited there the *Unitarian Miscellany and Christian Monitor* (monthly); and from 1824 to 1831 again edited the *North American Review*, of which he was chief proprietor. In 1830 he founded and was the first editor of the *American Almanac and Repository of Useful Knowledge*, published annually until 1861. In 1839 he became professor of history at Harvard, of which institution he was president from 1849 to 1853. During this time he reformed administrative methods, insisted upon the recognition by the Massachusetts Legislature of Harvard's chartered rights, and vigorously opposed the elective system. He is best known, however, as a biographer, and as an editor and collector of documents relating to American history. In this field he was a pioneer and rendered services of great value. As an editor he was severely criticised for taking liberties with his materials, such as failing to reproduce letters and documents accurately, making many verbal and other changes, and omitting numerous passages; but the extent to which he took such liberties has been greatly exaggerated. Perhaps his best known work is his edition of the *Writings of George Washington* (12 vols., 1834-37), the first volume of which is an excellent biography of Washington, frequently published separately. This edition met with much criticism, involving Sparks particularly in a controversy with Lord Mahon, and it has since been superseded in many respects by that of W. C. Ford. Sparks also edited: *The Library of American Biography* (first series, 10 vols., 1834-38; second series, 15 vols., 1844-47), to which he himself contributed several biographies; *The Diplomatic Correspondence of the American Revolution* (12 vols., 1829-30), since superseded in most respects by Wharton's *Revolutionary Diplomatic Correspondence of the United States* (6 vols., 1889); *The Works of Benjamin Franklin with a Life of the Author* (10 vols., 1836-40), since superseded by Bigelow's *Complete Works of Benjamin Franklin* (10 vols., 1887-89); and *Correspondence of the American Revolution; Letters of Eminent Men to George Washington* (4 vols., 1853). He also published a *Life of Gouverneur Morris, with Selections from His Correspondence and Miscellaneous Papers* (3 vols., 1832). He left voluminous manuscript journals, and a mass of valuable documentary material relating chiefly to the diplomatic history of the American Revolution, which was collected by him during several trips to Europe, and which he bequeathed to the Harvard Library. Consult: H. B. Adams, *Life and Writings of Jared Sparks* (2 vols., Boston, 1893).

SPARROW (AS. *spearwa*, *spearewa*, Goth. *sparwa*, OHG. *sparo*, *sparwe*, sparling; connected with OPruss. *sperglas*, *spurglas*, sparrow, and probably ultimately with Eng. *spur*, *spurn*). A small bird of the finch family (Fringillidæ), generally with dull plumage and slight powers of song, feeding on the ground or among underbrush or weeds, and nesting in bushes or low trees or on the ground. Originally the name belonged specifically to the common European sparrow (see HOUSE SPARROW), but now has been inaccurately extended to include certain warblers, weaver-birds, and others. Of American sparrows probably the most familiar is the common chipping sparrow (see CHIPPY), a small grayish bird. The field-sparrow (*Spizella pusilla*) is a very similar species, which occurs throughout the Eastern United States in summer, distinguished by its brighter rufous color and flesh-colored bill. A third species of this genus, the tree-sparrow (*Spizella monticola*), occurs in the United States only in winter, breeding in Labrador and the Hudson Bay region. It is considerably larger than the chippy and has a conspicuous black spot on the grayish-white breast. Next to the chippy the best known American sparrow is probably the song-sparrow (*Melospiza melodia* or *cinerea*), which in some one of its varieties ranges throughout practically the whole of North America. It is between six and seven inches in length, the general shade of the upper surface brown, of the under surface dirty white, but everywhere more or less streaked with black or rufous brown, the streaks on the centre of the breast tending to form one large characteristic blotch. This is one of the earliest spring songsters in the Northern States, and its refrain, although not extended, is remarkably clear and sweet. Its nest is composed of grasses, rootlets, and the like, lined with fine grasses and long hairs, and is frequently placed on the ground. The eggs are very variable in color and form, the ground shade ranging from nearly white to deep blue thickly marked with reddish brown. Two broods are often raised in a season. Two other species of Melospiza range through Eastern North America, the swamp-sparrow (*Melospiza Georgiana*) and Lincoln's sparrow (*Melospiza Lincolni*). They resemble the song-sparrow in appearance, but are much more shy and retiring in their habits. Some twenty or thirty other birds are called sparrows in the United States, among

FAMILIAR SPARROWS

1. CHIPPY (Spizella socialis).
2. VESPER SPARROW (Poöcætes gramineus).
3. WHITE-THROAT (Zonotrichia albicollis).
4. PURPLE FINCH (Carpodacus purpureus).
5. SONG SPARROW (Melospiza melodia).
6. BLUE SNOWBIRD (Junco hyemalis).
7. CHEWINK (Pipilo erythrophthalmus).
8. BLACK-THROATED SPARROW (Euspiza Americana).

which the vesper-sparrow (*Pooœtes gramineus*), the savannah sparrows of the genus Ammodramus (which also includes the sharp-tailed and seaside sparrows), the crowned sparrows of the genus Zonotrichia, the wood-sparrows or summer finches of the genus Peucæa, and the large fox-sparrow (q.v.) are especially worthy of mention, while the sage-sparrows (Amphispiza) and the lark-sparrows (*Chondestes grammacus*) are characteristic Western forms. A familiar species of the West is the black-throated dickcissel (*Euspiza Americana*), a fine singer. The vesper-sparrow is often called grass-finch or bay-winged bunting, but its more common name has reference to its fondness for singing late in the afternoon. It is essentially a ground-loving species, feeding and nesting only on the ground. The outer tail-feathers of each side are white and are exposed by the bird when it flies. Ammodramus includes upward of a dozen species, widely distributed, but popularly little known, on account of their retiring habits. They are chiefly shy, elusive little birds of fresh and salt marshes. The crown-sparrows are large, handsome birds, of which the common white-throated Peabody-bird (*Zonotrichia albicollis*) is the best known. The conspicuous black and white and sometimes golden-yellow markings on the head make the crown-sparrows conspicuous among their more plainly colored relatives. The wood-sparrows are a group of Southwestern and Mexican species of medium or rather small size, with short rounded wings, one species of which, known as Bachman's finch or the pine-woods sparrow (*Peucea æstivalis*), occurs in the South Atlantic States, especially Florida, and is noted as a very superior songster; a variety of this species, the oak-woods or Bachman's sparrow, is found in the Mississippi Valley as far north as Illinois. The lark-sparrow is notable for the fact that, unlike other sparrows, the sexes are very unlike in color; while the female is streaked grayish brown, the male is black with a large white patch on the wings. This is a prairie species abundant on the central plains, ranging eastward to Illinois, and occasionally, as a straggler, to the Atlantic Coast. Consult Ridgway, *Birds of North and Middle America*, part i. (Washington, 1901), and authorities there cited. See Plate of FAMILIAR SPARROWS; and Colored Plate of EGGS OF SONG-BIRDS.

SPARROW-HAWK. Any of several distinct species of small hawks, whose prey consists chiefly of sparrows and other small birds, insects, and mice. In America the name is universally given to *Falco sparverius*, a handsome little falcon less than a foot long. It is very courageous and very active, and lives largely on mice and insects. It is rufous above, barred with black; most of the head is slaty blue, and underneath it is buffy. It breeds from Florida to Hudson Bay, and winters from New Jersey southward, and is everywhere one of the commonest species of hawk. It nests in a hole in a tree and lays from three to seven creamy or reddish eggs, finely marked with darker tints.

The Old World sparrow-hawk (*Accipiter nisus*) is very similar, and has often been trained for the purposes of falconry, to take land-rails, partridges, and similar game. See FALCON; FALCONRY; and Plate of EAGLES AND HAWKS.

SPARTA (Lat., from Gk. Σπάρτη, *Spartē*, Doric Σπάρτα, *Sparta*), also LACEDÆMON. The capital of Laconia, and the most famous city of the Peloponnesus. It occupied partly a group of low hills on the right bank of the Eurotas, and partly the intervening plain. Its appearance in its palmiest days was by no means equal to its renown, for it was little better than a group of five villages, with plain and even mean private houses, though there were a few notable public buildings, such as the shrine of Athena or the Bronze House, whose walls seem to have been lined with bronze, probably decorated with reliefs. The passes which lead into the valley of the Eurotas are so easily defensible, and the distance from the sea is so great, that Sparta continued without walls down to the end of the fourth century B.C., and, indeed, was not regularly fortified till the time of the tyrant Nabis (B.C. 195). The five districts or villages, Cynosura, Limnæ, Mesoa, Pitane, and Dyme, were united in the worship of Artemis Orthia and Athena, and had a common agora, or market-place, on which stood the public buildings—the senate-house, and the offices of the ephors and other magistrates. Famous public places were the *Choros*, where the youths danced in honor of Apollo; the *Dromos*, or race-course, where the gymnastic exercises took place, and where were also temples of the Dioscuri and other gods; and the *Platanistas*, a broad level space, shaded by plane-trees, and reached by two bridges where the Spartan youth, divided into two bands, met in strenuous personal conflict. Probably the so-called Acropolis, which was crowded with temples, was situated on the hill to the northwest, on whose southern side the theatre can still be traced. Not far from here excavations conducted by the American School at Athens in 1892 and 1893 brought to light the foundations of a circular building, which had contained a colossal statue, and may have been identical with one mentioned by Pausanias as containing statues of Zeus and Aphrodite, said to be a foundation of Epimenides of Crete.

After the Dorian conquest of Laconia the supreme power always remained in the hands of the pure-blooded Dorian families of Sparta. The farmer population and the lesser Dorian towns seem to have been reduced to Perioeci (q.v.), or to Helots (q.v.). Their situation, amid a subject population largely in excess of their own numbers, practically forced upon the Spartans a strict military discipline, and this formed the basis of their whole system. Sparta was little else than a permanent camp. At the birth of a child, the elders decided whether it was strong enough to be reared. A weakling was exposed on Mount Taygetus. After the seventh year the boys entered on a course of severe training, designed to develop physical strength and courage, as well as the uncomplaining endurance of hardship and cunning such as might serve the soldier. Music and the dance were added, and perhaps the elements of letters. Girls, too, passed through a training in gymnastics and the dance, that they might be fit consorts and bearers of strong children. Sentiment played but little part in the Spartan system, and the function of marriage was only the perpetuation of the State. At the age of twenty the young Spartan was liable to active service, was admitted to the public meals,

and was now allowed to marry, though he could only obtain stolen interviews with his bride, since he was still obliged to live with his companions. At thirty he became a full citizen. Discipline, however, was not relaxed. He must still eat regularly at his *Phiditia*, or mess, and contribute regularly to its support from the produce of his farm, which was cultivated by Helots. The government was a development from the old Homeric form of the king and council of elders. In Sparta there was a double kingship. The two lines claimed descent from the twin sons of Aristodemus, Eurysthenes and Procles, but were named from the second generation, Agis and Eurypon, Agidæ and Eurypontidæ. These two kings were the religious representatives of the State, on whose behalf they offered stated sacrifices, and also exercised limited legal functions. Their chief duty was, however, the command of the army, over which in early times they exercised unlimited power, though in the fifth century B.C. they were subject to the ephors and the Assembly. In the field their power was absolute. Associated with the kings was a council (the Gerousia) of 28 elders, men over 60 years of age, chosen for life from certain noble families by acclamation in the popular assembly. They discussed and prepared the orders to be submitted to the assembly, and also sat as a court of criminal jurisdiction in crimes against the State, especially where the kings were involved. Once a month the assembly of the citizens (Apella) met at the call of the kings, though in the fifth century B.C. the ephors presided. The body seems ordinarily to have simply voted on the business presented to it. Speeches were in general delivered only by the officials, and there was certainly no general discussion. Into this government were introduced, at an early date, the ephors, who, during the period of Spartan greatness, were the real rulers. (See EPHORI.) They exercised a general oversight over the community and maintained the authority of the established order. Elected for one year, they had the power to call any magistrate to account and even to suspend him from office. They presided over the Gerousia, and could impeach any citizen before that court. Their short term of office and accountability to their successors were really almost the sole limits to their power. Under the iron discipline of this constitution, which was attributed to the mythical Lycurgus (q.v.), the Spartan State gradually extended its power until it had gained complete control over Laconia and Messenia, and the recognized leadership of a somewhat loosely joined confederacy, which included most of the Peloponnesus outside of Argos. At the time of the Persian wars Sparta was the leading State in Greece, but the constitution was not adapted for military operations requiring prolonged absence from home, and with the transfer of the war to Asia the Spartans soon withdrew from the scene. (The leading events other than domestic in the history of Sparta have been given under GREECE.) The creation of the fleet which decided the Peloponnesian War put a severe strain upon the ancient customs, and long absences in foreign lands, often with free opportunity for luxury, rendered men unwilling to submit to stern discipline on their return. The hegemony of Greece, which had fallen to Sparta on the overthrow of Athens, was used solely as a means of aggrandizement and profit, and in a short time led to renewed wars. In B.C. 371 the defeat at Leuctra at the hands of the Thebans broke forever the power of Sparta, and the disintegration, which had begun with naval empire and the accumulation of the gold and silver, forbidden by the ancient laws, went rapidly forward. The attempt of Agis IV. (c.244-240 B.C.) to reform the State was defeated and Agis put to death, but Cleomenes III. (c.235-219 B.C.) carried through a serious of sweeping changes, which increased largely the number of citizens, and reëstablished the Lycurgean order. After his death Sparta was ruled by the tyrants Machanidas and Nabis, was then forced into the Achæan League, and finally with the rest of Greece passed under the rule of Rome. Treated with favor by the Romans, the city prospered; the old laws of Lycurgus were once more placed in force, and the old training practiced at least nominally, though the forms of government seem to have been much altered. In the thirteenth century the Acropolis was fortified by a wall, which may still be traced. The Frankish lords of the Peloponnesus built a strong fortress at Mistra (1248-49) on a spur of Taygetus, west of Sparta, and its superior security led to the abandonment of the ancient city. After the Greek Revolution a new town of Sparta was laid out as the capital of the Nomarchy of Laconia.

Consult, on the topography: Curtius, *Peloponnesus II.* (Gotha, 1852); Leake, *Travels in the Morea* (London, 1830); N. E. Crosby, "Topography of Sparta," in *American Journal of Archæology*, vol. viii. (Princeton, 1893); Frazer, *Pausanias*, vol. iii. (London, 1898). On the ancient constitution, consult: Hermann, *Lehrbuch der griechischen Antiquitäten*, vol. i., 6th ed., by V. Thumser (Freiburg, 1889); Busolt, "Griechische Staats- und Rechtsaltertümer," in Müller's *Handbuch der klassischen Altertumswissenschaft* (Munich, 1892), both of which contain full bibliographies.

SPARTA. A city and the county-seat of Monroe County, Wis., 26 miles east by north of La Crosse; on the La Crosse River, and on the Chicago, Milwaukee and Saint Paul and the Chicago and Northwestern railroads (Map: Wisconsin, C 5). It has an attractive situation and artesian mineral wells, and is a much frequented summer resort. There are in Sparta a public library, the State Public School for Dependent and Neglected Children, and Saint Mary's Convent. The city is the shipping centre for a rich farming and stock-raising section, and manufactures flour, paper, and iron products. The water-works are owned by the municipality. Population, in 1890, 2795; in 1900, 3555.

SPARTACUS. The leader in the great insurrection of Roman slaves in Southern Italy which took place B.C. 73. He was a native of Thrace, originally a shepherd, but afterwards a robber chief. He was taken prisoner and placed in a gladiatorial school at Capua. Seventy gladiators, including Spartacus, escaped and forced their way through the streets of Capua, defeated a detachment of Roman soldiers sent to bring them back, and established themselves on Mount Vesuvius, where they received considerable accessions, chiefly runaway slaves. Spartacus was chosen leader, and proclaimed freedom to all slaves. Thousands rushed to his standard.

After defeating Claudius Pulcher, Spartacus routed and slew Cossinius, legate of P. Varinius Glaber, the prætor; then he worsted Varinius himself in several engagements, capturing his lictors and the very horse on which he rode. All the southern part of the peninsula now fell into his hands; the country was devastated, the cities either pillaged or garrisoned. After the defeat and death of his lieutenants, who had separated from him, B.C. 72, he marched northward through Picenum toward the Po, overthrew first one consular army under Cn. Cornelius Lentulus and then another under Gellius Poplicola, and at the head of a large force meditated a march upon Rome. Servile indecision saved the city. Spartacus was forced by his followers to retreat south, and took up his winter headquarters at Thurii. In B.C. 71 the proconsul, C. Cassius Longinus, and the proprætor, Cn. Manlius, were defeated; in Picenum, Mummius, a legate of Crassus, was utterly routed; at last, however, Crassus succeeded in forcing Spartacus into the narrow peninsula of Rhegium. Crassus now built lines of circumvallation to hem him in and force him to surrender; but one stormy winter night Spartacus broke out of the toils prepared for him, and resumed the offensive. Near Petelia, Spartacus once more defeated his adversaries; but seeing clearly that with such wretched materials as he had he could not hold out much longer, he made a dash for Brundusium, hoping to seize the shipping in the harbors, and get safely across the Adriatic to his native shore, but was baffled by the presence of Lucullus (q.v.). There was nothing left for Spartacus but to die gallantly as he had lived. Drawing up his army in battle array, and solemnly slaying his war-horse, he began his last fight in a spirit of heroic desperation, and after performing prodigies of valor he fell unrecognized among the heaps of his slain foes. After his death the slave insurrection was at an end.

SPARTANBURG. A city and the county-seat of Spartanburg County, S. C., 93 miles northwest of Columbia; on several branches of the Southern and the Atlantic Coast Line railroads (Map: South Carolina, C 2). It has the Kennedy Public Library, and is the seat of Converse College, a non-sectarian institution for women, opened in 1890, Wofford College (Methodist Episcopal, South), opened in 1854, and the State Deaf, Dumb, and Blind Institute. Spartanburg is situated in a rich cotton-growing and farming section, which also has deposits of gold, limestone, and granite, and other mineral wealth. It is the centre of a large cotton-manufacturing district, containing some 30 mills with more than 400,000 spindles. There are several large cotton mills in the city and suburbs; also iron works, lumber mills, and manufactories of brooms and soap. The government, under the charter of 1901, is vested in a mayor, chosen every two years, and a unicameral council. Population, in 1890, 5544; in 1900, 11,395.

SPARTEINE (from Neo-Lat. *Spartium*, from Lat. *spartum*, *sparton*, from Gk. *σπάρτον*, Spanish broom, cable). A volatile, oily liquid alkaloid obtained from the tops of the broom-plant (*Cytisus Scoparius*), a European shrub of the order Leguminosæ. Sparteine is odorless, very bitter, soluble in alcohol, ether, and chloroform, but insoluble in water. Its sulphate, which is used in medicine, is a colorless, crystalline powder, soluble in water and in alcohol. It is a cardiac stimulant, acting at times when others fail, and used under these circumstances or when it is necessary to obtain a substitute for other drugs of its class. It increases the amount of urine excreted.

SPARTIUM, spär'shĭ-ŭm. A genus of plants. See BROOM.

SPASM (Lat. *spasmus*, from Gk. *σπασμός*, *spasmos*, *σπάσμα*, *spasma*, spasm, from *σπᾶν*, *span*, to draw, rend). Involuntary and sudden muscular contraction, due to central nerve disturbance, to peripheral irritation, or to reflex conditions from irritation of other parts. There are two kinds of spasm: tonic and clonic. Tonic spasm is a prolonged involuntary rigidity of a muscle or a group of muscles. Such spasm occurs at the beginning of an epileptic attack, during hysteria major, tetanus, angina pectoris, and meningitis. It also occurs in the muscles of the calves of the legs in swimmers, attended with pain, when it is called cramp (q.v.). Clonic spasm is an involuntary contracting and relaxing of groups of muscles, causing twitching, jerking, and rolling movements and contortions. It is the common convulsion, or fit. Such a spasm occurs in epilepsy, hysteria major, uræmia, chorea, hydrophobia, and in some cases of indigestion and worms. In asthma (q.v.) there is spasm of the muscles controlling the bronchial tubes, as also in whooping cough (q.v.), together with hyperæsthesia. Spasm occurs also in colic.

The treatment of spasm consists of the use of antispasmodics such as asafœtida, galbanum, musk, sumbul, valerian, belladonna, cannabis indica, opium, the bromides, and stramonium, and the administration by inhalation of choloroform or amyl nitrite, or by outward application of heat in a prolonged hot bath.

SPAVIN, BOG (OF. *esparvain*, *esparvent*, Fr. *éparvin*, spavin; possibly from Goth. *sparwa*, OHG. *sparo*, *sparwe*, AS. *spearwa*, *spearewa*, Eng. *sparrow*; in allusion to the hopping gait of a spavined animal). A lesion of the true hock-joint of the horse, consisting in distention of the capsule inclosing the joint. It usually arises suddenly from a sprain in action, from overwork, or wounds.

SPAVIN, BONE. An inflammation of and bony deposit on the flat bones of the lower and inner part of the hock-joint of the horse. At first there is tenderness, local heat, swelling, and lameness, but as the inflammatory stage passes the lameness is less perceptible, although the horse still continues to go stiffly. If the lameness is only slight it usually disappears after a little exercise. The animal should be given rest.

SPAWN-EATER. The spotted-tailed minnow (*Notropis Hudsonius*). See MINNOW.

SPEAKER. The name given to the presiding officer in various legislative bodies. In the English House of Commons the office of Speaker seems to have existed as early as the reign of Henry III., but the title Speaker was first given to Sir T. Hungerford in the reign of Edward III. (1377). The Speaker of the House of Commons presides over the deliberations of the House, and enforces the rules for preserving order. He puts

the question and declares the determination of the House. As the representative of the House, he communicates its resolutions to others, and conveys its thanks or its censures. He issues warrants in execution of the orders of the House for the commitment of offenders, for the issue of writs, the attendance of witnesses, the bringing up prisoners in custody, etc. He cannot speak or vote on any question, but on an equality of voices he has a casting vote. The office is non-political; and hence a Speaker may hold during several successive and opposing administrations. A retiring Speaker is usually rewarded with a peerage. See PARLIAMENT.

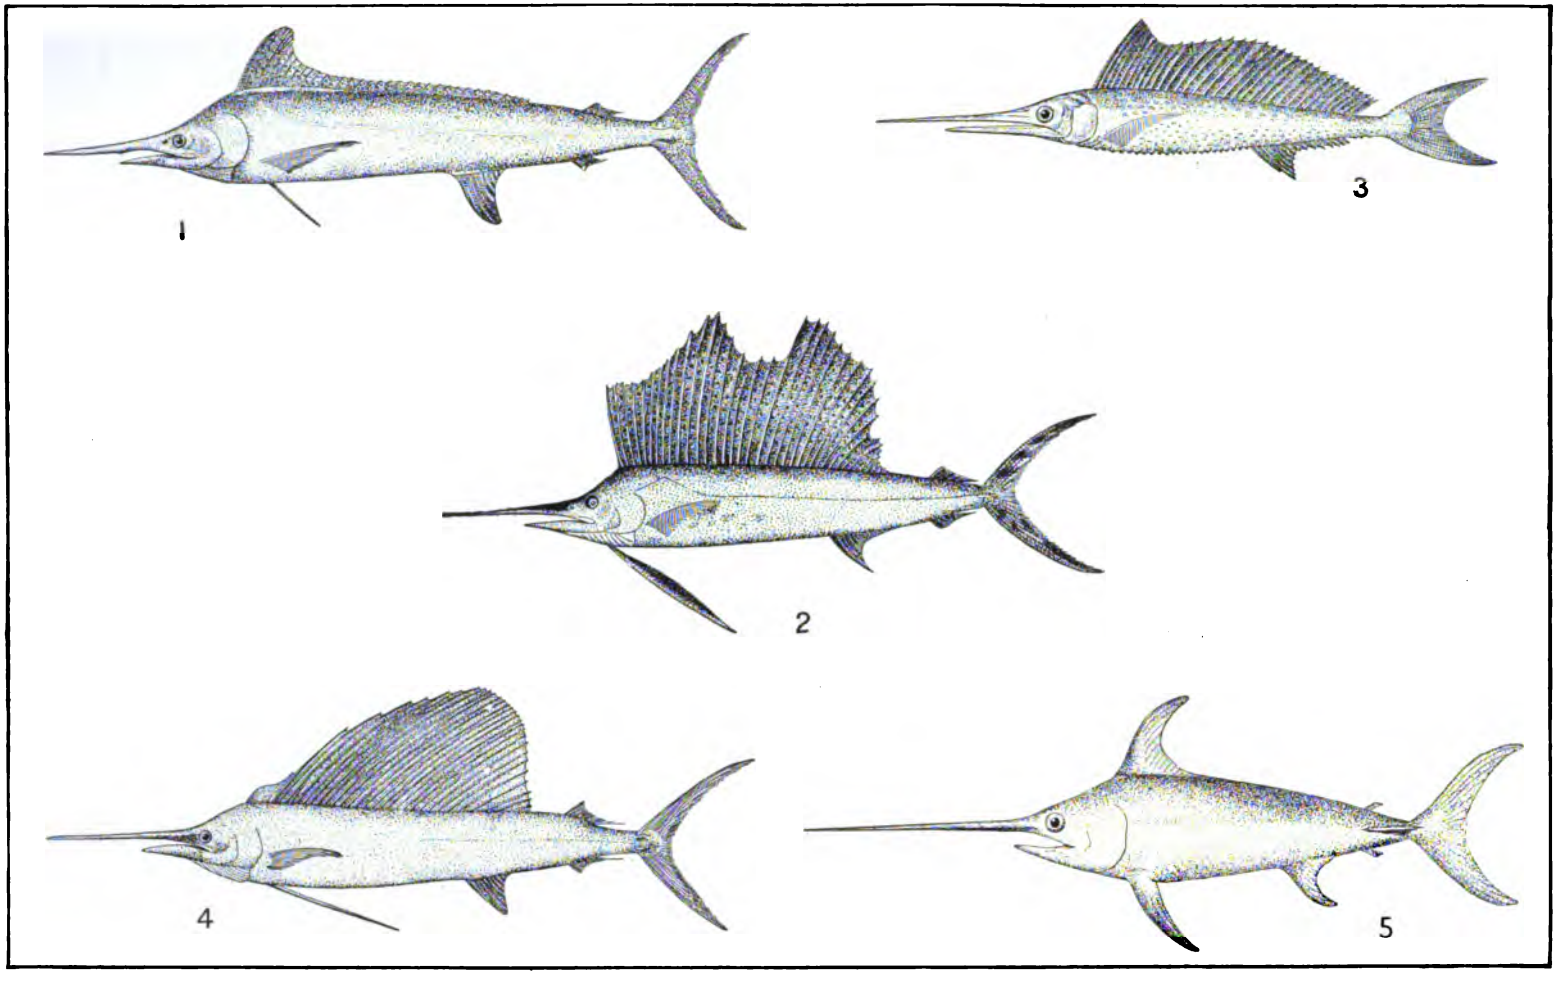
Unlike the English prototype, the Speakership of the United States House of Representatives is a political office of the highest importance. The first Speaker, chosen in 1789, was a moderator on the British pattern. But beginning with the right to appoint the standing committees in 1790, the powers of the office have gradually expanded until the Speaker has become the acknowledged leader of the House and the chief of his party. Henry Clay (1811-25) developed the political resources of the office, especially through the constitution of committees. The modern Speaker has been well called the American Premier. So far has the office departed from its original character that the Speaker now has the right to dispense the privileges of the floor in the interest of his party. He may even refuse to 'recognize' on the ground of personal dislike. Moreover, since 1860, as chairman of the Committee on Rules, he may in effect control the whole course of legislation. He "practically decides what shall be considered, how long debates shall last, and when the votes shall be taken." Through this function a kind of substitute for the right of the English Ministry to introduce and promote so-called 'Government bills' has been found. The Speaker is a member of the House chosen by the members; and he freely exercises his privilege of voting on any measure. Since 1874 his salary has been $8000 a year. He signs all bills, resolutions, and acts of authority; certifies to the mileage, etc., of members; and appoints three of the regents of the Smithsonian Institution. He may be removed from his office by an act of the House.

For the early history of the Speakership, consult Stubbs, *Constitutional History*, and in general, Todd, *Parliamentary Government* (London, 1869). The most important work on the American office is Follett, *The Speaker of the House of Representatives* (New York, 1896). This was preceded by Hart, "The Speaker as Premier," in *Atlantic Monthly*, March, 1891; reprinted in his *Practical Essays* (New York, 1893).

SPEAKING TRUMPET. An instrument for concentrating the waves of sound originated by the articulation of the human voice, and thereby enabling the sound to be conveyed to a greater distance. It was used on shipboard in enabling the officers to convey orders during windy weather from one part of the deck to another, or to the rigging, and in its more modern form, the megaphone (q.v.) is extensively employed. The invention is ascribed to Sir Samuel Morland (1625-1695) in 1670, though Athanasius Kircher laid claim to it. Morland's trumpet was shaped like a truncated cone, with an outward curve or lip at the opening.

SPEARFISH, or SPIKEFISH. The great 'billfish' or 'aguja blanca' (*Tetrapturus albidus*) of West Indian waters, which is dark blue above, whitish beneath, and may be seven feet long, including the spear-like jaws, and weigh 100 pounds. It is probably identical with the Mediterranean species, and others occur in the Eastern tropics. Their habits are similar to those of their relatives the sailfishes and swordfishes. See Plate of SPEARFISH AND SWORDFISH.

SPEARMINT. See MINT.



SPEARS, JOHN RANDOLPH (1850—). An American author and journalist, born at Van Wirt, Ohio. In 1875 he became editor of the East Aurora *Advertiser*, and the next year he founded the Silver Creek *Local*. He was a reporter on the Buffalo *Express* from 1880 until 1882, when he joined the staff of the New York *Sun*. His publications include: *The Gold Diggings of Cape Horn* (1895); *The Port of Missing Ships and Other Stories of the Sea* (1896); *The History of Our Navy* (1897); *Our Navy in the War with Spain* (1898); *The Fugitive* (1899); and *History of the American Slave Trade* (1900).

SPECIAL ASSESSMENT. A compulsory contribution levied in proportion to the special benefits derived from a public improvement, and designed to cover, entirely or in part, the cost of that improvement. A special assessment is levied most frequently in connection with the opening or improvement of streets or highways. It differs from a tax in that it is levied in proportion to the benefit directly derived from the uses to which the contribution is put. (See TAX.) Charges of the nature of special assessments were imposed in France as early as 1672. In 1807 a general law was passed authorizing such levies, but it has rarely been invoked. In Prussia, since 1875, the expenses of certain street improvements have been partially defrayed in this manner. In England contributions of the nature of special assessments were imposed in 1427 and in 1667. The Public Health Act of 1875 permits urban authorities, under certain contingencies, to recover the cost of improvements from property-owners, in proportion to the frontage of their premises. In England, however, no general policy of covering the costs of improvements by special assessments exists.

The principle of special assessments first appeared in America in a law of the Province of New York of 1691. By that law, however, all houses in the city of New York might be assessed in proportion to benefits derived from public improvements. By a law of 1787, assessments were limited to the owners of property which was intended to be benefited. In other States this form of revenue appeared about 1830. After the Civil War the principle became far more extended, and is now throughout the United States a recognized principle of local finance. In a typical case, when a street is graded or paved, after the improvement has been made a board of assessors is appointed, who apportion the cost in proportion to benefits received. Such assessments are usually subject to legal limitation as to amount. Consult Rosewater, *Special Assessments* (New York, 1893).

SPECIAL JURY. In the English law, a jury consisting of men who are entitled to be

SPEARFISH AND SWORDFISH

1. SPEARFISH (Tetrapturus albidus). 2. WEST INDIAN SAILFISH (Histiophorus nigricans). 3. YOUNG OF SWORDFISH (No. 5).
4. SAILFISH (Histiophorus gladius). 5. SWORDFISH (Xiphias gladius).

called esquires, or persons of higher rank, bankers, merchants, and persons who occupy private dwelling houses, or possess certain other property qualifications. Under the 'Juries Act' of 1870, either the plaintiff or the defendant in an action is entitled to demand a special jury, but the one making such demand must bear the additional expense, unless at the end of the trial he can obtain a certificate from the trial judge to the effect that the case was a proper one to be tried by a special jury. In some of the United States no provision is made for special juries; but in a few States *struck* or special juries may be ordered, in the discretion of the court, in important cases. See JURY.

SPECIAL PROCEEDING. Under modern codes of procedure, any civil proceeding which is not an action (q.v.). Under the New York Code of Civil Procedure, the following have been held to be special proceedings: an application for admission to the bar; supplementary proceedings; a proceeding to vacate an assessment; proceedings for contempt; proceedings for condemnation of land; habeas corpus. See ACTION, and consult Fiero, *Special Proceedings* (2d ed., New York, 1899).

SPECIAL SESSIONS. Under the English judicial system, where two or more justices of the peace sit together for the trial of some important cause, or to transact other urgent judicial business, the sitting is known as Special Sessions. In New York a criminal court for the trial of misdemeanors and petty criminal cases is called the Court of Special Sessions. See COURT; PETTY SESSIONS.

SPECIALTY. In law, in its broadest sense, any formal, as distinguished from a simple, contract, including judgments, recognizances, statutes staple, statutes merchant, and deeds of grant; but the term is more frequently used as synonymous with contract under seal. Contracts under seal were the earliest form of contract known to the law, having been used from the earliest time both under the common and the Roman law system. Unlike simple contracts, no consideration is required to give them validity at law, their validity, as in the case of all other specialties, depending on their form and the method of their execution. They must be written or printed on paper or parchment and they must be sealed and delivered by the grantor or obligor. It is said that signing a deed by the obligor is not essential to the validity, although it is now the universal practice to execute the instrument by signing as well as by sealing and delivering it. Delivery is effected by an actual delivery of the instrument by the person executing it to the obligor or to another for the obligor with the intent that it should become operative as a deed or contract under seal. After sealing and delivery the instrument remains in full force even if the person executing it take it back into his possession. One executing a specialty may, however, make a qualified delivery of it called a delivery in escrow (q.v.). Formerly specialties were classified as deeds poll and indentures (see DEED), but now the most satisfactory classification of specialties (using that term as applicable only to instruments under seal) is into grants, bonds, and covenants (qq.v.). All statements contained in a specialty are absolutely conclusive against the party making them and executing the instrument, that is, he is conclusively estopped to deny them. Whenever a specialty contract is given on account of or in place of a simple contract, the simple contract is merged in the specialty contract and thereby becomes extinguished. (See MERGER.) The statute of limitations provides a much longer period of limitation for specialties than other forms of obligations, the usual period being twenty years. (See LIMITATION OF ACTIONS.) In case of the death of the obligor the holder of specialty obligations executed by the deceased had at common law much higher rights against his estate than the holder of simple contract obligations. (See ADMINISTRATION.) Although consideration is not necessary to give legal validity to a specialty, courts of equity will not grant their peculiar form of relief by way of specific performance to one who has not given consideration for the specialty obligation which he holds. See SPECIFIC PERFORMANCE; TRUST; USES.

It was formerly held that a corporation could contract only by specialty under its corporate seal. This, however, is no longer the rule in the United States, where it is held that a corporation may enter into contracts by its proper officers without the use of its seal, wherever a private individual might so contract. For further information consult such titles as CONTRACT; BOND; DEED; COVENANT; SEAL; EQUITY; CONSIDERATION, etc., and consult the authorities referred to under CONTRACT and SEAL.

SPECIAL VERDICT. A verdict in which the jury find merely the facts as proved by the evidence and do not apply the law to the facts, but leave it to the discretion of the court as to whether in its opinion the plaintiff or defendant shall succeed. The matter is now regulated by statute in most jurisdictions. In some States such a verdict is said to be 'subject to opinion.' See JURY; VERDICT.

SPECIE PAYMENTS (abbreviation of ML. *in specie*, in coin, Lat. in kind, from *in*, in, and *specie*, abl. sg. of *species*, kind), SUSPENSION AND RESUMPTION OF. The circulating medium of modern States consists both of metallic money and of credit money, issued either by banks or by the Government, which in normal times is convertible into metallic money on demand. (See MONEY.) But there are few States which have not passed through crises when the metallic covering of its paper money has become too scanty, and the convertibility of the paper has been suspended. Such a general suspension of specie payments is legalized either directly or tacitly by the Government. The issues of credit money are usually in such close relation with the Government that such an action must receive governmental sanction. The effect of suspension is to relax the restrictions upon the issue of paper money, and the general result is a redundancy of such money and its depreciation. This does not happen immediately, as the action generally leads to the hoarding or export of such metallic money as remains in the country, thus causing a void in the monetary circulation which the issues of paper money do not at once fill. The extent of the depreciation of the paper money usually depends upon the facility with which it is issued. On the suspension of specie payments by the Bank

of England in 1797, the effect of increased note issues was only gradually felt, for the bank followed in the main a conservative policy. This was true also of the suspension by the Bank of France in 1870. On the other hand, during the suspension of specie payments in the United States in 1813, the banks issued notes recklessly and the depreciation was considerable. When the banks of the United States, on December 30, 1861, again suspended specie payments and the Government followed their example, the large issues of legal-tender notes caused a like result.

The resumption of specie payments is usually a slow and tedious process. The first step toward resumption is the gradual restriction of the paper issues; in the case of Government notes redemption is accomplished by the aid of taxation, while in the case of bank notes resumption occurs through pressure of the Government by taxation of excessive issues or by other means. The second step is to procure a fund of metallic money sufficient to meet probable demands for redemption. To effect this end the Government credit is usually called into requisition. The resumption of specie payments restores the convertibility of credit money, but does not destroy the money itself. It provides for the redemption in metallic money of such sums as may be presented, but not the compulsory redemption of the whole.

The financial history of the United States in the years succeeding the Civil War illustrates the process of resumption. The close of that war found the monetary circulation of the United States exclusively paper, Government issues, State bank notes, and national bank notes. Specie payments had been suspended since 1861, and a return to them seemed the first duty of financial policy. The fear of a contraction of the currency, however, made the first steps in this direction hesitating and uncertain. The gradual redemption of the United States notes, which in January, 1864, had stood at $449,000,000, undertaken under the law of April 12, 1866, had been arrested in February, 1868, when the amount stood at $356,000,000. In the financial troubles of 1873, the Secretary of the Treasury, upon somewhat dubious authority, had increased the volume, but by act of June 20, 1874, Congress stopped this increase when the issue had reached $382,000,000. The task of resumption was earnestly taken in hand early in 1875, when an act was passed providing for resumption on January 1, 1879. In its several provisions and as a whole the act was in the following years the object of repeated attack, but all efforts to repeal it failed. This law removed the limitation which had heretofore rested upon the aggregate issue of national bank notes. It provided, moreover, that as new notes were issued, United States notes to the extent of 80 per cent. of the new bank issues should be retired and canceled. Under this provision the volume of the legal-tender notes diminished by May 31, 1878, when this provision was repealed, to $345,000,000. The resumption act further authorized the Secretary of the Treasury, by the accumulation of surplus revenues and by the sale of bonds, to collect a supply of gold wherewith to resume. The amount to be collected and the amount to be maintained after resumption became a fact were left to his discretion. By the sale of bonds at favorable opportunities the Secretary had on hand on the day of resumption $140,000,000 in gold. The growing strength of the Treasury produced a diminishing premium on gold, and the first of January, 1879, passed off without the dreaded shock. Only a small amount of paper money was actually presented for payment. See MONEY.

SPECIES. See CLASSIFICATION OF ANIMALS; EVOLUTION.

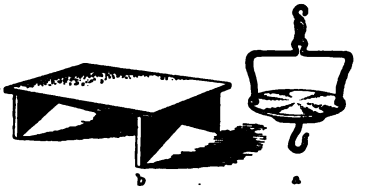
SPECIFICATION. In the law of patents, a technical description of the invention mentioned in an application for a patent, and when used without the word 'claim' it includes the claims or arguments of the inventor as to the novelty, usefulness, etc., of his invention. See PATENT, and the authorities there referred to.

SPECIFIC GRAVITY (ML. *specificus*, specific, particular, from Lat. *species*, kind). The ratio between the weights of equal volumes of any substance and of some other, chosen as a standard. For solids and liquids the standard substance is water, for gases, air, or sometimes hydrogen. Since the volume of a given weight of a substance changes with temperature, it is necessary for exact determinations that the standard selected should be at a certain fixed temperature. Thus specific gravity is not the ratio of an equal volume of a given substance to water at any temperature, but only at the standard temperature which is selected, as described below. Likewise for a specific gravity determination to be of value the temperature of the substance at the time of making the measurement should be given. For gases not only the temperature, but the pressure must be mentioned. For many purposes the term density has replaced specific gravity, but the two are not synonymous. The density of a substance (at a given pressure and temperature) is the mass of that substance in a unit volume, provided it is homogeneous; otherwise it is the mass of a volume so small as to be homogeneous, divided by the volume. Thus density is an absolute term, expressing the quantity of a certain kind of matter in a given space, while specific gravity is merely relative, being in fact the ratio of the density of the substance to the density of the standard. The specific gravity of a gas or vapor is usually referred to air at the same pressure and temperature as that of the gas, but also frequently to hydrogen under like conditions. In terms of the latter it is equal to half the molecular weight of the gas. See MOLECULES—MOLECULAR WEIGHTS.

The specific gravity of solids and liquids is variously referred to water at 4° C., 15° C., or 62° F., and sometimes still other temperatures. Specific gravities on these scales are respectively as 1.000045, 1.000913, 1.001180—the density of water at these temperatures being inversely as these numbers. The difference is obviously not of importance except for purposes of extreme accuracy. Density in the metric system is measured in grams per cubic centimeter (kilograms per liter). If a liter of water at 4° C. weighed exactly a kilogram, as was intended, the density of water at this temperature would be one and metric density and specific gravity referred to water at 4° C. would be identical. The density of water at this temperature is actually .999955, so that specific gravity referred to water at 4° is equal to density × 1.000045. Specific gravity referred to air at 0° C. and 76 centimeters pres-

sure is equal to metric density divided by the density of air = .001293.

On the English system density is variously expressed in pounds per cubic foot, pounds per cubic inch, grains per cubic inch. To reduce specific gravity referred to water at 62° F. to density on these scales multiply by 62.3546, .0360848, 252.593, respectively.



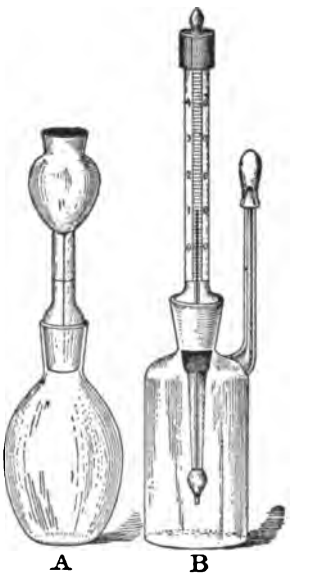
METHODS OF MEASUREMENT. I. DENSITY. Two courses may be pursued to determine the density of a substance: (1) Weigh a portion of it and measure its volume; (2) determine its specific gravity referred to a substance of known density. For approximate purposes the former is best, particularly in the case of solids of regular shape. To attain a high degree of accuracy, however, is difficult, since the direct determination of volume is subject to many errors. Hence the density of most substances is found by determining, by one of the methods below, its specific gravity referred to water or hydrogen, the density of each of these having been carefully investigated. The density of water is found by observing the loss in weight of a solid of regular shape when immersed in water, some of the best results being obtained with a glass cube whose exact dimensions were found by a method based on the interference of light.

II. SPECIFIC GRAVITY OF SOLIDS AND LIQUIDS. Most of the methods given below are based on Archimedes's principle, which states that a solid floating or immersed in a liquid loses weight equal to that of the liquid it displaces. Hence if it is totally immersed the loss of weight is the weight of a volume of liquid equal to the volume of the solid. Hence:

$$\frac{\textit{Weight of solid}}{\textit{Loss of weight}} = \frac{\textit{specific gravity of solid.}}{\textit{specific gravity of liquid.}}$$

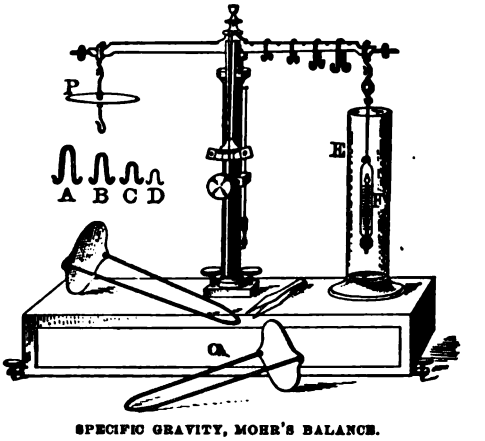
Thus if either is known the other may be found. For exact purposes the temperature of the liquid must be known, weighings in air must be corrected for the buoyancy of the latter, and the solid must be supported in the liquid so that only a single fine wire cuts the surface. Air bubbles are also a serious source of error, and for this reason water when used should be freely distilled or boiled.

(A) HYDROSTATIC BALANCE. A chemical balance (see BALANCE) so arranged that a vessel of liquid may be placed under one end of the beam without resting on the pan. This is done by replacing the ordinary pan by a shorter (Fig. *a*) or else by resting the vessel on a bridge (Fig. *b*) over the pan.



BRIDGE AND PAN FOR USE WITH BALANCE.

The solid is weighed in air, then suspended from a hook on the pan or pan support by a wire of known weight, so that it hangs totally submerged in the vessel of liquid, and again weighed.



(B) JOLLY BALANCE. A large delicate spiral spring supported by a vertical rod of adjustable length and carrying at the bottom two pans, one below the other. For description see JOLLY BALANCE.

(C) SPECIFIC GRAVITY BOTTLE. A light glass flask with a ground stopper generally pierced with a fine hole so that it may be completely filled. The flask is weighed empty, then full of water. Knowing the density of water, the internal volume is calculated. The bottle may now be filled with a liquid of unknown density and weighed and the density calculated. Or a weighed amount of solid in small pieces may be put in the bottle, which is then filled up with water and weighed. The difference between the weight of the solid plus that of the bottle entirely filled with water and the weight observed is the weight of water displaced by the solid. This is the most accurate method for liquids and solids in small bits.

SPECIFIC GRAVITY BOTTLE OR PYKNOMETER.
A, simple form; B, with thermometer.

(D) MOHR'S BALANCE. A balance beam divided into tenths carries suspended from one end by a platinum wire a glass cylinder, F, almost solid. On the other end is a counterpoise, P, balancing the cylinder in air. Riders, A, B, C, D, are provided of weight equal to the loss of weight of the cylinder in water at 15° C. and of 1-10, 1-100,

SPECIFIC GRAVITY, MOHR'S BALANCE.

1-1000 this weight. When the cylinder hangs in a jar, E, filled with a liquid whose density is desired, these riders are adjusted on the beam so that balance is restored, and the position of the riders then gives directly the specific gravity referred to water at 15°. Thus with the riders

as in the figure the specific gravity would be .8642. The glass cylinder carries a small thermometer, and the temperature should be adjusted to about 15°. The method is extremely convenient to three places of decimals. The fourth requires many corrections.

(E) HYDROMETER. A long hollow glass cylinder or 'stem' weighted at one end by a bulb containing shot or mercury so that it will float upright in a liquid. The stem is graduated and the specific gravity is given by the mark to which it sinks, read *through* the liquid. The graduations are sometimes in specific gravity or density, but often according to established arbitrary scales, those of Beaumé and Twaddell being best known. Instruments are made of different styles for milk, spirits, oil, acids, etc. See HYDROMETER.

HYDROMETER.

APPARATUS FOR METHOD OF BALANCING COLUMNS.

(F) BALANCING COLUMNS. A tube such as that shown is supported vertically in two jars containing two liquids. These are drawn up into the tubes by suction on the tube at the top, which is then closed. The height of the liquids in the tubes above their surfaces in the tumbler are inversely as their densities. If the liquids do not mix a simple inverted U tube may be used, one liquid being poured into each arm. If tubes less than half an inch in diameter are used the liquids should be drawn up only a little, heights measured, then as far as possible, and the ratio of the *increase* in lengths of the columns taken.

(G) The specific gravity of a solid lighter than water is found by either the hydrostatic or Jolly's balance, a weight being attached sufficient to sink it. This weight should hang under water throughout.

III. SPECIFIC GRAVITY OF GASES. BUNSEN'S METHOD. The rate of effusion of a gas, i.e. the volume which escapes per second through a very small opening, is for a given opening and difference of pressure inside and out, inversely as the square root of its density.

Near the top of a long vertical glass tube is a partition consisting of a disk of platinum pierced by a hole about .0005 inch in diameter. Above this the tube is closed by a ground stopper. The tube is filled with gas and plunged into a deep bath containing mercury and adjusted until a glass float carried by the mercury stands at a fixed level. The stopper is removed and the time required for the float to rise to another fixed level as the mercury drives out the gas is measured. The experiment is then repeated in exactly the same manner with the standard gas. The ratio of the times observed is the square of the ratio of the densities, i.e. the specific gravity of the unknown gas referred to the standard gas. See MOLECULES—MOLECULAR WEIGHTS.

For tables of density and specific gravity, consult *Smithsonian Physical Tables* (Washington, 1896). Methods of determining the specific gravity of a substance will be found in any standard text-book on physics.

SPECIFIC HEAT. See HEAT.

SPECIFIC LEGACY. See LEGACY.

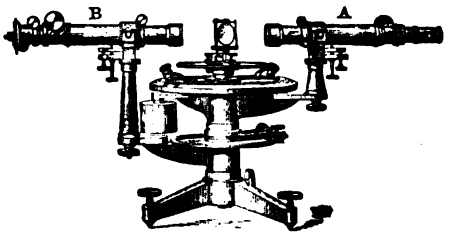
SPECIFIC PERFORMANCE. A technical legal term employed to denote the equitable doctrine and rules under which a court may compel a party who has refused to perform his part of an agreement to carry it out according to its terms. In an action at law for the breach of a contract the only relief possible is damages, but as money is not always an adequate compensation for the loss which may be suffered, the courts of equity will in certain cases decree a specific or actual performance of the terms of the contract. It lies in the discretion of the court whether or not to grant this relief, but precedents must be followed as a guide. In general, to obtain a decree of specific performance the plaintiff must satisfy the court that the remedy at law is entirely inadequate; that there was a valid, fair, and reasonable contract between the parties; and that he has done nothing inequitable on his part. It is a general rule to grant specific performance of contracts for the conveyance of real estate. It is only in exceptional cases that the relief will be granted in cases of contracts to convey personal property, and then only when the article is unique in its character and practically unobtainable elsewhere, such as a rare picture which could not be duplicated. In a few cases specific performance of a contract to do some act, such as build a structure, will be decreed. For example, where a railroad agreed to build an ornamental bridge over a private roadway in consideration of the right of way through a man's premises, the court decreed that the company should construct the bridge according to the terms of their contract. Consult Fry, *On Specific Performance*. See also CONTRACT, and authorities there referred to.

SPECTACLED BEAR (so called from the marking on the face). The small bear of the northern Andes. See BEAR.

SPECTACLES (Lat. *spectaculum*, show, from *spectare*, to behold, from *specere*, to see; connected with Gk. *σκέπτεσθαι*, *skeptesthai*, to look, Skt. *spaś*, to see, OHG. *spehôn*, Ger. *spähen*, to

spy). A device for the purpose of aiding the sight when impaired by age or otherwise. (See SIGHT, DEFECTS OF.) They were invented during the thirteenth century. The credit is attributed by some to Alessandro di Spina, a Florentine monk, and by others to Roger Bacon. The lenses are nearly always made of the best optical glass, and by the best makers are ground with extreme care. Lenses may be mounted in either eye-glass or spectacle frames, care being taken that the centre of the lens is opposite the pupil and that the glasses are tilted at a proper angle for reading or distance as desired. When separate lenses are required for these purposes the so-called bifocal glasses may be used. They are made by cementing a small strong lens upon the lower part of the other, so that when the eyes are lowered, as in reading, the line of vision passes through that portion. Lenses are now numbered, with one of a focus of one meter as a unit, known as one diopter. One with four times that strength has a focal distance of one-quarter of a meter and is known as 4 D. (diopters). Convex spherical lenses are used in hypermetropia, presbyopia, and after removal of the crystalline lens for cataract. Concave spherical lenses are employed in myopia. If astigmatism exists a cylindrical lens, either concave or convex as required, is used. As the astigmatism may be in only one meridian, while that at right angles to it is normal, or as there may be either hyperopic or myopic astigmatism in both, or hyperopic in one and myopic in the other, it is sometimes necessary to employ cross-cylinder lenses, a combination of two cylinders with their axes at right angles to each other. Prismatic glasses are used in cases with weakness of ocular muscles, one being chosen which will make the images seen by the two eyes coincide. Combinations of cylindrical and spherical lenses and prisms are needed when errors of refraction or accommodation are combined with astigmatism and muscular weakness, which cause double vision.

SPECTATOR, THE. (1) A famous periodical published daily in London from March 1, 1711, to December 6, 1712, to which Addison and Steele were the principal contributors. Addison wrote 274 papers, Steele 236. Addison's essays, almost perfect in form, fixed a new standard in manners, morals, and taste, whose influence lasted for years. The *Spectator* was revived in 1714, when 80 numbers were issued, of which Addison contributed 24.



(2) A London weekly periodical, founded in 1828, devoted at first solely to literature and social questions; politics were, however, introduced and it became a strong advocate of the Reform Bill. The first editor was Robert S. Rintoul, who continued in office till his death in 1858. John Stuart Mill was a member of the staff. From 1861 to 1897 it was edited by Richard Holt Hutton, who wielded great influence in literature and theology, while his partner, Meredith Townsend, managed politics, which were liberal until 1886. He was succeeded as editor and owner by John St. Loe Strachey, the political attitude of the paper being Liberal-Unionist.

SPECTRAL BAT. See BAT and Colored Plate of MAMMALIA.

SPECTRE (from Lat. *spectrum*, appearance, image, apparition). A fanciful book-name for one of the small lemurine animals of the Malayan region, the tarsier, on account of its gaunt form, enormous eyes and nocturnal appearance. Many superstitious notions attach to these and related animals (see LORIS) among the natives of the East Indies, causing them to be regarded with more dread than curiosity. Their nocturnal and irregular appearance have caused certain bats and small owls also to be called 'spectral.'

SPECTROGRAPH (from Lat. *spectrum*, appearance, image, apparition, from *specere*, to see + Gk. *γράφειν*, *graphein*, to write). A particular form of spectroscope (q.v.) in which the apparatus to record the radiations is a photographic plate. The apparatus, then, consists of a collimator, a prism or a grating, and a telescope in which the eyepiece is replaced by a photographic camera.

SPECTROMETER (from Lat. *spectrum*, appearance, image, apparition + Gk. *μέτρον*, *metron*, measure). An instrument especially designed to determine the index of refraction of transparent bodies. The ordinary type of instrument is illustrated in the cut, and, as shown, consists essentially of two arms which are movable around an axis carrying a platform on which rests a prism of the substance to be investigated. One of the arms carries a telescope, A, while the other supports what is known as the 'collimator,' B. This consists of a tube at one end of which is a slit made by two movable parallel edges, and at its other end is a lens so placed that the slit is in its principal focus. If a source of light, for instance a sodium flame, is placed in front of the slit, a beam of parallel light will proceed from the collimator lens, fall upon the prism, suffer deviation, enter the telescope and be focused by the objective on the cross-hairs of the eyepiece. The angles made between the telescope and collimator may be read on a scale attached to the platform of the instrument.

SPECTROMETER.

To determine the index of refraction of a substance in the form of a prism, for radiations of a given wave length, it is necessary to know: First, the angle of the prism, that is, the angle made between the two plane faces of the prism; second, the angle of minimum deviation for the given radiations. Both these quantities can be measured with the spectrometer, care being taken to have the axes of the telescope and collimator perpendicular to the axis of the instrument, and the edge of the prism parallel to it. The following formula then gives the index of refraction, in which A represents the angle of the prism and D the angle of minimum deviation:

$$\text{Index of refraction } n = \frac{\sin \frac{A+D}{2}}{\sin \frac{A}{2}}$$

SPECTRO-PHOTOMETRY (from Lat. *spectrum*, appearance, image, apparition, + Gk. *φῶς, phōs*, light + *-μετρία, -metria*, measurement, from *μέτρον, metron*, measure), or SPECTRAL PHOTOMETRY (see also SPECTROSCOPY and PHOTOMETRY). The study of the relative intensities of light of various colors from the same source or from different sources. Not only, as an ordinary photometry, may the relative intensities of two sources of white light or of monochromatic light be compared, but spectro-photometers are provided with dispersing prisms so arranged that the various colors of one beam of white light may be compared with the corresponding colors of another. The general method is to bring some of the light from one source and some from the other

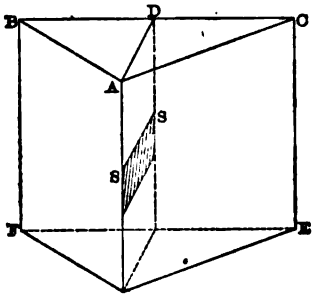


FIG. 1. DOUBLE PRISM, BRACE'S SPECTRO-PHOTOMETER.

source side by side in the same field of view, and by suitable means to alter the intensity of either beam (or of both) in a known degree until a 'match' or photometric equality is secured; this condition of equality being determined by the vanishing of the line of separation between the two portions of the field of view, illuminated respectively by the two sources to be compared. There is also a so-called 'method of contrast' devised by Lummer and Brodhun.

The most recent and efficient form of spectro-photometer is that devised by Professor Brace of

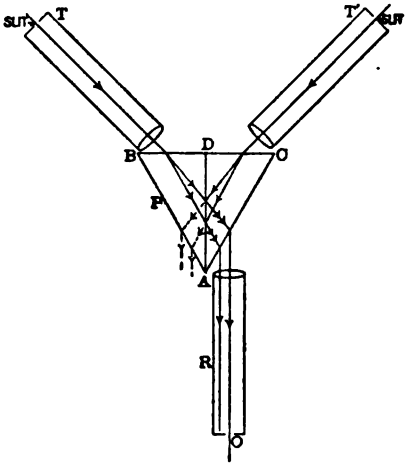

FIG. 2. OPTICAL SYSTEM, BRACE'S SPECTRO-PHOTOMETER.

the University of Nebraska. It consists essentially (see Fig. 1) of a double prism P with a narrow silvered strip SS on the face AD of the right half. T and T′ are two similar collimators symmetrically situated with respect to the prism and provided with adjustable slits through which the light from the two sources enters the optical system of the photometer. The amount of light entering the system through either collimator depends upon the width of its slits. The width of one slit, say T, is, after the initial adjustments of the instrument, kept fixed throughout any one series of observations, while the width of the other collimator-slit (T′) may be altered at will to secure a match in intensity of the two beams. Light of the same wave-length (i.e. of the same color) is thus brought by direct transmission from the collimator T, and after reflection at the silver strip from T′, to the same focus in the observing telescope R. When the eyepiece is removed and the prism viewed through a slit in the focal plane of R, the eye sees three fields (as in Fig. 3), the central one, ABCD illuminated by light from the right collimator, T′, and the upper and lower ones, ACF and BDG, by light from the left collimator, T. The fields meet in the sharp edges of the silver strip. A match in intensity is secured by altering the width of the slit T′, which is controlled by an accurately turned screw carrying a graduated drum so that the width of T′ can be altered at will by a known amount and thus the total amount of light passing through this collimator can be changed as desired. The intensities of two beams will be inversely proportional to the slit-widths required for a match between them and the light coming through the fixed slit T. (This simple relation is not quite true; the deviations from it are treated in the articles cited below.) The amount of light coming through the collimator with the fixed slit may be altered without changing the width of the slit by means of a rotating disk mounted directly in front of the fixed slit, so as to cut off the light during a certain fraction of each revolution. This device greatly increases the range of the instrument.

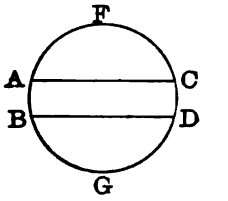

FIG. 3. FIELD VIEW OF SPECTRO-PHOTOMETER.

By turning the telescope R through a small angle the various colors of the spectrum may be brought into the field of view in succession, and the relative intensities of the two sources for each color determined.

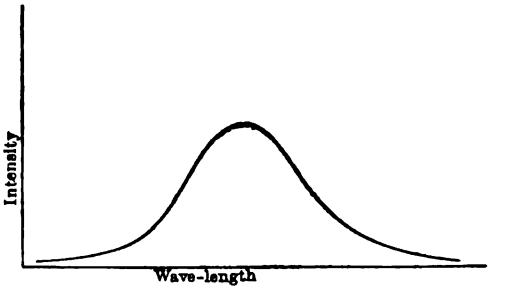

FIG. 4. INTENSITY CURVE, INCANDESCENT BODY GENERALIZED.

According to the measurements of Fraunhofer, Koenig, Brodhun, and others, the distribution of intensity in the spectrum of the sun and other incandescent bodies corresponds roughly to the

curve in the accompanying diagram, Fig. 4. A comparison of the intensity-distribution in the spectra of the electric incandescent and arc lights with that of the sun gives the following results, calling unity the relative intensity of each with respect to the sun for sodium light (D line):

WAVE-LENGTH	Inc. / sun	Arc / sun
800 μμ	11.86	1.67
Line A	4.88	1.37
" B	2.68	1.28
" C	1.25	0.97
" D	1.00	1.00
" E	0.38	0.77
" F	0.17	0.56
" G	0.10	0.83
" H	0.05	1.21

The reflecting power of a polished plane surface or the absorbing power of a thin film or plate of an absorbing medium can be determined for various colors by means of a spectro-photometer, by placing the mirror or the thin film in front of the adjustable slit T′, and comparing the intensity of the light after reflection or transmission with the intensity of the light coming directly to the other collimator of the photometer. For example, a polished silver surface reflects 95 per cent. of the red light falling on it normally, while for the blue only 60 per cent. is reflected. A mirror of solid cyanine reflects 15 per cent. of the orange, 2 per cent. of the green, and 6 per cent. of the violet.

BIBLIOGRAPHY. The methods of observation and of calibration, and the sources of error are fully treated in the following articles: Lummer und Brodhun, *Zeitschrift für Instrumentenkunde*, 1889, p. 42, and 1892, p. 137 (Berlin); Murphy, *Astro-Physical Journal*, 1897, p. 1 (Chicago); Brace, *Philosophical Magazine*, 1899, p. 420 (London), and *Astro-Physical Journal*, 1900, p. 6 (Chicago); Capps, *Astro-Physical Journal*, 1900, p. 25 (Chicago); Tuckermann, *Astro-Physical Journal*, 1902, p. 145 (Chicago).

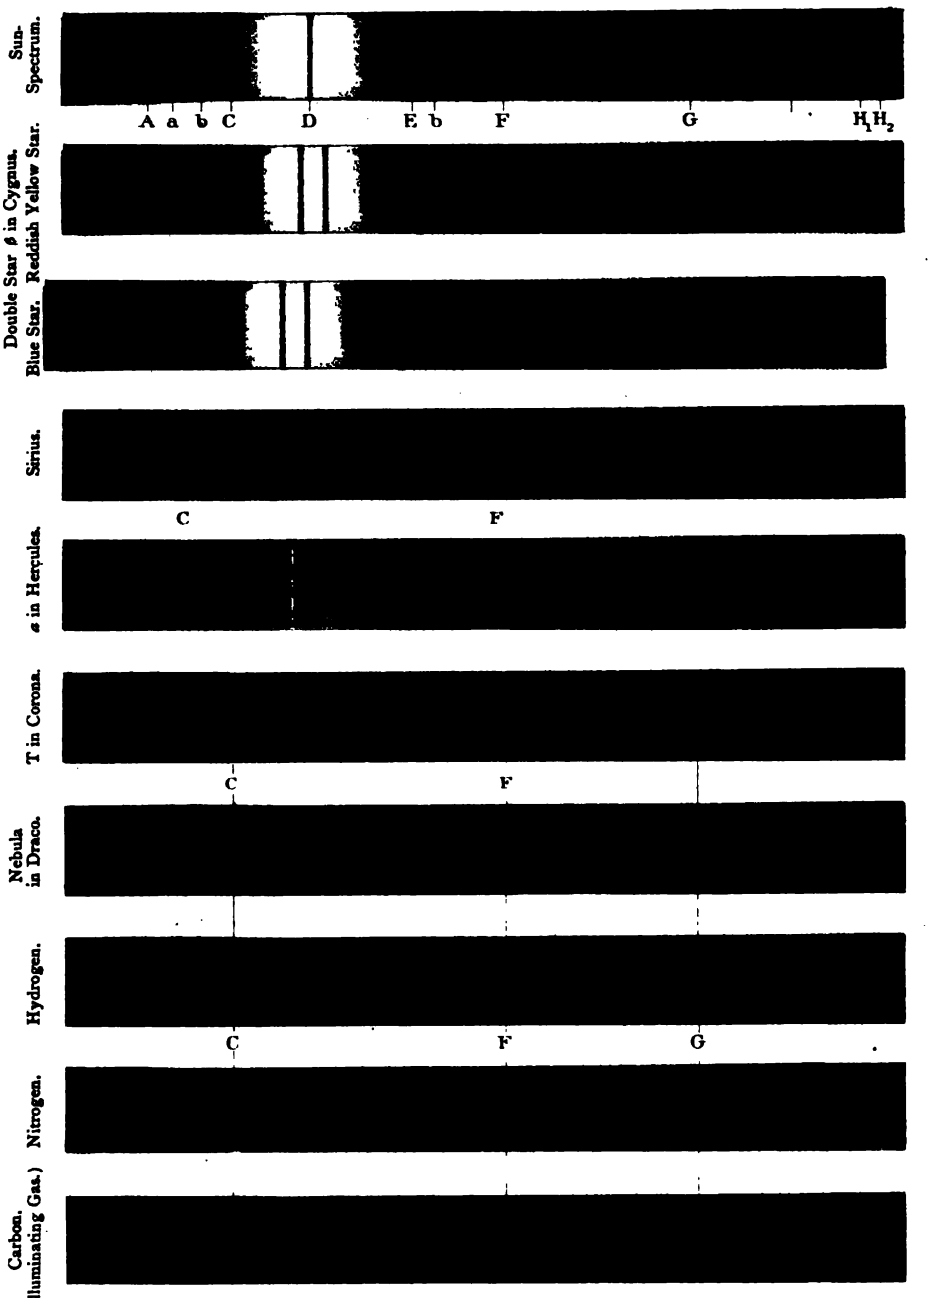
SPECTROSCOPE (from Lat. *spectrum*, appearance, image, apparition + Gk. *σκοπεῖν*, *skopein*, to view). An instrument designed to investigate the nature of the radiations emitted by various sources of 'light,' it being understood that this term includes *all* waves in the ether, although only those within certain narrow limits of wave-length affect the sense of sight. It is shown in the article on SPECTROSCOPY that radiations are being sent off in the ether from all natural bodies, and that these are in the form of waves of different wave-length. When these waves pass through a spectroscope they are dispersed in such a way that the waves of certain wave-length are brought to focus at a point different from that to which waves of a different wave-length are brought. In this way the radiations from any source are analyzed and spread out in what is called a 'spectrum.' The essential features of a spectroscope are then: first, a slit, or extremely small source of radiation; second, some means of producing dispersion: third, a lens or other means of focusing the radiations at the eyepiece of a telescope, upon a screen, or upon some suitable recording instrument. If the radiations are of such a nature as to affect a photographic plate, that is, if they are in the ultra-violet or in the visible portion of the spectrum, methods of photography may be used in connection with the spectroscope. (See SPECTROGRAPH.) If the radiations are in the infra-red, that is, if the wave-lengths are so long that they do not affect the sense of sight, instruments must be used which are sensitive to such radiations; for instance, a thermometer, bolometer, radio-micrometer, radiometer, or other heat-registering device. It has been found that if a plate of glass covered with some phosphorescent substance, such as Balmain's paint, is exposed to light and then carried into a darkened room, it will continue to be luminous for some time; but, if exposed in a spectroscope to infra-red radiations, the phosphorescence at those points reached by the radiations is destroyed. This furnishes a method, therefore, for the study of these long waves.

As ordinarily constructed, a spectroscope has the same general appearance as a spectrometer (q.v.). There is, however, in addition, in case prisms are used to produce dispersion, some auxiliary apparatus for the purpose of enabling the observer to record numerically the positions occupied by the waves which he is observing, in comparison with other waves. One method which is in common use is to attach to the instrument a tube containing at one end a transparent scale, and at its other end a lens, the tube itself being so placed that when the scale is illuminated by a lamp the waves proceeding from it fall upon the last face of the last prism and are *reflected* in such a manner as to be brought to focus in the same plane as are the radiations under investigation. By this means there is produced across the spectrum a series of lines regularly spaced and numbered, and the position of any radiation can be recorded.

Various means are used to produce dispersion, but the two methods most generally adopted are (1) to interpose a prism or train of prisms between the collimator and telescope, or (2) to allow the light from the collimator to fall upon a diffraction grating (q.v.). The dispersing action of a prism and of a grating has been explained before (see DIFFRACTION AND DIFFRACTION GRATINGS); but there are several important differences between the spectra obtained by these two instruments. Prismatic spectra are said to be 'irrational' because there is no simple relation between the material and shape of the prism and the dispersion produced by it; and, further, because prisms of the same shape and size produce quite different spectra, in the sense that the relative deviations of the same waves differ widely when different prisms are used. See DISPERSION.

The spectra produced by plane gratings, on the other hand, obey a definite law, there being an extremely simple relation between the constants of the grating and the deviation of a given train of waves, which is independent of the material of the grating, and which enables one by simple means to measure the wave-length of the radiations being studied. If a concave grating is used in place of a plane one, as was first done by Rowland in 1882, it is not necessary to have lenses in the spectroscope, the essential parts of the instrument then being simply a slit, a grating, and some receiving apparatus, such as a photographic plate. There is a further advantage in the use of a concave grating (which may also be obtained with a plane grating if suitably ad-

justed) if this instrument is used in the standard manner, in the fact that the spectra produced are of such a kind that the distances along the photographic plate are proportional to differences in wave-length of the waves which are thus recorded. A spectrum of this kind is said to be 'normal.'



SPECTROSCOPY. The science which deals with the methods of production of the spectra by various sources of light (or of waves in the ether) and with their study and interpretation. Newton, in 1672, was the first to observe that if sunlight entering a darkened room through a small opening were allowed to fall upon a prism a spectrum was produced, owing to the fact that waves characteristic of different colors suffer different deviations by the prism, and that, therefore, the components of white light were separated. (See DISPERSION.) Newton made no observations except upon the visible portions of the spectrum; but in the year 1800 F. W. Herschel observed that the spectrum continued beyond the red, as was shown by holding a thermometer in that position; and in 1801 J. W. Ritter proved the existence of the ultra-violet light by showing that silver chloride was affected not alone by the violet portion of the spectrum, but beyond. In 1802 Wollaston made the discovery that the solar spectrum was not continuous, but was interrupted by certain dark lines, using in his experiments a slit and a prism with its edge parallel to the slit. It is remarkable that Newton did not make this same discovery in his investigation on the spectrum of the sun, because he also at times used a slit in the same manner as did Wollaston. The most important investigation, however, on the solar spectrum, one which in fact serves as the foundation of the science of spectroscopy, was that of Fraunhofer beginning in the year 1814. Fraunhofer (q.v.) was the inventor of the diffraction grating (q.v.), and was the first to measure accurately the wave-lengths of light waves. By using both grating and prism spectroscopes he showed that there were numerous dark lines in the solar spectrum, to the strongest of which he gave certain names in the form of letters, A, B, C, etc. He studied, further, the radiations from certain of the stars and from certain sources of light such as flames, etc. He made the important observation that the position occupied in the solar spectrum by the dark D lines is identical with that occupied by the bright yellow line observed in the spectra of all flames. His whole work was epoch-making.

Herschel was the first to investigate the absorption spectra produced by various bodies, that is, to study the effect of interposing between the source of light and the spectroscope a substance which absorbs certain radiations. The next great step was made by Kirchhoff, who showed from theoretical considerations that the emission spectrum and absorption spectrum of a substance should be the same at a definite temperature, and that as the temperature changed the intensity of the spectra would vary. In this way Kirchhoff was able to explain the dark lines in the solar spectrum as due to an absorbing layer of metallic vapors forming an atmosphere around the white-hot central portion of the sun, which was supposed to emit a continuous spectrum. In collaboration with Bunsen he then undertook a careful study of the spectra of various substances and founded the science of spectrum analysis. The explanation of the fact that absorption spectra and emission spectra are identical was first given by Stokes many years before Kirchhoff's statement, and Balfour Stewart had also arrived at the same idea. From the day of Kirchhoff up to the present time all branches of spectroscopy have been pursued most vigorously, the most important discovery being the principle of the concave grating, made by Rowland in the year 1882, which is discussed under SPECTROSCOPE, and under DIFFRACTION AND DIFFRACTION GRATINGS.

There are many methods of making vapors luminous, among which it may be sufficient to name the flame, the electric arc, the electric spark. The spectra produced in these various ways have received the names of flame spectra, arc spectra, etc. The standard method of producing flame spectra is to hold a portion of the substance to be investigated or a salt of the substance in the Bunsen flame until it is vaporized, and thus the vapor is raised to the temperature of the flame, and in general becomes luminous. Other flames than that of the Bunsen burner may be used. Extremely minute amounts of the substance may be recognized in this way, as has been shown by Kirchhoff and Bunsen. They state that one fourteen-millionth of a milligram of sodium can be recognized in the Bunsen flame; one sixty-thousandth of lithium; one fifty-thousandth of a milligram of calcium, etc. To produce arc spectra it is customary to bore out a small opening in a carbon rod, fill this with some salt of the substance to be investigated, and then use it as the positive pole in the ordinary electric arc. By this means a high temperature is produced, namely about 4000° Centigrade, and the vapor of the substance is made luminous. To produce the spark spectrum numberless methods are in use. Among these it may be sufficient to mention two. If the electric spark produced by an induction coil or transformer is made to pass between solid electrodes made up of the substance to be studied, they will be vaporized and the vapor will be luminous. If a gas, for instance nitrogen or hydrogen, be inclosed in a glass bulb into which enter two metal wires to serve as electrodes, and if the pressure be made sufficiently low, a spark can be made to pass through the remaining gas. Changes in the pressure, in the electrical constants of the circuit, etc., produce alterations in the spectra. The main distinction between the flame spectra and arc spectra is one of temperature, but so little is known in regard to the mechanism of a spark that no conclusions can be drawn with certainty. Beyond a doubt the spectra produced in the arc are due in the main to the high temperature of the arc, whereas the cause of the production of spectra in the spark is probably not a temperature effect at all, but something concerned with the transformation of electric energy.

The means of producing spectra are discussed under the head of SPECTROSCOPE (q.v.). Prisms or gratings are used for this purpose. The accepted method at present for measuring wave-lengths in the spectrum of any substance is to photograph on the same plate with these lines the spectrum of some substance whose lines are known and then to obtain the desired quantities by a method of interpolation. The spectrum of iron is as a rule used to give the comparison lines.

SPECTRUM

SPECTRA OF THE FIXED STARS AND NEBULAE COMPARED WITH THE SUN-SPECTRUM AND OTHER SPECTRA

It has been found as a result of careful observation that, with one or two doubtful exceptions, the spectrum of a solid or liquid is always continuous; and within recent years attempts have been made successfully to express in mathematical form the connection between the temperature of the solid and the distribution of energy in its spectrum as a function of its wave-length. These laws have been deduced theoretically and verified by experiment. It has been found further that the spectrum of a gas when rendered luminous is in all cases discontinuous, although occasionally there is a faint continuous background. This fact in regard to gaseous spectra is what would be expected from the kinetic theory. The exact origin of the spectrum is in general inside the atom; but the connection between the parts of the atom and the ether in which waves are produced is not known. The spectra of compounds when rendered luminous at a temperature not sufficient to decompose definitely the substance have been studied with care, and many interesting facts have been discovered. It has been shown that all gases will produce under varying conditions different spectra, but the reason for this is by no means clear. There are at least three different spectra of hydrogen, many of oxygen, many of argon, etc. The influence of pressure, of temperature, and of the electrical conditions is marked; and these subjects form at present one of the most important fields of research in spectroscopy.

The spectrum of a gas is modified if the source of light is either approaching or receding from the spectroscope, as, for instance, in the case of a star with a motion toward or away from the earth. It is owing to this fact that one is able, by a comparison of the spectra of certain stars with spectra produced here on the earth, to calculate the motion of the stars in the line of sight. See DOPPLER'S PRINCIPLE.

A careful comparison of the lines in the spectrum of any one gas or vapor, and of the spectra of different vapors, has led to the discovery of several simple mathematical laws connecting them. Thus the lines in the ordinary hydrogen spectrum have such wave-lengths that they can be expressed in a mathematical formula which is known as Balmer's law. This can be expressed as follows: $\lambda = h \frac{m^2}{m^2 - 4}$, where λ represents the wave-lengths, m has in succession the values 3, 4, 5, etc., and h is a constant whose value is approximately 3647.20.

A relation similar to this of Balmer's has been shown by Kayser and Runge to apply to most of the lines in the spectra of the alkalies and the alkaline earths. Another law has been found to express most accurately the distribution of the lines in the well-known bands which are produced by carbon, nitrogen, and other substances. Laws have been found also connecting the spectra produced by different substances, in those cases where these substances are related chemically.

In the year 1896 Zeeman discovered that a source of light if placed in a magnetic field and viewed either along the lines of force or at right angles to them had its spectrum changed by the resolution of its lines into several components. This fact has a most important bearing upon theories of matter and serves to prove that the vibrations in the ether are produced by the vibrations inside the atom of minute electrical charges which have been called electrons. A recent investigation of the Zeeman effect by Runge has shown that the components of these spectrum lines produced by the magnetic field also obey certain mathematical laws.

A most important branch of spectroscopy is the study of the solar spectrum as we observe it on the earth. A few of the absorption lines are due to the fact that the waves coming from the sun pass through the atmosphere of the earth, and, therefore, suffer absorption owing to the water vapor and oxygen in it. The 'rain band' is due to the presence of the former. The other lines are, as explained above, caused by the absorption in the atmosphere of the sun itself. The interior portion of the sun, which is at a high temperature, emits a continuous spectrum, but, owing to the presence in the atmosphere of the sun of metallic vapors at a temperature less than that of the interior, there is absorption, and thus the solar spectrum is a continuous one crossed by dark lines. There are radiations also coming to us from the outer portions of the sun, the so-called chromosphere and corona; but these are not easily observed, except at times of solar eclipses. Most of the solar lines can be identified with the spectra of known substances on the earth; for instance, sodium, iron, carbon, etc., are known to be in the sun. It may be stated in general that if the earth were raised to a temperature as high as that of the sun its spectrum as seen at a distance would be practically identical with that of the sun as we see it.

A careful study has been made of the spectra of the various stars, and attempts have been made with more or less success to group the stars in certain classes according to their spectra, the idea being that some knowledge might be obtained in regard to the evolution of the stars and their present stage in this progress. Consult Schuster, "The Evolution of Solar Stars," *Astrophysical Journal*, April, 1893.

The wave-lengths of a few of the important Fraunhofer lines in the solar spectrum, as measured by Professor Rowland, are as follows:

B	6870.186	$\times 10^{-8}$ Cm.	F	4861.527	$\times 10^{-8}$ Cm.
C	6563.054	"	G	4308.061	"
D_1	5896.357	"		4307.907	"
D_2	5890.186	"	H	3968.625	"
E_1	5270.495	"	K	3933.825	"
E_2	5269.723	"			

BIBLIOGRAPHY. There is a complete discussion of the methods, results, and theories of spectroscopy in Kayser, *Lehrbuch der Spektroskopie* (Leipzig, 1900). A briefer account is given in Landauer, *Spectrum Analysis* (New York, 1897). Fraunhofer's original papers are reprinted in *Prismatic and Diffraction Spectra, Scientific Memoir Series*, vol. ii. (New York, 1898); and those of Stewart and Kirchhoff in *Radiation and Absorption*, same series, vol. xv. (New York, 1901). Rowland papers *On Concave Gratings for Optical Purposes* (1883); *On the Relative Wave Lengths at the Lines of the Solar Spectrum* (1886); together with other papers contained in his collected physical papers (Baltimore, 1902), should be consulted by the student. More popular books dealing with spectroscopy are: Lockyer, *Contributions to Solar Physics* (London, 1874); id., *Chemistry of the Sun* (Lon-

don, 1877); Roscoe, *Spectrum Analysis* (London, 1866); Schellen, *Spectrum Analysis* (New York, 1872). See LIGHT.

SPECTRUM. See LIGHT; DISPERSION; SPECTROSCOPE; SPECTROSCOPY.

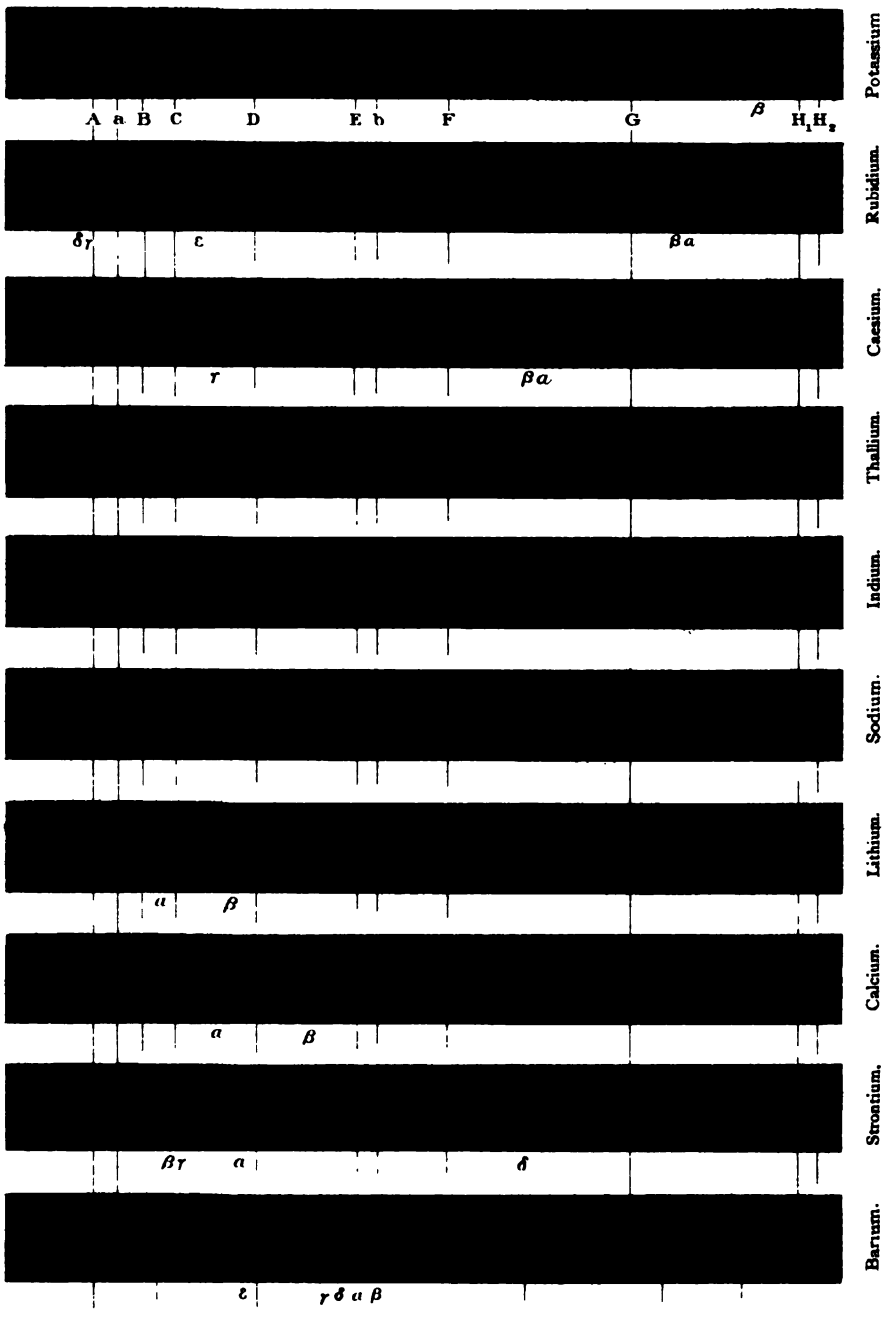
SPECTRUM ANALYSIS. As is explained in the article on SPECTROSCOPY, the spectrum of a definite substance under definite conditions is always the same. The spectrum of the radiations emitted by iron vapor, for instance, when rendered luminous, is characterized by certain definite trains of waves, or, as ordinarily expressed, by certain 'lines.' If the conditions under which the spectra are produced are varied, for instance, if for one case the spark was used, and in another the arc, there are differences in the spectra, consisting mainly in variations in the intensity of the lines. Further, if other substances are mixed with the iron, or if the iron exists as an impurity in some other substance, or if the pressure of the surrounding atmosphere is varied, there are corresponding alterations in the iron spectrum. But under definite conditions there are definite lines which are characteristic of iron. Extremely small traces of a substance may be thus made evident by the presence of its spectrum; and in a mixture of many substances the presence of the various parts may often be ascertained by a study of the spectrum emitted. This constitutes the science of spectrum analysis and has proved useful to the chemist in many cases. In fact the discovery of several elements, viz. cæsium, rubidium, and gallium, was due to the detection in certain spectra of lines which could not be ascribed to any known substances. The application of spectrum analysis to the study of the spectra of the sun, stars, and other heavenly bodies has proved most important, and some of the results of various observations and investigations are given in the article on SPECTROSCOPY (q.v.).

SPECULAR IRON ORE. See HEMATITE.

SPECULATION (Lat. *speculatio*, exploration, contemplation, from *speculari*, to view, watch, spy out, from *specula*, watch-tower, from *specere*, to see). Buying and selling of property chiefly with a view to securing a profit through changes in the price of that property. There is a speculative element in a great variety of business transactions; but the term is usually confined to those in which the element of risk is relatively important. In former times speculative activity was largely engaged in seeking to take advantage of differences in price in distant markets. Foreign trade 100 years ago was highly speculative. Improvements in transportation and in means of communication have reduced such differences to a matter of exact calculation. Speculative business has, therefore, come to be confined almost exclusively to transactions involving the time element.

In its simplest form time speculation involved the buying of property outright, and the holding of it in anticipation of a rise in price. This practice is as old as civilization, and until late times has usually been regarded as socially injurious. Toward the end of the seventeenth century the practice developed in Holland of buying and selling the products of fishing voyages before the results of the voyage were actually known. In the early part of the eighteenth century speculation in grain, coffee, etc., was very active in Amsterdam, developing many of the practices of modern exchanges. In all of these early forms of speculation, however, what was bought and sold was the right to a particular lot of goods.

With the development of warrants and the grading of goods speculation received a new impetus. It thus became possible for a man to sell goods which he did not possess, since he could at any time secure identical goods upon the market if he could pay the price. It is largely to this principle that the phenomenal development of speculation in recent years is due. For the extent of speculative dealings and the practices of modern exchanges, see STOCK EXCHANGE.



ECONOMIC FUNCTION OF SPECULATION. When the supply of any commodity is subject to great uncertainty, as, for example, the products of agriculture, it is manifestly to the advantage of society that it should be properly distributed through a period of considerable length. A class of individuals who study the conditions of demand and supply endeavoring to buy such commodities when they are abundant and cheap, in order to sell them when they are dear, serve to bring about such a distribution of consumption and thus render an important social service. Again, some commodities, such as iron, are subject to great fluctuations in demand, and hence in price, thus introducing a large element of uncertainty into all of those forms of industry which make extensive use of them. The speculator, by making contracts to deliver the article at a future date at a fixed price, frees the consumer from that uncertainty. Legitimate speculation thus serves as a means of insurance against certain classes of risks.

It may be, however, that the speculator is mistaken in his estimates of future supply and demand. In that case he exaggerates the evil which it is his function to minimize. Thus speculation may keep prices abnormally high for a period, only to render prices abnormally low for a succeeding period. Speculation may thus bring about a crisis (q.v.) with its attendant industrial stagnation.

A more serious evil results from the fact that speculation is carried on not only by those who are conversant with market conditions, but by a large class of individuals who engage in it without the proper equipment of technical knowledge. Unscrupulous operators, through false reports, or through their own apparent eagerness to buy or sell, often lead such unsophisticated speculators to their financial ruin. Such influences tend to increase business uncertainty, and hence diminish considerably the net social gain from speculation.

Popular sentiment in England and America has generally been hostile to speculation, and laws have frequently been passed to prevent it. An act of Parliament was passed in 1733, "To prevent the infamous practice of stock-jobbing." The act had no effect and was repealed in 1860. In America an act was passed in 1864 to prevent speculation in gold, but its operation was so unsatisfactory that it was repealed in two weeks. In several of the States laws have been enacted aiming to prohibit speculation in one form or another. These have proved quite ineffective. Bills were introduced in the Fifty-first, Fifty-second, and Fifty-third Congresses

SPECTRUM

SPECTRA OF THE METALS OF THE ALKALIES AND ALKALINE EARTHS.

which were designed to prevent certain forms of speculation in grain, but did not become law.

Consult: Emery, *Speculation on the Stock and Produce Exchanges of the United States* (New York, 1896); Hadley, *Economics*, chapter "Speculation" (ib., 1898). See also general treatises on political economy (q.v. for references).

SPEDDING, James (1808-81). An editor of Bacon's works. He was born in Cumberland, England. From the grammar school at Bury Saint Edmunds he passed to Trinity College, Cambridge, where he graduated in 1831. Leaving Cambridge in 1835, he entered the Colonial Office. This position he gave up in 1841 that he might devote himself to the study of Bacon. For 30 years he continued his researches with slight interruptions. He died from an accident in London. Spedding's most delightful book is *Evenings with a Reviewer* (written in 1845, and privately printed; published 1881), in which with quiet humor Macaulay's essay on Bacon is torn into shreds. His *magnum opus* is an edition of Bacon's entire works with an exhaustive life (14 vols., 1857-74), in the preparation of which he was in some degree aided by Leslie Ellis and D. D. Heath. The biographical and historical parts of this work, much cut, were published under the title, *Account of the Life and Times of Bacon* (2 vols., 1878). Spedding also contributed articles to J. Gairdner's *Studies in English History* (1881) and wrote several other admirable historical papers. Consult the memoir of G. S. Venables prefixed to *Evenings with a Reviewer* (London, 1881); Edward Fitzgerald's *Letters* (ib., 1889); and Hallam Lord Tennyson's *Memoir of his father* (London and New York, 1897).

SPEECH (*AS. spæc, spēc, spræc, sprēc*, OHG. *sprâhha*, Ger. *Sprache*, speech, from AS. *specan, sprecan*, OHG, *sprehhan*, Ger. *sprechen*, to speak; possibly connected with Skt. *sphūrj*, to murmur). The act of producing vocal sound for the communication of ideas. Speech differs from voice in that the latter is rather the physiological potentiality and mechanical process, and from vocal language, which is the result produced by speech. Speech is, so far as known, like vocal language, peculiar to man, although attempts have been made to assign it also to monkeys and apes, while gesture language (q.v.) is shared by man with other animals. In a looser sense speech is synonymous with language. See Language; Voice.

SPEECH, Defects of. See Aphasia; Deaf Mute.

SPEED, James (1812-87). An American politician, born near Louisville, in Jefferson County, Ky. He graduated at Saint Joseph's College (Bardstown), was in the office of the clerk of the Circuit and County Courts, and after further legal study at Transylvania University began practice at Louisville in 1833. In 1847 he was elected to the State Legislature, where he served one term. He was the most effective opponent of the disunion cause in Kentucky, was elected to the State Senate in 1861, and in 1861-64 was in charge of the Kentucky recruiting stations. In 1864 he was appointed Attorney-General of the United States by President Lincoln, but he resigned from the post in 1866 because of his opposition to the reconstruction policy of President Johnson. In 1856-58 and 1875-79 he held a chair in the law department of the University of Louisville. His reputation as a jurist was considerable.

SPEED, John (c.1552-1629). An historical antiquary, the son of a London tailor. Through the generosity of Lord Brooke, he was able to give up manual labor and devote himself to study. Between 1600 and 1610 he published 54 maps of England and Wales, which were collected and described under the title of *Theatre of the Empire of Great Britaine* (1611). He next published the great work on which he had been engaged for many years: *The History of Great Britaine*, from the invasion of Julius Cæsar to King James I. (1611). This is regarded as the best history up to that time written by an Englishman. He also published *Genealogies Recorded in Sacred Scripture* (about 1611), of which 33 editions appeared in the course of 30 years, some of them being attached to issues of the Bible, and *A Cloud of Witnesses Confirming the Holie Word* (1616).

SPEEDWELL (*Veronica*). A genus of about 200 annual and perennial herbs and shrubs of the natural order Scrophulariaceæ, natives of temperate and cold climates. Some species grow in ditches and marshes, some only on the driest soils. They have generally very beautiful blue, white, or pink flowers, for which several species are cultivated. The bitter and astringent leaves of the common speedwell (*Veronica officinalis*), widely distributed in the Northern Hemisphere, are in some countries used medicinally and as a substitute for tea, as are those of the germander speedwell. *Veronica Virginica* is called Culver's physic in North America. Brooklime (q.v.) belongs to this genus.

SPEISS (Ger. *Speise*, amalgam, food, OHG. *spisa*, food, from OIt., ML. *spesa*, expense, cost, from OIt. *spendere*, from Lat. *expendere*, to expend, from *ex*, out + *pendere*, to weigh). A mixture of the antimonides, arsenides, and sulphides of copper, iron, and nickel, that collects at the bottom of a crucible when ores of arsenic, antimony, cobalt, or lead, containing sulphur, are smelted with fluxes. The speiss containing nickel, which is obtained largely in the preparation of smalt, is an important source of that metal.

SPEKE, spēk, John Hanning (1827-64). An English African explorer. He was born at Jordans, Somersetshire, entered the Indian army in 1844, served in the Punjab campaigns, and distinguished himself as a soldier, naturalist, and sportsman. While in the Indian service he made several trips into the Himalayas and even entered Tibet, bringing back valuable collections. He began his brilliant though brief career as an African explorer in 1854, when he accompanied Captain Burton into Somaliland. He was also Burton's companion on the expedition of 1857-59 from Zanzibar into the interior of Africa. In 1858 they discovered Lake Tanganyika, and in the same year, while Burton was ill at Kaze, Speke reached the Victoria Nyanza. He believed that he had found one of the sources of the Nile, but Burton discredited the information he brought back and Speke could not verify his discovery until 1862, when he returned to the lake with Capt. J. A. Grant, and, proceeding northward, came to the Nile, which he found to be the

outlet of the lake. Speke was killed by the accidental discharge of his gun. His books were *What Led to the Discovery of the Source of the Nile* (1864), and *Journal of the Discovery of the Source of the Nile* (2 vols., 1863). His companion, Grant, also described their journey in *A Walk Across Africa* (London, 1864).

SPELLING (from *spell*, ME. *spellen*, OF. *espeler*, to spell, OHG. *spellōn*, to declare, narrate, discourse, from OHG. *spel*, AS. *spel*, *spell*, Goth. *spill*, tale, narrative, history, tidings). The representation of words by combinations of alphabetic symbols; the practical application or use of an alphabet. In an alphabet that is accurately constructed and used there is one, and but one, symbol for each significant speech-sound, and but one speech-sound is represented by any given symbol. Under these conditions spelling is determined solely by the pronunciation ('sound') of the word to be spelled, that is, it is at once obvious when the pronunciation is known, and is accordingly marked by no irregularity or ambiguity. Such phonetically correct and simple orthography requires no special consideration apart from the alphabet employed. (See ALPHABET; PHONETICS; and SPELLING REFORM.) Outside of the writings of phoneticians, however, spelling of this degree of precision does not exist, though in certain languages there is a fairly close approximation to it. In customary spelling, in brief, each of the above-stated principles is, to a greater or less extent, violated, viz. there is alphabetic inadequacy, or the lack of symbols to represent certain important speech-sounds; redundancy, or the use of two or more symbols or combinations of symbols to represent the same sound; and the use of the same symbol or combination to represent two or more sounds. In other words, alphabetic writing as actually practiced is more or less ambiguous, irregular, and arbitrary. This divergence of customary spelling from the true alphabetic method has resulted, historically, in part, from defects inherent in the alphabets themselves (inadequacy and redundancy); but principally from continuous change in the sounds of the languages to which they have been applied. Since in every language pronunciation varies from age to age and from locality to locality, the phonetic character which every alphabet has originally possessed —or, more precisely, its phonetic use in spelling— could be maintained only by continuous adaptation to these alterations of the uttered words.

As a matter of fact changes of this sort in spelling have taken place in all alphabetically written languages, and in living European languages in particular (which alone are considered here) they have occurred abundantly, especially prior to the invention of printing; but except in some modern instances they have been effected under conditions unfavorable to phonetic precision, and so, in many cases, instead of producing greater accuracy, have often resulted in increased confusion. At best they have been inadequate to prevent spelling from becoming more and more faulty, from the phonetic point of view, as the alteration of pronunciation has advanced. Ambiguities and irregularities multiplied, new and complex associations between sounds and symbols were formed, and it became increasingly difficult to infer the pronunciation of a word from its written form. Moreover, this natural tendency toward phonetic corruption was intensified by a cause to which most of the defects of modern spelling may be attributed, namely, the establishment of a 'standard,' relatively unchangeable orthography, due principally to the introduction of the printing press. The beginnings of such an inflexible system existed earlier, wherever certain spellings were recognized as customary and then as 'correct' from the literary point of view (regardless of their phonetic value), and the feeling that the unity of the written and spoken words should be preserved was, accordingly, weakened; but its chief sources were the practical need of uniformity in spelling, which was quickly felt and (with much blundering) supplied in the printing office, and the influence of printed books. From this fixation of orthography it resulted not only that practically all the existing faults of the spelling found by the printer (together with those which he himself added) were rendered permanent, but also that even the imperfect earlier tendency to respond to phonetic change was almost wholly suppressed. Pronunciation has continued to change, often radically, but spelling has lagged behind. In certain languages notable divergence of the written from the spoken language has thus been effected, while others, like Italian, have been more fortunate in having had a relatively rational system of spelling to start with, or having undergone less extraneous disturbance, or having been able to adhere more closely or revert more frequently to the phonetic method.

These facts are well illustrated by English spelling, which in its existing standard form presents an extreme case of phonetic corruption or dealphabetization. The earliest English (Anglo-Saxon) spelling was almost purely phonetic, that is, the scribes sought to indicate the actual sounds of the words they wrote, using— with a high degree of precision—for this purpose the Roman alphabet (with certain modifications) and giving to its letters the values assigned to them in the pronunciation of Latin, with which they were familiar. But as the sounds gradually changed, confusion, due largely to imperfect adaptation (see above), slowly set in; certain symbols were not accurately distinguished, or were employed with different values in different combinations; the significance of some was irregularly altered and new ones were introduced; others were lost; and the accentual marks over the long vowels used in Anglo-Saxon disappeared, increasing the difficulty in distinguishing the long from the short vowels—a defect which has never been remedied except (in part) by non-alphabetic devices. But the most important irregularities were due to the influence of Norman, and later of literary (Parisian) French, under which, in the thirteenth and fourteenth centuries, English was practically respelled in accordance with Anglo-French methods. Notwithstanding this and other sources of confusion, however, English spelling remained for a considerable period in a notable degree phonetic. The change effected by the invention of printing has been indicated above; but it should be added that the printer's choice of spellings not only was not guided by any principles, but was often determined by ignorance, English having suffered, in this particular, more than any other language. Alteration in response

to phonetic change was not, indeed, wholly stopped—for it has continued in some measure until the present day—but it was made more and more difficult, and from the sixteenth century the power of effecting any substantial phonetic improvement of English spelling has been lost. Notwithstanding many later modifications of details (there are still over 3000 words whose orthography is unsettled), the development of English orthography ends with that period, the subsequent life of the spoken language being practically unrepresented in it. In this direction—that of sound—the alteration has been great, but we still retain what is essentially the Elizabethan spelling, in total disregard of the fact that the pronunciation which it embodies has very largely disappeared.

Another important source of confusion in English spelling, closely associated with this process of fixation, must also be mentioned. Under the influence of the revival of learning, which brought words of classical origin into special prominence, the idea was developed that (regardless of their pronunciation) such words should be made to conform in spelling as exactly as possible to the Latin and Greek terms from which they were ultimately derived. This etymological theory of spelling gained strength, both from the weakness of the contemporary feeling for phonetic accuracy and from the practical difficulty found by the printer, in his quest of uniformity, in making a selection among existing forms, which offered a wide opportunity for the activity of pedants; and from the sixteenth century until the present time it has kept its hold upon our orthography. There was much tinkering, not only with words directly borrowed from the classical tongues, but also with words of Romance origin, while the native English and Scandinavian elements of the language were but little interfered with. A result was the introduction of many forms erroneous from both the phonetic and the true philological points of view; for apart from the indefensibility of this use of spelling as a means of rendering derivation obvious to the eye the method was dangerous in the hands of men whose knowledge of the history of the language was necessarily inadequate. A familiar example is the present English *debt* (from Early Modern English and Middle English *det, dette*, from Old French *dette*), in which the *b* was etymologically inserted both in French (though later abandoned) and in English to make the spelling more directly suggest the original Latin *debita*, though it has never been pronounced. On the other hand, this process in some cases actually corrupted pronunciation. For example, the *l* in *fault* (Middle English and Old French *faute*), which was inserted in the same way, to suggest the Latin *fallere*, has actually come to be pronounced, though the correct pronunciation (in this particular) survived as late as the time of Pope, who makes the word rhyme with *ought, thought*, and *taught*. Of pure etymological blunders, again, an instance is the *s* in *island*, which was inserted to indicate derivation from the Latin *insula* and connection with English *isle* (also corrupted from *ile*), to neither of which it is at all related. The corruptions of this kind form a long and instructive list.

The results of the above-indicated history, embodied in modern English orthography, are briefly as follows:

(1) While all of the other principal European alphabets have retained with comparatively small variations the Roman or 'Continental' values of the letters, that of English has to a very large extent abandoned them. This is especially true of the 'long' vowels—at least of their common or name-giving values: Thus, approximately, 'long *a*' (say) = Cont. *é;* 'long *e*' (mete) = Cont. *i;* 'long *i*' (isle) = Cont. diphthong *ai;* 'long *o*' = Cont. *ó;* 'long *u*' (duty) = Cont. diphthong *iu*. Great confusion thus exists in the vowel-nomenclature, as well as an unfortunate divergence from the common usage of those languages which are most closely connected with English, both historically and practically. The quantity of vowels, also, as was noted above, is not (as in oldest English) distinguished by any alphabetic means, while the various orthographic devices employed for the purpose (doubling of consonants, etc.) are clumsy and are not used with uniformity.

(2) The letters of the alphabet are used with a great diversity of sound-values: Thus, of the vowels, accented and unaccented, *a* has 9 (as in *name*, *bare*, *man*, *father*, *water*, *want*, *ask*, *village*, *data*), *e* 9 (*be*, *here*, *there*, *acme*, *met*, *alert*, *English*, *sergeant*, *prudent*); *i*, 8; *o*, 10; *u*, 9; *y*, 3—48 in all; of the consonants, *b*, 2 (counting the silent ones); *c*, 6; *d*, 4; *f*, 3; *g*, 4; *h*, 3; *j*, 5; *k*, 2; *l*, 3; *m*, 3; *n*, 3; *p*, 2; *q*, 3; *r*, 2; *s*, 5; *t*, 5; *v*, 2; *w*, 2; *x*, 5; *y*, 2; *z*, 4—70 in all. To a certain extent this multiplication of values is due to the inadequacy of the alphabet, which has but 26 symbols to represent the 40 elementary sounds of cultivated English speech (44 with the diphthongs), but it is far in excess of what is necessary and results in manifold ambiguities.

(3) The various English speech-sounds are written with an even greater variety of symbols and combinations of symbols. These sounds, which comprise 16 vowels and 24 consonants (with 4 diphthongs), are represented in the standard phonetic alphabet, adopted by the American Philological Association, as follows (the sound being that of the corresponding letter in the word placed within the parenthesis): i (*it*), e (*met*), a (*at*), ɑ (*ask*), e (*not*), o (*obey*), ʊ (*but*), u (*full*), I (*pique*), ē (*they*), ā (*air*), ä (*arm*), ē (*nor*), ō (*no*), ū (*burn*), ū (*rule*), p (*pet*), t (*tip*), ch (*chest*), c or k (*come*), f (*fat*), th (*thin*), s (*sown*), sh (*she*), h (*he*), b (*bet*). d (*dip*), j (*jest*), g (*gum*), v (*vat*), dh (*thee*), z (*zone*), zh (*azure*), w (*wit*), l (*lo, ell*), r (*rat, are*), y (*ye, year*), m (*me*), n (*no*), ng (*sing*): diphthongs, ɑi (*aisle*, isle), ɑu (*out*, hour), ei (*oil*, boy), iu (*feud*, jew). The ways in which these sounds are represented in the customary spelling are too numerous to be here given and illustrated in full, but the orthographic situation will be understood from the following examples: i (*it*), accented or unaccented, is represented by i, y, e, o, u, ie, ee, ui, ai, hi, ive, eo, a, ia, ei, ey, ea, eig ('), ehea, ewi, ois, uy, oi, igh, ay, ieu, as in the following words: fit, hymn, pretty, women, busy, sieve, breeches, build, Saint John (sin'jun), exhibit, fivepence (fip'ens), Theobald (tib'ald), carriage, forfeit, donkey, guinea, sovereign, James's forehead, housewife (hus'if), chamois, plaguy, Jervois (jer'vis), Denbigh, Rothesay (roth'si), Beaulieu (bew'li). E (met) = e, ea,

a, u, ai, ei, ie, eo, ue, ay, œ, ave, as in *get, head, many, bury, said, heifer, friend, leopard, guess, says, fœtid*, Aber*gavenny* (abergen'i). O (*no*) = o, o-e, oa, ow, ou, owe, oe, oo, ew, ewe, ough, oh, eau, eo, au, os, aut, ock, as in holy, *vote, road, boul, soul, rowed, woe, brooch* (brōch), *sew, sewed, though, oh, beau, yeoman, hauteur*, apro*pos*, *hautboy*, Co*ck*burn (kō'bn). C (*come*) = c, k, q, ck, ch, cc, cq, qu, que, lk, gh, sc, x, ke, lke, quh, cch, as in *call, kill, quell, back, ache*, account, acquaint, liquor, bar*que, walk*, hou*gh*, viscount, except, Bur*ke*, Fol*kes*tone, Ur*quh*art, Bac*ch*anal. T (*tip*) = t, tt, ed, th, tw, bt, ct, pt, cht, phth, te, tte, as in *ten, better, stopped, thyme, two, debt, indict, receipt, yacht, phthisis, caste, gazette*. In brief, the 44 (with the diphthongs) English sounds are represented by upward of 500 symbols and combinations. From this it results that an English word can, theoretically, be written in a great variety of forms.

The confusion of English spelling, however, while great, is not so complete as might be expected from its above-stated theoretical defects; it exhibits a certain amount of system and it is possible also to demonstrate in it a very considerable phonetic element. Apart from the inadequacy of the alphabet, its chief practical defects are the ambiguities in the use of *c* and *k* (*cat, kill*), *c* and *s* (*cinder, seat*), *f* and *ph* (*fool, philosopher*), *t* and *d* or *ed* (*dropped*, kept), *ch* and *k* (*cholera, keep*), and the employment of silent letters, that is, letters which if omitted would leave the symbol (see above) a simpler and, generally a more common (though not necessarily more phonetically correct) one for the same sound (as in *feather, jeopardy, parliament, pedagogue, guard, add, feign, ghost, though, thorough*, scythe, etc.).

SPELLING REFORM. The modification of customary spelling in such a way as to remove, or at least lessen, the divergence of orthography from pronunciation. (For the origin, character, and practical results of this divergence, particularly in English, see SPELLING.) Complete reform of this sort involves: (1) The elimination of superfluous letters (e.g. in English, of two of the equivalent letters *c* (hard), *k*, and *q*); (2) the enlargement of the alphabet by the addition of enough symbols (letters or digraphs) to represent all the significant speech-sounds of the language (in English there are 40 elementary sounds and but 26 letters); (3) the use of each letter or symbol to represent but one sound; and (4), in English the use of the letters of the alphabet with their Roman values. Among such (proposed) remodelings of the English alphabet the most practical is that adopted by the American Philological Association and given above in the article on SPELLING. If the above-stated conditions were fulfilled, orthography and pronunciation would be in harmony—that is, spelling would be essentially phonetic. While, however, such completeness is the aim of the modern spelling reformer, it has hitherto remained—and is likely long to remain—merely an ideal. The customary spelling is so firmly connected with the habits, the practical interests, and the æsthetic (literary) sentiments of its users that such thoroughgoing reform of it is impracticable, changes in the alphabet especially being very hard to introduce. The practical efforts of the reformers are accordingly now directed almost exclusively toward the simplification of spelling by the removal of irregularities which can be eliminated without radically changing the forms of words, and by the omission of silent letters which are phonetically useless (that is, do not determine the value of another letter, as does the silent *e* of English hat*e*). Changes of this sort have occurred sporadically at every period in every European language; the spelling reformer attempts merely to make this familiar process more general and systematic. Rules for such simplification were adopted in 1883 by the American Philological Association and the British Philological Society, and in 1886 a list of amended spellings, based upon them, was adopted by the Philological Association and published in its *Transactions*. It has since been republished in (and approved by) the leading American dictionaries. While simplification of this sort would not, alone, produce phonetic accuracy, it would greatly enhance the phonetic character, uniformity, and simplicity of English spelling. Up to the present time, however, spelling reform, even in this restricted sense, though persistently urged by special associations and by persons of high scientific and literary authority, has made but little headway. Certain of the recommendations of the philological societies have been put into practice by a few individuals and journals, and by some scientific societies, but no general tendency to adopt them has been evident. Perhaps the most important step in this direction was the adoption by the American National Education Association in 1898 of the twelve simplified spellings: Program, tho, altho, thoro, thorofare, thru, thruout, catalog, prolog, decalog, demagog, pedagog.

In France, where the peculiarities of orthography give spelling reform a practical importance second only to that which it has in English-speaking countries, much interest in this subject has long existed, but little has been accomplished, the French being in matters of orthography almost as conservative as the English. The reform has also been active in Germany, and something has been done there, particularly in the omission of silent letters (*tat* for *that*, etc.). Spanish and Italian spelling are so simple and so largely phonetic that the practical reasons for reform have relatively little application to them.

SPEL'MAN, Sir HENRY (c.1564-1641). An English antiquary and philologist. He was born at Congham, Norfolk, and was educated at Cambridge and in law at Lincoln's Inn. He became High Sheriff of Norfolk, and was employed on various public missions by King James. In 1612 he removed to London, where he began to devote himself to the investigation of ancient law and custom with a view to establishing their relation to the English Constitution. In prosecuting this work he encountered so many strange and obsolete words that he turned aside to compile a glossary of law terms the first part of which, to the end of the letter L, he published in 1626, at his own expense. The second volume appeared in 1664 edited by Sir William Dugdale. He also compiled a collection of decrees of English Church councils from 1066 to 1531. He is best known in modern times by this and his curious *History and Fate of Sacrilege* (1693; new ed., London, 1846, 1853).

SPELT (AS. *spelt*, from Lat. *spelta*, spelt). A species of wheat (*Triticum Spelta*), characterized by grains held tightly within the chaff and not hulled out in threshing. It is grown chiefly where wheat fails on the poorer soils of the mountainous regions of Germany, Italy, Spain, and France, and is mainly employed as a stock food. It is little grown in America. The grain commonly called spelt in the United States and Russia is emmer (*Triticum dicoccum*), which has a much shorter and more compact head than spelt, and is much hardier as regards cold, drought, and rust resistance. Both spelt and emmer are grown and harvested like wheat.

SPENCE, HENRY DONALD MAURICE (1836—). An English clergyman and theological writer, born in London. He was educated at Westminster School and Cambridge University; took orders in the Church of England; held various important charges; and in 1886 became Dean of Gloucester. Among his numerous published works are: *Cloister Life in the Days of Cœur de Lion* (1892); *The Church of England; a History for the People* (4 vols., 1897-99); *The White Robe of Churches of the XI. Century* (1900); and *Early Christianity and Paganism* (1902).

SPENCE, JOSEPH (1699-1768). An English anecdotist, born at Kingsclere, in Hampshire. He was sent to Eton and Winchester, whence he passed to Oxford. Elected fellow of New College in 1720, he took orders in 1724. *An Essay on Pope's Odyssey* (1726) led to an intimate friendship with the poet, and to Spence's appointment as professor of poetry at Oxford (1727). He afterwards held the professorship of modern history and several ecclesiastical appointments. In 1749 he was presented by a former pupil with a small estate at Byfleet, in Surrey, where he amused himself with gardening. He was found dead in a canal in his garden. While associated with Pope he noted down the conversations of the poet and his friends. These most valuable anecdotes, after circulating in manuscript for the benefit of Warburton, Joseph Warton, Dr. Johnson, Malone, and other critics, were published in 1820. Among Spence's other works is the pleasant *Polymetis* (1747), dialogues on the Roman poets and artists. Consult the *Anecdotes*, edited from Spence's own manuscript, by S. W. Singer (London, 1820; reprint, 1859); *Selections*, edited by Underhill (Camelot Series, London, 1890); Dobson's essay on Spence in *Eighteenth Century Vignettes* (first series, New York, 1892).

SPEN'CER. The county-seat of Clay County, Iowa, 152 miles northwest of Des Moines; on the Little Sioux River, and on the Chicago, Milwaukee and Saint Paul and the Minneapolis and Saint Louis railroads (Map: Iowa, B 1). It has a public library and a fine court house. Spencer is known for its large hay interests. There are also some manufactures. The water-works and the electric light plant are owned by the municipality. Population, in 1890, 1813; in 1900, 3095.

SPENCER. A town, including several villages, in Worcester County, Mass., 12 miles west by south of Worcester; on the Boston and Albany Railroad (Map: Massachusetts, D 3). It has the Richard Sugden Library, with more than 11,000 volumes, and Spencer Public Park. Boots and shoes, wire, and woolen goods are manufactured. The government is administered by town meetings. The water works are owned and operated by the town. Population, in 1890, 8747; in 1900, 7627. Settled in 1720, Spencer formed a part of Leicester until 1753, when it was separately incorporated. Consult: Draper, *History of Spencer* (Worcester, 1860); Tower, *Historical Sketches Relating to Spencer, Massachusetts* (Spencer, 1901-02).

SPENCER, AMBROSE (1765-1848). An American jurist, born in Salisbury, Conn. He was educated at Yale and Harvard; was admitted to the bar in New York; in 1794 entered the State Assembly, and the next year became a member of the State Senate, to which he was reëlected in 1798. From 1802 to 1804 he was Attorney-General of the State, and in the latter year he became one of the judges of the Supreme Court, and was its Chief Justice from 1819 to 1823, when he resumed his private practice. From 1824 to 1826 he was Mayor of Albany, and from 1829 to 1831 a member of Congress. Eight years later he retired to a farm near Albany, but continued to take an interest in politics, and in 1844 he presided over the National Whig Convention at Baltimore. He secured the abolition in New York of the death sentence in all cases except those of murder and treason; took an important part in the State Constitutional Convention of 1821; and later opposed an amendment making the judiciary elective. Consult *Memorial of Ambrose Spencer* (Albany, 1849).

SPENCER, CHARLES, third Earl of Sunderland. An English statesman. See SUNDERLAND, CHARLES SPENCER, third Earl of.

SPENCER, HERBERT (1820-1903). A distinguished English philosopher. He was born at Derby, April 27, 1820. His father was a teacher by profession, with views in advance of his time. He believed in training the student's mind in observation and in reflection on objective facts instead of mere ideas. Herbert's health was delicate in childhood, and he was largely educated at home with as much outdoor life as possible. A little later he was put in charge of his uncle, a clergyman of the Church of England. He early showed a fondness for studies in nature, and for a good many years his favorite occupation was the catching and preserving of insects and the rearing of moths and butterflies; he also studied botany with some passion, and in these ways laid the foundation for the scientific character and interest of his later work. His parents were both originally Methodists, but his father became a Quaker. The boy's mind, however, being an independent one, and having early been brought into contact with the intellectual influences centring about John Stuart Mill and with the scientific spirit, he imbibed the tendencies of the age toward extreme liberalism in theological matters.

An uncle planned to send him to Cambridge, but the boy 'perseveringly objected,' and continued to study privately. He had no aptitude for languages, and made little progress in the classics, but showed original constructive power in mathematics and mechanics. His father wanted him to take up teaching, but an accidental opportunity decided in favor of another vocation more suitable to his tastes. In the autumn of 1837 work was offered to him under the chief engineer of the London and Birmingham Railway,

with whom he spent nearly a year. For some ten years he engaged in engineering pursuits. When the railway mania finally subsided, Spencer, now twenty-six, was left, like many other young men, without occupation. But the time spent at home while he was looking for something to do was not wasted. He had leisure for a good deal of miscellaneous reading. He studied Lyell's *Principles of Geology*, in which the doctrine of evolution as defended by Lamarck was attacked, but came away from the reading with a favorable impression of Lamarck's doctrine as against creationism.

While he was in the railway service, still a mere boy, he wrote some articles for *The Nonconformist* on "the proper sphere of government," in which he outlined the principles of non-interference which regulated all his thinking in later life. When no more work offered as an engineer, he went to London and soon obtained employment on *The Economist*, becoming its sub-editor in 1848. This position, which he held till 1852, gave him time for his studies, and made him acquainted with that brilliant coterie which centred about George Henry Lewes, George Eliot, and John Stuart Mill. During his leisure hours he wrote his first considerable work, *Social Statics* (1851). It is of a decidedly *a priori* character, and not written in the inductive spirit of his later thinking. It shows, however, his tendency to reconcile opposing influences and to discover closeness of relations where others did not suspect them. Subsequently he became dissatisfied with both its views and its methods, and wished to recall it from circulation. This being found impossible, in later years he revised it by omitting what he had outgrown.

In the eight years after his leaving *The Economist*, he pursued his studies with eagerness, and published a work on *Psychology* (1855), which he afterwards revised and expanded into a part of his *Synthetic Philosophy*. Over-application brought on a serious attack of nervous prostration, which obliged him for the rest of his life to abridge his hours of study. He became a chronic sufferer from dyspepsia and insomnia, so that all his later work had to be done under these disadvantages. Meanwhile he had conceived a system of philosophy which should embrace the general principles of all existing knowledge. In 1860 he published a prospectus or outline of it, indicating his intention to give twenty years to its development. The first instalments of the system did not meet with the reception he expected, and he feared he would have to abandon his undertaking. But the timely aid of American friends, at the head of whom was Mr. Youmans, editor of the *Popular Science Monthly*, enabled him to continue his work. His health, however, was so precarious that at one time he feared he would not live to complete the system. With this view he suspended his labors on the main part of his work to write *The Data of Ethics*, which had been the object of the whole system, and in which it was intended to culminate. Fortunately, his life was prolonged sufficiently to enable him to complete the system, and to revise a part of it in order to bring it up to date. It consists of *First Principles* (1862); *Principles of Biology* (1864); *Principles of Psychology* (1871-72); *Principles of Sociology* (1876-80); *Principles of Ethics* (1879). He also wrote three volumes of *Essays Scientific, Political, and Speculative* (1858-63), and some fugitive articles including two essays on Weissmannism (1894, 1895). He died December 8, 1903.

It was his intention in the *Synthetic Philosophy* to develop a complete and articulated conception of all cosmic phenomena, including those of mental and social principles. His qualifications for attempting so comprehensive a task were wide powers of generalization, profound acquaintance with the facts of the various sciences, and a veritable genius for detecting the relations and connections of phenomena that escape the specialist. No philosopher has employed such a wealth of illustration and facts to explain his meaning or to prove his thesis. It is the clearness of his thought, the force of his illustrations, and the dependence of his views upon the facts and methods of the inductive sciences that have given him his power over all thinkers, except the technical and traditional philosophers. His attempt to systematize all knowledge in terms of modern science must always receive high credit among intelligent men.

The *First Principles* endeavors to define the fields of 'the unknowable and the knowable,' and the postulates with which the study of the knowable must be pursued. The whole weakness of Spencer's system is shown in his discussion of the unknowable. The Absolute, Space, Time, Matter, Force, and Motion were all taken as unknowable. After telling us that all these are unknowable, he asserts that the most certain things in our conviction are the 'Absolute' and all the other fundamental data for the knowable. Besides, after telling us that all explanation consists in reference to the known, he says that all phenomena are explained as manifestations of the unknowable. Then, in the discussion of the knowable, Space, Time, Matter, Force, etc., appear as known. Both the strength and weakness of his system are due to this equivocal import of the term knowledge. If Spencer had omitted all reference to the dogma of the unknowable and confined himself to a discussion of the knowable, he would have avoided the controversy which has invited the distrust of his system. The postulates with which he conducted his speculations were, besides the existence of Space, Time, Matter, Motion, and Force, the assumption of the indestructibility of Matter, the continuity of Motion, and the persistence of Force, which he regarded as an *a priori* truth, though also determinable inductively.

The whole system is an application of the idea of evolution to the universe, and more particularly to organic life and its forms, and to political and social institutions. Spencer's conception of this process did not go beyond Darwin's in its details, but it was apparently quite as original and certainly more comprehensive, besides involving philosophic conceptions of which Darwin was incapable. Spencer applied the materialistic formula to the explanation of all things, but protested that he was not a materialist. Even if he had expressed his doctrine, as he said he could as well have done, in terms of consciousness, it would not have modified the accusation against his materialism, as the expression of philosophy in terms of mental states does not insure one against all that materialism stood for. In order to adapt the conception to all forms of phenomena, he variously expressed

the process as the passage from the simple to the complex, from the homogeneous to the heterogeneous, from indefinite homogeneity to definite heterogeneity, and so on. This description of the process brought him into controversy with all those who like metaphysics, and gave him no credit with those who do not. It was at best a vague formula, which might be true or false according to the definition of the terms and the statement of the facts; the phrase at least meant nothing more than the facts, and was not explanatory. In his facts and illustrations, however, Spencer gives a clearer idea of his doctrine than in his abstract formulas intended to cover every type of phenomena in the organic and inorganic kingdoms. These facts, he thinks, show a continuous order of things with historical connections and relations which suggest a common origin from some ultimate indefinite form of force which he calls matter and motion. Darwin did not pretend to go beyond the extension of a few types in the organic world or to develop their genesis. He was content to demonstrate the origin of species in the organic world and left unsolved and undiscussed the general origin of things—a much larger task. Spencer sought to make intelligible the process of evolution throughout the whole field of nature, and hence the importance of his formula about the 'continuous redistribution of matter and motion,' as embodying the whole system of changes and growths in the cosmos.

It was Spencer's antagonism to the doctrine of creationism that caused a complete misunderstanding of what evolution really undertakes to accomplish. The theory of creation was equivocal. It assigned a cause for the origin of phenomena, and it was associated with the conception of the miraculous and supernatural. Spencer denied the creational theory and adopted the gradual development of all things in its stead. But what he failed to recognize sufficiently, though he sees it at times, is the fact that evolution is the history of origin, not the explanation of it. It determines the law, not the cause of genesis. All that Spencer and his coadjutors established is the fact that the origin of things was *gradual* instead of *catastrophal*. Creationism was so closely associated with the latter conception that the disproof of great breaks in nature carried with it the principle by which every change has to be explained. The transition from species to species may be gradual instead of catastrophal, but this fact does not eliminate the agency of causes, and it was cause that the creationistic theory sought and unfortunately made catastrophal. It was natural, therefore, when the evolutionists showed that the process was gradual, that creationism should suffer to the same extent, but after all the real conquest was in favor of law instead of caprice in the order of nature, so that if Spencer and the evolutionists had refused to conceive their problem in opposition to creationism, and had limited themselves to the conception of the history of genesis, they would have escaped controversy with the metaphysicians on the one hand and with the theologians on the other.

Conceiving evolution, however, as the history rather of events than of causes that originate change, we shall find that Spencer's services to human knowledge can hardly be overestimated. It was a stroke of genius to combine the ideas of the persistence of force, adjustment to environment, and natural selection for the purpose of explaining the relations of all phenomena. It offered a mode of unifying the cosmos which showed identities and relations throughout the whole not before observed. The persistence of force guaranteed the fundamental identity of all reality, in spite of the differences of form which it assumed, while the varieties of composition explained the differences. The conception supplies an initial presumption of the variation of a single species to account for the varieties; this once done, the whole problem of evolution is at least historically conceived as intelligible. In the inorganic world it is merely a question of the collocations of matter. In the organic world it is a question both of collocation and of the adjustment of structure and function. In the ethical world the growth is in the form of the substitution of altruism for egoism or selfishness. In the political and social worlds the process is but a repetition of that in the others, except that we deal with collective as distinct from organic wholes. One law prevails throughout the whole process—the redistribution of matter and motion according to the conditions of the persistence of force. Originally Spencer reduced life to a function of matter and motion. But in the last edition of his *Biology* he admitted that life was an 'unknown force,' a position which involves a complete revolution in his system as recognizing something more in the world as ultimate than matter and motion. The hypothesis of a universal ether and the modification of older views regarding the nature of electrical and magnetic phenomena, with the discovery of a number of forms of energy not suspected a generation ago, threaten to modify greatly the bases of Spencer's system. But they do not disturb the general conception which he formed of the process of evolution, since this is independent of the forces involved and is simply a process of composition and decomposition throughout the cosmos and in all specific forms of reality. It is Spencer's manner of tracing the relations and affinities between the various phenomena of existence that gives his work its interest and has so generally influenced the intelligent public. He knew little of Greek philosophy and less of the modern Kanto-Hegelian movement. The consequence was that he began his speculations with science, eschewed the transcendentalism of German epistemology, and wrote in terms that every intelligent man can understand. The public has not cared whether his abstract formulas were clear or not, or whether they really expressed an explanation. They were impressed with his power of illustration and reference to facts which they were willing to use as interpreting his formulas, and as his illustrations and analogies depicted such an interesting unity in the course of nature, they were ready to take him as a prophet of the new gospel and leave subtleties to the transcendentalists. Spencer will not be forgotten for a method that supplies a clear conception of the unity of all things in terms of facts instead of abstract conceptions, though he was at times too much of a philosopher to avoid the sins which his scientific temperament sought to correct in others.

losophy of Herbert Spencer (New York, 1894); Collier, *An Epitome of the Synthetic Philosophy* (ib., 1889); Guthrie, *On Spencer's Unification of Knowledge* (London, 1882); Painter, *Herbert Spencers Evolutionstheorie* (Jena, 1896); Gaupp, *Herbert Spencer* (Stuttgart, 1897).

SPENCER, JESSE AMES (1816-98). A Protestant Episcopal scholar. He was born at Hyde Park, N. Y.; graduated at Columbia College (1837), and the General Theological Seminary; was ordained 1840, and became rector of Saint James's Church, Goshen, N. Y.; professor of Latin and Oriental languages at Burlington College, N. J., 1849-50; editor and secretary of the Episcopal Sunday School Union and Church Book Society (1851-57); rector of Saint Paul's, Flatbush, L. I. (1863-65); and professor of Greek in the College of the City of New York (1869-81). He edited the American reprint of T. K. Arnold's series of Greek and Latin text-books (1846-56) and other classics, including the Greek New Testament (1847). His independent works include a *History of the English Reformation* (1846), *Egypt and the Holy Land* (1850), *History of the United States* (1856-69), *Eschatology* (1887), *Memorabilia, 1820-86* (1890).

SPENCER, JOHN CANFIELD (1788-1855). An American jurist and politician, born at Hudson, N. Y. He graduated at Union College in 1806, studied law, and was admitted to the bar at Canandaigua in 1809. In 1813 he was brigade judge-advocate-general in the army on the northern frontier. From 1817 to 1819 he was a Democratic member of the United States House of Representatives and wrote the report condemning the United States Bank, which was afterwards used by President Jackson at a time when the author's views had changed. In 1820-21 he was a member of the Lower House of the State Legislature, serving as Speaker the first year. He was in the State Senate from 1824 to 1828, and in 1827 was appointed by Governor Clinton one of the committee to revise the statutes of New York. This work was finished in 1830; a second edition was published in 1835-36, and a third in 1846-48. For a time he was affiliated with the Anti-Masonic Party, and he was appointed by Governor Van Buren to prosecute the alleged abductors of William Morgan (q.v.), but resigned in 1830. He again sat in the Legislature in 1832, and in 1834-40 was Secretary of State for New York and Superintendent of Schools. On October 12, 1841, he became Secretary of War in the Cabinet of President Tyler. He was transferred to the Treasury Department, March 3, 1843, but opposed measures looking to the annexation of Texas and resigned May 2, 1844. He then resumed the practice of law at Albany, and was influential in establishing the State Asylum for Idiots. He edited a translation of De Tocqueville's *Democracy in America* (2 vols., 1838). Consult Proctor, *Review of John C. Spencer's Legal and Political Career* (New York, 1886).

SPENCER, JOHN CHARLES, Earl (1782-1845). An English statesman, best known as Lord Althorp. He was the son of the second Earl Spencer, and was born in London. After being educated at Harrow and Cambridge, he entered Parliament in 1804 and became a junior lord of the treasury in 1806. From that year till 1834 he continuously represented Northamptonshire in the Whig interest. In 1830 he became Chancellor of the Exchequer and leader in the House of Commons under the Grey Ministry, and was active in carrying the Reform Bill of 1832. He held office under the Melbourne Ministry which succeeded the Grey Ministry in July, 1834, but in November of the same year the death of his father gave him a seat in the House of Lords. He died October 1, 1845. He was a man without ambition or especial ability, fond only of agriculture and country sports; but honesty and industry raised him to positions of responsibility, all of which he filled with great credit. Consult Myers, *Lord Althorp* (London, 1890).

SPENCER, JOHN POYNTZ, fifth Earl Spencer (1835—). An English statesman. The only son of the fourth Earl, he was born at Spencer House, was educated at Harrow and at Cambridge, and in 1857, the year of his graduation, was elected member of Parliament, and by his father's death succeeded to the peerage. He was Lord Lieutenant of Ireland 1869-74, and again in 1882-85; and lord president of the council, with a seat in Mr. Gladstone's Cabinet, 1880-83 and 1886. He was First Lord of the Admiralty 1892-95.

SPENCER, JOSEPH (1714-89). An American soldier, born in East Haddam, Conn. He was a probate judge in 1753, and rose to the rank of colonel in the French and Indian War. He was one of the eight brigadier-generals appointed by Congress on June 22, 1775, served at Boston and New York, became a major-general in August, 1776, and commanded in Rhode Island in 1777. He resigned in January, 1778, and was a member of Congress in 1779.

SPENCER, JOSEPH WILLIAM WINTHROP (1851—). An American geologist, born at Dundas, in Ontario, Canada. He graduated at McGill University in 1874, and received the degree of Ph.D. from the University of Göttingen three years later. He was professor of geology in King's College, Nova Scotia, in 1880-82, and in Missouri State University, 1882-87; and was State geologist of Georgia, 1888-93. He is especially distinguished for researches in lacustrine geology. Among his published works are: *Niagara Fossils* (1884); *Glacial Erosion in Norway* (1887); *Geological Survey of Southwestern Georgia* (1891); *Geological Survey of the Paleozoic Belt of Georgia* (1893); and *Duration of Niagara Falls and History of the Great Lakes* (1895).

SPENCER, PLATT ROGERS (1800-64). The originator of the Spencerian system of penmanship. He was born at East Fishkill, New York, and at the age of ten years removed to Ashtabula County, Ohio. He gave many lectures upon penmanship in various parts of the country, and his work was influential in causing the establishment of business colleges. Spencer published *Spencer and Rice's System of Business and Ladies' Penmanship* (1848), later republished as *Spencerian or Semi-Angular Penmanship.*

SPENCER, ROBERT, second Earl of Sunderland. An English statesman. See SUNDERLAND, ROBERT SPENCER, second Earl of.

SPENCER, SARA ANDREWS (1837—). An American author and woman-suffragist, president and proprietor of the Spencerian Business College, Washington, D. C. She was born in

Savona, Steuben County, N. Y., and in 1864 married Henry C. Spencer, and afterwards removed to Washington, D. C. In 1871, with other women, she made an unsuccessful attempt to register and vote, and afterwards brought suit on which the Supreme Court of the United States decided (1874) that women have not the right to vote without local legislation. She represented the National Woman's Suffrage Association at the Republican National Convention in Cincinnati, in 1876; and engrossed, signed, and presented the *Woman's Declaration of Rights* at the Centennial Celebration at Philadelphia. Her publications include *Problems on the Woman Question* (1871).

SPENCER, WILLIAM ROBERT (1769-1834). An English poet and wit. He was a grandson of the third Duke of Marlborough. He was educated at Harrow and at Christ Church, Oxford, but left the university without a degree. Among his friends were Pitt, Fox, Sheridan, and Sydney Smith. His last years were passed in Paris, where he died in poverty. In 1796 Spencer published a version of Bürger's *Leonore*, which was praised by Scott; and in 1802 burlesqued German romance in *Urania*, a play performed at Drury Lane. In 1811 he collected his poems in a volume, which contained his best known pieces, like "Beth Gêlert" and "Too Late I Stayed." As a poet, Byron ranked him with Moore, Campbell, and Rogers. Consult the reprint of Spencer's *Poems* with biography (London, 1835).

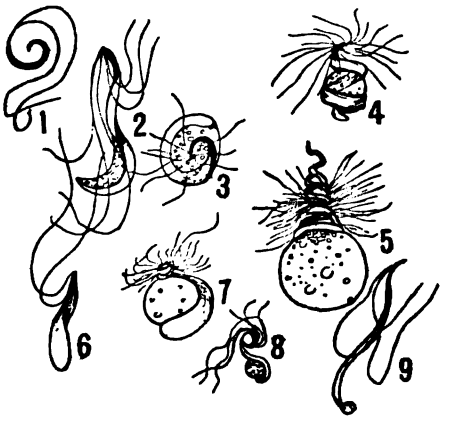
SPENER, spā'nĕr, PHILIPP JAKOB (1635-1705). A German clergyman, the founder of the German Pietists. He was born at Rappoltsweiler, in Upper Alsace, and was educated at Strassburg, Basel, Tübingen, Geneva, and Lyons. At Geneva he was influenced by Labadie (q.v.), and his natural disposition led him strongly toward a religion of spiritual and untheological type. He preached at Strassburg, was transferred to Frankfort, and in 1666 became first pastor there. He strove to awaken a deeper faith and more active Christian life, emphasized the necessity of conversion and regeneration, and the study of the Scriptures, in opposition to the prevalent teaching which laid stress on orthodoxy and connection with the Church, and cared more for the symbolical books than for their source. His views were set forth in his *Pia Desideria, oder herzliches Verlangen nach gottgefälliger Besserung der wahren evangelischen Kirche* (1673). In 1670 he began meetings at his house for the cultivation of evangelical morality, the so-called *collegia pietatis*, with the aim, as he expressed it, of forming within the Church (*ecclesia*) a smaller church (*ecclesiola*) which should have a deeper spirituality. At the same time he reorganized the method of catechising and improved the religious instruction given to children. In 1679 a preface which he wrote for a new edition of the *Postille* of Arndt, in which he censured the morals of the upper classes, brought him into difficulties; and in 1686 he accepted an invitation to become Court preacher at Dresden and member of the upper consistory. In this capacity he effected changes in the theological teaching of the University of Leipzig and in the system of religious catechising practiced throughout Saxony; but because of attacks from the orthodox theologians, and having fallen into disgrace with the Elector Johann Georg III., in 1691 he went to Berlin as provost of the Church of Saint Nicholas and consistorial inspector, offices which he retained till his death. The Elector of Brandenburg encouraged his efforts for religious reform and intrusted theological instruction in the new University of Halle to Francke, Breithaupt, and others of his disciples. In 1695 the theological faculty of Wittenberg formally censured as heretical 264 propositions drawn from Spener's writings. There is no collected edition of his works; the full list (180 in number) is given in his biography by Von Canstein (Halle, 1740), and his chief works have been edited by Grünberg (Gotha, 1889). Consult also the lives by Hossbach (Berlin, 1828; 3d ed. by Schweder, 1861), by Wildenhahn (Leipzig, 1842; Eng. trans., Philadelphia, 1881), and by Grünberg (Göttingen, 1892-97). See PIETISM; GERMAN THEOLOGY.

SPENGEL, spĕng'l, LEONHARD (1803-80). A German classical scholar, born at Munich. He became known through his edition (1826) of Varro's *De Lingua Latina*, and was appointed in 1826 lector, in 1830 professor in the present Wilhelmsgymnasium of Munich. In 1842 he accepted a chair at Heidelberg which he held until his return, as professor, to Munich in 1847. Among his publications were his edition of the *Ars Rhetorica ad Alexandrum*, which, following Petrus Victorinus, he attributed to Anaximenes of Lampsacus (*Anaximenes Ars Rhetorica quæ Vulgo Fertur Aristotelis ad Alexandrum*, 1844), his edition of the *Rhetoric* of Aristotle (*Aristotelis Ars Rhetorica cum Adnotatione*, 1867), and his text edition of the *Rhetores Græci* (3 vols., 1853). His address *Ueber das Studium der Rhetorik bei den Alten* (1842) is a valuable outline sketch of the art of eloquence in classical times.

SPEN'NYMOOR. A town in Durham, England, 4 miles northeast of Bishop Auckland (Map: England, E 2). It has coal-mining and iron industries. Population, in 1901, 16,660.

SPEN'SER, EDMUND (c.1552-99). An English poet, born in London. He claimed relationship to the noble family of Spencers at Althorp, but he seems to have been more closely connected with the Spensers of Lancashire. His father, certainly in reduced circumstances, has been identified with John Spenser, a London clothmaker. The boy was apparently sent to the Merchant Taylors' School, London, whence he passed, as sizar or poor scholar, to Pembroke Hall, Cambridge. At the university he read widely and eagerly in Latin, Greek, Italian, and French literature. He was especially fond of Petrarch and Chaucer, of Marot and Du Bellay. He formed lifelong friendships with Gabriel Harvey and Edward Kirke. After graduating M. A. in 1576, he seems to have spent nearly two years with his kinsfolk in Lancashire, where he fell in love with a young woman whom he celebrated in verse under the name of Rosalind. In 1578 he went to London and found a place in the household of the Earl of Leicester. There he probably met Sir Philip Sidney, to whom he dedicated *The Shepheardes Calender* (1579). In 1580 he was appointed secretary to Lord Grey, the new Lord Deputy of Ireland. Thenceforth Spenser lived mostly in Ireland. There he completed *The Faerie Queene*, already begun at Leicester House.

By 1588 or 1589 he was living at Kilcolman Castle, in the County of Cork, which with its extensive lands was legally transferred to him in 1591. In the meantime he had written *Astrophel*, a noble pastoral elegy on Sidney, and had received a visit from Sir Walter Ralegh (1589), made memorable by *Colin Clouts Come Home Againe*. In 1590 he accompanied Ralegh to London, was welcomed by the Court, and published the first three books of *The Faerie Queene*, a moral and historical allegory. In 1591 followed a volume of miscellanies called *Complaints*, including "The Ruines of Time," "The Teares of the Muses," "Mother Hubberd's Tale," "The Tale of the Butterflie," and four other poems. Evidently disappointed of expected Court preferment, Spenser returned to Ireland, where he married a certain Elizabeth, probably Elizabeth Boyle, related to the first Earl of Cork. The courtship is described in the *Amoretti* (published in 1595), a series of mellifluous sonnets; and the marriage is celebrated in the *Epithalamion* (published in 1595), the richest nuptial hymn in the English language. In 1596 he brought to London for publication three more books of *The Faerie Queene*. Spenser intended to continue the work to twelve books, but he never got further than two cantos on *Mutabilitie* (printed 1609). While in England he seems to have completed a prose treatise on the *Present State of Ireland* (not published till 1633); he prepared for the press the beautiful *Foure Hymnes* (1596), in honor of love, beauty, heavenly love, and heavenly beauty; and wrote for a double marriage at Essex House the *Prothalamion* (1596), one of his choicest poems. Once more disappointed of preferment, he returned to Ireland. In October, 1598, his castle was sacked and burned by the Irish rebels. Spenser fled to England, where he died at a London inn, January 16, 1599. He was buried near Chaucer in Westminster Abbey.



The Shepheardes Calender marks an epoch in English poetry. Conventional in theme, it yet shows a command over rhythm greater even than Chaucer's. It sounded the note of the Elizabethan outburst. As Spenser grew older he became more weighty in substance and discovered new melodies. In *The Faerie Queene* he invented a nine-line stanza known as 'Spenserian.' It is the Italian *ottava rima* with an added Alexandrine (twelve syllables). The rhymes run ababbcbcc. But there is more in Spenser than sweet verse. His imagination dwelt in a realm of beauty and the noblest ideals. His greatest fault is an insistence on the allegory until it becomes monotonous and obscure. With the poets themselves, for whom this weakness counts less than for the general public, Spenser has been a favorite. The generation following him were Spenserians, and to him Milton owed much. In the romantic revival at the end of the eighteenth century Spenser was potent, and Keats's *Eve of Saint Agnes* and Byron's *Childe Harold* were written in the Spenserian stanza.

Consult the *Life* by R. W. Church (English Men of Letters, London, 1879); *Works*, ed. H. J. Todd (8 vols., ib., 1805, new ed. 1877), by J. P. Collier (5 vols. new ed., ib., 1891), by R Morris, with memoir by J. W. Hales (Globe edition, ib., 1869, often reprinted), and by A. B. Grosart (Huth Library, 10 vols. ib., 1882-84). Consult also G. L. Craik, *Spenser and his Poetry* (ib., 1845), and the essays by Lowell, *Among My Books*, second series (Boston, 1876), and by Aubrey de Vere (London and New York, 1894). The Spenser Society, founded at Manchester in 1867, published a facsimile of the first edition of *The Shepheardes Calender*.

SPENSERIAN STANZA. See SPENSER, EDMUND; VERSIFICATION.

SPERANSKI, spâ-răn'skê, MIKHAIL, Count (1772-1839). A Russian statesman. Educated at the Saint Petersburg Ecclesiastical Academy, he was appointed professor of mathematics there in 1797, and State Secretary in 1801. He became Assistant Minister of Justice in 1808, and Privy Councilor in 1809. During his administration he remodeled the system of taxation and the system of national education, and instituted many other reforms. His influence brought him many enemies, and he was banished in 1812, but recalled in 1816 and made Governor of Pensa. As Governor-General of Siberia (1819-21) he displayed great energy in fighting official corruption and bettering the condition of the exiles. In 1821 he was made a member of the Imperial Council. Nicholas I. intrusted him with the codification of the Russian laws, which task he performed with singular success.

SPERM, IN PLANTS (Lat. *sperma*, from Gk. *σπέρμα*, seed, from *σπείρειν*, *speirein*, to sow), ANTHEROZOIDS, SPERMATOZOIDS. The male sexual cell, whose union with the egg is the process of fertilization, and results in the formation of an embryo. Sperms are produced by all plants except the lower algæ and many of the fungi, and are often characteristic of great groups of plants. An ordinary sperm is an actively moving, naked cell, consisting essentially of a relatively large nucleus with a thin sheath of cytoplasm, forming the body, and delicate, hair-like swimming

TYPES OF SPERMS.

1, Chara; 2-4, fern; 5, Marsilia; 6, club moss; 7, fern; 8, quillwort; 9, liverwort.

appendages (cilia). The male organ which produces sperms is uniformly called an antheridium (q.v.). See FERTILIZATION; REPRODUCTION; SEX.

SPERMACETI (Neo-Lat., whale's seed, from Lat. *sperma*, from Gk. *σπέρμα*, seed + *oeti*, gen. sg. of *cetus*, from Gk. *κῆτος*, *kētos*, whale; so called because at first supposed to be the spawn of the whale). A waxy substance obtained from cavities in the head of the sperm whale (*Physeter*

macrocephalus), which lives in the Pacific and Indian Oceans. In the living whale it is dissolved in an oil, but on cooling separates as a solid. As much as twelve barrels of crude spermaceti is obtained from an ordinary whale. It is purified by pressure, melting, and crystallization. It is white or translucent, crystallizable from alcohol and ether, not soluble in water, smooth to the touch, and without taste or odor. It becomes rancid and grows yellowish on exposure to light. It burns with a bright flame. Its specific gravity is .945, and its melting-point is about 38° C. (about 100° F.). It does not, like fats and oils, give glycerin after saponification, but cetyl alcohol. It consists chiefly of cetin, or cetyl palmitate, $\left.\begin{matrix} C_{16}H_{31}O \\ C_{16}H_{33} \end{matrix}\right\}O$. Spermaceti is used as an ingredient of many ointments and cerates. It is made into sperm candles of definite weight for photometric purposes.

SPERMATISTS. A school of physiologists of the seventeenth century, who held that the whole of the material transmitted from the parents to the offspring as the foundation of the embryo was contained in the spermatozoön of the male, opposing those (the ovulists) who asserted that all the material was supplied by the mother in the egg. See PREFORMATION.

SPERMATOPHYTES (from Gk. *σπέρμα, sperma*, seed + *φυτόν, phyton*, plant), SEED-PLANTS. The highest of the four primary divisions of the plant kingdom, distinguished from the other groups by the production of seeds. The much used name phanerogams, meaning evident sexual reproduction, is unfortunate because in this group sexual reproduction is least evident. The once used name anthophytes, meaning flowering plants, which last is probably the most commonly used popular name, is also inappropriate, since the production of flowers is not coextensive with the group. The most recently proposed name siphonogams, meaning sexual reproduction by means of a tube, referring to the passage of the male cells to the eggs through pollen-tubes, has not been extensively adopted. Since the seed-production seems to distinguish the group more than any other character, the name spermatophytes, which is in common use, seems likely to prevail.

This group, which includes practically all the conspicuous vegetation (herbs, shrubs, and trees), is by far the most useful group to man, so useful, indeed, that until the closing years of the nineteenth century elementary botanical training dealt with no other group and botanists were thought of chiefly as students of flowers. More than 100,000 species of seed-plants have been described, and grouped in two distinct but very unequal divisions—gymnosperms (q.v.) and angiosperms (q.v.). They are distinguished by the position of their seeds, which are naked or freely exposed in the former, but inclosed in a seed-case in the latter.

In all seed-plants the alternation of generations (q.v.) is very much obscured by the great reduction of the sexual plants, which are not popularly recognized, and are undiscoverable except by laboratory manipulation, the whole visible body of these plants, contrary to the popular notion, being the sexless phase or sporophyte. All the members of the group are also heterosporous. (See HETEROSPORY.) The pollen-grain is a sexless microspore that in germination gives rise to a small plant consisting of only a few cells, among them two male cells, which are formed within the pollen-grain and are to function as sperms. The pollen-grain is transferred to the immediate neighborhood of the female plant, usually by the wind or by insects. See POLLINATION; FERTILIZATION.

The megaspore, a large sexless spore, that produces the female plant, is developed within the

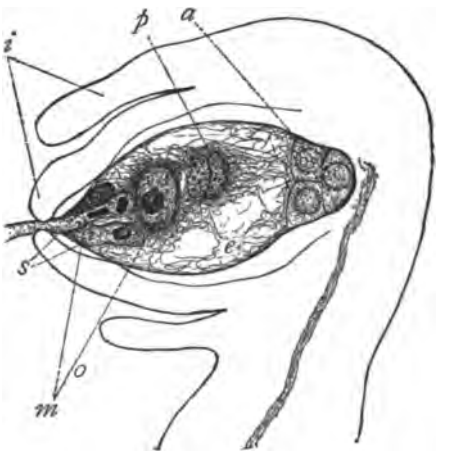


FIG. 1. OVULE.

Showing *i*, integument; *e*, embryo-sac; *a*, antipodal cells; *p*, polar nuclei fusing; *s*, syneryids; *o*, eggs; and *m*, pollen tube containing male cells.

ovule, which is, therefore, a sporangium. The fact that in this sporangium there is but a single megaspore, and that is not discharged, but retained,

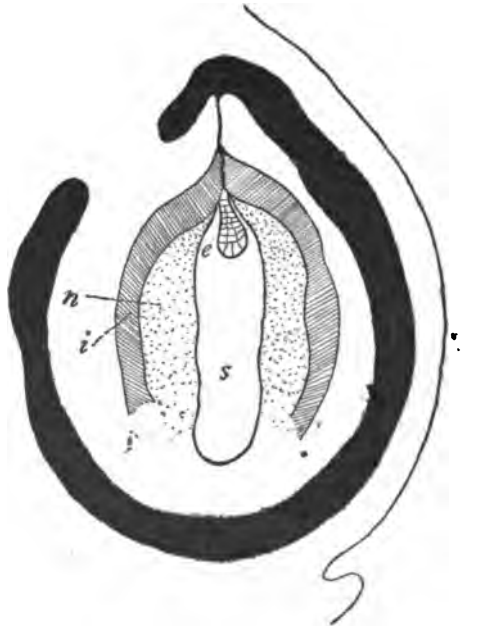

FIG. 2. OVULE IN OVARY CAVITY.

Showing *i*, integument; *n*, nucellus; *s*, embryo-sac; and *e*, embryo.

is what makes a seed possible; for the retained megaspore germinates within its sporangium

(ovule) and produces the female plant there. This megaspore within the ovule was once thought to be merely a sac-like cavity, within which the embryo appeared, and hence was called the 'embryo-sac' (*e*, Fig. 1; *s*, Fig. 2). In germination the megaspore produces a female plant, with several or many cells, which has long been called 'endosperm,' and recognized as a prominent nutritive tissue within the seed. The female plant, therefore, is entirely inclosed within the ovule, and produces an egg (*o*, Fig. 1) which is reached by a pollen-tube (*m*, fig. 1) and fertilized. This act of fertilization is followed by two conspicuous results, namely (1) the development of the embryo (*e*, Fig. 2), and (2) the development of a hard superficial tissue (testa) in the outer part of the ovule, which hermetically seals the female plant and embryo within, the whole complex structure constituting the seed.

In the seed condition the plant passes into a resting period of greater or less duration, and then, under favorable conditions, the seed is said to germinate. This simply means the renewed growth of the young plantlet, whose embryo, which had begun to develop, was checked by the hard investment of the seed. A seed, therefore, is a complex of three generations: (1) the old sexless generation (sporophyte), represented at least by the seed coats; (2) the following female sexual generation (gametophyte), represented by the endosperm; and (3) the new sexless generation (sporophyte), represented by the embryo.

SPERMATOZOÖN (Neo-Lat., from Gk. *σπέρμα, sperma*, seed + *ζῷον, zōon*, animal). The male germ cell. The phenomenon of sexuality consists of the union of two cells. In the lowest forms these may be alike, but in the higher plants and animals there is a difference in size of the two uniting cells. The larger is called the female cell or 'egg,' the smaller the spermatozoön. This difference in size is advantageous, for it means a division of labor. The large cell is passive and accumulates a large amount of food-material by virtue of which the future embryo is better provided for. The spermatozoön, on the other hand, retains the capacity for locomotion; it seeks the passive egg. Consequently, the spermatozoön becomes as small as possible and is provided with a large locomotive organ—the tail, flagellum, or lash. The spermatozoön is thus a highly specialized, actively locomotor cell. A typical flagellate spermatozoön consists of three parts: head, middle piece, and tail. The head contains the nucleus, made up of an extremely dense mass of chromatin; also often an apical body or acrosome, lying in a spur of the head. The middle piece is larger than the tail and usually contains the centrosome. The tail is a cytoplasmic thread, containing a central delicate thread and having a lateral membrane or fin which makes the stroke of the tail more effective. Spermatozoa exhibit a great variety of forms. Thus, the head may be nearly globular or spear-shaped, or even of the shape of a corkscrew. The membrane may be absent or it may twist spirally around the axial thread. Finally the spermatozoön may, as in certain Crustacea, be not thread-like, but star-shaped or spindle-shaped, with the head at the centre. In plants, also, the spermatozoön (spermatozoid) exhibits a great diversity of form from a sphere to a screw-like thread.

The spermatozoa develop in a special organ of the body called *testis*, typically a mass of germ cells, young and old. In the young male this gland is made up of epithelial cells known as primordial germ cells; from these by cell-division arise 'spermatogonia,' still undifferentiated cells. The spermatogonia grow until they become very big, and are then called 'spermatocytes.' Each large spermatocyte divides and the daughter cells promptly divide again into 'spermatids,' four of which thus arise from each spermatocyte. But each spermatocyte has only half the number of chromosomes that the original spermatocyte had. Each spermatid now undergoes a change of form by which it becomes a spermatozoön, and not until then is it ready to fertilize the egg. See FERTILIZATION.

SPERMOPHILE (from Gk. *σπέρμα, sperma*, seed + *φιλεῖν, philein*, to love). A ground-squirrel of the genus Spermophilus, of which more than a dozen species occur in the United States, but only one or two in Europe. They are all terrestrial, live in burrows under ground, feed chiefly on herbage and seeds, are very prolific, and are commonly called 'gophers' (q.v.), thus confusing them with an entirely different group of mammals. Three of the species, at least, are sufficiently abundant to do much damage to lawns and cultivated fields. A very effective means of destroying them is by soaking some absorbent substance in carbon bisulphide and placing it in the burrows. In size, form, color, and length and shape of tail, the spermophiles show great variety. They are usually some shade of brown, mottled, spotted, or striped with other shades. With the tail, they will average about a foot in length. All are western, and denizens of open regions, only two species occurring as far east as Illinois. The flesh is edible. Consult Bailey, "Prairie Ground Squirrels," in *Bulletin 4* (Department of Agriculture, Division of Ornithology and Mammalogy, Washington, 1893). Compare CHIPMUNK.

SPERM WHALE. See WHALE.

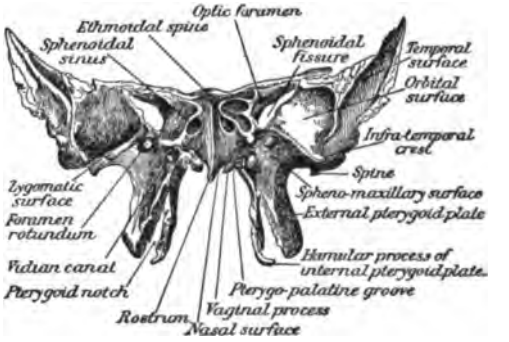
SPES (Lat., hope). The Roman goddess of hope, represented as a youthful divinity clad in a long robe and bearing a bud in one hand. Spes personified particularly hope for good harvests and for children, and gradually came to be looked upon as a goddess of the future, to be invoked at births, marriages, and other important times.

SPEUSIP'PUS (Lat., from Gk. *Σπεύσιππος*) (c.395-c.339 B.C.). An Athenian philosopher, nephew and pupil of Plato, with whom he is supposed to have visited Syracuse. For the last eight years of his life Speusippus was head of the Old Academy. He went even further than Plato in his mystical interest in the Pythagorean numbers, but in general agreed with his master, save that he denied the perfect goodness of the primordial unity, inasmuch as bad must be held to proceed from it as well as good. Consult Fischer, *De Speusippi Atheniensis Vita* (Rastatt, 1845).

SPEY, spā. A river of Scotland, rising in Inverness-shire, and, after a northeast course of about 110 miles, falling into the Moray Firth, 3 miles west of Portgordon (Map: Scotland, E 2). The Spey is the second longest river in Scotland. It has salmon fisheries.

SPEYER, spī'ẽr, or **SPEIER** (in Eng. often *Spire*). The capital of the Palatinate, Bavaria, situated at the confluence of the Speyerbach and the Rhine, 23 miles north of Karlsruhe (Map: Prussia, C 4). The chief feature is the magnificent cathedral, a vast Romanesque edifice. Its construction was begun in 1030 by Conrad II., the founder of the Franconian dynasty of German emperors, and in its original form it was completed in the reign of his grandson, Henry IV. It was long the burial place of the German emperors. It suffered in 1689 and 1794 from the vandalism of the French invaders, who spared nothing. The work of restoration was completed in 1858. The interior is embellished with magnificent frescoes, statues, and reliefs by Schraudolph and other masters. Among the other architectural monuments of the city is a splendid gate of the thirteenth century. Speyer has a fine museum of antiquities. The manufactures include woolens, machinery, shoes, tobacco, vinegar, and sugar. Speyer, the Roman Augusta Nemetum (later Noviomagus), was created an episcopal see in 348. It was a favorite residence of the German emperors, and became a free Imperial city in 1294. At the Diet of Speyer in 1529 the followers of Luther presented their protest, which gave them the appellation of Protestants. The city belonged to France from 1801 to 1814, when it passed to Bavaria. Population, in 1900, 20,911.

SPEZIA, spĕt'sê-ȧ. A city in the Province of Genoa, Italy, on the Gulf of Spezia, 56 miles by rail southeast of Genoa (Map: Italy, D 3). The beautiful scenery and mild climate have made it a favorite winter resort. The advantages of the Gulf as a naval station were pointed out by Napoleon I., and in 1861 the Italian Government made it the chief naval harbor of Italy. On the hills around the harbor there are strong fortifications. The ship-building yards are important, some of the largest Italian warships having been constructed here. The city has a technical institute, a school of navigation, and a marine hospital. Considerable trade is carried on, chiefly in olive oil, wine, fruits, and marble. There are manufactures of furniture, hemp-linen, and leather. Spezia is near the site of the ancient Luna, of which some remains exist. Population (commune), in 1881, 30,732; in 1901, 65,612.



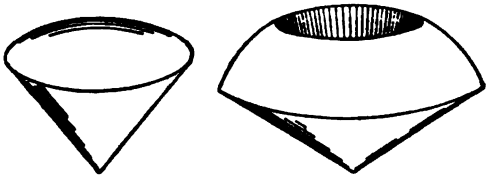
SPHACTE'RIA, or SPHAGIA. An island off the southwestern coast of Messenia, Greece, commanding the entrance to the Bay of Navarino.

SPHAGNUM (Neo-Lat., from Gk. *σφάγνος, sphagnos, σφάκος, sphakos, φάσκος, phaskos, φάσκον, phaskon*, sort of moss), or BOG MOSS. A genus of mosses intermediate between the liverworts and true mosses (see MUSCI) remarkable for their whitish or pale color. They often grow in considerable masses, absorbing water like sponge, but becoming friable when dry. They contribute much to the formation of peat, although peat from sphagnum alone is of poor quality. Gardeners employ them for covering and moistening the roots of plants because they readily absorb moisture from the air. The cells of the leaves are remarkable for their spiral structure, and for large pores in their sides. See Plate of BRYOPHYTES and Colored Plate under MUSCI.

SPHENE (from Gk. *σφήν, sphēn*, wedge; so called from the shape of the crystals). One of the light-colored (yellow or green) varieties of titanite (q.v.).

SPHENISCI (Neo-Lat. nom. pl., from Gk. *σφηνίσκος, sphēniskos*, diminutive of *σφήν, sphēn*, wedge). A group of birds, the penguins (q.v.).

SPHENOID BONE (Gk. *σφηνοειδής, sphēnoeidēs*, wedge-shaped, from *σφήν, sphēn*, wedge + *εἶδος, eidos*, form). A bone situated at the anterior part of the base of the skull, and articulated with all the other cranial bones, which it wedges firmly together. It somewhat resembles a bat with its wings extended, and hence was termed the *os vespertilionis*. It is divisible into a body, the greater and lesser wings, and various processes. The greater wings present three surfaces: a superior or cerebral surface, forming part of the floor on which the brain rests; an anterior surface, which assists to form the outer part of the orbit of the eye; and an external surface with a rough ridge, giving attachment to the external pterygoid muscle, one of the most powerful muscles of mastication. The second, third, fourth, fifth, and sixth cranial nerves emerge from the cranial cavity through foramina in this bone.



SPHENOID BONE AS SEEN FROM THE FRONT.

SPHERE (Lat. *sphæra*, from Gk. *σφαῖρα, sphaira*, ball, globe; connected with Lith. *spirà*, ball of dung, and perhaps with Skt. *sphar*, to hasten, stretch out). A solid bounded by a surface every point of which is at a given distance from a fixed point. The given distance is called the *radius* and the fixed point the *centre* of the sphere. A spherical surface may be generated by revolving a semi-circumference about its diameter. Sections of a sphere made by planes are circles. If the plane passes through the centre of the sphere, the circle is a *great* circle, otherwise a *small* circle of the sphere. If the segments into which a plane divides a sphere are unequal, the smaller is called the *minor* and the larger the *major* segment. That portion of the spherical surface which is included between two parallel planes which cut or touch the surface is called a *zone*. The portion of a sphere generated by the revolution of a circular sector about any diameter of its circle as an axis is called a *spherical sector*.

The surface of a sphere is equal to four times the area of a great circle of the sphere, or $4\pi r^2$, r being the radius of the sphere. Its volume is $\frac{4}{3}\pi r^3$. The rectangular equation of a sphere, the origin being at the centre, is $x^2 + y^2 + z^2 = r^2$. (See COÖRDINATES.) (For the formulas for areas and volumes relating

to zones, segments, and sectors, see MENSURATION.) A remarkable property of the sphere is that its surface is equal to the curved surface of the circumscribed cylinder and its volume is two-thirds of that of the cylinder, a property said to

SPHERICAL SECTORS. THE LEFT ONE A SPHERICAL CONE.

have been discovered by Archimedes (q.v.). If a sphere and a double cone be inscribed in an equilateral cylinder, the sphere and the volume between the cone and the cylinder are Cavalieri bodies. See CAVALIERI.

SPHERICAL TRIGONOMETRY. See TRIGONOMETRY.

SPHEROGRAPH. See SAILINGS.

SPHEROID. See ELLIPSOID.

SPHEROIDAL STATE (from *spheroid*, from Gk. *σφαιροειδής*, *sphairoeidēs*, like a ball or sphere, from *σφαῖρα*, *sphaira*, ball, globe + *εἶδος*, *eidos*, form). The phenomenon observed when a drop of water placed on a highly heated surface remains in its spherical shape and moves about over the surface, evaporating gradually, instead of vaporizing instantaneously. The experiment to show this condition of a liquid is generally performed by using a metallic disk heated by a lamp or Bunsen burner, on which one or more drops of water are carefully let fall. If the disk is sufficiently heated a layer of vapor will be formed between its surface and the drop, which is known as the 'Crookes's layer.' The liquid remains suspended on this vapor and the drop takes the form of an oblate spheroid, the temperature, however, never rising above the boiling point, being in the case of water about 206° F. or 96.6° C., while the disk itself must have a temperature of at least 340° F. or 171° C. The explanation of this fact is that the latent heat carried off in the course of vaporization is sufficient to keep the temperature below the boiling point. The drop does not actually touch the disk, but is supported on a cushion of vapor, which is evaporating toward the hot plate so rapidly as by its reaction to keep the water from falling. This may be seen by looking at a flame through the intervening space, or by attempting to pass an electric current from the drop of water to the metal disk, using a galvanometer to detect its passage, there being no deflection of the needle unless the two substances are in actual contact. The liquid takes a spherical shape owing to capillary action. Other liquids and bodies that are solid at ordinary temperatures also show this phenomenon, and instead of a metallic surface, that of a hot liquid can also be used. A striking illustration of this same principle is the immersion of a hand in molten metal, or in liquid air, the thin layer of aqueous vapor preventing the passage of the heat or cold to the hand. Consult: Stewart, *Elementary Treatise on Heat* (6th ed., Oxford, 1895); Barker, *Physics* (New York, 1893); Daniel, *Text-Book of the Principles of Physics* (3d ed., New York, 1894).

SPHINCTER MUSCLE (Lat. *sphincter*, from Gk. *σφιγκτήρ*, *sphinktēr*, that which binds tight, sphincter, from *σφίγγειν*, *sphingein*, to strangle; possibly connected with Arm. *pirk*, tight). A circular band of muscular fibres, whose function is to antagonize the expellent action of certain viscera, especially the bladder and the lower part of the intestinal canal. It is to the presence of these muscles that the higher animals owe the power of retaining for a considerable period the excrementitious matters collected in the bladder and rectum, and of discharging them at intervals, the sphincter muscles being, like those engaged in the process of respiration, mainly, but not entirely, under the control of the will.

SPHINX (Lat., from Gk. *σφίγξ*, *sphinx*, from *σφίγγειν*, *sphingein*, to strangle). A composite monster, famous in Greek mythology, having the head of a woman, the body of a lion, the wings of a bird, and the tail of a serpent. According to the legend, she proposed a riddle to the Thebans, slaying all who were unable to guess it, and when Œdipus finally solved her riddle, she threw herself over a cliff and perished. She is said to have been the daughter of Echidna and her son Orthrus, or of Chimæra and her brother Orthrus. The name sphinx was applied by the Greeks to a class of composite figures, familiar in Egyptian art, having the body of a lion and the head of a man or of some animal. A figure of this sort with a human head was called an androsphinx; one having a ram's head, a criosphinx; and one with a hawk's head, a hieracosphinx. Like the winged bulls and lions found in Assyria, the Egyptian sphinx was the guardian genius of the temple before which it stood. The avenues leading to many Egyptian temples were guarded by long rows of sphinxes placed at intervals on either side. Primarily the sphinx represented an imaginary human-headed animal, living in the desert, and believed to be a favorite incarnation assumed by the Sun-god Re. As a rule, the face was modeled after that of the reigning Pharaoh, the son of Re and his representative upon earth, and therefore Egyptian sphinxes were almost invariably male, though they might also present the features of a reigning queen. Where the sphinx has the head of an animal, the head is that of the animal sacred to the god before whose temple the figure is placed.

The most remarkable of all Egyptian sphinxes is the Great Sphinx of Ghizeh, lying about 300 feet east of the second pyramid. It is sculptured out of the native rock, to which masonry has been added in certain places to complete the form. The body is roughly hewn out, but the head was originally executed with great care. The entire height of the monument, from the crown of the head to the pavement on which the fore legs rest, is about 66 feet. In length the figure measures 172.5 feet; the fore legs are 50 feet long; and the head is 30 feet long by nearly 14 feet in breadth. The face was originally colored red, but the coloring has almost entirely disappeared. In 1816 the front of the Sphinx was cleared of sand by Caviglia, who found close to the breast a shrine, or small temple, containing an inscription of Thothmes IV. and one of Rameses II. Both monarchs had cleared away the sand that had accumulated about the monument. From the inscription of Thothmes IV. it is clear that the

Sphinx was considered to represent Harmachis (q.v.), a special form of the sun-god, and its office was to serve as a guardian of the necropolis near the pyramids. It has been supposed to be the work of King Chephren of the Fourth Dynasty, and some archæologists have even assigned it to an earlier period, but the existing evidence is insufficient to fix its date with any degree of accuracy. Consult: Vyse, *The Pyramids of Gizeh* (London, 1840); Lepsius, *Denkmäler* (Berlin, 1849-58); Perrot and Chipiez, *History of Art in Ancient Egypt* (London, 1883); Baedeker, *Aegypten* (4th ed., Berlin, 1897); Petrie, *A History of Egypt* (New York, 1899); Budge, *A History of Egypt* (ib., 1902). See Plate of PYRAMIDS.

SPHINX MOTHS. Moths of the family Sphingidæ, described under HAWK-MOTH. Prominent American examples are depicted on the Colored Plates of MOTHS, and of INSECTS.

SPHYGMOGRAPH (from Gk. *σφυγμός, sphygmos*, pulse + *γράφειν, graphein*, to write). An instrument invented by Vierovdt and perfected by Marey, by which are ascertained and permanently recorded the force and frequency of the pulse-beat and the changes which it undergoes. It consists of two essential parts: (1) Of two levers, one of which is so delicately adjusted on the vessel the pulsation of which it is desired to examine, that on each expansion of the vessel the lever undergoes a corresponding slight elevation; this lever communicates by a perpendicular arm with a second, to which it transmits the impulse received from the vessel; the extremity of this second lever is armed with a pen-point, which records the movement thus indicated on a movable plate, controlled by the second part of the instrument. (2) The second portion consists of a plate, moved by clockwork, and bearing a strip of paper on which the sphygmogram is written. The instrument may be combined with a microphone, constituting a sphygmophone. The pulsations may be seen by an appliance termed a sphygmoscope.

SPICCATO, spē-kä'tō (It., separated). A term in music indicating a distinct and detached mode of performance. Its usual application is to music for bowed instruments, where it implies that each note is to be played with a springing bow. The bow is allowed to fall by its own weight upon the string; it rebounds and falls again, thus producing the next tone.

SPICE BUSH. See FEVER BUSH.

SPICE ISLANDS. A group of islands in the Dutch East Indies. See MOLUCCAS.

SPICES. See FLAVORING PLANTS.

SPIDER (ME. *spither*, from AS., Goth., OHG. *spinnan*, Ger. *spinnen*, to spin; cf. OHG. *spinna*, Ger. *Spinne*, spinner, spider). Any member of the Araneida, an order in the class Arachnida. The arachnids are distinguished from insects by the possession of four pairs of legs; while spiders are separated from other Arachnida by the presence of spinning-organs near the tip of the body. The body of a spider is divided into two portions connected by a small slender pedicel. The anterior part is called 'cephalothorax,' and is supposed to represent the combined head and thorax of insects. The posterior part is the 'abdomen.' On the anterior part of the cephalothorax are the eyes, commonly eight in number, and frequently arranged in two transverse rows of four each. In the lower front margin of the cephalothorax are the mouth-parts. These consist of a pair of jaws, sometimes called mandibles or 'falces;' a pair of palpi, whose basal joints are enlarged into maxillæ; and a median unpaired lower lip. The mandibles are two-jointed; the basal joint is very large and stout, the apical one is small, claw-like, and called the 'fang.' The palpi are filiform, and six-jointed. In the female they are simple and often terminate in a claw; in the male, however, the apical joint is curiously modified into a complicated accessory sexual organ, suited to carry and apply the seminal fluid. The four pairs of legs are similar in structure, but variable in length. Each consists of seven joints, and ends in two or three toothed claws. The spiders that live on webs usually have three claws, the median more curved than the others; while other spiders commonly have but two. In place of the median claw is sometimes a dense fascicle of hairs. The abdomen of spiders is generally soft, tumid, and has no apparent joints. The genital organ opens near the base of the abdomen beneath. The male aperture is inconspicuous, but the female vulva or epigynum is often very prominent, and sometimes quite complicated. At the apex of the abdomen are four to six short, often two-jointed pieces, the spinnerets or spinning-organs. Each spinneret has on its surface many minute orifices, from each of which may issue a thread, and the many threads joined together make the spider's line. The substance which exudes from the spinnerets is glutinous, but dries on contact with the air. Some spiders possess an accessory spinning-organ, a transverse surface in front of the base of the spinnerets known as the 'cribellum.' Correlated with this is a row of curved hairs on the hind metatarsus, called the 'calamistrum.' The spider draws the row of hairs over the cribellum and combs out a curled or tangled thread of silk.

The mouth of the spider opens into a short œsophagus, which leads to a sucking-stomach which draws up the liquid food. From the posterior part of this organ arise two branches which extend upward and forward and meet over the mouth; each branch gives off on the outer side four smaller branches, one in front of each leg, and these unite below the sucking-stomach. From the stomach arises the intestine, which passes into the abdomen and opens just behind the spinnerets. In the abdomen just above the intestine is a long tubular heart or pulsating vessel, with openings in front, behind, and along the sides. The nervous system is represented by a large, long ganglionic mass lying on the floor of the cephalothorax. In front is a smaller mass which gives rise to nerves to the eyes and jaws. At the base of the abdomen below there is a cavity on each side, nearly filled by a series of thin plates through which the air reaches the blood. These are the 'lungs.' Spiders also have a pair of branching tracheæ, which open just in front of the spinnerets. The silk-glands lie above the spinnerets and along the floor of the abdomen. They are of two kinds, most of them short, but two are larger and very long. Each silk-gland has a separate opening or duct in the spinnerets.

The eggs are deposited (10 to 2000 in number) within silken cases or cocoons made by the mother spider for this purpose. The young spider on hatching is in general appearance much like the parent, but with larger hairs, and less distinctly marked. As the young spider grows, it is obliged to molt the skin. The number of molts varies from six to nine. The spider's silk is not used solely in the construction of webs, but serves a variety of purposes. With many spiders the web is a loose, irregular maze of crossed threads, which are the true 'cobwebs.' In other cases it is a flat sheet of threads with a tubular retreat at one corner. The geometric or orb webs consist of a varying number of radiating lines, crossed by many parallel or spiral threads. The whole is supported by several guy-lines or stouter threads. At one corner or in the near vicinity is a silken nest or retreat, where the spider remains concealed during the day or when not using the web. This retreat is connected by a line to the centre of the web. When waiting for prey the spider rests upon the centre of the web, head downward and legs extended. See ORB-WEAVER.

The male spider is usually smaller than the female, with longer legs, and often is more highly colored; sometimes he has additional spines on the legs, or spurs on the coxæ. In many of the minute species the male has the front of the cephalothorax greatly swollen and elevated, often molded into grotesque shapes. The courtship of spiders is frequently attended with grave peril to the male. The female, if not in the suitable temper, may attack and devour her devoted admirer. In some cases, however, the male is larger than his mate.

As a rule spiders can see clearly only for a few inches. They have an acute sense of hearing, as well as of touch. A number of spiders are so shaped or colored as to deceptively resemble ants, an appearance heightened by their erratic movements. Others resemble the surfaces upon which they usually occur, as the bark of trees, dead leaves or twigs, and the petals of flowers. A few are able to produce sounds; some by rubbing the base of the abdomen over the base of the cephalothorax, others by rubbing the palpi against the sides of the mandibles. A considerable number, known as trap-door spiders, dig holes in the ground, line them with silk, and cover the entrance by a close-fitting door, the upper surface of which is made to resemble its surrounding. Some species make similar nests in trees. A few spiders are social and produce webs in common, or closely connected to each other. Some of the large spiders are very powerful and can kill small birds, rats, fish, and other animals. All spiders have poison-glands and use them in capturing prey, but with most spiders the mandibles are so small and weak as to be incapable of piercing the human skin, and if they did so the small amount of poison injected could have no deleterious effect. With the large tarantulas it is different, although cases of death from their bites are few and doubtful. There is one group of spiders, however (genus Latrodectus), which appear to merit the name of 'poisonous spiders.' The New Zealand species, locally known as 'katipo' (q.v.), certainly appears to be dangerous. A species of Latrodectus occurs in the Southern United States, where it is called 'malmignatte,' but its bite (as far as known) has not proved fatal.

The classification of spiders, formerly quite simple and based on their habits and webs, has undergone a complete revolution. Thirty-five or forty families are now known; several, however, contain but few species. The more prominent families may be grouped in two classes for convenience. Of the non-web-building kinds are the Theraphosidæ, or tarantulas, and trap-door spiders. They have vertically moving fangs, four lung-slits, and are of large size. The Dysderidæ possess but six eyes and live in dark places. The Drassidæ are flat, with prominent spinnerets, and live on the ground or under stones. The Clubionidæ are convex and occur on bushes or among dead leaves. The Sparassidæ are very flat and broad and are abundant in the tropics. The Thomisidæ, or crab-spiders, are flat, broad, can walk sidewise, and catch prey by the fore legs. The Lycosidæ, or wolf-spiders, have the eyes in three rows, those of the lowest very small; they wander in woods and fields. The Attidæ, or jumping spiders, have eyes in three rows, those of the lowest row the largest; they jump, and stalk their prey.

Among web-building forms are the Agalenidæ, which make flat sheets of web with a tubular retreat at one side; the Dictynidæ, which possess a cribellum, and make irregular webs, with curled threads; the Theridiidæ, which make the familiar cobweb; and the Epeiridæ, which make geometric or orb webs.

Consult: Emerton, *The Common Spiders of the United States* (Boston, 1902); McCook, *American Spiders and Their Spinning Work* (Philadelphia, 1889); Cambridge, *The Spiders of Dorset* (Sherbourne, 1879-81).

SPIDER-CRAB. Any crab in which the legs are of unusual length in comparison with the body. The famous giant crab of Japan (*Macrochira Kempferi*) is the largest known spider-crab, and has legs from four to six feet in length. On the eastern coast of the United States the name is usually given to species of Libinia, especially *Libinia canaliculata*, which is very common on muddy shores or flats.

SPIDER-MONKEY, or COAITA. Any American monkey of the genus Ateles, characterized by slenderness and agility (see MONKEY). They frequent in small bands the tallest forest trees, moving swiftly by astonishing leaps, sprawling out like spiders, and catching by their perfectly prehensile tails. Most are black or nearly so, with the face shaded by projecting hair, which is either light or dark in color. They are mild, intelligent, and make interesting pets. Ten species occur between Southern Brazil and Central Mexico, of which the Amazonian red-faced (see Plate of MONKEYS) and the Mexican one are best known. Their food is mainly fruits and insects, and their flesh is eaten.

SPIEGEL, spē'gel, FRIEDRICH VON (1820—). A German Orientalist, one of the pioneers in the field of Iranian philology. He was born in Kitzingen, studied at Erlangen, Leipzig, and Bonn, then spent five years in the libraries of Copenhagen, Paris, London, and Oxford, and from 1849 to 1890 was professor of Oriental languages in the University of Erlangen. His early studies on Pali and the publication of the *Kammavâkya*

(1841) and the *Ancedota Palica* (1845) did much for the knowledge of southern Buddhism. They were quickly followed by his researches on Zoroastrianism and the Avesta. The edition of the greater part of the extant Avesta, together with the Pahlavi translation (1853-58), was followed by a German version (1852-63), and supplemented by a commentary (1865-69). He published a number of Persian works, as well as grammars of the Old Persian and Old Bactrian languages. Then came the valuable linguistic and archæological works, *Die altpersischen Keilinschriften* (1862), *Erân* (1863), *Erânische Altertumskunde* (1871-78), *Vergleichende Grammatik der alterânischen Sprachen* (1882), and *Die arische Periode und ihre Zustände* (1887). Mention should be made of a *Chrestomathia Persica* (1845), of the *Grammatik der Parsisprache* (1851), and of the *Einleitung in die traditionellen Schriften der Parsen* (1856-60).

SPIELHAGEN, spēl'hä-gen, FRIEDRICH (1829—). A German novelist, born at Magdeburg, and educated at Berlin, Bonn, and Greifswald. He taught for a while at Leipzig, and in 1859 became editor of the *Zeitung für Norddeutschland*, in Hanover. Thence he moved in 1862 to Berlin, and edited (1878-84) Westermann's *Illustrirte Monatschefte*. Spielhagen began novel-writing with *Problematische Naturen* (1860), and then for a while dealt with social problems, arising from the irrepressible conflict between the stolid landed nobility and the intelligence of the nation. In several books (*Durch Nacht zum Licht*, 1861; *Die von Hohenstein*, 1863; *In Reih und Glied*, 1866; *Hammer und Amboss*, 1869) he treated the subject with an aggressive optimism that won him a popularity which he afterwards maintained by sensational novels of a lower type. Of these *Sturmflut* (1877), *Der neue Pharao* (1899), and *Freigeboren* (1900) are sufficient exemplars. Excellent are his critical *Beiträge zur Theorie und Technik des Romans* (1883). His own ideal for the novel is to present an artistically composed picture of the times, and for this he makes constant hardly veiled allusions to persons of contemporary prominence, so that his novels lose with time something of their significance and actuality. As a translator Spielhagen rendered into German Curtis's *Howadji*, Emerson's *English Traits*, a selection of American poems (1859; 2d ed. 1865), and Roscoe's *Lorenzo de' Medici*. He also translated from the French minor works of Michelet, *L'amour*, *La femme*, *La mer*. His collected novels appeared in 22 vols. in 1895. Consult his autobiographical *Finder und Erfinder* (1890), and Karpeles, *Friedrich Spielhagen* (Leipzig, 1889).

SPIELMANN, spēl'man, MARION H. (1858—). An English art critic and author. He was born in London and studied at University College, London, with a view to becoming an engineer. He soon turned to literature, beginning with articles on art for the *Pall Mall Gazette* (1883). Afterwards he became art critic of the *Daily Graphic*, art editor of *Black and White*, and (1887) editor of the *Magazine of Art*. Among his publications are the *History of Punch* (1895), exceedingly well done; *Millais and His Works* (1898); *The Unidentified Contributions of Thackeray to Punch* (1899); *John Ruskin* (1900); *Notes on the Wallace Collection in Hertford House* (1900); and *British Soulpture and Soulptors of To-Day* (1902).

SPIGELIA (Neo-Lat., named in honor of Adrian van der *Spiegel*, a Belgian physician and professor of anatomy at Padua in the seventeenth century). A genus of plants of the natural order Loganiaceæ. *Spigelia marilandica*, often called worm grass and Carolina pinkroot, a native of the Southern United States, occurring from New Jersey to Wisconsin, and west to Texas, is a perennial plant with a simple quadrangular stem. The root has been employed in the United States as a vermifuge, as has also *Spigelia anthelmia*, a tropical American annual with spike-like racemes of purplish flowers.

SPIKE. A kind of inflorescence (q.v.).

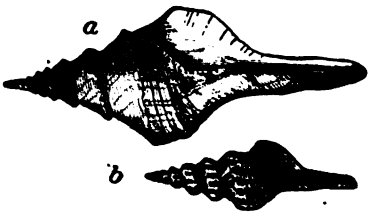
SPIKENARD (OF. *spiquenard*, from Lat. *spica nardi*, spike of nard, from *spica*, spike, point, head or tuft of a plant, and *nardi*, gen. sg. of *nardus*, Gk. *νάρδος*, nard, from Pers. *nard*, from Skt. *nalada*, Indian spikenard), or NARD. A costly perfume of India highly prized by the ancients and used both in baths and at feasts. The 'ointment of spikenard' (John xii. 3) was probably an oil or fat impregnated with the perfume. The plant which produces it has been ascertained to be the Nardostachys jatamansi, a native of the mountains of Northern India. The root, which is from three to twelve inches long, sends up many stems, with little spikes of purple flowers, which have four stamens. Andropogon nardus yields an oil which is sometimes called oil of spikenard; and in the United States Aralia racemosa, a tall herb with large perennial spicy aromatic roots, is known as spikenard. See ARALIA.

SPINA BIFIDA (Lat., cleft spine). A congenital hernia of the membranes of the spinal cord through a fissure in the wall of the bony canal. A tumor is thus formed, which is nearly round, varying in size from that of an egg to that of an adult head, lying in the middle line of the back, fluctuating, and adhering to the adjacent vertebræ either directly or by a pedicle. The sac may contain only the spinal membranes (meningocele) or a part of the cord with the membranes (meningo-myelocele), or lastly the spinal cord so distended by the expansion of the central canal as to form a neural lining to the sac. The usual termination of the condition is death. As the size of the tumor increases, fatal convulsions ensue; or the skin investing the tumor may ulcerate, and suffocation follow. Occasional cases are, however, recorded in which patients with this affection have survived till middle life. Active surgical treatment usually hastens death, and should only be used in the most urgent circumstances. Moderate support by means of a hollow truss, or a well-padded concave shield, may tend to keep the disease stationary; and any interference beyond this is, in the great majority of cases, unadvisable.

SPINACH, or **SPINAGE** (OF. *spinache*, *espinache*, *espinage*, *espinace*, from ML. *spinacia*, *spinacium*, spinach, from Lat. *spina*, thorn, spine, so called because of the prickly fruit), *Spinacia*. A genus of herbs of the natural order Chenopodiaceæ; probably natives of Asia. Common spinach, or garden spinach (*Spinacia oleracea*),

is an annual widely cultivated for its young leaves, which are used as greens. Two very distinct botanical varieties are cultivated: prickly spinach, with somewhat triangular and arrow-headed leaves and rough knobby fruit; smooth spinach, or round spinach (*Spinacia glabra* of some botanists), with round and blunt leaves and smooth fruit. Upon poor soil and after the appearance of the stem, which reaches a height of two feet, the leaves become bitter, hence the more luxuriantly spinach grows, the better it is. It may be sown in spring in rows about one foot apart, but it is generally sown in autumn for early spring use. The smooth spinach is very generally preferred for the former purpose, and the prickly kind for the latter. Several unrelated plants are also called spinach, of which the best known is New Zealand spinach (*Tetragonia expansa*), a plant of the natural order Mesembryaceæ, a trailing, succulent annual that withstands the heat of summer and is a valuable successor to true spinach. See Plate of YAM, SWEET POTATOES, etc.

SPINAL CARIES. See SPINE, CURVATURE OF THE.



SPINAL COLUMN (Lat. *spinalis*, relating to a thorn or to the spine, from *spina*, thorn, spine), or SPINE. The most important and characteristic part of the skeleton of the highest animal sub-kingdom, which includes mammals, birds, reptiles, amphibians, and fishes. In each of these classes it is composed of a series of bones placed one above or in front of another, and called the vertebræ; and hence, these animals, having this distinguishing characteristic in common, are all included in the term *vertebrates*. The vertebræ vary greatly in number in different animals, and in shape they differ extremely, even in different parts of the same spine, in accordance with their special functions. In man the number of vertebræ which collectively form the spinal column is 7 in the neck (cervical vertebræ), 12 in the back (dorsal vertebræ), 5 in the loins (lumbar vertebræ), 5 ossified together, forming the sacrum, and 4 similarly united forming the termination of the column or coccyx. However long or short the neck may be, every mammal has 7 cervical vertebræ, excepting the three-toed sloth, which has 9, and the sea-cow, which has 6. In the other regions of the spine no such law exists. Each vertebra is attached to the two between which it lies by numerous strong and more or less elastic ligaments, and between each pair of vertebræ there is interposed a lenticular disk of fibro-cartilage, which acts as a buffer. By these arrangements the spinal column is rendered highly elastic, the communication of jars or shocks is prevented, and a very considerable general range of movement permitted, although the motion between any two adjacent vertebræ is slight. The elasticity of the column is further increased by the component vertebræ being arranged in curves, instead of being placed perpendicularly. These curves enable the spine to bear a greater vertical weight than it could otherwise maintain; they facilitate the movements of the body, especially in the act of running; and they are so disposed as to protect the cord in movements of the spine.

The vertebral canal formed by the apposition of the spinal foramina, or neural arches, and containing and protecting the spinal cord, varies in its size at different parts of the column. The intervertebral foramina through which the nerves emerge vary in shape and position in different parts, but are always of sufficient size to prevent injurious pressure on the nerves during movements of the spine; and in the dorsal region, which is the ordinary seat of angular curvature, the nerves are so protected by bony arches that they may escape injury, even when the bodies of several dorsal vertebræ have been destroyed by ulceration.

SPINAL CORD. See NERVOUS SYSTEM AND BRAIN.

SPINDLER, KARL (1796-1855). A German novelist, born at Breslau. He studied law at Strassburg, fled thence to escape being drafted into the military service of France, and became an actor. In 1825 he turned to literature, and became one of the group, including Hauff and Häring ('Wilibald Alexis'), which imitated in historical fiction the *Waverley* methods of Scott. Most of his work, which fills 101 volumes in the Stuttgart collective edition of 1854-56, while fascinating as to plot, is careless in execution. In a few cases, however, as *Der Jesuit* (1820), *Der Jude* (1827), *Der Invalide* (1831), and *Der Vogelhändler von Imst* (1842), he skillfully depicted the historical background, and merited, though he did not gain, a more than temporary success.

SPINDLESHELL. A genus (Fusus) of gastropodous mollusks nearly allied to Murex (q.v.), having a spindle-shaped shell, with a very elevated spire, the first whorl often much

SPINDLE-SHELLS

a, A living species (*Fusus proboscidalis*); *b*, A fossil (Miocene) species (*Fusus longirostris*).

dilated, and with a straight elongated canal. About 100 existing species have been described, and more than three times that number of fossil ones.

SPINDLE TREE (*Euonymus*). A genus of about 60 species of shrubs or small trees of the natural order Celastraceæ. The common spindle tree (*Euonymus Europæus*), a European shrub with an orange-colored aril, is often planted for ornament. The hard, fine-grained wood is used for fine turnery and for skewers. It was formerly used for making musical instruments and for spindles, whence the name. Charcoal made of it is much valued for crayons. In the United States wahoo, or burning bush (*Euonymus atropurpureus*), is a small crimson-fruited tree or shrub, which occurs from New York to Nebraska and southward. Strawberry bush (*Euonymus Americanus*) is a low shrub often found along wooded river banks from Illinois southward.

SPINDLE TREE (*Euonymus Europæus*).

SPINE, CURVATURE OF THE. There are two distinct forms of curvature, *lateral curvature*, arising from weakness of the bones, ligaments, and muscles, and *angular curvature*, which results from carious disease of the vertebræ.

Lateral curvature of the spine, or scoliosis, is not simply a bending of the spine laterally. In addition there is also considerable rotation or twisting of the vertebral bodies which normally are held in their proper relation and position by the ligaments and muscles. Muscular action is necessary for the maintenance of the erect pose; and if, through fatigue and exhaustion or through muscular weakness, from disease, such as rickets (q.v.), the muscles fail to act, a temporary deformity is brought about. If this is not remedied the ligaments become relaxed, the bones which are not yet fully developed adopt their growth to conform to the new relations, and the deformity persists. Postural habits, such as standing on one leg or sitting incorrectly at a desk, tend to distort the spine and to stretch certain ligaments, and often result in permanent deformity.

Lateral curvature is more frequent among girls than among boys, for their muscles are less developed by physical exercise and their general strength is often unequal to the strain put upon them in their school life. In lateral curvature the bodies of the vertebræ rotate toward the convexity and the spines toward the concavity of the curve. In the dorsal region the ribs are carried with the vertebræ in their rotation, and therefore the chest becomes deformed and the functions of heart and lungs are seriously interfered with. In order to maintain the erect position a compensatory curve develops. In the dorsal region the tendency is to the right, while in the lumbar region it is to the left.

The subjects of this affection do not usually complain of pain and often nothing wrong is noticed except an awkwardness in gait or a tendency to carry one shoulder higher than the spinal processes and the abnormal curve of the spine. Spinal supports and plaster jackets are not to be used. The whole treatment should be directed to strengthening the muscles by exercise and massage. Exercise, however, must not be carried to excess, for this will only aggravate the existing conditions.

Angular curvature of the spine, commonly known as *Pott's disease*, is the result of caries of the vertebræ, a disease essentially tubercular in character. It occurs most frequently in children between the ages of three and twelve years, but is also met with in babes and in adults. An injury such as a blow or a fall often acts as an important factor, but at times we can trace no existing cause whatever. The most common seat of disease is in the dorsal vertebræ. The inflammation begins in the bodies of the vertebræ, and as they become softened or destroyed the spinal column above settles down upon the healthy portion below and the spines of the diseased vertebræ are pushed backward, producing a deformity more or less marked.

The symptoms are rigidity of the spine with tenderness and a deformity of varying degree. Sometimes abscesses form and pus and bony debris are evacuated (especially lumbar and psoas abscesses). The pain is frequently marked and in some cases pressure upon the spinal cord or nerves gives symptoms of an aggravated type. The disease is slow, with a poor prognosis, although the chances are vastly improved if treatment is begun early. The best we can hope for is an arrest of the disease and an ankylosis at the site of the trouble. Rest of the spine is the essential factor in treatment, and is obtained by a plaster-of-Paris jacket or some one of the surgical appliances especially adapted to special regions. General treatment and hygiene are of course necessary.

SPINEL (OF. *spinelle*, *espinelle*, Fr. *spinelle*, spinel, from Lat. *spina*, thorn, spine). A mineral magnesium aluminate crystallized in the orthorhombic system. It has a vitreous lustre and is found in various shades of red, passing into blue, green, yellow, brown, black, and occasionally nearly white. It is highly prized as a gem, and the transparent red colored crystals are called *spinel rubies;* while the violet and purple ones are known as *almandine;* the rose-red to pink colored varieties as *balas rubies;* the black varieties as *pleonaste;* the yellow or orange spinels are called *rubicelle*, and the pale to sapphire-blue kinds are known as *sapphirine.* The gem varieties are found for the most part in Ceylon, Siam, and other Eastern countries, and near Franklin, N. J., crystals occur that occasionally afford small gems.

SPINELLO ARETINO, spē-nĕl'lō ä'rā-tē'no, properly LUCA SPINELLO (c.1333-1410). A Florentine painter, a prominent representative of the declining school of Giotto. He was born in Florence, of a family of Aretine goldsmiths settled there, and probably was a pupil of Jacopo di Casentino. He was employed upon the chief decorative tasks of Middle Italy, in the churches of Florence, in the Campo Santo of Pisa, where he painted scenes from the lives of Saints Ephesus and Hippolytus, and in the Palazzo Pubblico of Siena, decorating the Sala di Badia with subjects from the life of

Pope Alexander III. His best preserved works are the frescoes of the "Life of Saint Benedict," in San Miniato, Florence. He also executed extensive frescoes at Casentino and Arezzo, where, in Santa Maria degli Angeli, was his celebrated "Fall of Lucifer," which gave rise to Vasari's well-known fable that the painter died of fright in consequence of an apparition of Lucifer calling him to account for the painting. Spinello's work is facile in composition and vivacious in presentation, but superficial in form and execution.

SPINET (OF. *espinette*, Fr. *épinette*, from It. *spinetta*, spinet, point, diminutive of *spina*, from Lat. *spina*, thorn, spine). A stringed musical instrument with a keyboard, smaller and

SPINET.

weaker than the harpsichord, and, like it, one of the precursors of the pianoforte. The general outline of the instrument nearly resembled that of a harp laid in a horizontal position, with the keys occupying the position of the sounding-board. The oldest extant specimen is dated 1490.

SPINNAKER. A triangular racing sail carried by yachts. It hoists to the foremast or foretopmast head and is spread by a boom which is, at other times, carried up and down the foremast. The spinnaker is only set when the wind is free or behind the yacht. See YACHT.

SPIN'NER, FRANCIS ELIAS (1802-90). An American political leader, born at German Flats, now Mohawk, N. Y. From 1845 to 1849 he was auditor of the naval office in New York City. In 1854 he was elected to Congress as a Free-Soil Democrat, but soon identified himself with the newly organized Republican Party, and was twice reëlected to Congress, serving from 1855 until 1861, when he was appointed Treasurer of the United States. This position he filled with great credit until 1875, when he resigned on account of failing health and went to Florida, where he passed the remainder of his life. During his administration women were first employed as clerks in the Treasury Department to take the places of the men who enlisted in the Federal armies.

SPINNING (from *spin*, from AS., Goth., OHG. *spinnan*, Ger. *spinnen*, to spin; probably connected with AS., OHG. *spannan*, Ger. *spannen*, Eng. *span*, to stretch out, extend, and ultimately with Lat. *spatium*, extent, Gk. *σπᾶν*, *span*, to draw out). The art of drawing, twisting, and combining either animal or vegetable fibres, so that they are formed into continuous threads ready for the further operations of weaving, knitting, or sewing. The principal textile fibres are silk, wool, flax, jute, and cotton (qq.v.), and the method of spinning each of these substances differs slightly from the rest.

The most ancient instruments for spinning were the *spindle* and *distaff*, representations of which are to be seen on the earliest Egyptian monuments. The distaff was a stick or staff upon which a bundle of the prepared material was loosely bound, and which was held in the left hand or stuck in the belt; the spindle was a smaller tapering piece to which the thread was attached. By a dexterous twirl of the hand the spindle was made to spin round and at the same time recede from the spinster, who drew out between the forefinger and thumb of the right hand a regular stream of fibres so long as the twisting of the spindle lasted. It was then drawn in, the new length of thread wound upon it, and the operation renewed. An obvious improvement in this device was to set the spindle in a frame and make it revolve by a band passing over a wheel, driven by occasional impetus from the hand.

The *Saxon wheel* is said to have been invented in Nuremberg in 1530. This wheel, used only for flax-spinning, contained the germ of Arkwright's invention, described later on. A bobbin or 'pirn' with a separate motion was placed on the spindle, which had a bent arm—a flyer or flight—for winding the yarn on the bobbin. The spindle and bobbin revolved at different speeds, the revolutions of the spindle giving the twist, and the difference of the speed causing the winding on. The two-handed wheel had two spindles and pirns a little apart, with the distaff stuck into the frame between them, and the spinster produced a thread with each hand.

During the last half of the eighteenth century three inventions were made which completely revolutionized the art of spinning. These three inventions were Hargreaves's *spinning jenny*, Arkwright's *throstle machine* or *roll-drawing spinning machine*, and Crompton's *mule spinner*.

In the spinning jenny a number of large reels of fibre formed into a thickish coil, called a *roving*, were set on upright fixed spindles, and the ends of the rovings were passed between two small movable bars of wood placed horizontally and under the control of the spinner, who could thus make them press more or less on the roving, and consequently increase or decrease the draw upon it from the spinning spindles, which were set in a row at the other end of the frame, and all capable of being set in motion simultaneously by the wheel. The spinner drew out the rovings by moving the bars back and forth and at the same time turned the crank with his right hand to rotate the spindles.

The *throstle machine*, patented by Arkwright in 1769, had for its object the drawing of the rovings through a succession of pairs of rollers, each pair in advance of the others, and moving at different rates of speed. The first pair receive the sliver, compress it, and pass it on to the second pair, which revolve at a greater speed, and thus pull it out to exactly the number of times

greater length that their revolutions exceed those of the other pair, and as the first roving is passed though a second, third, and sometimes fourth machine, the finished roving is 32 times longer than the sliver. As the roving issues through the last rollers of each machine it is received on *spools* or *reels*, calculated to hold a given quantity; and these are transferred to the *spinning frames*, which resemble the *roving frames*. Here the roving takes the place of the sliver, and, as it unwinds from the spool, is drawn through successive pairs of rollers, moving as before at different rates, each succeeding pair faster than the backward ones, so that the roving gets thinner and thinner, until the tenuity is carried as far as

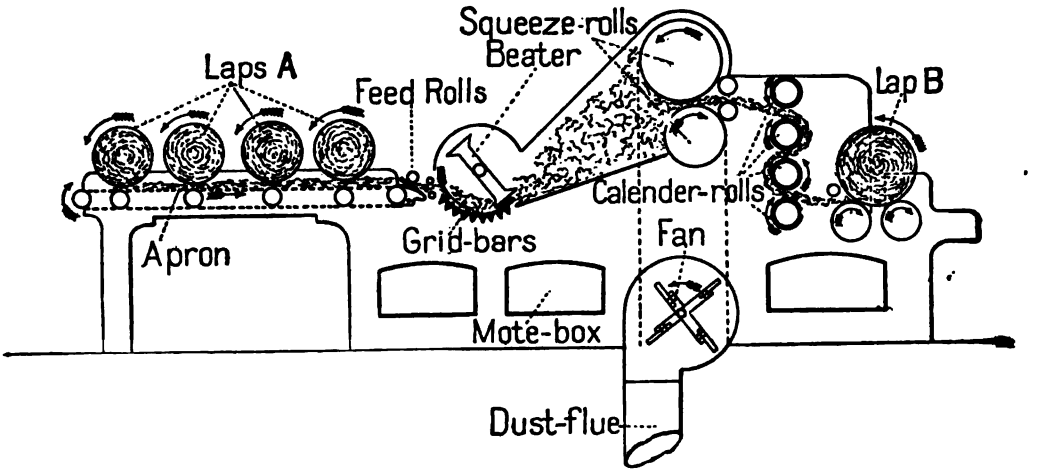


FIG. 1. SECTION OF INTERMEDIATE OR FINISHER-LAPPER.

desirable. It is then carried on to a spindle which revolves with great rapidity, and, by means of a simple arrangement, is made both to twist the thread and wind it on the spindle ready for the weaver.

It was found that the process of spinning by rollers produced too great a strain upon the thread in its progress to admit of its being drawn as fine as is wanted for many purposes, and this led to the invention of the mule jenny by Crompton in 1779, which has a traveling frame upon which the spindles are set, and which in its modern form is described below.

During the nineteenth century many important improvements were made in the details of the construction of spinning machinery, but the general principles are those worked out a hundred years ago. The greatest improvements have been changes in the construction of spindles, allowing them to revolve more rapidly and freely. In the modern factory spinning is the final process in a series of operations necessary to convert the raw fibre into thread. Each of these processes has for its object the removal of smaller and smaller impurities and the production of a finer and stronger thread. These are: (1) opening and picking; (2) carding and combing; (3) drawing; (4) roving; (5) spinning. Other intermediate operations may be introduced.

The *opener* or *breaker lapper* is a similar machine to the *intermediate* or *finisher lappers*, as shown in Fig. 1, and described below. In the breaker lapper the cotton as taken from the bale is fed to it in a hopper or by some kind of automatic feed, and delivered in laps which are then placed on the intermediate lapper, either 3 or 4 laps being 'doubled' on the same and the cotton after being loosened and further cleaned is delivered in laps to be placed on the finisher lapper, 3 or 4 laps from the intermediate being again 'doubled' and delivered in a single lap ready for the card. The function of the lappers is to thoroughly loosen the lumps of cotton as taken from the bale, to remove dirt and dust and as much leaf, trash, and motes as possible. There are usually three of these, the breaker, intermediate, and finisher lapper. Fig. 1 is a section of an *intermediate* or *finisher lapper*. The cotton enters these machines in a sheet made up from the laps, A, delivered onto the slowly moving apron, from which it is taken by the feed-rolls and delivered to the rapidly revolving *beater*, which forces it against the *grid-bars*, loosening the dirt and motes which fall through the *grids* into the *mote-box*. The cotton is left in a light and feathery mass which is drawn between the *squeeze-rolls* by the suction of the fan, which also draws the dust and fine dirt from the beaten mass and discharges them through the *dust-flue*. The sheet of cotton from the squeeze-rolls is taken by the *calender-rolls*, and compressed and finally rolled into the lap B. The lap is about one inch in thickness, 40 inches to 48 inches wide, and usually from 48 to 52 yards long.

After the cotton has passed through the series of lappers the laps from the finisher lapper go to the *card* (Fig. 2). (See CARDING.) The cotton in the lap A is delivered to the *feed-roll* of the card and is grasped by the teeth of the *licker-in* or *taker-in*, from which it is taken in a thin sheet by the fine wire teeth of the *card-clothing* on the *cylinder* B, and carried upward to come in contact with the teeth on the clothing of the *top-flats*, and the fibres are combed into a degree of parallelism—the *cylinder* revolving rapidly, while the *flats*, which are in a chain, move slowly forward so that new *flats* are continually coming in contact with the cylinder—and much of the short and broken fibres is removed; the *comb*, C, removes the short fibres

from the *flats* and they are rolled upon the *rod*, and the flats are further cleaned by the brush. The carded cotton is taken from the *cylinder* by the *doffer cylinder*, the latter having a surface velocity somewhat less than that of the main cylinder, and is removed from the *doffer* by the *comb*, D, in a thin evenly carded film; this film is drawn through the *trumpet* by the *calender-rolls*, in a round strand about one inch thick called a *sliver*, which is automatically coiled in the *sliver-can* by the *coiler*.

As all the processes are arranged to 'double' the mass of cotton and then to reduce the mass in size by 'drawing' it out to several times its original length until the yarn is finally produced, an examination of Fig. 3 will help the reader to understand how the 'drawing' acts on the fibres. On the left is shown the *sliver* from the card, the cotton being in a more or less tangled condition, but after passing between the successive pairs of *drawing-rolls*, 4.4', the last or right hand pair, revolving faster than the others, 'draws' the fibres past each other and straightens them, bringing them into a nearly parallel position.

The card-sliver goes first to the *drawing frame*, Fig. 4, and four or six slivers, A, are combined by passing them through the drawing rolls as above described. The *drawing sliver* is carried through the trumpet and deposited in the can by the coiler the same as from the card. This drawing process is repeated two or three times as the work may demand, always 'doubling' and 'drawing,' but without putting in any twist. After the drawing frames, the drawn sliver is placed in cans, behind the first of the *roving frames* which have rolls similar to the drawing frames, but have spindles by which the stock, then called *roving*, is twisted and wound on bobbins. The first of the roving frames is called the *slubber*, and is heavier than the *intermediates* and *fine frames*, as the other roving frames are designated. The full bobbins, A, from the slubber are placed in the creel of the *intermediate* frame, as shown in Fig. 5, and two strands combined are delivered to the rolls and drawn, the new strand of roving is carried to the top of the *flyer*, on the spindle B, is passed through one arm of the flyer, which is hollow, and

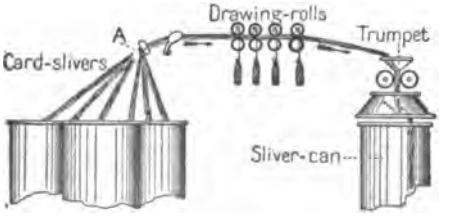

FIG 4. SECTION OF DRAWING FRAME.

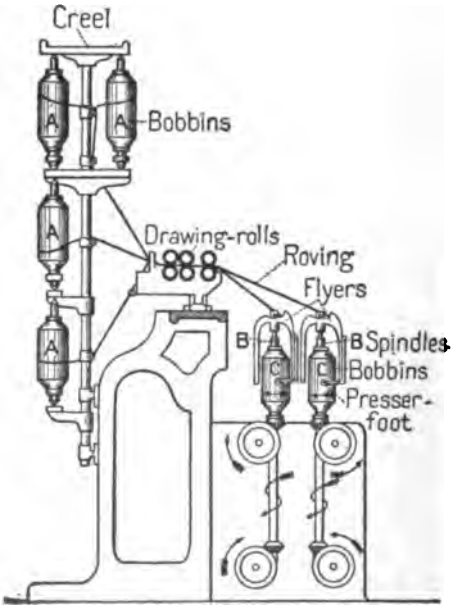

FIG. 5. SECTION OF ROVING FRAME.

strand of roving, while the difference in speed between the flyer and the surface of the bobbin winds the roving on the latter.

The *fine frame* is a similar frame to the above, and delivers the roving finer and more even than any of the preceding machines and ready for the *spinning frame* (Fig. 6). The roving may be doubled or run singly on the spinning frame, the rolls produce the drawing effect as on the preceding machines, and the revolution of bobbin and spindle puts in the twist. The *bobbin* A is fast on the *spindle* B, and draws the yarn through the *traveler*, a small wire loop attached

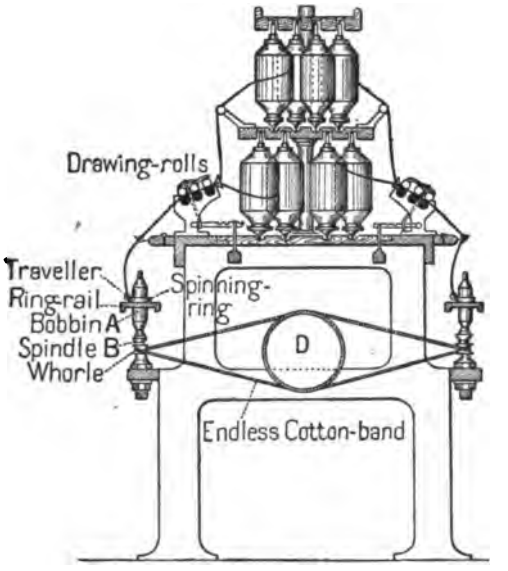

FIG. 6. SECTION OF SPINNING FRAME.

to and movable on the *spinning ring*, which surrounds each spindle. The spindles are made to revolve by an endless cotton *band*, which passes around the *whorl* of the spindle and is driven by the *cylinder* D. The production of the spinning frame is technically 'frame-spun yarn,' either

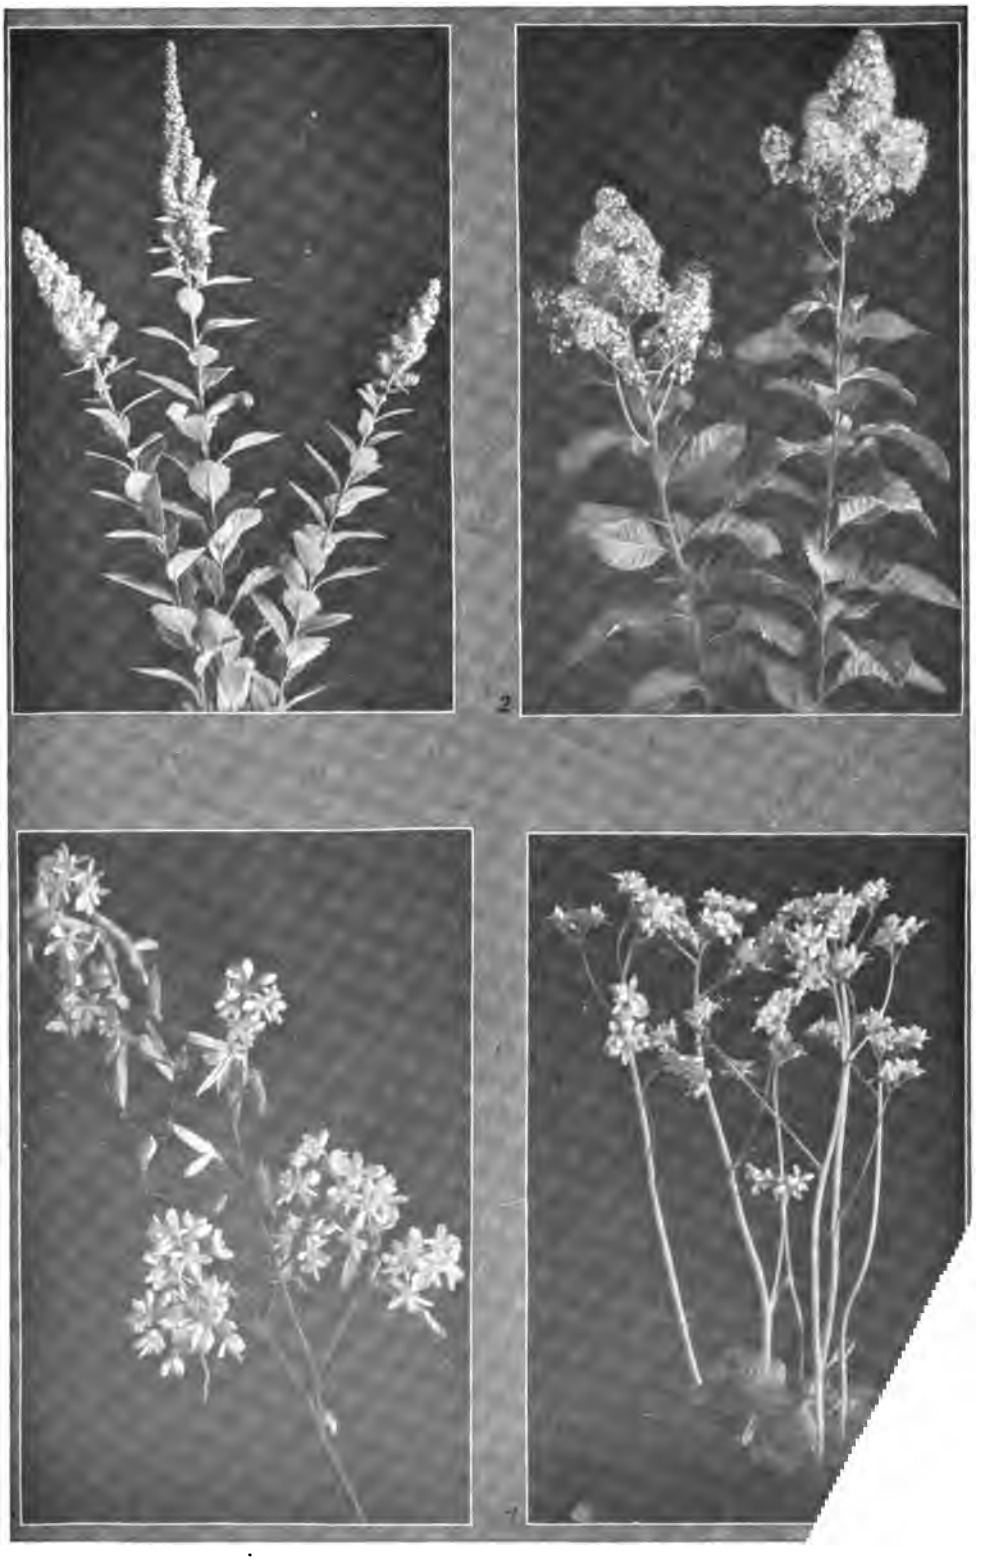
SPINNING-GLAND. One of a class of glands (q.v.) possessed by the larvæ of many kinds of insects and by the majority of spiders. See SPIDER.

SPINOLA, spē'nō-lȧ, AMBROSIO, Marquis de (1569-1630). A Spanish general, born in Genoa, Italy. In 1602 he led a force of 9000 veterans to the Netherlands against Maurice of Nassau. Made chief commander of the Spanish army there, he forced Ostend to surrender in 1604, after a siege of more than two years. He continued his operations against Maurice till the twelve years' truce of 1609, when he took command of the Spanish troops in Germany. He took the field against the Elector Palatine Frederick V. and the Protestant Union in 1620, and forced the Union to disband in 1621. He captured Jülich in 1622, and Breda in 1625. Disease forced him to give up his command, but he afterwards commanded the Spanish army in Italy.

SPINOZA, spē-nō'zȧ, BARUCH, or BENEDICT (1632-77). A famous Dutch-Jewish philosopher, born in Amsterdam, November 24, 1632. His father, a Portuguese merchant, had fled from Catholic persecution to the Netherlands. Spinoza was carefully educated in Jewish theology and speculation. He was, however, alienated from the orthodox belief by studies of physical science and of the writings of Descartes and probably those of Giordano Bruno. His heresies resulted in threats of severe punishment from his instructors in the Talmud and the Cabala, and the relation soon became so unpleasant that Spinoza withdrew from the synagogue. The rabbis, in 1656, excommunicated him and secured his banishment from Amsterdam. However, he remained in the neighborhood of the city for five years, supporting himself, as in later years, as a lens-maker.



Previous to his expulsion from the Jewish community Spinoza is said to have fallen in love with the daughter of Van den Ende, his master in Greek and Latin, and to have been rejected by her. Possibly even before his expulsion he composed his first work, *Tractatus de Deo et Homine ejusque Felicitate* (discovered in a Dutch translation in 1852, the Latin original not being extant), in which the form of his developed system is foreshadowed. And the *De Intellectus Emendatione* and *Tractatus Theologico-politicus* are also probably referable to the period of his Amsterdam residence, although the latter was not published until 1670 and the former until 1677.

In 1661 Spinoza went to Rhynsburg, near Leyden, and two or three years later to Voorburg, near The Hague. Shortly after, yielding to the solicitations of friends, he removed to The Hague itself. The Elector Palatine, Charles Louis, offered him a chair at the University of Heidelberg, but Spinoza declined the position in order to be free from any restrictions upon his thinking. An offer of a pension, on the condition of his dedicating a work to Louis XIV., he rejected with scorn. His domestic accounts, after his death, show that he preferred to live on a few pence a day rather than be indebted to another's bounty. He died February 21, 1677. His constitution was no less undermined by consumption and overwork than his sensitive mind was wrought upon by persecution and the violent severance of natural ties. But no word of complaint ever passed his lips; simplicity and heroic forbearance, coupled with an antique stoicism and a child-like, warm, sympathizing heart, were the salient features of his character. His life, in its nobility and suffering, is perhaps the most convincing plea for the vitality of the philosophy for which it served as the human context.

Spinoza's philosophy finds its most adequate expression in his great work, *Ethica Ordine Geometrico Demonstrata* (posthumously published in 1677). The basis from which it was developed was mainly Cartesianism. Certainly from Descartes he derived his empirical rationalism and his conception of exact demonstration. This latter, on the analogy of geometrical demonstrations, consisted of a series of axioms with corollaries, propositions, and elucidations, designed to render bias or extraneous inference impossible, and there can be no doubt that Spinoza was one of the most conscientious of thinkers in his effort to eliminate the personal equation. Nevertheless, there are few philosophers in whom the personal element is more distinctive. The very fact of Spinoza's severance from his own race and religion, together with his failure to adopt Christian thought, made the individuality of his system the more inevitable; he was bound by no tradition and so followed to the fullest the instincts of his reason. He was influenced by Descartes in method and probably by Bruno in his pantheism, but his system is still his own to a degree seldom true in the history of philosophy.

This system is a thorough-going and complicated pantheism. The universe is identical with God, who is the substance of all things. The conception of substance (which Spinoza inherited from the Scholastics) is not that of a material reality, but of a logical subject—the self-sufficient and comprehensive basis for all reality, capable of sustaining as its attributes all temporal existences. Spinoza recognized the possible existence of an infinite number of such attributes, but held that only two kinds are known to us—extension, or the world of material things, and thought. These two comprehend existence and they include all that exists in a real and palpable way, at least so far as human knowledge is concerned.

The idea of extension as the gist of physical reality, and of thought as a non-extended reality, Spinoza derived from Descartes. But Descartes made each of these independent substances and conceded to them the power of causal interaction —mind acting upon body and *vice versa*. Spinoza, as we have seen, makes both forms of reality dependent upon an ultimate substance—God—in which is their existence. Furthermore, he denies their power of causal interaction. Cause and effect in his conception are always similar; extension and thought are wholly dissimilar: therefore their causal interrelation is impossible. Causation may subsist between individual objects in the attribute extension, that is, between physical bodies, or between individual ideas in the attribute thought, but not between ideas and things. To explain the apparent causal interactions of the latter Spinoza resorted to an elaborate theory of parallelism. Every idea has a physical counterpart in the attribute extension; every physical object has its idea. This

1. HARDHACK (Spiræa tomentosa).
2. WILLOW-LEAVED SPIRÆA (Spiræa salicifolia).
3. SHADBUSH (Amela
4. SAXIFRAGE (Saxif

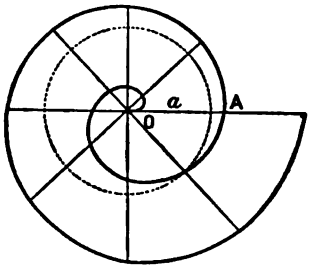
is not only true for the individuals in each attribute, but necessarily for their relations also. Hence parallel with every physical causal series there is an ideational causal series reduplicating it; neither is dependent upon the other, but both depend upon the divine substance made manifest through them.

The individuality of things, whether ideas or physical objects, Spinoza explained as particular modes or 'affections' of substance. All particular things in space are the modes of God in the attribute extension; all particular thoughts and feelings are modes of God in the attribute thought. The modes are *natura naturata;* substance or God is *natura naturans.* The modes are ephemeral and their existence assumes temporal form; God is eternal, outlasting all attributive changes. Particular things, accordingly, whether of body or mind, are evanescent and finite. All existence is mortal.

Nevertheless there is an indestructible world. It is not to be found in the realm of existences, but in a realm of essences—something wholly different. The Spinozistic conception of essence is most nearly related to the Scholastic conception of Realism and to Plato's conception of a world of ideas. It is an hypostatization of the universal aspect of things, that is, of their essential nature in a logical or definitive sense, and in many respects is a striking forecast of Hegel's logic of the Absolute. The most distinctive difference between Spinoza's world of existences and his world of essences is that the former exists in time, while the latter has no temporal being. But mortality can pertain only to temporal being; therefore the world of essences, being timeless, must be immortal. Furthermore, the world of essences is a world of immanent being. Every existence has a universal or essential character, though to realize this character it must transcend its own intrinsic form, that is, free itself from whatever gives it particularity. The world of essences thus has a kind of being within the world of existences—as the immanent cause of the latter—though it does not share its temporal limitation. Now this is precisely true of the divine substance; and so it is that the world of essences represents the essential nature of God.

Immanent causation means self-causation, and that which is self-determined is free. From this reasoning Spinoza derived his doctrine of freedom to be won in the world of essences. Existence in the attribute is bondage, for each existent thing is determined by its own causal series; every particular object or idea is subject to other objects or ideas, and the form of its being is determined by them. Only in non-temporal, self-caused being, that is, in the universal and immanent, is freedom possible; only by identification with the eternal verities, with substance or God, is immortality—and with it peace—to be obtained.

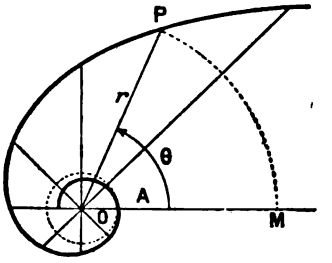
From this conception springs Spinoza's ethical doctrine, developed in the third, fourth, and fifth parts of the *Ethica.* In its practical form his teaching assumes that everything, so far as in it lies, strives to remain in its own being. The effort by which this striving is manifest is nothing but the actual essence of the thing. This effort, when it is in the mind alone, is will; when in mind and body, it is appetite. If desire is satisfied, we have pleasure; if not, we have sorrow. All affections and emotions resolve into desire, joy, and sorrow, accompanied by ideas. The good is that which we know to be useful, that is, that which we know to be a means for the nearer attainment of the standard of human nature which is our ideal. Knowledge of good and bad can be a cause in the moral world, counteracting passion and raising us from the world of appetite and mortality to the world of eternal truths.



The passage from mortality to immortality, from bondage to freedom, is made plausible to Spinoza's mind by the fact that every reality has its immanent cause, its universal aspect, or what may be called its cosmological truth. By cultivating steadily this immanent and universal nature man is enabled to realize his immortal destiny. As to the nature of the initiative by which a soul in bondage is to alter its course, Spinoza has no clear teaching. The problem seems not to have presented itself to him, and indeed this is hardly to be wondered at, since his own mind turned so instinctively to what he conceived to be the divine and the good.

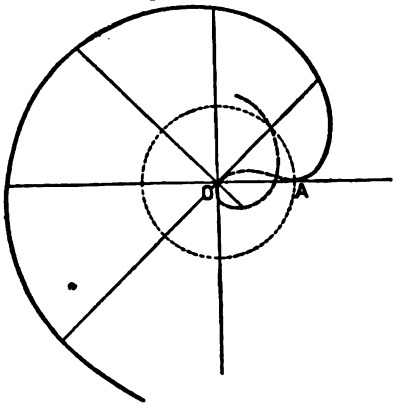
Spinoza's position in the development of philosophical thought is in many respects unique. He belonged to no school and he founded none. While in a measure his work was based upon that of his predecessors, it is too strikingly individual to be conceived a mere continuation, even of Cartesian thought. In the vigor and comprehensiveness of his conception, in synthetic daring, he must be ranked with the greatest philosophical thinkers; and though his system gave rise to no sequential development, he has had perhaps the most pervasive influence of any modern philosopher except Kant. Not only metaphysicians, but poets such as Goethe, Wordsworth, and Shelley, have gone to him for inspiration, and the essence of his thought has been in large part appropriated in the poetic pantheism of modern interpretations of nature.

Complete editions of Spinoza's works have been published by Paulus (1802-03), by Bonden (1843-46), and by Van Volten and Land (1882-82). English translations have been made for the Bohn Library (1883), by White and Stanlay, the *Ethics* (London, 1883), by Fullerton, *The Philosophy of Spinoza,* selections with introduction (New York, 2d ed. 1894). Of the extensive literature especially to be mentioned are: Caird, *Spinoza* (Edinburgh, 1888); Martineau, *A Study of Spinoza* (London, 1882); Pollock, *Spinoza* (2d ed., ib., 1899); Fullerton, *On Spinozistic Immortality* (Philadelphia, 1899); Camerer, *Die Lehre Spinozas* (Stuttgart, 1877); Baltzer, *Spinozas Entwickelungsgang* (Kiel, 1888); Berendt and Friedländer, *Spinozas Erkenntnislehre* (Berlin, 1891); Hoff, *Die Staatslehre Spinozas* (ib., 1895); Kuno Fischer, *Geschichte der neueren Philosophie,* I. (Heidelberg, 1897).



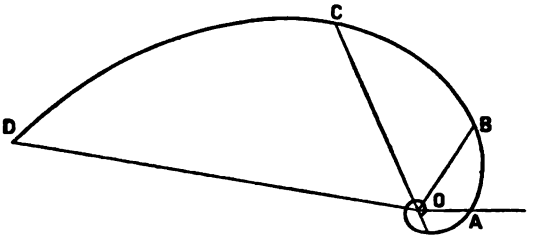
SPIRÆA (Lat., from Gk. *σπειραία, speiraia,* meadow-sweet, from *σπεῖρα, speira,* coil, twist, spire; so called from the shape of the follicles). A large genus of herbs and low deciduous shrubs of the natural order Rosaceæ, natives of the Northern Hemisphere. Dropwort (*Spiræa filipendula*) and meadow-sweet or queen of the meadow (*Spiræa ulmaria*) are European species. Two other species are shown on the accompanying plate. Many species are cultivated in shrubberies for their flowers.

SPIRAL (ML. *spiralis*, from Lat. *spira*, coil, spire, from Gk. σπεῖρα, *speira*, coil, spire, twist). A curve which during its gradual regression from a point winds repeatedly around it. A *plane* spiral is generated by a point moving along a line according to a fixed law, while the line revolves uniformly about a fixed point in the plane. A spiral which is not plane is generated by a point moving on a given surface other than a plane, about a fixed point according to a given law, e.g. the loxodrome (q.v.). A great many spirals have been studied. Of these the most common are the spiral of *Archimedes*, the *hyperbolic*, *parabolic*, *Cotes's*, *logarithmic* or *equiangular* spirals, and the *lituus*.



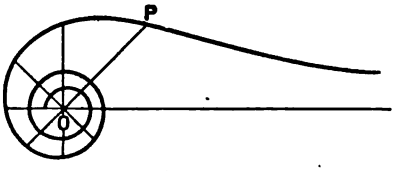
ARCHIMEDES SPIRAL.

The spiral of Archimedes, probably discovered by Conon, has the equation $r = a\theta$. In this curve the point moves with a constant velocity along the radius vector, and the length of the radius is proportional to the angle described. The curve may be constructed by points as follows: Draw a circle of radius a about O as a centre; draw radii dividing the circumference into n equal parts, and lay off from O on these radii the distances $\frac{a}{n}, \frac{2a}{n}, \frac{3a}{n}, \frac{4a}{n}$, etc. The circle used in this construction is called the measuring circle of the spiral. If the point so moves that the radius vector varies inversely as the angle described, the curve is called a *hyperbolic* or *reciprocal* spiral. Its equation is $r = \frac{k}{\theta}$, k being the circumference of the measuring circle. It follows from the equation that an infinite number of spires are necessary for the curve to reach the origin. The curve received its name from the fact that it can also be constructed by means of an auxiliary equilateral hyperbola. If r varies directly as the square root of θ the equation becomes $r^2 = a\theta$, and we have the *parabolic* spiral. The figure represents the curve for both positive and negative values of r.



HYPERBOLIC SPIRAL.

If p denotes the perpendicular distance from the pole to the tangent at any point P of the curve, and if $p = \frac{br}{\sqrt{a^2 + r^2}}$, various spirals may be formed representing this equation. These are known as Cotes's spirals, and are of scientific



PARABOLIC SPIRAL.

interest, especially in their relation to trajectories (q.v.). If $b = a$ the equation is that of the *logarithmic* or *equiangular* spiral. The characteristic property of this spiral is that the angle between any radius vector and the corresponding tangent is constant. The equation of the logarithmic spiral is $\log r = a\theta$. It is evident from the equation that the curve has an infinite number of spires. The evolute (q.v.) of the logarithmic spiral is a similar logarithmic spiral.

LOGARITHMIC SPIRAL.

A spiral in which the square of the radius vector varies inversely as the angle described is called the *lituus* or *trumpet*, a curve described by Cotes (1682-1716). Its equation is $r^2 = \frac{a}{\theta}$. The curve begins at infinity and winds round the origin, but cannot reach it by a finite number of spires.

LITUUS.

One of the best, although not recent, monographs on the general subject is to be found in the *Mémoires de l'Académie des Sciences* (1704, pp. 47, 69). For the general and special bibliographies and for a list of various spirals studied,

partie complémentaire, 1899, p. 166). On the spiral of Archimedes, consult Pfaff, *Betrachtungen über die Spirale* (Munich, 1830). On the parabolic spiral and that of Cotes, consult Sacchi in the *Nouvelles Annales de Mathématiques* (1860). On the logarithmic spiral, Turquan in the same journal (1846) and Whitworth (1869). On the hyperbolic spiral, Fouret and Lebon in the same journal (1880).

SPIRE (AS. *spir*, stalk, Ger. *Spier*, needle, pointer). A very acute pyramidal roof in common use over the towers of churches or secular buildings. The history of spires is somewhat obscure, but there is no doubt that the earliest examples of anything of the kind are the pyramidal roofs of towers in the Romanesque buildings of the eleventh century. In the twelfth century, especially in France, these stone roofs were often made octagonal and pointed and took the form we call spire. They were less used in England and Italy, where square and flat tops remained common; they were most developed in France and Germany. The point where the square tower merged into the octagonal base of the spire was marked by angle turrets and pinnacles, to which tabernacles and windows often corresponded in the alternate faces of the spire. This masking afterwards was carried still farther up by galleries, flying buttresses, and pinnacles, enhanced by every variety of tracing and surface ornament, breaking up the outlines of the spire. At first the surface of the spire was of solid masonry merely varied by angle moldings and scaled surfaces, but before the close of the thirteenth century the masonry was often more or less pierced and the outlines infinitely varied, first with windows and galleries and then by a network of tracery which made of the entire spire a series of lacework patterns or grouped arcades and pinnacles.

SPIRE. A town of Germany. See SPEYER.

SPIRIFER (Neo-Lat., from Lat. *spira*, coil, spire + *ferre*, to bear). A genus of long hinged fossil brachiopods of Paleozoic age. The shells are biconvex with the greatest width on the hinge line, the hinge areas are well marked and usually large, the ventral beak prominent and overreaching that of the dorsal valve, the surface marked by strong radial folds or striations, and with a pair of calcified spirally coiled brachidia within the interior of the shell. These brachidia served as supports for the breathing organs and are coiled in the form of cones with the apices of the cones directed toward the outer angles of the shell. The genus has many species, ranging from the Silurian system upward into the Carboniferous and distributed all over the world. Consult Schuchert, "Synopsis of American Fossil Brachiopoda, etc.," *Bulletin of the United States Geological Survey, No. 87* (Washington, 1897).

SPIRILLUM. See BACTERIA.

SPIRIT (Fr. *esprit*, from Lat. *spiritus*, spirit, breath, air, from *spirare*, to breathe). A term sometimes used in connection with a variety of volatile substances, and more especially with solutions of volatile substances in alcohol. *Spirits of wine* is ordinary alcohol; *spirits of wood* or *pyroxylic spirit*, is wood alcohol, or methyl alcohol; *spirit of hartshorn* is aqueous ammonia; phurous acid, etc. Among the 'spirits,' i.e. alcoholic solutions, used in medicine may be mentioned those of lemon, peppermint, ether, chloroform, phosphorous, camphor, lavender, bitter almonds, etc. *Aromatic spirits of ammonia* is made up of 34 parts of ammonium carbonate, 90 parts of ammonia water, 1 part of nutmeg oil, 10 parts of oil of lemon, 700 parts of alcohol, and 1 part of oil of lavender flowers, enough water being added to make 1000 parts. In the British pharmacopœia alcoholic solutions of 20 per cent. strength are called 'essences.'

SPIRITUALISM (from *spiritual*, Lat. *spiritualis*, relating to spirit or breath, from *spiritus*, spirit, breath, air, from *spirare*, to breathe). A term which, as most commonly used, describes the belief of those who think that communications are occasionally established between the living and the dead who survive in some other mode of existence. This conception, in so far as any general acceptance of the doctrine is concerned, is probably not more than half a century old, although sporadic instances of the belief are possibly as old as human nature.

In modern times the first definite movement in the direction of a general interest in spiritualism took place in 1848 in America, and was associated with the Fox sisters, at Hydesville, New York. The 'phenomena' associated with these sisters were the traditional 'raps' and 'knockings,' the meaning of which required that the experimenter agree upon some certain number of 'raps' as an indication of an affirmative or negative answer to questions. In more complicated matters the answers were spelled out by pointing to letters, etc. The *modus operandi* of the 'communications' is not important, as it was only the familiar production of physical phenomena supposed to be evidence of some transcendental origin. The Fox sisters performed their wonders for all classes of men and women and numbered among their followers many intelligent people. But opinion was divided as to the value and significance of their 'phenomena.' The more intelligent investigators discovered fraud in them, and finally the sisters confessed to the manner in which they had consciously produced the 'raps' and 'knocks.' In the meantime the excitement and interest in spiritualism had spread to England and the Continent. It was probably much less the actual facts in the alleged phenomena that created the widespread interest in the subject than it was two facts in the mental condition of the age wholly independent of the inciting cause. The first was the immense strides which skepticism and criticism had made in discrediting the older theology; the second was the growing faith in scientific experiment and methods.

It was about the same time that hypnotism (q.v.) began to arouse a scientific interest and to contribute to the spiritualist's cause. It had arisen about 1770 or 1780 under Mesmer and was called mesmerism (q.v.) after him. But the quackery and incautiousness associated with it, encouraged by the inertia of scientific academies, brought it into neglect, and it was not heard of more until Dr. Braid, of Manchester, England, reopened the question by showing that there were genuine phenomena in it worthy of scientific attention. This was about 1840. He changed the

name of mesmerism to hypnotism and employed 'suggestion' as the explanatory principle as against 'magnetic fluids' of Mesmer. But the peculiar methods of producing hypnosis and the strange psychological susceptibilities exhibited by hypnotic patients were well calculated to impress the popular mind with the belief in occult forces, and in spite of the scientific treatment to which it has been exposed, it still suggests to the public the possibility of supernormal phenomena. Its facts were more easily demonstrable, and could be put to more dignified uses, than the ordinary absurdities of the séance room.

Another type of phenomena occurred about the same time to encourage the spiritualist in his general theory. It was the production of Andrew Jackson Davis, who discovered in 1844 that he could go into a 'trance,' and that he had a strange power of performing intellectual feats in this condition, which were not natural to him in his normal state. He made a bargain with two friends to 'mesmerize' him and to take down in notes what he said during the 'trance.' A volume was published as a result representing the work of fifteen months. His utterances, which were very slow and deliberate, were taken down verbatim, and the volume was called *The Principles of Nature, Her Divine Revelations, and a Voice to Mankind*. The work dealt with the physical, chemical, and vital phenomena of the cosmos on a large scale, and treated of astronomical matters in a manner to excite curiosity, especially when the prediction of a new planet was verified soon afterwards by the discovery of Neptune by Leverrier and Adams. At the same time the man was practicing 'clairvoyance,' and the book asserted the existence of spirit 'communication.' But it was not the philosophic nature of the work that gave it its influence. It was the apparent illiteracy of the man who produced it, and its association with 'clairvoyance' and alleged spirit 'communications.' Davis himself said that, up to the time of his work, he had read but one book in his life and this was a romance called *Three Spaniards*. This claim, however, seems to be fairly well controverted, and it is probable that the man had read scientific matter in a casual way. But no amount of casual reading will easily explain in a normal way the systematic character of this work. There are indications in the man's history, and the fact that he was 'clairvoyant' or subject to the 'trance' state is evidence, that his was a remarkable case of secondary personality. See DOUBLE CONSCIOUSNESS.

In 1853 a work was published by Judge Edmonds and Dr. George Dexter that was second in interest only to that of Davis. Mr. Edmonds was a Judge of the Supreme Court of New York State and Dr. Dexter was an eminently respectable citizen of New York City. Their attention had been called to the subject of spiritualism by the excitement about the Fox sisters, and they set about investigation for themselves, and soon developed personal phenomena of a peculiar interest. They entered upon a system of experiments in coöperation upon themselves and various 'mediums,' with the result that they published a work which soon became classic, owing to the reputation of the authors. The phenomena recorded and described purported to represent more or less direct communications with discarnate spirits. At first they investigated with a view to ascertain whether the phenomena were genuine in any sense of the term, and having convinced themselves that they were dealing with spiritistic influences, they published, as the bulk of their work, the alleged messages from Swedenborg and Bacon, and the respectability of the men availed to carry their work through many editions. But the subject of secondary personality was not understood in their time, and was not worked out until a generation later, when the result was to discredit the spiritistic claims of Edmonds's and Dexter's work.

The most remarkable personality, however, in this movement was William Stainton Moses. He was born in 1839 and was educated at Oxford in England, becoming a clergyman in the Established Church. In 1872 he became interested in spiritualism through his friend, Mrs. Speer, and soon developed 'mediumistic' powers in himself. He fought against their influence on his mind for a long time, but his skepticism was finally overcome, and he became a spiritualist and abandoned the Church and at last became the editor of the chief spiritualist paper, *Light*. No one ever questioned his sincerity and honesty. The phenomena which he records were of a type and variety which tend to excite astonishment. They included the physical and the trance phenomena of the usual kind, such as the alleged movements of physical objects without contact, and even through other matters, and automatic writing evincing the personal identity of deceased persons and the spiritual and hortatory counsel of discarnate spirits long since deceased. His two works, *Spirit Identity* and *Spirit Teachings*, were widely read. But he resented scientific investigation because he thought it a reflection on his honesty, and hence, though there is some independent testimony to the nature of his phenomena, they depend mostly upon his own asseverations; and though there is no reason to impeach the probity of these, neither he nor his contemporaries reckoned sufficiently with the problems of abnormal psychology and secondary personality to assure the elimination of influence in the production of the phenomena that were quite compatible with honesty and yet were inconsistent with their supernormal character.

After the excitement produced by the Fox sisters, there appeared a perfect inundation of similar and more questionable performances in the person of all sorts of traveling 'mediums.' The popular conception of spiritualism was soon determined by the methods of this class of impostors. Their 'demonstrations' took the form of cabinet séances, 'materializations,' slate writing performances, and tricks that are easily imitable by the prestidigitator. To this day the general public has no other conception of spiritualism than that which is furnished by the most absurd and most trivial legerdemain. Finally the indifference of the public after discovering the futility of such methods and the influence of the Report by the Seybert Commission (see below) caused the interest in such phenomena to decline. The Society for Psychical Research (see PSYCHICAL RESEARCH, SOCIETY FOR) also had its share of the credit in this depreciation of the movement.

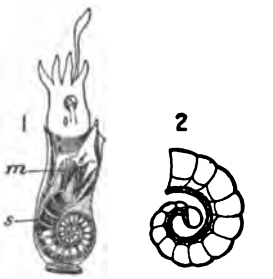
To this period, contemporaneous with Moses and apparently combining the phenomena described by him and the performances of the

average trickster, belonged David D. Home, who created an enormous sensation throughout America and Europe. He received the attention of Sir William Crookes, and a system of experiments involving all sorts of physical 'miracles,' which still mystify students who have confidence in Crookes.

What the Society for Psychical Research has accomplished tends to show that the methods of physical science which had captivated the last generation are not adequate to cope with the problem. It has been shown to be a psychological problem that must comprehend the whole field of normal and abnormal psychology, including in the latter all the phenomena of automatism, sensory and motor, illusion, hallucination, secondary personality, hysteria, insanity of the functional sort, and the various hyperæsthesias. The consequence of all this has been to suggest that neither fraud nor spirits are always necessary to account for seemingly supernormal phenomena. We are being made acquainted with a vast fund of facts in connection with subliminal consciousness which are well calculated to strike the unwary as having a spiritistic significance, but which are only the strange productions of irresponsible secondary personalities. These personalities, like the dream life of normal people, are apparently quite as liable to deception as are the states of consciousness of every-day life. However, the range and capacity of the powers of subliminal states have not yet been exactly determined.

About the same time that the Society for Psychical Research was founded a Mr. Seybert gave a fund to the University of Pennsylvania for the investigation of spiritualism, and the Seybert Commission was appointed for the purpose. The commission exposed many of the ordinary frauds of professional mediums, and its conclusions were adverse to the usual spiritistic claims. After publishing a *Report*, the commission was allowed to lapse.

In Germany and France the movement has had a similar history and outcome. In Germany Reichenbach was the most important investigator, and in France Cahagnet and Du Potet are the principal men of interest. This was in the earlier period. Later we have Karl du Prel, A. N. Aksakoff, a Russian, and Schrenck-Notzing, who manifested interest in the subject and wrote freely upon it.



In recent years the *Proceedings* of the Society for Psychical Research have recorded data, especially in the phenomena of coincidental apparitions and experiments with a Mrs. Piper, a Boston 'medium,' which some of the members have thought favorably confirm the possibility of the spiritistic theory. She has been the subject of experiment for nearly eighteen years. This, with two recent volumes of Mr. F. W. H. Myers, has had the effect of reviving an interest in the general problem. But the subject must still run the gauntlet of scientific skepticism and investigation. The early history of the movement has been so infected with charlatanism, fraud, half-baked science, and various forms of radicalism in religious and social matters as to put it under abeyance by the intelligent part of the community.

It is not possible to determine with any accuracy the number of adherents to the spiritualistic belief. They are certainly very numerous, and have many thriving organizations. These take the form of the ordinary church. It is claimed that they have nearly 350 churches and over 200,000 members. It is probable that the number of believers far exceeds this figure. There is nothing in the belief to suggest the necessity of organization as in the orthodox Christian Church. Their periodicals are quite numerous. There are few, however, of first class character. *Light*, a weekly, published in London, England, is, perhaps, the best. The *Banner of Light* is published in Boston, Mass.

The literature on the subject is a very large one, but most of it is not of much importance. Even the best of it has to be read with more than the usual caution. The following, in addition to those mentioned in the body of the article, is a brief list of the most important works connected with the claims of spiritualism and dealing with various phases of it: Edmonds and Dexter, *Spiritualism* (New York, 1854-55); Allan Kardec, *Livre des esprits* (Paris, 1853); Mrs. De Morgan, *From Matter to Spirit* (London, 1863); Alfred Russel Wallace, *Miracles and Modern Spiritualism* (ib., 1876); Karl Du Prel, *Philosophy of Mysticism* (Eng. trans., ib., 1889); Frank Podmore, *Aspects of Psychical Research* (ib., 1897); id., *Modern Spiritualism* (ib., 1902); Frederick W. H. Myers, *Human Personality and Its Survival of Bodily Death* (ib., 1902); Flammarion, *L'inconnu* (Paris, 1899); Flournoy, *Des Indes à la planète Mars* (Geneva, 1900); Parish, *Hallucinations and Illusions* (London, 1897).

SPIROPHYTON (Neo-Lat., from Gk. *σπεῖρα*, *speira*, coil, twist, spire + *φυτόν*, *phyton*, plant). A fossil alga found in rocks of Devonian age. It presents a flabellate expansion with a central pit from which radiate curved ribs as from the centre of a vortex. The surfaces of the Esopus grit of Lower Devonian age in eastern New York and Pennsylvania are covered with these algal fronds. The genus is known also in the Carboniferous rocks, and it has been described from European localities under the name of Taonurus.

SPIRULA (Lat., diminutive of *spira*, coil, spire). A genus of small decapod, dibranchiate cephalopods, comprising two or three species, and constituting the family Spirulidæ, in which the internal skeleton is in the form of a nacreous, discoidal shell, the whorls of which are not in contact with one another, and which are divided into a series of chambers by partitions pierced by a ventral tube or siphuncle. The animal has minute lateral fins, and there are six rows of small suckers on the arms. The three species constituting the family dwell in the deep waters of the tropical seas. In internal anatomy Spirula is a true dibranchiate, having two branchiæ and an ink-bag. It has the peculiar feature that the hinder end of the body acts as a suctorial disk for fastening itself to foreign bodies.

SPIRULA.

1, Animal, showing position of shell; *s*, shell; *m*, siphon muscles; 2, shell enlarged.

The genus Spirula is not known in a fossil state, but it has ancestors, Spirulirostra and Spirulirostrina, in the Tertiary deposits of Italy. These latter have remnants of the 'guard' at the apical portion of the shell, which feature seems to indicate the descent of Spirula from some form of shell like Belemnites. See CEPHALOPODA.

SPIT'ALFIELDS. An eastern district of London, England, in Whitechapel, adjoining Bethnal Green. It is a manufacturing district inhabited chiefly by the poorer class of population, and by silk-weavers, descendants of French Huguenots. It is the seat of the Spitalfields market. Spitalfields derives its name from the Hospital of Saint Mary, founded in 1197. Population, in 1891, 26,594; in 1901, 27,965.

SPIT'HEAD. A roadstead off Portsmouth, England, between Portsea Island and the Isle of Wight (Map: England, E 6). It is 14 miles long by 4 miles in average breadth, and receives its name from the 'Spit,' a sand-bank stretching south from the English shore for three miles. Fortified by circular towers, and, except on the southeast, protected from all winds, it is a favorite anchorage of the British navy, styled by sailors 'the King's bedchamber,' on account of its security.

SPIT'TA, KARL JOHANN PHILIPP (1801-59). A German religious poet, born in Hanover. He was educated at Göttingen, and from 1824 to 1828 he was a tutor at Lüne, and there wrote the best of his hymns. Afterwards he was vicar or pastor in several churches, and in 1859, shortly before his death, was made superintendent at Burgdorf. His hymns, contained in *Psalter und Harfe* (1833; revised with biographical note by his son, Ludwig, 1890; 'Jubilee' ed., 1901), and in the *Nachgelassene geistliche Lieder* (1861 and often), rank high in the German spiritual song of the century, and attained great popularity by their freshness of thought, purity of style, and depth of sentiment.

SPITZBERGEN. A group of islands in the Arctic Ocean, situated about 430 miles north of the northern extremity of Norway, between 76° 30′ and 80° 48′ north latitude, and between 10° and 30° east longitude (Map: Arctic Regions, H 3). The group consists of three large islands, West Spitzbergen, North East Land, and Edge Island, whose areas are, respectively, about 15,000, 4000, and 2500 square miles, and a number of smaller islands. All of them are of a rocky and mountainous character and very irregularly indented. West Spitzbergen has an ice-covered plateau running along its eastern coast and eroded toward the west into deep and narrow valleys terminating in fiords, and carrying the overflow of ice in the form of glaciers to the sea. These valleys and fiords are separated by rugged and rocky mountain spurs, here and there forming a network of craggy peaks and ridges interspersed with glaciers. The highest point is the Horn Sund Tind with an altitude of 4560 feet. North East Land is almost wholly covered with an ice sheet, while the other islands are free from permanent ice, or carry only isolated glaciers on their eastern slopes. The mean monthly temperatures range from 10° below zero in February to 37° above in August. Snow falls at all seasons, but in summer a considerable herbaceous growth covers the lower western slopes. This consists largely of mosses, though there are 130 species of flowering plants and ferns, with sedges predominating along the shores. The fauna includes the reindeer, which, however, is fast disappearing, the polar bear, and the fox. The walrus is still found along the coast, but the birds are becoming fewer.

Spitzbergen has no permanent inhabitants, and no country claims possession of it. The islands were discovered by the Dutch in 1596. The interior was first explored in 1892 by Rabot, and in 1896 by Sir Martin Conway, who was the first to cross the large island. Spitzbergen has been an important base for polar expeditions, and in 1897 Andrée made it the starting point in his ill-fated attempt to reach the Pole by balloon. In recent years the west coast has been visited by a number of tourists, and in 1896 a weekly steamship service during summer was established from Norway, and a small hotel was built on the coast.

SPITZ DOG, or POMERANIAN DOG. See SHEEP DOG.

SPITZ'KA, EDWARD CHARLES (1852—). An American psychiatrist, born in New York City. He was educated at New York University, in Germany, and in Vienna. He served as interne in the New York City Asylum for the Insane, was professor of medical jurisprudence and diseases of the nervous system in the New York Post Graduate Medical School and Hospital from 1881, consulting surgeon to the Northeastern Dispensary, physician to the department of nerve diseases in the New York Polyclinic, and physician to the Metropolitan Throat Hospital. His writings include *A Treatise on Insanity* (New York, 1883), besides many monographs.

SPITZWEG, spĭts'vāk, KARL (1808-85). A German genre and landscape painter, one of the most original figures in the art world of Munich, the most genial exponent of the humorous genre. Born and educated in Munich, he dispensed drugs for several years, then studied at the university, and in 1833 was won to art by his accidental surroundings in a watering place. Under the introductory guidance of the historical painter Hansonn (1791-1863), he took to brush and palette, but, practically self-taught, developed his rare talent for the depiction of those inimitable types of German philistinism amusingly associated with his name. On the establishment of the *Fliegende Blätter* in 1844, he became one of its most diligent contributors, whose incomparable humorous drawings were for years the delight of the entire reading world. Among his finely colored pictures of old bachelors, bookworms, hermits, etc., and his poetic landscapes with fanciful accessories, may be mentioned: "The Poor Poet" (1837), "Two Hermits" and a "Scholar in the Attic" (1882), all in the Pinakothek, Munich; "Spanish Serenade," "The Hypochrondriac," "Herd-Girls on an Alp," and "Turkish Coffee-House," all in the Schack Gallery, Munich; "Going to Church Near Dachau" (1862), in Dresden; "His Reverence" and

"Village Street," both in the National Gallery, Berlin. Reproductions of his works appeared in the collections *Spitzweg Mappe* (Munich, 1887) and *Spitzweg Album* (ib., 1888). Consult: Regnet, in *Zeitschrift für bildende Kunst* (Leipzig, 1886), and Holland, in *Allgemeine deutsche Biographie*, xxxv. (ib., 1893).

SPLAY. The sloping or bevelled opening in window recesses and other such openings. Also the corner taken off the outer angle of such openings.

SPLEEN (Lat. *splen*, from Gk. *σπλήν*, spleen; connected with Lat. *lien*, Skt. *plihan*, spleen). The largest and most important of the so-called ductless glands. It is generally oval in form, somewhat concavo-convex, soft, of very brittle consistence, highly vascular, of a dark bluish-red color, and situated in the left hypochondriac region, with its interior slightly concave surface embracing the cardiac end of the stomach and the tail of the pancreas. In the adult it is usually about 5 inches in length, 3 or 4 in breadth, and an inch or an inch and a half in thickness, and weighs about 7 ounces. At birth its weight in proportion to that of the entire body is as 1 to 350, which is nearly the same ratio as in the adult; while in old age the organ decreases in weight, the ratio being as 1 to 700. The size of the spleen is increased after gastric digestion, and is large in highly fed and small in starved animals. In intermittent fevers and leucocythæmia it is much enlarged, weighing occasionally from 18 to 20 pounds, and constituting what is popularly known as the ague-cake.

The spleen is invested externally by the peritoneum and inside this by a fibrous capsule giving off from its inner surface numerous small fibrous bands termed *trabeculæ*, which unite at numerous points with one another, and run in all directions. The parenchyma or proper substance of the spleen occupies the interspaces of the above-described areolar framework, and is a soft pulpy mass of a dark reddish-brown color, consisting of colorless and colored elements. The *colorless elements* consist of granular matter, of nuclei about the size of the red blood-disks, and a few nucleated vesicles, and constitute one-half or two-thirds of the whole substance of the pulp in well-nourished animals, while they diminish in number, and sometimes altogether disappear, in starved animals. The *colored elements* consist of red blood-disks and of colored corpuscles either free or included in cells; sometimes enlarged blood-disks are seen included in a cell, but more frequently the inclosed disks are altered in form and color, as if undergoing retrograde metamorphoses. Besides these, numerous deep-red, or reddish-yellow, or black corpuscles and crystals, closely allied to the hæmatin of the blood, are seen diffused through the pulp substance.

The venous blood of the spleen is carried away by the splenic vein, which contributes to form the great portal venous system, distributed through the liver; while arterial blood is supplied by the splenic artery, the largest branch of the cœliac axis. The branches of this artery subdivide and ramify like the branches of a tree, with the *Malpighian* or *splenic corpuscles* attached to them like fruit. These splenic corpuscles, originally discovered by Malpighi, are whitish spherical bodies, which are either connected with the smaller arterial branches by short pedicles, or are sessile upon their sheaths. They vary considerably in size and number, their diameter usually ranging from 1-30 to 1-60 of an inch. Each consists of a membranous capsule, homogeneous in structure, and formed by a prolongation from the sheath of the artery. The blood capillaries form a delicate plexus within these corpuscles.

With regard to its uses the spleen may be regarded as a storehouse of nutritive material, which may be drawn upon according to the requirements of the system, and the constant presence in large amounts of certain nitrogenous substances seems to indicate that some special nitrogenous metabolism takes place in it. The formation of both white and red blood cells probably also occurs in the spleen as well as the disintegration of exhausted blood corpuscles.

SPLEENWORT. See ASPLENIUM, and Colored Plate of FERNS.

SPLICING. See KNOTTING AND SPLICING.

SPLINT (Swed. *splint*, spike, forelock, flat iron peg, Dan. *splint*, splinter; connected with Eng. *split*). In surgery, a certain mechanical contrivance for keeping a fractured limb in its proper position, and for preventing any motion of the fractured ends; it may also be employed for securing perfect immobility of the parts to which it is applied in other cases, as in diseased joints, after resection of joints, etc. Many different kinds of splints are used, but wood and plaster of Paris are most common. In using wooden splints we take light strips slightly wider than the limb and long enough to reach beyond the joints that lie to either side of the injury. The fractured ends are brought as nearly as possible into their normal relation, thoroughly padded with absorbent cotton to prevent pressure or friction, and then the splints are applied and firmly bandaged to the limb, so as to prevent all motion. Wire netting, gutta percha, leather, and other materials are also frequently employed, as they can be molded to the shape of the limb. In the same way plaster of Paris can be applied to one side of a limb, carefully molded to it, and held in place by bandages. All movable splints, however, have the disadvantage that they must be readjusted from time to time, and thus the fractured limb is subjected to handling.

The plaster of Paris splint is desirable, therefore, in many cases. The limb is carefully protected with a light layer of non-absorbent cotton, especial care being used to guard bony prominences and to avoid any unevenness. Coarse, wide-meshed bandages well rubbed with dry plaster of Paris are immersed for a moment in water and then applied like ordinary bandages, each layer being rubbed into the one beneath so as to make a firm cohesive splint. The plaster should include the joints to either side of the injury. This splint may be both strengthened and lightened by the introduction of wooden or metal strips between the layers of plaster. Drying takes place rapidly and gives a firm resisting splint. In compound fractures or in operative cases a fenestrum may be left over the wound proper and an opportunity thus given to attend to the required dressings without disturbing the splint.

SPLINT. A bony enlargement on the horse's leg between the knee and the fetlock, usually appearing on the inside of the fore leg, frequently situated between the large and small canon bones.

It is usually caused by concussion, and is most common in young horses that have been driven rapidly along hard roads before their bones have become firm.

SPLÜGEN, splü'gen. An Alpine pass leading between the Tambohorn and the Surettahorn from the Swiss Canton of Grisons into Italy at an altitude of 6946 feet (Map: Italy, D 1). The southern or Italian descent has three great galleries built to protect the road from avalanches, and completed by the Austrian Government in 1834.

SPODUMENE (from Gk. *σποδούμενος, spodoumenos*, pres. part. mid. of *σποδοῦν, spodoun*, to burn to ashes, from *σποδός, spodos*, ashes). A mineral lithium and aluminum silicate crystallized in the monoclinic system. It has a vitreous lustre and is light green, gray, yellow, or purple in color. It occurs commonly in the coarse granitic veins, and is found in Sweden, the Tyrol, Scotland, Brazil, and in Massachusetts, Maine, Connecticut, North Carolina, and South Dakota. The yellow green to emerald green crystalline variety found in Alexander County, N. C., is highly valued as a gem, and is known as *hiddenite*, from its discoverer, W. E. Hidden, of New York.

SPOF'FORD, AINSWORTH RAND (1825—). An American librarian, born at Gilmanton, N. H. He was privately educated, became a bookseller, then associate editor of the Cincinnati *Daily Commercial* (1859), and in 1861 assistant librarian of Congress. From 1864 to 1899 he was librarian in chief of the Congressional Library, and became widely known for exceptional knowledge of books. He wrote much for periodicals on literature, economics, and history, and edited with others a *Library of Choice Literature* (10 vols., 1881-88), a *Library of Wit and Humor* (5 vols., 1884), and a *Practical Manual of Parliamentary Rules* (1884). He published annually *The American Almanack and Treasury of Facts, Statistical, Financial, and Political* (1878-91), and *A Book for All Readers* (1900), on the collection and preservation of books and the founding of libraries.

SPOFFORD, HARRIET ELIZABETH (PRESCOTT) (1835—). An American novelist, born at Calais, Me. Educated at Newburyport, Mass., and Derry, N. H., she adopted literature as a profession and first attracted attention in 1859 by a story of Parisian life, *In a Cellar*, printed in the *Atlantic Monthly*. In the same year she published *Sir Rohan's Ghost*, followed by *The Amber Gods and Other Stories* (1863), and *Azarian, an Episode* (1864). In 1865 she married Richard S. Spofford, a Boston lawyer. The more noteworthy of her later books were: *New England Legends* (1871), *The Thief in the Night* (1872), *Art Decoration Applied to Furniture* (1881), *Marquis of Carabas* (1882), *Poems* (1882), *Hester Stanley at Saint Marks* (1883), *The Servant Girl Question* (1884), *Ballads About Authors* (1888), *Scarlet Poppy and Other Stories* (1894), *A Master Spirit* (1896), and *In Titian's Garden and Other Poems* (1897).

SPOHR, spōr, LOUIS (1784-1859). A German composer and violinist, born at Brunswick. He studied there under Kunisch and Maucourt and in 1802 became a pupil of the celebrated Franz Eck. In 1805 he accepted the appointment of concertmeister at Gotha and in 1812 went to Vienna as leader at the Theater an der Wien, where he remained until 1815. From 1817 to 1819 he filled a similar position at Frankfort and in 1821 received a life appointment as Court conductor at Cassel. It was in connection with this last position that he won his greatest successes as a violinist, composer, and conductor; besides which he succeeded in bringing his orchestra to a pitch of perfection that earned it a world-wide reputation. In 1831 he completed his work, *The Violin School*, which has remained one of the standard works of instruction for that instrument. His oratorio *Calvary* received its first presentation on Good Friday, 1835. He was a prolific composer and wrote in all nearly 200 works. Most of his operas were little known outside of Germany, but his oratorios have been very popular in England and America, particularly *Die letzten Dinge* (The Last Judgment). As a composer of distinct individuality he ranks but little below the greatest representatives of German music. He died at Cassel. Consult: *Autobiography* (Cassel, 1860; Eng. trans., London, 1865); Schletterer, *Louis Spohr*, in Waldersee's *Sammlung* (Leipzig, 1881).

SPOILS SYSTEM. See CIVIL SERVICE REFORM.

SPOKAN, spō-kān'. An Indian tribe of Salishan stock (q.v.) formerly occupying the whole basin of Spokane River in Washington and Idaho, and now chiefly gathered upon reservations in the same States. They were visited in 1806 by Lewis and Clark, who call them *Liartielo*. In language, customs, and alliance they were closely connected with the Sanpoil (q.v.). All are now civilized and Christianized, about equally divided between Catholic and Protestant. The majority are reported to be thrifty and industrious, promising soon to become self-supporting and good citizens. They numbered about 700 in 1903.

SPOKANE, spō-kān'. The county-seat of Spokane County, Wash., 450 miles east of Puget Sound, on the Spokane River and on the Northern Pacific Railway, the Great Northern Railway, the Oregon Railroad and Navigation Company, and several local branch lines (Map: Washington, H 2). The city was formerly known as Spokane Falls. Elevation, 1900 feet above sea level. The Spokane River flows through the heart of the city from east to west in a series of waterfalls, having a total descent of 142 feet, from which, at the lowest stage of water, 30,000 horse-power is available. Electrical power generated here is transmitted to the famous Cœur d'Alêne silver and lead mines of Idaho, 100 miles away. Spokane has the Gonzaga College (Roman Catholic), opened in 1887, Brunot Hall, an Episcopal school for girls, and Saint Stephen's School for Boys. The city is well provided with hospitals and charitable institutions, and expends about $8000 annually for a public library (Carnegie). The notable buildings are the court house, city hall, post office, and Auditorium Theatre. Twenty-three bridges span the river within the city limits. Fort Wright, a large United States army post, is situated on the river just outside the city. Spokane is the mining centre of the Pacific Northwest, the tributary mines producing over $21,000,000 annually in gold, silver, copper, and lead. The city is surrounded on the north, east, and south by large

pine timber forests. It is also the metropolis of a highly productive cereal belt. In the census year 1900 there was $2,678,823 capital invested in the various industries, whose output was valued at $15,427,540. Lumber, foundry and machine shop products, cars, flour, malt liquors, brick, brooms, furniture, pottery, marble and granite, and ornamental iron constitute the principal manufactures. The government is vested in a mayor, chosen every two years, and a unicameral council, and in administrative officials, the majority of whom are appointed by the mayor with the consent of the council. The city spends annually for maintenance and operation about $547,000, the principal items of expense being: Schools, $157,000; interest on debt, $145,000; the fire department, $67,000; police department, $36,000; and streets, $21,000. The water-works, which represent an expenditure of $1,326,761, are owned and operated by the municipality. Population, in 1890, 19,922; in 1900, 36,848. In the early part of the nineteenth century an Indian trading post was established at Spokane, but there was a population of only 350 in 1880. The growth of the present city dates from 1884, when the Northern Pacific Railway was completed to this point. The city soon became an important distributing centre, and by 1892 was entered by eight railways. In 1889 it was almost completely destroyed by fire, but was quickly rebuilt. Consult a chapter by Harold Bolce, in Powell, *Historic Towns of the Western States* (New York, 1901); Edwards, *An Illustrated History of Spokane County* (n. p., 1900).

SPOLETO, spō-lā'tō. A city in the Province of Perugia, Italy, situated on a hill, 61 miles north-northeast of Rome (Map: Italy, G 5). It is dominated by a citadel, now a prison, in which in 1499 Lucretia Borgia was incarcerated. The town is united with the neighboring height of Monte Luco by a Roman bridge and aqueduct. Beneath the Piazza Vittorio Emanuele are the ruins of a Roman theatre. Several of the churches occupy the sites of Roman temples. The eleventh-century cathedral has a fine Renaissance portico. The gathering of truffles, together with the preservation of meats, fruits, and vegetables, the manufacture of olive oil and silk, and the mining of lignite are the chief industries. Population (commune), in 1881, 21,507; in 1901, 24,642. The ancient Umbrian town of *Spoletium* was colonized by the Romans in B.C. 241. It was destroyed by the Goths, but rebuilt by Narses. In 574 it became the capital of the Lombard Duchy of Spoleto, which rose to great power in the ninth century, when two of the dukes, Guido (q.v.), and Lambert, his son, successively received the Imperial crown from the Pope. From 1220 to 1860 it was a Papal possession.

SPOLIATION (Fr. *spoliation*, from Lat. *spoliatio*, a plundering, from *spoliare*, to plunder, spoil). The destruction of a thing by a person not an owner or interested therein, particularly the erasure of a signature on or alteration of the body of an instrument in writing. The wrongdoer is liable in damages for his act. Such an alteration or destruction of an instrument will not destroy its legal effect if the original contents can be clearly proved. Spoliation differs from *alteration* in that the former is committed by a stranger and the latter by a person interested in the thing destroyed or altered.

In admiralty law, the hasty spoliation or destruction of ship's papers or other documents connected with the voyage by the officers of a vessel suspected of smuggling or blockade running is held to create a presumption of guilt, which, however, may be rebutted.

In ecclesiastical law the term denotes the destruction or waste of church property.

SPONGE (Lat. *spongia*, from Gk. *σπογγία*, sponge; connected with Lat. *fungus*, mushroom). A group of animals representing a distinct branch or phylum, Porifera. The sponges are many-celled animals, with three cell-layers, without a true digestive cavity, supported usually by calcareous or siliceous spicules, the body-mass permeated by ciliated passages or containing minute chambers lined by flagellate, collared, monad-like cells. There is no true mouth-opening, but usually an irregular system of inhalent pores opening into the cell-lined chambers or passages through which the food is introduced in currents of sea water, the waste particles passing out of the body by a single but more usually by many cloacal openings (oscula). Sponges are hermaphroditic, multiplying by fertilized eggs, the germ passing through a morula and a gastrula stage.

Sponges are divided, according to the nature of the skeleton or supporting fibres or spicules, into two orders: (1) *Calcispongiæ*, in which the spicules are calcareous, and (2) *Silicispongiæ*, or glass sponges, in which the spicules are siliceous, or horny and fibrous, as in the bath sponges, when spongin instead of silica forms the supporting framework. Examples of the siliceous sponges are the Venus's flower-basket (Euplectella) and allied deep-sea forms, such as Hyalonema, Holtenia, etc. To the second order also belongs the fresh-water sponge (Spongilla), which grows in lakes or sluggish streams. These differ from other sponges in producing statoblasts or winter buds, formed by the protoplasm dividing into round bodies as large as a pin's head and enveloped by a dense membrane, thus enabling the species to survive freezing cold or droughts.

Certain sponges bore into shells, causing them to disintegrate. For example, *Cliona sulphurea* has been found boring into various shells, such as the oyster, mussel, and scallop; it also spreads out on all sides, enveloping and dissolving the entire shell. It has even been found to penetrate one or two inches into hard statuary marble. Cliona also disintegrates coral.

A FOSSIL SPONGE.
One of the Brachiospongia (*Tholiasterella gracilis*).

Of the marketable sponges there are six species, with numerous varieties. They are available for our use from being simply fibrous, having no siliceous spicules. The Mediterranean sponges are the best, being the softest; those of the Red Sea are next in quality, while our West Indian species are coarser and less durable. Our glove-sponge (*Spongia tubulifera*) corresponds to *Spongia Adriatica*, which is the Turkey cup-sponge and Levant toilet sponge of the Mediter-

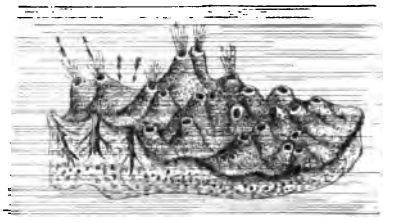
ranean. *Spongia gossypina*, the wool sponge of Florida and the Bahamas, corresponds to *Spongia equina*, the horse or bath sponge of the Mediterranean. This wool sponge of Florida attains under favorable circumstances a weight of one-tenth pound, in six months, and reaches a size of commercial value in a year.

Fossil sponges are known in rocks of all ages. They appear first in the Cambrian as Protospongia and Archæoscyphia, representing the hexactinellids and lithistids. They are represented in the Ordovician by the curious Brachiospongia, and a number of irregular forms; in the Silurian by Astræospongia, Astylospongia; in the Devonian by Hindia and the Dictyospongidæ, which latter enjoyed such great expansion in the shallow seas of western New York during Chemung time. Receptaculites is a peculiar sponge that is common in the Ordovician. During the Mesozoic sponges attained a great development, became especially abundant during the Cretaceous period, and declined during the succeeding Tertiary. Noteworthy Cretaceous genera are Ventriculites and Cœloptychium.

BIBLIOGRAPHY. Hyatt, "Revision of North American Poriferæ," in *Memoirs Boston Society of Natural History* (vol. ii., Boston, 1875); Rauff, "Palæospongiologia," in *Palæontographica*, vol. xl. (Berlin, 1893); Hinde, *Catalogue of Fossil Sponges of the British Museum* (London, 1883); Hall and Clarke, "A Memoir on the Palæozoic Reticulate Sponges Constituting the Family Dictyospongidæ," in *Memoirs of the New York State Museum*, vol. ii. (Albany, 1898).

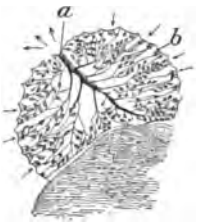
SPONGIOZOA (Neo-Lat. nom. pl., from Gk. *σπογγία, spongia*, sponge + *ζῷον, zōon*, animal). One of the branches or phyla of Invertebrates, intermediate between the Protozoan and the Cœlenterati, and represented by a single class, Parifera, which comprises the sponges.

SPONSORS (Lat. *sponsor*, surety, from *spondere*, to promise; connected with Gk. *σπένδειν, spendein*, to pour a libation). The persons, also called godfathers and godmothers, who present a candidate for baptism, and in the Roman Catholic Church for confirmation also, to the minister of those sacraments. In the case of infants they are representatives who make the vows the child is incapable of making; with adults they act rather as witnesses, and among their duties is a subsequent general oversight in spiritual matters, with a view to preserving religious life in their godchildren. The spiritual bond resulting from this relation is supposed by Roman Catholic theologians to constitute a species of affinity, and hence an impediment of marriage, extending to the parents of the baptized, and even at one time operating between the sponsors themselves.



SPONTANEOUS COMBUSTION (Lat. *spontaneus*, willing, of one's own accord, from *sponte*, abl. sg. of **spons*, will). The ignition of substances at a given moment apparently without the intervention of any causative agency. The spontaneous combustion of organic materials is a frequent cause of fires. When large quantities of soot, linen, paper, cotton or woolen stuffs, ship's cables, etc., are soaked with relatively small amounts of oils (especially drying oils) and exposed to a limited access of air, they may be expected to take fire sooner or later. Similarly, trimmings of lamp-wicks have been known to take fire if kept in open boxes. The presence of moisture frequently aids spontaneous combustion, and piles of damp hay, freshly mown grass, sometimes take fire spontaneously. The phenomenon is not, however, without a clearly defined cause. Fats and oils can be shown to undergo a slow process of combustion at but slightly elevated, if not at the ordinary, temperatures. This fact may be demonstrated by placing a little oil on a hot (but not red-hot) metallic surface, when the combustion of the oil will cause a peculiar odor and will render the oil faintly luminous in the dark. The combustion of a small amount of oil causes the evolution of a corresponding amount of heat; the consequent rise of temperature accelerates the combustion, and hence produces a further elevation of temperature, and so forth, until at a given moment the temperature may become so high as to cause the inflammation of the oil, and with it of the entire mass of organic material containing it. The more porous the material, the greater the surface of oil exposed to the air, provided the amount of oil is not large enough to fill the pores completely. Free access of air might prevent spontaneous combustion by effecting a lowering of the temperature; nor could combustion take place if too little or no air at all were admitted. As to the spontaneous combustion of human bodies, it is an impossibility, and all reports of such cases can be clearly shown either to be due to erroneous observation or to be intentionally fraudulent. See PYROPHORUS.

SPONTANEOUS GENERATION and PROTOGENESIS. The doctrine that different forms of life, especially the lower, have arisen by phy-



SPONGE STRUCTURE.

1. Exterior of a living bath-sponge: the arrows show how the water is sucked into the small pores and expelled from the elevated canal-mouths (oscules).
2. Diagram of canal system, represented by a young sponge with a single excurrent orifice; such a system is represented in a large sponge by each oscule: *a*, oscule; *b*, inhalent pores.
3. Vertical section of a part of a bath-sponge: *b*, inhalent pores; *c*, canals; *d, d*, flagellated chambers; *e, f*, skeleton fibres; *g*, maturing eggs.
4. Enlarged view of a part of the canal system: *a*, inhalent pores and passages by which water is drawn into the spherical flagellated chambers and their connecting passages (apopyles) conducting it into larger spaces (*b*) whence it flows out through an oscule (*c*). Cf. Fig. 2.
5. Enlarged view of flagellated cells lining the chambers and canals; and a single cell: *n*, nucleus; *c*, contractile vesicle; *m*, collar; *f*, flagellum.
6. Various forms of siliceous spicules.
7. One form of siliceous fibrous skeleton.
8. Fresh-water sponge; vertical section of Spongilla; the water enters through the dermal pores (*a*) into the sub-dermal cavities (*b*), then enters the incurrent pores and passages (*c*, colored black), and passes into flagellated chambers (*d*), thence out through the excurrent canals (*e*), into the main central canal or perigastric cavity (*f*), in which the openings (*g*) of these canals from all sides are indicated by the black dots; and the water is finally discharged through the apical oscule (*h*).
9. A bath-sponge (Spongia).
10. A branching sponge (*Chalinopsilla oculata*), a 'finger' sponge, common on the Atlantic coast of the United States.

sico-chemical agencies from inorganic substances. This view prevailed from ancient times until after the middle of the seventeenth century, and as late as 1842 Weeks maintained that mites (Acarus) were spontaneously generated in "several solutions under electrical influence." In 1859 Pouchet, in his *Hétérogénie*, revived the subject, and in 1871 Bastian maintained that bacteria and torulæ were developed at the present day in certain fluids containing organic matter by laws similar to those by which crystals arise, or by what he calls 'archebiosis.'

In 1660 Redi disproved the prevailing notion that the maggots of flies were generated in putrefying meat, by covering similar pieces of meat with fine gauze, and keeping away the blow-flies. He thus demonstrated that the maggots grew from eggs, and that there was "no life without antecedent life." About a century and a half ago Needham experimented by boiling and corking flasks of water containing infusoria, but in every case animalcules appeared after a longer or shorter period. This led Spallanzani (1768) to make more careful experiments. He boiled infusions longer, and instead of simply corking, fused the necks of his flasks. The result was that the infusions remained entirely free from living organisms. Schulze and Schwann in 1836 made further experiments. They carefully boiled their infusions, and then supplied air; but they made it first pass through red-hot tubes, so that any germs present in it would be burned. Under these conditions no infusoria appeared. Then the discovery was made by Cagniard de la Tour that fermentation, like putrefaction, is always accompanied by the presence of microscopic organisms. In 1854-59 Schroeder and Dusch invented the screen of cotton-wool now used for plugging the openings of tubes, which kept out the germs, and it was thus found that the cause of putrefaction and fermentation, and the origin of the living forms accompanying these processes, must be microscopic particles existing in the air. The next step was taken by Pasteur (*On the Organized Particles Existing in the Air*, 1862). On sowing these particles in suitable sterilized infusions he raised from them microscopic organisms. Germs like these were afterwards shown by Cohn to be low plants to which he gave the name 'bacterium.' Finally Tyndall, in 1869, by passing a beam of light through the air in a box, showed that whenever dust was present the putrefaction occurred sooner or later; when it was absent it did not. The result of these experiments and conclusions is that the view that spontaneous generation takes place at the present day has been entirely discarded.

SPONTANEOUS GENERATION (PROTOGENESIS) NECESSARY TO ACCOUNT FOR THE BEGINNINGS OF LIFE. Some of those who, like Wyman, made observations disproving its occurrence at the present day, yet supposed that in the beginning the first living organisms probably arose from inorganic matter, through the action of unknown physico-chemical processes. In 1868 Herbert Spencer, while rejecting the ancient doctrine of spontaneous generation, stated his belief that the formation of organic matter and the evolution of life in its lowest forms "took place at a time when the heat of the earth's surface was falling through ranges of temperature at which the higher organic compounds are unstable." He conceived that the molding of such organic matter must have begun with portions of protoplasm, moré minute, more indefinite, and more inconstant in their characters than the lowest rhizopods, or even the Protogenes of Haeckel. With this view biologists are now in agreement.

It is evident that the earliest living organism appeared when the temperature of the earth's crust and of the air and sea approached that which it is now; the earth's climate probably exceeded in temperature that of the present torrid zone; the sea may have been less saline; but we know that at present exceedingly few plants and animals can live in hot springs; that there is no life in our geysers, and, judging from analogy, the earth's surface must have been nearly as it is now when the first bit of animated protoplasm came into being.

When the earth had assumed its present shape, with its incipient continents, and the oceans lying in their basins, the period arrived when the conditions for the appearance of life became favorable, and at this critical moment the protoplasmic substance probably came into being. The chemical compounds giving origin to it were far more abundant, and the physical and chemical conditions more favorable.

The origin of protoplasm was probably the result of a combination of circumstances which certainly never occurred before in the history of our planet, and which has never happened since. The phenomenon of protogenesis, after taking place once for all, could never have again occurred. Such is the nature of cell-division, of sexual reproduction, of growth, and of heredity, that it would be contrary to the course of nature to suppose that it was ever afterwards necessary for it to again occur. After protoplasm appeared, the earth and ocean probably became too cool to supply a sufficiently high temperature, or chemical compounds of the right degree of stability to form protoplasm.

FIRST BEGINNINGS OF LIFE. To account for the beginnings of life we have been compelled to imagine the creation of a primordial microscopic bit of protoplasm. In shape it was drop-like, spherical or oval, its form being due to gravity, as the primary form of all living beings tends by the action of gravity to be round or ovate.

This primordial being had the power of absorbing and digesting food, or the protoplasmic materials round it, and hence of growing; it was contractile and could move automatically, and thus it was adapted for moving through the water, sending out from its body rootlike extensions or pseudopodia to aid in seizing its food and in locomotion. A single 'chance' germ (though in nature there is no such thing as chance) would have been sufficient. Such a primordial cell or sphere of protoplasm, by the simple process of self-division, even if not far enough advanced in organization to have a nucleus, may have multiplied itself, and in a few hours even become the parent of thousands of young, while the lapse of a few days would enable it to give birth to millions.

These primordial beings were plastic. Already the earth's surface varied, if not in relative distribution of land and sea, in depth, specific gravity, density, light, and shade, in the nature of the bottom of the primeval sea, and in chemical constitution and other physical features.

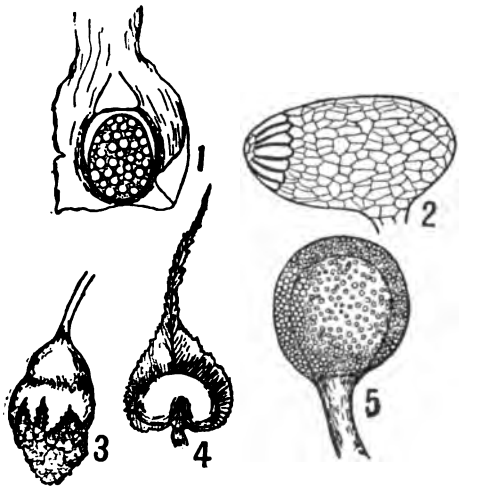
There would follow migrations and the foundation of new colonies in scattered areas. Adaptation to each new environment would take place, and in the course of time variation would set in and the evolution of higher organisms take place. See EVOLUTION. Consult: Chambers's *Encyclopædia*, art. "Spontaneous Generation"; Spencer, *Principles of Biology* (New York, 1898-1901); Haeckel, *The History of Creation* (ib., 1876); Verworn, *General Philosophy* (ib., 1899).

SPONTINI, spôn-tē'nê, GASPARO LUIGI PACIFICO (1774-1851). An Italian dramatic composer, born at Majolati, Ancona. In 1791 he became a pupil at the Conservatory della Pietà de' Turchini at Naples, where he studied under Sala and Tritto. As early as 1803 he had produced sixteen operas in the light Italian style used at that time. His opera *La finta filosofa* and two imitations of French opéra comique, *Julie* and *La petite maison*, met with little success. He then gave himself up to the study of Mozart and showed a marked change in the one-act opera *Milton* produced in 1804. The Empress Josephine, to whom he had dedicated the score of *Milton*, had him appointed chamber-composer, and she secured the production of *La vestale* in 1807. It proved a great success. His grand opera *Ferdinand Cortez* (1809) was equally successful. In 1810, as director of the Italian Opera, he staged Mozart's *Don Giovanni* in the original form for the first time in Paris. In 1820 he was appointed general musical director at Berlin. He wrote for the Berlin festival play *Lalla Rukh* (1821), remodeled as the opera *Nurmahal, oder das Rosenfest von Kaschmir* (1822); *Alcidor* (1825); and *Agnes von Hohenstaufen* (1829). In 1842 he resigned his position and returned to Paris. He died in his birthplace.

SPOONBILL. An ibis-like bird of the family Plataleidæ, distinguished by the flat, dilated, spoon-like form of the bill. The species are five or six, in two genera widely distributed. The spoonbills of the Old World belong to the genus Platalea, and have the windpipe curiously convoluted. The spoonbills of the New World lack these convolutions, and are therefore placed in a distinct genus Ajaja. The roseate spoonbill (*Ajaja ajaja*), the only American species, is very abundant within the tropics. It is nearly three feet in length, and is a beautiful bird, with plumage of a fine rose color, of which the tint is deepest on the wings; the tail-coverts are carmine. It was formerly abundant in Florida, but is now rare there, and most commonly seen along the coast of Texas. It nests in colonies, and builds a coarse platform of sticks, in trees, on which it lays three eggs, white spotted with brown. The only European species is the white spoonbill (*Platalea leucorodia*), common in marshy districts throughout Northern Europe and Asia in summer, and in the salt marshes of the Mediterranean in winter. See Colored Plate of WADERS.

SPOON-BILLED SANDPIPER. A rare reddish, stint-like sandpiper (*Eurynorhynchus pygmæus*) of Eastern Asia, remarkable only for its spoon-shaped bill. (See Colored Plate of SHORE-BIRDS.) It breeds in Siberia, occasionally crossing to the Alaskan coast, and migrates southward in winter to China and India.

SPOON'ER, JOHN COIT (1843—). An American lawyer and legislator, born in Lawrenceburg, Ind. In 1859 he removed with his parents to Wisconsin. He graduated at the University of Wisconsin in 1864. He served during the Civil War first as a private in the Fortieth Wisconsin Volunteers and subsequently as a captain in the Fiftieth Wisconsin, and was brevetted major at the close of hostilities. In 1867 he was admitted to the bar, and from 1868 to 1870 he was Assistant Attorney-General of the State. He was a member of the State Assembly in 1872-74, and in 1885 he was elected to the United States Senate. In 1892 he was defeated for Governor by George W. Peck, and in 1893 resumed legal practice in Madison. In January, 1897, he was again elected to the United States Senate to succeed Senator Vilas. He took a prominent part in legislation and debates, and became recognized as the spokesman of the McKinley and Roosevelt administrations. He was reëlected for a third time in January, 1903, despite the opposition of Governor La Follette's faction in the Wisconsin Legislature.



SPOONER, SHEARJASHUB (1809-59). An American dentist and author, born at Brandon, Vt. He graduated in 1830 at Middlebury (Vt.) College, at the College of Physicians and Surgeons, New York City, in 1835, and practiced dentistry in New York with much success until 1858. He contributed extensively to periodicals, professional and other, and published, in addition to dental works, two compilations once valuable: *Anecdotes of Painters, Engravers, Sculptors, and Architects, and Curiosities of Art* (1853), and a *Biographical and Critical Dictionary of Painters, Engravers, Sculptors, and Architects from Ancient to Modern Times* (1853; new ed. 1865). He also bought and restored the plates of Boydell's *Shakespeare Gallery*, which he republished.

SPORADES, spôr'â-dēz (Gk., scattered). The collective name for the islands lying in the southeastern portion of the Ægean Sea between Samos and Rhodes, and east of the Cyclades (q.v.) (Map: Greece, J 5). The ancients included under the Sporades a number of islands which lie south of the Cyclades proper and whose principal members are Melos, Ios, Santorin, and Amorgos; but these are now classed with the Cyclades, belonging to the Greek nomarchy of that name. The Sporades proper belong to Turkey. Their principal members are Astropalia, Leros, Patmos, Nicaria, Calimno, Cos, Nisyros, and Scarpanto. Some also include Rhodes, Samos, Chios, and Lesbos with the neighboring islands. In a wider sense the name Sporades is applied to all the islands of the Ægean Sea except the Cyclades proper. The group lying in the western part of the sea, north and east of Eubœa or Negropont, the principal member of which is Scyros, are known as the Northern Sporades, and belong to the Greek Nomarchy of Eubœa. For details, see articles on the principal individual islands.

SPORAD'IC (Lat. *sporadicus*, from Gk. σποραδικός, *sporadikos*, from σπείρειν, *speirein*, to sow). Isolated. In medicine, a disease is sporadic when but few cases, widely separated, appear. If many cases are found in the same region, the disease is called epidemic (q.v.). In botany, sporadic growths are those which are scattered or widely dispersed.

SPORANGIUM (Neo-Lat., from Gk. *σπόρος*, *sporos*, seed + *ἀγγεῖον*, *angeion*, vessel). The plant organ within which asexual spores are produced. Among algæ and fungi the sporangium is usually a single cell (mother-cell), which produces few to numerous spores. Among bryophytes there are no distinct sporangia, the spores being produced by a more or less complex capsule which is the essential feature of the characteristic leafless sporophyte (sporogonium) of the group. Among pteridophytes the sporangia are very prominent, and their origin is the basis of a fundamental distinction in the group. They are complex, many-celled organs, usually borne on leaves, and if they are developed from a single superficial (epidermal) cell the plant is *lepotosporangiate*, if they involve several epidermal and deeper cells the plant is *eusporangiate*. The ancient ferns, represented by a few tropical forms to-day, were eusporangiate; while the great host of modern ferns, including the water ferns, are leptosporangiate. It is natural, therefore, to regard the eusporangiate condition as primitive, and the leptosporangiate as derived. The two other divisions of pteridophytes (horsetails and club mosses) and all the spermatophytes (seed-plants) are eusporangiate.

The structure of the ordinary fern sporangium indicates its highly specialized character. It consists of a long slender stalk that bears a spore-containing capsule. The walls of the capsule are thin, except for a single row of thick-walled cells (annulus) which girdles the capsule like a

TYPES OF SPORANGIA.
1, Quillwort; 2, fern; 3, liverwort; 4, club moss; 5, fungus.

meridian, from the stalk nearly around to the stalk again. At maturity the annulus acts like a bent spring, and when the thin wall of the capsule begins to yield straightens violently, hurling out a spray of spores. In the eusporangiate plants such a contrivance is absent.

In most ordinary ferns the sporangia are developed in very great numbers upon the under surface of foliage leaves, usually occurring in definite groups (sori), popularly called 'fruit dots,' which are generally protected by a flap-like outgrowth (indusium, q.v.) from the epidermis. In some ferns (e.g. 'sensitive fern'), however, foliage-work and spore-production are separated, and distinct ('spore-leaves') in the other g and club mosse sporophyll bei the horsetails club mosses (L phylls are or (strobilus), w cones of pines, of the flowers exhibit heteros ferentiated, so sporangia) an rangia). This pteridophytes, (Selaginella, plants. Since seed-plants, lo are really mic spectively, sta sporophylls, a supposed.

SPORE (fr general, a sing plant for repr spores are not (Cyanophyceæ, are a prominen or other of tw mode of origin duced by mere gium. Sexual of two sexual simple or com (q.v.).

ASEXUAL SP asexual spores character of t which produce rophyceæ, q.v.) ospore or swa naked mass of means of one Among the br zoöspores are t concave side.

ceæ, q.v.) the spores have no cilia and hence cannot swim, and as each sporangium produces four such spores they are called tetraspores.

Among the fungi, asexual spores, which are produced in great profusion and variety, have received many names. Among the alga-like fungi (Phycomycetes, q.v.) they are developed in one-celled sporangia, and are mostly light, dry cells, easily scattered by wind. Such are called simply spores, with no designating prefix. Among the sac-fungi (Ascomycetes, q.v.), however, two conspicuous forms of asexual spores occur: the one, conidia, which are successively cut off from the tip of a filament, often forming chains; the other, ascospores (fig. 4), developed within a delicate sac (ascus). Among the rusts (Uredinales, q.v.) the greatest variety of asexual spores for one plant is reached; e.g. in wheat rust there are four. Among toadstools (Basidiomycetes, q.v.) the characteristic spores are basidiospores, borne two or four together on the tips of pointed branches from a swollen filament, the basidium (fig. 8). There are several other spores of minor significance among the fungi, each with its distinctive name. Among the bryophytes (liverworts and mosses) and most of the pteridophytes the asexual spores are called simply spores. In heterosporous plants (some pteridophytes and all spermatophytes), however, there are two kinds of asexual spores, megaspores or macrospores and microspores (qq.v.). Before their character in seed plants was appreciated these two kinds were called respectively embryo-sacs and pollen-grains. In all of these wind-dispersed asexual spores, the spore-wall consists of two layers, a delicate inner one (intine or endospore) and a tough outer one (exine or exospore), often variously sculptured, especially in the pollen-grains of flowering plants, and sometimes even winged, as in the pollen-grains of pines (fig. 2).

SEXUAL SPORES. Only two names, zygospores and zygotes, are used to designate sexual spores which result from the union of similar gametes (fig. 5, 7). (See ISOGAMY.) Oöspores, produced by all but the lowest plants, are formed

TYPES OF SPORES.

1, Megaspore of Selaginella; 2, microspore (pollen) of pine; 3, spore of Equisetum with elaters, 4, ascospore of lichen; 5, zygospore of Spirogyra; 6, zoöspore of Vaucheria; 7, zygospore of Mucor; 8, basidiospores; 9, zoöspores of green alga.

by the union of dissimilar gametes (see HETEROGAMY) known as sperms and eggs (oöspheres). See SEX in plants.

Under suitable conditions any spore begins to form a new plant, the process being called germination. In some cases the germination is immediate; in others it is delayed for a longer or shorter period by unfavorable conditions, as in winter. Spores adapted to delayed germination are called resting spores, and may be recognized by their unusually heavy protecting wall. See REPRODUCTION.

The methods of spore dispersal are as diverse as the various means of seed dispersal. In many of the lower forms, as in the algæ and some fungi, zoöspores may distribute the species over wide areas. Most aerial spores are light and usually small, and are thus readily scattered great distances by wind, a fact evidenced by the usually early appearance of ferns on new tropical islands. Mechanical expulsion and special devices for separating or entangling spores, as the elaters of Equisetum (fig. 3), are common.

SPÖRER, spĕ'rĕr, GUSTAV FRIEDRICH WILHELM (1822-95). A German astronomer, born in Berlin and educated there. He taught at Bromberg, at Prenzlau, and at Anklam (since 1849). Here he began in 1860 to observe sun spots with the view of determining the law of solar rotation. Through a Government endowment a solar observatory was erected by him at Anklam. Spörer arrived independently at a conclusion similar to that of Carrington concerning the equatorial quickening of the sun's movement on its axis. In 1868 he took part in an expedition to East India for observing a total eclipse of the sun. The structure of the chromosphere was also investigated by Spörer. This showed the chromosphere to be of the same nature as the vast protrusions from it. From 1874 to 1894 Spörer was observer at the astrophysical observatory at Potsdam.

SPOROPHYLL (from Gk. *σπόρος, sporos,* seed + *φύλλον, phyllon,* leaf). A leaf-like organ that occurs only in spermatophytes and in certain pteridophytes and bears sporangia (sporecases). Though generally unlike ordinary foliage leaves in appearance, they are regarded as foliar organs. See SPORANGIUM.

SPOROPHYTE (from Gk. *σπόρος, sporos,* seed + *φυτόν, phyton,* plant). The sexless phase in alternation of generations (q.v.).

SPOROZOA (Neo-Lat. nom. pl., from Gk. *σπόρος, sporos,* seed + *ζῷον, zōon,* animal). A class of parasitic protozoa comprising the malaria germs, Texas cattle-fever germs, etc. While the sporozoa differ much in structure, they are similar in parasitic habits and development. As a rule they are more or less oval or elongated, with no organs of locomotion except in the early stages. They are very minute, though *Gregarina gigantea,* which lives in the intestine of the European lobster, is of comparatively colossal size, being a little over half an inch in length. They are nourished by the absorption of the fluid in which they live. The young arise as 'sporoblasts,' which when enveloped with a membrane are called spores, the contents of which break up into several small bodies or 'sporozoites'; the latter to complete their development must leave the first host and enter a second one.

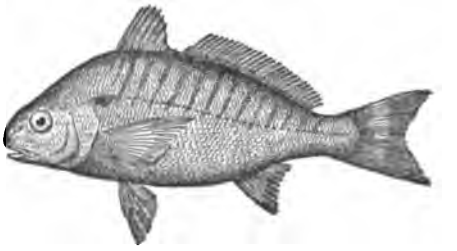
Some of the sporozoa are parasites in the interior of cells, such as those lining the intestine of higher animals. Malaria in man has been proved to be due to the presence of a sporozoan

(*Hæmamœba* or *Plasmodium Laverani*) which invades and destroys at a certain stage in its life history the red corpuscles of the blood. The sporozoites are developed in a mosquito (Anopheles) and are transferred from the salivary glands to man by the sting or proboscis. The bird-malaria germ is communicated by the ordinary mosquito (Culex). Another form (*Apiosoma bigeminum*) causes the Texas fever in cattle, the infection being carried by ticks (q.v.). A parasite of the tsetse fly (q.v.), which is a flagellate hæmatozoan, is the cause of the tsetse disease in Southern Africa. See *Insects and Disease*, in article INSECT.

The Myxosporida are generally rather large sporozoa, their hosts being fish and insects. The silkworm disease called pebrine is due to one of the Myxosporida (*Glugea bombycis*), which inhabits all the tissues of the caterpillar.

The Sarcosporida, also called Rainey's or Mieschers's corpuscles, take up their abode in the voluntary muscles of mammals. They form oval cysts, which when ripe inclose spores, each of which contains numerous kidney-shaped sporozoites. Thus *Sarcocystis Miescheriana* occurs in the muscles of the pig; *Sarcocystis muris* in the mouse; *Sarcocystic Lindemanni* rarely in human muscle.

SPORT (by aphæresis for *disport*, from OF. *desporter, deporter, depporter*, to support, banish, amuse, divert, from Lat. *deportare*, to carry away, from *de*, down, away + *portare*, to carry). In biology, the appearance at birth of an individual having one or more marked or extraordinary physical or mental characteristics; a sudden aberration from the type. See EVOLUTION; NATURAL SELECTION.



SPORTS, BOOK OF. A name popularly given to an edict issued by James I. of England in 1618 dictating the games which should or should not be played on Sundays after divine service. According to this declaration "no lawful recreation shall be barred to my good people which does not tend to the breech of the laws of my kingdom and the canons of the established Church." The sports allowed were dancing, archery, leaping, vaulting, May games, Whitsun ales, Morris dances, and the setting up of May poles. The occasion of this proclamation was the conduct of some Puritan authorities in the County of Lancashire, who, by their arbitrary repression of the customary recreations of the people, had created considerable discontent and (in the estimation of the King and his advisers) "had given much comfort to the Roman Catholics" by giving a repulsive aspect to the reformed religion. The unlawful sports were bear-baiting, bull-baiting, and bowling. In 1644 the Long Parliament ordered all copies of the Book of Sports to be called in and publicly burned.

SPOT, or LAFAYETTE. A small food-fish (*Leiostamus xanthurus*) of the South Atlantic and Gulf Coast, locally called 'Lafayette' (q.v.), 'goody,' and 'oldwife.' The color is bluish above and silvery below, with about fifteen dark, wavy bands slanting down the sides, and a black spot behind the eye. It appears numerously on the northern coast in September, when it is preparing to spawn in the inlets.

SPOTS'WOOD, or **SPOT'TISWOOD,** ALEXANDER (1676-1740). A British soldier and American colonial governor. He was born at Tangier, Africa; entered the British Army; served with Marlborough and was wounded at Blenheim. He was appointed Lieutenant-Governor of Virginia in 1710, became active in promoting the interests of William and Mary College, and was also interested in the improvement of the condition of the Indians. It is to his efforts that the improvement in the production of tobacco is attributable, and he favored the act for making tobacco-notes a circulating medium. He introduced the manufacture of iron into Virginia. Owing to a lack of support, disputes, and other difficulties, he was superseded in 1722, but he remained in America, and in 1730 was appointed Deputy Postmaster-General.

SPOTTED FEVER. See MENINGITIS.

SPOT'TISWOODE, SPOT'TISWOOD, SPOTTISWOOD, or **SPOTS'WOOD,** JOHN (1565-1639). Archbishop of Saint Andrews. He was educated at the University of Glasgow, and on his father's death in 1583 succeeded him as parson of Calder. He was for many years an uncompromising Presbyterian, but he afterwards adopted English episcopal ideas. He became the chief instrument of James I. and Charles I. in their attempts to reconstruct the Scottish Church after the English model. He was made Archbishop of Glasgow in 1603 and member of the Scottish privy council in 1605. In 1610 he was moderator of the Assembly which gave its consent to the introduction of episcopacy into Scotland. In 1615 Spottiswoode was translated to the see of Saint Andrews, which held the primacy in Scotland. In 1618 he persuaded the General Assembly to accept the Five Articles of Perth, ordaining certain ceremonial innovations, and he subsequently inforced the articles as far as he could. He took part in the revision of the Scottish Prayer-Book, but was opposed to the introduction of the Laudian system into Scotland. In 1633 he crowned Charles I. at Holyrood, and in 1635 he was made Chancellor of Scotland, a dignity which no churchman had held since the Reformation. Finding that the King was determined to introduce the Prayer-Book, he, as usual, stifled his own scruples and acted energetically, according to the King's wishes, but in the resulting disorders he found it necessary to flee from Scotland. He was excommunicated and deposed by the General Assembly, December 4, 1638, and Charles asked him to resign the Chancellorship. Spottiswoode was the author of the *History of the Church and State of Scotland from the Year of Our Lord 203 to the End of the Reign of King James the VI., 1625*, an official compilation written at the request of King James, first printed in London in 1655.

THE SPOT.

SPOTTISWOODE, WILLIAM (1825-83). An English mathematician and physicist, born in

London. He was educated at Balliol College, Oxford. His memoirs on the contact of curves and surfaces in the *Philosophical Transactions* and various other scientific journals are important and original. Among his works are: *Meditationes Analyticæ* (1847); *Elementary Theorems Relating to Determinants* (1851; a second edition appeared in *Crelle's Journal*, 1856); *A Tarantasse Journey Through Eastern Russia* (1857); *Polarization of Light* (1874); *A Lecture on the Electrical Discharge, Its Form and Functions* (1881).

SPOTTSYLVANIA COURT HOUSE, BATTLES OF. A series of battles during the Civil War, fought between May 7 and May 21, 1864, at and near Spottsylvania Court House in Virginia, 49 miles north by west of Richmond, between the Federal Army of the Potomac, under General Meade, and the Confederate Army of Northern Virginia, under General Lee. As in the battle of the Wilderness (q.v.), the movements of the Federal army were directed by General Grant. Both armies paused for breath after the battle of the Wilderness (May 5th, 6th), and prepared to renew the struggle. The Federal wagon trains were early in the afternoon of the 7th drawn to the eastward to clear the direct road to Spottsylvania Court House, upon which a night march had been ordered. This was, however, anticipated by General Lee, and Longstreet's corps (under R. H. Anderson) moved toward the same point, which (having a shorter line) they reached early on the morning of the 8th in time to oppose the advance of Warren's corps. Anderson had been ordered to begin his march at about the hour when (forced to move earlier by the burning forest in which he could not bivouac) he actually arrived at his destination. Notwithstanding the celerity with which Anderson moved, Watson's division of the Federal cavalry reached the Court House some hours earlier, and had not, as alleged, Sheridan's dispositions been countermanded by Meade, the result might have been different. Anderson immediately intrenched, and, although attacked by Warren with vigor, was enabled to maintain his position until heavily reinforced.

By noon of the 9th the relative positions of the opposing forces were as follows: The Confederate line formed a semicircle in front of the Court House, facing north, northwest, and northeast, with Anderson, Ewell, and Early from left to right. Confronting them were Warren, Sedgwick, and Burnside from right to left in order named; Hancock had not yet arrived, but had been ordered to threaten Lee's left. In the course of these movements the distinguished commander of the Sixth Corps—General Sedgwick—was killed by a sharpshooter, and was succeeded by General Wright. It was discovered that Hancock's movement had caused Lee to draw troops from his right, and Grant thereupon (on the 10th) delivered a severe blow upon that part of his enemy's line. Combining for the purpose the Fifth, Sixth, and part of the Second Corps, all under Hancock, while Burnside was to coöperate (a storming party of 12 regiments under Colonel Upton being a feature of the attacking column), he scaled the enemy's intrenchments and took several guns and some hundreds of prisoners. The general attack failed, and was repulsed with loss; it was renewed with success and Upton's men (their commander severely wounded) were finally withdrawn, bringing their prisoners with them, but leaving the guns behind. On the 11th there was no fighting.

A reconnaissance made on the 11th from Hancock's corps discovered a salient, at the right centre of the Confederate intrenchments. At 4 o'clock the next morning a combined attack of Hancock and Burnside was made, resulting in the capture of 4000, prisoners, 30 guns, several thousand stand of arms, and many colors. This success was only achieved after the most severe hand-to-hand fighting that occurred during the war. The captured artillery was turned upon the defenders of the position, who, heavily reinforced, resisted most strenuously. Five times Lee's men made desperate attempts to dislodge Hancock, each time losing heavily. It was 3 o'clock next morning before the fighting ceased, after the troops had been for nearly twenty hours under fire. Lee retired to a fresh position in rear of the one previously occupied and strongly intrenched. Until the 18th the two armies lay facing each other, engaging in several minor conflicts, and Grant then, on May 19th-21st, transferred his army to the North Anna River. On the 8th Sheridan had been detached with his command and sent on a raid in the direction of Richmond and against Lee's communications. He was promptly followed by the Confederate cavalry, but, notwithstanding their efforts, succeeded in passing entirely around Lee's army. He had four severe engagements with Stuart's cavalry, in one of which that distinguished leader was mortally wounded, recaptured 400 Federal prisoners, captured large quantities of supplies and war material, destroyed miles of railroad and telegraph, passed within the outer defenses of the enemy's capital, and after a fortnight's absence reached Grant's headquarters. The Federal losses at Spottsylvania are estimated at 6820; those of the Confederates at 9000, in killed, wounded, and missing. Consult: *Official Records;* Johnson and Buel (eds.), *Battles and Leaders of the Civil War* (New York, 1887); Humphreys, *The Virginia Campaign of 1864 and 1865* (New York, 1883); Grant, *Personal Memoirs* (last ed., New York, 1895); Badeau, *Military History of Ulysses S. Grant* (New York, 1868-81); and Swinton, *Campaigns of the Army of the Potomac* (new ed., New York, 1882).

S. P. Q. R. The abbreviation of *Senatus populusque Romanus* (the senate and the Roman people), the motto surmounting the Roman standards.

SPRAGUE, sprāg, CHARLES (1791-1875). An American poet, born in Boston, Mass. Leaving school at an early age, he became a merchant's clerk, and in 1820 teller in a bank. From 1825 to 1865 he was cashier in the Globe Bank of Boston. His literary skill was chiefly shown in occasional poems, which were first collected in 1841. In 1850, 1855, and 1876 editions of his *Poetical and Prose Writings* were published. Much of his verse is in the familiar rhymed couplet of the eighteenth century, to which period its literary feeling chiefly belongs.

SPRAGUE, WILLIAM (1830—). An American manufacturer and politician, born at Cranston, R. I. After studying at the Irving Institute, Tarrytown, N. Y., he entered his fa-

ther's calico factory, and afterwards became interested in linen weaving and locomotive building. He was elected Governor of Rhode Island, but at the outbreak of the Civil War he offered his services to the United States Government, and served with the Rhode Island troops, participating in the first battle of Bull Run and in the Peninsular campaign. From 1863, when his term as Governor expired, until 1875, he was a member of the United States Senate and served as chairman of the committees on public lands and on manufactures and as a member of the committees on commerce and on military affairs.

SPRAGUE, WILLIAM BUELL (1795-1876). An American clergyman and compiler of *Annals of the American Pulpit* (10 vols., 1857-1869), a comprehensive biographical dictionary of the leading American ministers of all denominations. He graduated at Yale (1815), studied theology at Princeton (1819), had pastoral charges at West Springfield, Mass. (1819-29), and Albany, N. Y. (1829-69), and afterwards devoted himself to literary work at Flushing, L. I. Besides the *Annals* mentioned above, he wrote numerous books, of which the chief are: *Life of Rev. Edward Dorr Griffin, D.D.* (1838); *Life of Rev. Jedidiah Morse* (1874); and *Women of the Bible* (1850).

SPRAIN (from OF. *espreindre*, from Lat. *exprimere*, to press out, from Lat. *ex*, out + *premere*, to press), or STRAIN. A term employed in surgery to designate a violent stretching of tendinous or ligamentous parts with or without rupture of some of their fibres. Sprains are very frequent in all the joints of the upper limbs, especially in the wrist and the articulations of the thumb. In the lower extremity the ankle is the joint by far the most frequently affected; and this is accounted for anatomically by the small size of the articular surfaces, the great weight the astragalus (the bone presenting the lower articular surface) has to support, and the unyielding nature of the lateral ligaments. In slight sprains of this joint the ligaments are only stretched or slightly lacerated, but in more severe cases they may be completely torn through. Sprains are sometimes mistaken for fractures, and *vice versa;* and the two injuries may coexist. The pain and swelling sometimes make an accurate diagnosis difficult, especially if the patient is not seen for some time after the accident; and if any doubt exists, the case should be treated as for the more severe injury. Sprains of the knee are not uncommon, and are characterized by great swelling from effusion of fluid within the joint. Sprains of the back are not unfrequent accidents, and are the most serious of any. The treatment of sprains generally must be regulated by their severity. In most cases, elevation of the joint, the application of cold, and complete rest in a splint will be sufficient, and as soon as the inflammation subsides massage and movement are necessary to prevent adhesions. Sometimes pain and impaired function persist for a long time, and frequently after a severe sprain a joint is permanently weaker.

Sprains, or strains, are very common among horses, owing to the severe exertions required of them, often while they are young and unprepared for such work. Various muscles, ligaments, and tendons are liable to strain, but none more frequently than the large tendons passing down the back of the fore limbs. In slight cases cold water continuously applied for several hours gives relief; but in all serious cases diligent fomentation with water about the temperature of 100° is preferable; or the injured part may be swathed in a thick woolen rag, kept constantly moist and warm by frequent wetting with the hot water. Perfect rest is essential, and in order to insure the relaxation of the large tendons of the horse's limbs, he may in bad cases be kept slung for several days. Blisters, hot oils, firing, and all such irritants are on no account to be used until the inflammation abates, and the part becomes cool and free from tenderness. Such remedies are then useful for causing the reabsorption of swelling, and perhaps also for invigorating the weakened part.

SPRAT (dialectic variant of *sprot*, from AS. *sprota*, OHG. *sprozo, sprozzo*, Ger. *Spross*, sprout, from AS. *sprēotan*, Ger. *spriessen*, to sprout). A small European herring (*Harengula sprattus*), very abundant in the northern Atlantic. It is six inches in length when fully grown. Sprats are cured in great quantities both dry-salted and in brine, and form a cheap and excellent food. Certain small and unimportant species have taken the name in America, where the true sprat is not found.

SPREADING ADDER. See HOGNOSE; and the photographic Plate of SNAKES.

SPRECK'ELS, CLAUS (1828—). An American business man, born at Lamstedt, in Hanover, Germany. He emigrated to Charleston in 1846; worked for a time in New York City; and went to San Francisco in 1856. In 1857 he started the Albany Brewery in San Francisco, and in 1863 organized the Bay Sugar Refining Company. Two years afterwards he sold his interests and went to Europe, where he studied the manufacture of sugar in all its aspects. Returning to California, he engaged more extensively than ever in business, having large interests in manufactures and shipping both in California and in the Hawaiian Islands. He acquired large sugar interests in Hawaii; built large refineries with improved processes; engaged in beet-sugar farming in California; and by the control he exercised over the sugar industry gained for himself the name of the 'sugar king.'

SPREE, sprā. A river of Prussia, which rises in the eastern part of the Kingdom of Saxony, on the borders of Bohemia (Map: Prussia, E 2), and after a winding northwest course of 226 miles, mainly through Brandenburg, falls into the Havel at Spandau. It flows through a low and marshy region, frequently expanding into lakes. It becomes navigable for small vessels at Liebsch, and has recently been deepened below Berlin so as to admit large ships to that city. It is connected with the Oder by two canals.

SPREMBERG, sprĕm'bĕrk. A town of Prussia, on the Spree, 77 miles southeast of Berlin (Map: Germany, F 3). Its chief industry is cloth manufacture. There are oil mills and mines of lignite. Population, in 1900, 10,925.

SPRENGEL, sprĕng'el, KURT (1766-1833). A German physician and botanist, born at Boldekow, near Anklam, and educated at Halle. In 1789 he was made professor of medicine there, and in 1797 he was appointed professor of botany as well. He published: *Versuch einer pragmatischen Geschichte der Arzneikunde* (1792-

1803; 4th ed. 1846), *Handbuch der Pathologie* (1795-97; 4th ed. 1815), *Historia Rei Herbariæ* (1807-08), *Geschichte der Botanik* (1817-18), and *Neue Entdeckungen im ganzen Umfange der Pflanzenkunde* (1819-22).

SPRENGER, sprĕng'ĕr, ALOYS (1813-93). A German-English Orientalist, born at Nassereit, Tyrol. He was educated at Innsbruck and at the University of Vienna. In 1836 he settled in London and became a naturalized British subject. In 1843 he proceeded to Calcutta under an appointment to the medical service of the East India Company. In 1844-48 he was principal of the Mohammedan College at Delhi. In December, 1847, he became an assistant resident at Lucknow, where he was employed for some time in cataloguing the manuscripts in the royal library of the King of Oudh. From 1851 to 1854 he was official Persian translator at Calcutta, and principal of the Mohammedan College at Hoogli. During these years he traveled extensively through the Orient, gathering materials for his projected *Life of Mohammed*, the first portion of which was published at Allahabad in 1851. In 1857 he returned to Europe, and settled at Heidelberg. In 1858-81 he was professor of Oriental languages at the University of Bern. The remainder of his life he spent in retirement at Heidelberg. His published works include: *Technical Terms of the Suffees* (1844); *An English-Hindustani Grammar* (1845); *Selections from Arabic Authors* (1845); *The History of Mahmud Ghaznih* (1847); *The Gulistan of Saadi* (1851), a translation from the Persian; *Leben und Lehre des Mohammed* (3 vols., 1861-63); and *Die alte Geographie Arabiens* (1875).

SPRING (AS. *spring*, *spryng*, OHG. *spring*, *sprung*, Ger. *Spring*, spring, from AS. *springan*, *sprincan*, OHG. *springan*, Ger. *springen*, to spring, leap; probably connected with Gk. *σπέρχεσθαι*, *sperchesthai*, Lith. *sprugti*, to spring away, escape). A subterranean stream which discharges at the earth's surface. Most springs are fed by meteoric waters in the form of rain and snow that percolate into the soil and accumulate at some depth in the strata. This accumulation is known as ground water, and its upper surface, which is called the water-level, coincides more

ARRANGEMENT OF STRATA CAUSING A SPRING.

The water collects in the depression A, and percolating through the porous stratum D, issues at B as a spring. C and E are impervious layers which prevent the escape of the water above or below D.

or less closely with the surface of the ground, receding from it, however, under the hill crests and approaching it closely under the valleys. When the side of a valley is steep or its floor is much depressed the ground water may come to the surface and escape as a spring. Springs may also be formed by the percolating waters encountering an impervious layer of clay or cemented sand which retards their further descent, causing them to follow this dense stratum until they emerge on some hill slope. Springs of this character are more or less dependent on rainfall. All water in penetrating the soil and rocks, even if at no great depth, becomes more or less charged with dissolved mineral and organic matter, as by reason of its carbonic acid it possesses marked solvent powers. Spring waters therefore commonly contain various solid substances in solution, such as the carbonate, sulphate, or muriate of lime, salts of soda, potash, magnesia, and iron, or more rarely silica. When the quantity of dissolved solids is unusually large the spring is termed a mineral spring, and is often utilized for medicinal purposes. See MINERAL WATERS.

Underground waters may collect above an impervious stratum which does not appear at the surface, and they escape by slow percolation through the overlying strata, forming a marsh or swale. To such marshy tracts occurring in the arid regions of California, Arizona, and Mexico, the name cienega has been given.

Thermal springs, whose temperatures are notably higher than that of ordinary springs, usually have a deep-seated origin. In regions where the rocks have been greatly disturbed and fractured the surface waters penetrate to great depths, and thus become warmed by the interior heat of the earth, or they may be heated from contact with uncooled masses of lava. It is also known that igneous rocks of all kinds give off a great quantity of vapor during the process of cooling, and some springs thus may be fed by waters whose source lies deep within the earth, and which for the first time appear at the surface. Thermal springs are mostly limited to mountainous regions; in the United States they occur in great numbers along the Appalachians and the Rocky Mountains. In company with geysers they are found in the Yellowstone National Park, Iceland, and New Zealand. Consult Schlichter, *The Motion of Underground Water*, *Water Supply and Irrigation Papers*, No. 67, United States Geological Survey (Washington, 1902). See ARTESIAN WELLS; GEYSERS; GEOLOGY.

SPRING. A term used in mechanics to designate variously constructed devices of metal or other elastic material adapted to resist concussion, to supply motive power, or to register stress through their property of tending to return to their original form. A spiral spring is one which is wound around a fixed point or centre in constantly receding coils, like the mainspring of a watch or clock. Spiral springs are usually made of flat strips or ribbons of steel, but may be made of round or other shaped wire. A helical spring is one which is wound around a cylindrical arbor in advancing spirals like the thread of a screw. Helical springs are usually made from round bars or from square rods of steel, and are perhaps more extensively used than any other form. An elliptical or laminated spring is made of flat bars, plates, or 'leaves' of regularly varying lengths superposed one upon the other. For formulas for calculating the strength and energy of springs of various forms and sizes, consult Kent, *Mechanical Engineers' Pocket Book* (New York, 1900).

SPRING, GARDINER (1785-1873). An American Presbyterian clergyman, son of Samuel Spring (q.v.). He was born at Newburyport, Mass., and was graduated at Yale College in

1805. He began the study of law at New Haven, taught for two years in Bermuda, at the same time continuing his legal studies, and was admitted to the bar at New Haven in 1808. The next year he entered Andover Theological Seminary to study for the ministry. In 1810 he was ordained, and settled as pastor of the Brick Presbyterian Church, New York City, where he remained for over fifty years. He was one of the founders of the American Bible Society in 1816, the American Tract Society in 1825, and the American Home Missionary Society in 1826. He published many books of a religious character besides his *Personal Reminscences of the Life and Times of Gardiner Spring* (1866.)

SPRING, SAMUEL (1746-1819). An American Congregational clergyman. He was born at Northbridge, Mass., graduated at the College of New Jersey in 1771, and later studied theology. In 1775 he joined the Continental Army, and accompanied Benedict Arnold as chaplain of the invading army into Canada. In 1776 he left the army, and the next year was installed pastor of the church at Newburyport, Mass., where he continued until his death. He was one of the founders of Andover Theological Seminary, and also of the Massachusetts Missionary Society, and to him is attributed the idea of forming the American Board of Commissioners for Foreign Missions. Many of his occasional sermons have been printed, the most notable of them being *A Sermon on the Death of Washington* (1799), and *A Discourse in Consequence of the Late Duel* (1804)—that between Burr and Hamilton. Consult the *Life and Times of Gardiner Spring*, vol. i. (New York, 1866).

SPRING BALANCE. An instrument used to determine the weight of a body by the extension or compression of a spring. In the usual form of spring balance a spring of coiled wire is contained in a metal case and incloses a central rod to which is attached at one end a hook, and at the other a projection which extends through a slit in the case and moves over a graduated scale. The central rod can also be connected by means of a rack and toothed wheel with an axle on which is fastened a pointer moving over a circular scale or dial. The spring balance measures the amount of attraction of the earth at any particular place; consequently, readings at the equator would be different from those at the poles or other places on the earth's surface. The ordinary balance, on the other hand, would give the weight for a body irrespective of its position. The force of the spring varies with temperature, which alters the length and elasticity of the wire and renders impossible precise measurements.

SPRINGBOK (Dutch, springing goat). A South African gazelle (*Gazella euchore*). It is larger than the common deer, and its neck and limbs much longer and more delicate. The general color is fulvous brown on the upper parts, pure white beneath, the colors separated on the flanks by a broad band of deep vinous red. The whole head is white, except a broad brown band on each side from the eye to the mouth, and a brown spot in the centre of the face. The springbok derives its name from the prodigious leaps which it takes either when alarmed or in play, often to the height of seven feet, and sometimes of twelve or thirteen feet. It is one of the most sought-after game animals of South Africa, yet remains numerous. Consult authorities cited under ANTELOPE; and see Plate of GAZELLES.

SPRING EEL. A fish of the small order Opisthomi and family Mastacembelidæ, several species of which occur in the fresh waters of the East Indies; they are eel-like in form, with the dorsal fin very long, and the fore part of it composed of low free spines. Allied to this is a small, curious eel (*Derichthys serpentinus*) dredged from the depths of the North Pacific. See Plate of EELS.

SPRINGER, ALFRED (1854—). An American chemist, born in Cincinnati, Ohio. He studied chemistry at the University of Heidelberg, and then settled in the practice of his profession in Cincinnati. He published studies on *Glycocholic Ether* (1879), *Pentachloramyl Formate* (1881), and *Reduction of Nitrates by Ferments* (1883), in which he announced his discovery of denitrifying ferments among the microörganisms of the soil, and forming a sort of link between the plants and their nitrogenous constituents; also, *A Latent Characteristic of Aluminum* (1891) and *Increase of Segmental Vibrations* (1897).

SPRINGER, ANTON (1825-91). A German art critic and historian. He was born at Prague, and studied at the university of his native city and at Tübingen. He taught successively at Prague, Bonn, Strassburg, and Leipzig. His historical works include: *Geschichte des Revolutionszeitalters* (1849); *Oesterreich, Preussen und Deutschland* (1851); and *Geschichte Oesterreichs seit dem Wiener Frieden* (1863-65). His principal works on art are: *Die Baukunst des christlichen Mittelalters* (1854); *Geschichte der bildenden Künste im 19. Jahrhundert* (1858); *Bilder aus der neueren Kunstgeschichte* (1867); *Raffael und Michelangelo* (1877); *Grundzüge der Kunstgeschichte* (1888; 4th ed., as *Handbuch der Kunstgeschichte*, 1895); and *Albrecht Dürer* (1892). Consult the posthumous *Aus meinem Leben* (Berlin, 1892).

SPRINGER, WILLIAM MCKENDREE (1836—). An American jurist and political leader, born at New Lebanon, Ind. He graduated at the Indiana State University in 1858, and for the next four years was a newspaper correspondent and editor. He was admitted to the bar in 1859, and in 1872 became a member of the Illinois Legislature. From 1875 to 1895 he was a member of Congress, where he introduced a resolution which was carried by a large majority, declaring that it would be "unwise, unpatriotic, and fraught with peril to our free institutions" for one man to serve more than two terms in the Presidency. From 1895 to 1899 he was United States Judge of the Northern District of Indian Territory and Chief Justice of the United States Court of Appeals there.

SPRINGFIELD. The capital of Illinois, and the county-seat of Sangamon County, 185 miles southwest of Chicago; on the Illinois Central, the Chicago and Alton, the Chicago, Peoria and Saint Louis, the Baltimore and Ohio Southwestern, the Saint Louis, Chicago and Saint Paul, the Cincinnati, Hamilton and Dayton, and the Wabash railroads (Map: Illinois, C 4). It is regularly laid out with wide streets. The most prominent edifice is the State Capitol, a handsome building begun in

1867, and completed twenty years later. It is 399 feet long and 286 feet wide, and has a massive dome 364 feet high. Other interesting structures are the old Capitol, now used as the county court-house, and the Lincoln residence, now under State supervision. The Lincoln Monument and Mausoleum of gray granite, the cost of which was borne by several States, is situated a little more than a mile from the heart of the city. There are the Bettie Stuart Institute (female), Concordia Seminary, Saint Agatha's School, and the Academy of Our Lady of the Sacred Heart. The State Library has 50,000 volumes, and the Public more than 42,000 volumes. There are also the State Historical Library, that of the Illinois State Museum of Natural History, and the Supreme Court Library. Other noteworthy features are the City Hall, Post-Office, Governor's Mansion, the High School, and the Odd Fellows' Buildings, the Orphanage of the Holy Child, the Springfield and Saint John's Hospitals, and the David Prince Sanitarium.

Springfield is the centre of a rich farming and coal-mining region, which also has important horse-breeding interests. Its industries in the census year 1900 had an invested capital of $5,030,438, and an output of $6,612,286. The Illinois Watch Company maintains a very large establishment here, and there are also engine works, boiler works, car shops, foundries and machine shops, lumber mills, woolen mills, breweries, and manufactories of soap, saddlery, flour, mattresses, brick, clothing, etc. The government is vested in a mayor, elected biennially, and a unicameral council. The subordinate officials, with the exception of the school board, which is chosen by the council, are appointed by the mayor. For maintenance and operation, the city spends annually about $375,000, the principal items being: Schools, $106,000; interest on debt, $52,000; fire department, $45,000; police department, $32,000; municipal lighting, $23,000; and streets, $21,000. The water-works are owned by the municipality. Population, in 1890, 24,963; in 1900, 34,159. First settled in 1819, and laid out in 1823, Springfield was incorporated as a town in 1832, and was chartered as a city in 1840. In 1837 it was chosen as the State capital, and the State Legislature assembled here for the first time in 1839. Consult Power, *History of Springfield* (Springfield, 1871).

SPRINGFIELD. The county-seat of Hampden County, Mass., 98 miles west-southwest of Boston; on the Connecticut River, and on the Boston and Albany, the Boston and Maine, and the New York, New Haven and Hartford railroads (Map: Massachusetts, B 3). Several bridges here span the river. There are 498 acres in the public park system. Forest Park, the largest of the pleasure grounds, contains 464 acres. In Court Square are the Soldiers' and Sailors' Monument and a statue of Miles Morgan. "The Puritan," by Saint Gaudens, near the library, is a work of great merit. Among the prominent buildings of Springfield are some designed by H. H. Richardson, the most notable of which, perhaps, are the County Court-House and the Church of the Unity. The United States Arsenal is conspicuously situated within the extensive armory grounds. Some 1200 men are employed here in making rifles for the United States Government. (See SMALL ARMS.) Other prominent structures are the railroad station, the Springfield Science Museum, Art Museum (containing the George Walter Vincent Smith collection, one of the best in the country), the City Hall, the Federal Government Building, the High School, and the Public Library. Springfield is the seat of the French-American College, opened in 1885, and of the International Y. M. C. A. Training School. The Public Library has more than 115,000 volumes. There are several other collections of books, among which is the Hampden County Law Library, dating from 1813. The most important charitable institutions include the State Almshouse, Springfield Hospital, Mercy Hospital, and the Hampden Homœpathic Hospital.

Springfield is a port of entry, its foreign trade in 1901 consisting of imports valued at $88,846. In the census year 1900 the various manufacturing industries had capital to the amount of $17,106,000, and an output valued at $21,207,000. The leading manufactures are foundry and machine-shop products, paper and envelopes, tobacco, cigars and cigarettes, brass castings, lumber and lumber products, buttons, electrical apparatus and supplies, confectionery, bicycles, automobiles, rubber and elastic goods, cotton and woolen goods, tools, etc. The government is vested in a mayor, annually elected, and a bicameral council. Springfield spends annually for maintenance and operation about $1,165,000, the principal items being: Schools, $360,000; interest on debt, $140,000; streets, $135,000; fire department, $97,000; police department, $68,000; municipal lighting, $67,000; and charitable institutions, $58,000. The water-works are owned and operated by the municipality. The system has cost $2,141,263. The net debt of the city in 1902 was $2,196,888; the assessed valuation of real and personal property, $74,338,927. The population in 1800 was 2312; in 1850, 11,766; in 1870, 26,703; in 1880, 33,340; in 1890, 44,179; in 1900, 62,059.

Springfield was first settled in 1636 by a party from Roxbury headed by William Pynchon. Until 1640, when it received its present name, it was known as Agawam. On October 4, 1675, during King Philip's War, it was attacked by Indians and burned. During Shays's Rebellion it was the scene (September, 1786) of a riot headed by Shays. Later (January 25, 1787) occurred a sharp skirmish between a small body of State militia and about 2000 insurgents led by Shays, the latter being easily defeated. In 1852 Springfield was chartered as a city. Consult: Green, *Springfield, 1636-1886* (Springfield, 1888); Burt, *The First Century of the History of Springfield, The Official Records from 1636-1736* (Springfield, 1898-99).

SPRINGFIELD. The county-seat of Greene County, Mo., 200 miles southeast of Kansas City; on the Saint Louis and San Francisco and the Kansas City and Memphis railroads (Map: Missouri, C 4). The city is in the vicinity of the Ozark Mountains, and is surrounded by beautiful forest and prairie scenery. It is the seat of Drury College (non-sectarian), opened in 1873, and of Loretto Academy. Other features include the United States Government building, the high school building, Saint John's Hospital, and the Zoölogical Gardens. The national cemetery here has 1703 graves, of which 737 are of unknown dead. Situated in the mineral belt of southwest

Missouri, Springfield has also important agricultural, lumbering, and stock-raising interests. In manufacturing, it ranked fourth in the State in the census year 1900, its industries having an invested capital of $2,111,048, and an output valued at $4,126,871. The leading establishments are carriage and wagon factories, lumber mills, flouring mills, foundries, and shops of the Saint Louis and San Francisco and the Kansas City and Memphis railroads. Springfield is also the centre of an extensive wholesale trade. The government is vested in a mayor, chosen biennially, and a unicameral council. The school board is elected by popular vote. Population, in 1890, 21,850; in 1900, 23,267. Springfield was settled as an Indian trading post about 1819, and in 1838 was incorporated, having been laid out three years earlier.

SPRINGFIELD. The county-seat of Clark County, O., 45 miles west of Columbus; at the confluence of Lagonda Creek and the Mad River, and on the Erie, the Cleveland, Cincinnati, Chicago and Saint Louis, the Pittsburg, Cincinnati, Chicago and Saint Louis, and the Ohio Southern railroads (Map: Ohio, C 6). It is the seat of Wittenberg College (Lutheran), opened in 1845, and has a female seminary, and the Warder Public Library, with more than 18,000 volumes. Noteworthy are the city hall, the United States Government building, the homes of the fraternal organizations, and Snyder Park. The Soldiers' Monument here was erected at a cost of $400,000. Springfield is surrounded by a highly productive farming section. Excellent water power has aided in making an important industrial centre. In the census year 1900 there was invested in the various industries capital to the amount of $14,091,175. Their output was valued at $12,777,173. More than five-sevenths of the capital, and nearly two-thirds of the output were represented by the manufactures of agricultural implements, and foundry and machine shop products. The government is vested in a mayor, elected biennially, and a unicameral council. For maintenance and operation the city spends annually about $395,000, the principal items being: Schools, $132,000; streets, $152,000; municipal lighting, $48,000; fire department, $40,000; interest on debt, $37,200; police department, $34,000. The water works, which represent an expenditure of $707,577, are owned by the municipality. Population, in 1890, 31,895; in 1900, 38,253.

SPRING HILL COLLEGE. A Roman Catholic institution near Mobile, Ala., founded in 1830, under the direction of the Society of Jesus. Its courses are preparatory (one year), commercial (four years), and classical (six years). The students in 1902 numbered 166, and the faculty 26. The buildings and ground were valued in that year at $250,000. The income was about $42,000 and the library contained 18,500 volumes.

SPRINGING USE. A use which is limited to take effect on the happening of a future event and not depending upon any preceding use or estate. This is a peculiar form of future estate and differs from a shifting use, which operates in derogation of some other estate, and from a remainder which must be limited upon some particular or preceding estate. It may be limited to rise either upon a certain or uncertain and contingent event. Consult Gilbert *On Uses*, Sudgen's edition.

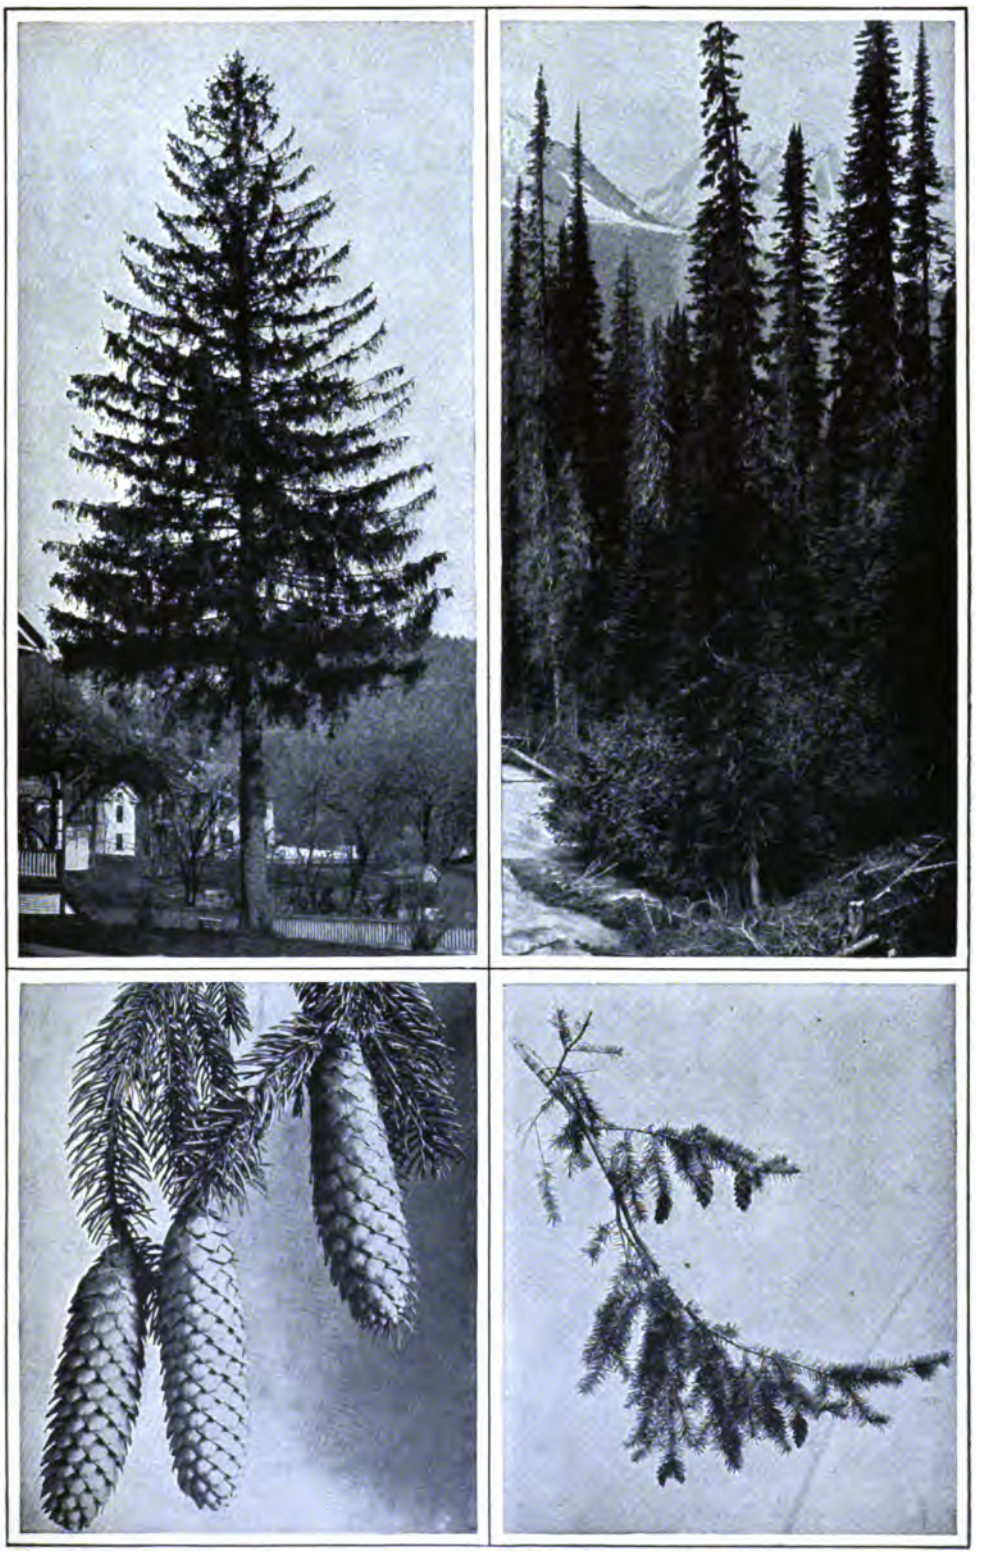
SPRINGTAIL. Any one of the very minute insects of the families Poduridæ, Smynthuridæ, Entomobryidæ, and Papiriidæ, of the thysanuran suborder Collembola. These little insects leap by the tail-like organ arising from the under side of the penultimate or antepenultimate segment of the abdomen, reaching forward horizontally when at rest, nearly to the head. This organ when suddenly drawn toward the perpendicular throws the insect high into the air and sometimes to a distance of several feet. The springtails are found in great numbers on the surface of the ground or just beneath the surface in boreal and even arctic regions. They occur in the spring in the Northern United States on bright sunny days when the snow is melting, frequently in great numbers on the surface of the snow. One species (*Achoreutes nivicola*) is commonly known as the 'snow-flea.' Springtails are also found on the surface of stagnant water, and commonly in deep soil which contains more or less soil humus.

SPRING VALLEY. A city in Bureau County, Ill., 17 miles southeast of Princeton; on the Chicago, Rock Island and Pacific and the Chicago, Burlington and Quincy railroads (Map: Illinois, C 2). It is important as the shipping centre of a coal-mining and farming region. There is a public library. The water-works are owned by the municipality. Population, in 1890, 3837; in 1900, 6214.

SPRING WHEAT. See FLOUR and WHEAT.

SPRIT (AS. *sprēot*, pole, sprout, from *sprēotan*, Ger. *sprieseen*, to sprout). A light spar extending from the peak (see SAIL) to a sliding becket on the mast. In the early days of square-rigged ships, square sails set on yards under the head booms were called the sprit-sail, sprit-sail topsail, and sprit-sail topgallant sail. When the square sprit-sails of the head booms were replaced by fore-and-aft jibs and staysails, the various sprit-sail yards were no longer used, but as a spreader was needed for the jib guys, whisker booms (see SHIP) were devised, and these are occasionally called sprit-sail yards, though they are in two parts, one on each side of the bowsprit cap.

SPRUCE (ME. *Spruce*, *Pruce*, from OF. *Pruce*, from ML. *Prussia*, Prussia), *Picea*. A genus of about twenty species of coniferous trees, indigenous to the Northern Hemisphere, nearly half being natives of North America. The genus was formerly combined with Abies (see FIR), from which it differs in having pendulous cones, leaves jointed on the twigs, keeled on both sides and not arranged in ranks, but scattered and pointing in every direction. The spruces occur as trees farther north than most others, forming forests within the Arctic Circle, and extending south, especially in the mountains as far as the Pyrenees in Europe, and North Carolina and Arizona in the United States. Some of the species occur in pure forests over immense tracts, the white spruce and also the black spruce covering extensive areas in Canada to the almost total exclusion of other trees. In Europe the Norway spruce is similarly distributed. The species are pyramidal in habit of growth, the lower branches drooping when old. The Norway spruce (*Picea*



excelsa), the principal European species, is of rapid growth, attains a height of 150 feet or more, and is extensively planted both as a forest tree and as an ornamental. The timber is valuable for fuel and for house building, and is largely exported from Norway and Sweden for masts and spars of sailing vessels. The tree yields resin and turpentine; its bark is used in tanning and for basket-making, etc. The wood is used for wood pulp and paper manufacture. In North America the prevailing species over the greatest extent of territory are the white and the black spruce (*Picea alba* and *Picea nigra*), although in lumbering the two species are seldom recognized. The former is found from New York to British Columbia and northward to Newfoundland, Hudson Bay, and Alaska. It is a handsome tree 50 to 150 feet high. The wood is light, soft, compact, nearly odorless, light yellow, and with scarcely distinguishable sap wood. It is largely used for general building, spars, flooring, etc. It also yields some of the spruce gum of commerce. The latter has a distribution somewhat similar to the white spruce, except that it descends along the mountains to North Carolina and Tennessee and probably does not reach Alaska. It is a somewhat smaller tree, but is otherwise very similar to the white spruce. It forms immense forests in Maine, New York, Canada, and elsewhere, and is largely used for wood pulp and paper. These two species are the chief and best source for wood paper-making. The gum of the black spruce is used for chewing. The branches are used in the preparation of essence of spruce, and by adding sugar or molasses and slightly fermenting, spruce beer is obtained. The bark contains tannin and is used to some extent in tanning leather. The roots are often split into narrow strips and made into baskets, coarse mats, ropes, etc. The Sitka or tideland spruce (*Picea sitchensis*) is a large tree occurring abundantly from northern California to Alaska, following the coast as far as the island of Kadiak. It is one of the largest trees of North America, attaining in its lower regions a height of more than 300 feet and a diameter of 7 or 8 feet at 100 feet from the base. Specimens upon the islands in southeastern Alaska measured more than 200 feet in height and 25 feet in circumference 4 feet from the ground. The timber of this tree is very valuable, entering into all kinds of building operations. In the tree-planting operations in the West the spruces, especially the white and the Norway, have proved among the most adaptable of evergreen species. The black, being of slower growth, less ornamental, and not so well adapted to dry soils, is less frequently planted. For ornamental planting none excels the blue spruce, which is of rather slow growth. All are hardy and all have been extensively planted in Europe. Each of the American species has developed several well-known varieties, which vary principally in the character of their foliage, branching habits, etc. A tree known as Douglas spruce or Douglas fir (*Pseudotsuga Douglassi*) is one of the important timber trees from the Rocky Mountain region to the Pacific and north to British Columbia. Upon the Pacific Coast it attains a height of more than 300 feet and a diameter of 10 to 12 feet. The timber is fine, straight-grained, heavy, and very strong, and is useful for all kinds of building, masts, etc. It has been very successfully planted in Minnesota, where it is believed it will supersede the other species for general planting.

SPRUNER VON MERZ, KARL (1803-92). A German chartographer, historian, and poet, born at Stuttgart. He entered the Corps of Cadets at Munich in 1814, became lieutenant in 1825 and had attained tne rank of lieutenant-colonel in 1855, when King Maximilian II. appointed him his aid-de-camp. Favored with that monarch's special confidence, he was a steadfast advocate of Pan-German and liberal principles at the Bavarian court. In 1864 King Ludwig II. appointed him his adjutant-general and in 1883 general of infantry. He retired from service in 1886 and died in Munich. His principal work is the great *Historisch-geographischer Handatlas* (118 maps, 1837-52; 4th ed. by Sieglin, 1893 et seq.); besides which he published a model *Atlas zur Geschichte von Bayern* (1838); Handatlas für die *Geschichte des Mittelalters und der neueren Zeit* (90 maps, new ed. by Menke, 1879); *Historisch-geographischer Schulatlas* (10th ed., 1880); and others. He wrote a *Leitfaden zur Geschichte von Bayern* (1853); *Pfalzgraf Rupert der Kavalier* (1854); *Charakterbilder aus der bayrischen Geschichte* (1878); several historical dramas and, anonymously, *Jamben eines greisen Ghibellinen* (1876), and *Aus der Mappe des greisen Ghibellinen* (1882), both strictly Christian, but anti-papal.

SPULLER, spụ'lâr', EUGÈNE (1835-96). A French publicist and political leader, born at Seurre (Côte d'Or). He was educated at the college at Dijon and studied law at the University of Paris, but in 1863 became identified with journalism. After the proclamation of the Republic in 1870 he became Gambetta's secretary and one of his most trusted supporters, and with him escaped from Paris in a balloon on October 7, 1870, in order to assist him in reorganizing the provincial governments. He was elected by a Paris constituency to the Chamber in 1876, and became one of the most influential leaders of the Union Republic group. Upon the formation of Gambetta's short-lived Cabinet, in November, 1881, Spuller was made Under-Secretary of State for Foreign Affairs. He returned to the Chamber in the following year, and in 1884 was chosen one of the vice-presidents of the body. He was Minister of Public Instruction in the Rouvier Cabinet in 1887, and Minister of Foreign Affairs in the Tirard Cabinet in 1889-90. In 1892 he was elected Senator, and in 1893-94 held the portfolio of Public Instruction in the Cabinet of Casimir-Périer. He published: *Petite histoire du second empire* (1870); *Ignace de Loyola et la compagnie de Jésus* (1876); *Michelet, sa vie et ses œuvres* (1876).

SPUNGING-HOUSES. In the law of England, the private houses of the bailiffs, who may detain there a debtor who has been arrested for debt for 24 hours, to admit him or his friends to arrange to settle the debt. The name is derived from the extortion often practiced on the debtor. The name is not used in the United States.

SPUR (AS. *spora*, OHG. *sporo*, Ger. *Sporn*, spur, from AS. *spcornan*, OHG. *spurnan*, to kick, spurn; connected with Lat. *spernere*, to despise, Gk. σκαλρειν, *spairein*, to flounder, Lith. *spirti*, to tread, Skt. *sphur*, to thrust with the foot).

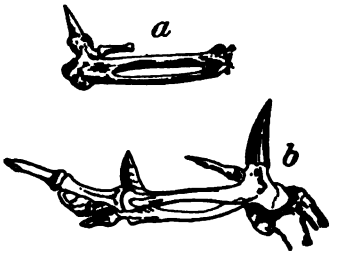
NORWAY SPRUCE AND CONES

DOUGLAS SPRUCE AND CONES

Originally spurs were made with a single point or prick and were known as the 'prick-spur' or goad-spur, but they soon developed into the rowel. In some instances the spur proper consisted of a ball from which projected a sharp point. Although the rowel is first met with in the thirteenth century, it was not common until the middle of the fifteenth century. In the Middle Ages the use of the spur was limited entirely to knights, who were granted their spurs as a symbol that they had won their right to knighthood. Similarly, the hacking off of his spurs denoted the public disgrace and degradation of the knight. During the age of chivalry, to serve a pair of spurs on a dish before a knight was a pointed declaration on the part of the host that he desired his guest to leave as speedily as possible. In the United States Army the spurs of mounted officers are of yellow metal or gilt, with ornamentation, while the rank and file wear the same pattern spur made of steel with a plain surface. Throughout Europe generally, the gilt spur denotes an officer of field rank, and the steel spur a mounted officer of regimental rank. The use of the spur is not nearly so common in these days of lightly equipped horsemen and intelligently bred horses.

SPURGE (OF. *spurge, espurge*, from *espurger*, from Lat. *expurgare*, to purge, cleanse, from *ex*, out + *purgare*, to cleanse, from *purus*, pure + *agere*, to drive, to do), *Euphorbia*. A genus of about 600 species, mostly tropical shrubs or trees or temperate climate herbaceous species of the natural order Euphorbiaceæ, characterized by a resinous, milky, usually acrid juice. Some of the green-stemmed, fleshy, and spiny African species so resemble certain cacti in their habit of growth as to render their identification more or less uncertain when not in flower. The leaves are either wanting or fall off early, and the functions of assimilation are performed by the stems. The flowers of many species, especially of Poinsettia, have bright-colored bracts that make them very ornamental. About forty species are indigenous or introduced in the Eastern United States.

CYPRESS SPURGE (*Euphorbia cyparissias*).



SPUR'GEON, CHARLES HADDON (1834-92). A celebrated English preacher. He was born at Kelvedon, Essex, attended school at Colchester, and spent a few months at an agricultural college at Maidstone. His family intended him for an Independent minister, but his own sympathies drew him toward the Baptists, whose connection he joined in 1850. The same year he became a school-teacher, and, removing to Cambridge, began to deliver cottage sermons in the neighborhood. The popularity of the 'boy preacher' was almost immediately established, and at the age of eighteen he had charge of a small Baptist congregation in the village of Waterbeach, Cambridgeshire. In 1854 he entered upon the pastorate of the New Park Street Chapel, London, where his preaching proved so attractive that in two years' time the building had to be greatly enlarged. The Surrey Music Hall was for some time engaged for his use, and finally his followers built for him the well-known 'Metropolitan Tabernacle' in Newington Butts, opened in 1861. Many evangelistic and philanthropic agencies grew up in connection with this immense chapel, such as the Stockwell Orphanage; a pastor's college, where hundreds of young men were trained for the ministry under Spurgeon's care; the Golden Lane Mission, etc. He was compelled in his later years to stop his work frequently because of ill health, and died at Mentone, France. His sermons were published weekly from 1854, and yearly volumes were issued since 1856. They had an enormous circulation, and many of them were translated into various languages. He also published many volumes, including: *The Saint and His Saviour* (1857); *Morning by Morning, and Evening by Evening* (1866-68); *John Ploughman's Talks* (1869); *The Treasury of David* (a commentary on the Psalms, largely from Puritan writers, 1870-85); *Lectures to My Students* (1875-77); *Commenting and Commentaries* (1876); *John Ploughman's Pictures* (1880); and after 1865 he edited a monthly magazine, *Sword and Trowel*.

In theology he was a pronounced Calvinist, in biblical science an extreme conservative, in policy an open communion Baptist, in politics a Liberal Unionist, in all things independent. He attacked the Low Church Party in the Church of England because it countenanced, he asserted, the teaching of baptismal regeneration in the Prayer Book, and in 1864 withdrew from the Evangelical Alliance because it was supported by it. He attacked his own co-religionists for their alleged rationalistic views and withdrew in 1887 from the Baptist Union. As a preacher he knew how to enchain the attention of his hearers through sermons of great length, by a flow of vigorous English and a mingling of tenderness and sternness, humor and soberness. A biography by his wife and private secretary was published in London in 1897-98.

SPURRY (OF., Dutch *spurrie*, MDutch *sporie, spurie, speurie, spurrie*, spurrey; of uncertain etymology). Plants belonging to the genera Spergula and Buda of the order Caryophyllaceæ. The species of Spergula are natives of Europe, those of Buda of America. Spurry is a weed sometimes cultivated as a forage crop. Corn spurry or common spurry (*Spergula arvensis*) is an annual from 6 to 12 inches high, producing a tangled mass of succulent stems with numerous whorled linear leaves. It prefers sandy or stony soil, upon which it is often planted as a green manure and as a soiling crop for sheep and cattle. The plant readily re-seeds the ground, but need not become a pest on well-tilled farms, where it is often welcomed as a catch crop. Giant spurry (*Spergula maxima*), by many botanists not regarded as a species distinct from the above, is similar to, but larger than, common spurry.

SPURS, Battle of the. See Battle of the Spurs.

SPUR-WINGED GOOSE, PLOVER, etc. Many terrestrial birds have the bend of the wing armed with one or more spurs or bony knobs, which they use for attack and defense. This armament is conspicuous in the geese of the African family Plectropteridæ, of which there are four species, and here it is based upon one of the wrist-bones, instead of on the metacarpus, as is usual elsewhere. The 'spur-winged plover' (*Hoplopterus spinosus*), one of the commonest birds of the Nile Valley, is only one of many tropical plovers so armed, the largest and finest spurs being those of a Chilean plover (*Belonopterus Chilensis*); its spur is situated just

Anatomy of wing-spurs.

a, spur of the spur-winged plover; *b*, relative positions of the two wing-spurs of the screamer (q. v.).

at the base of the thumb, and, as in other cases, is sheathed with horn, and sharp at the end. Some of the jaçanas have wing-spurs, and others a peculiar blade-like enlargement of the forearm. Lastly, the large, turkey-like South American screamers (q.v.) have two wing-spurs, the larger of which is an inch and a quarter long. Consult Lucas, "Weapons of Birds," in *Bird Lore*, vol. iv. (New York, 1902).

SPURZHEIM, spōōrts'hīm, Johann Kaspar (1776-1832). A German physician and phrenologist, born near Treves. While studying medicine at Vienna he was introduced to Gall (q.v.), and became his pupil and later his colleague in investigating the structure and functions of the brain. He lived in France and England alternately, and was widely known as a lecturer. In 1832 he came to the United States on a lecturing tour, but fell ill and died suddenly in Boston. Among his works are: *The Physiognomical Works of Drs. Gall and Spurzheim* (1815); *Elementary Principles of Education* (1821); *Phrenology* (1825); *Anatomy of the Brain* (1826); and *Sketch of the Natural Laws of Man* (1828). Consult Carmichael's *Memoir of Spurzheim* (Dublin, 1833). See Phrenology.

SPUTUM. See Expectoration.

SPUYTEN DUYVIL (spī'ten dī'vil) **CREEK.** A channel connecting the Hudson with the Harlem River, at the northern end of Manhattan Island (q.v.).

SPY (OF. *espie*, from *espier*, Fr. *épier*, to spy, from OHG. *spehōn*, Ger. *spähen*, to watch; connected with Lat. *specere*, Gk. *σκέπτεσθαι*, *skeptesthai*, Skt. *spaś*, *paś*, to look). A person employed to obtain information regarding an enemy by entering the latter's camp, and employing any possible means or methods by which to attain his ends. He differs from the scout in that the latter never surrenders his military character, is invariably a soldier, and secures his information without employing false pretenses. While the employment of spies is recognized by the law of nations, the spy himself is regarded as an outlaw and generally meets with an ignominious death whenever discovered. Military law (q.v.), although distinct in ordering the death of a spy, is not clear in defining what constitutes a spy.

SPY, spē. One of the most important archæological sites in Europe. In 1886 while exploring a grotto in the commune of Spy, near Namur, Belgium, MM. de Puyot and Lohest recovered two human skeletons from a bed rich in Paleolithic implements and remains of ancient animals, among which those of elephants abound. These ancient men were below the Belgians in stature and were dolichocephalic. Consult Mortillet, *Le préhistorique* (Paris, 1900).

SPY, The. A novel by James Fenimore Cooper (1821) giving the story of Harvey Birch, a spy employed by Washington in 1780 in Westchester County, New York, 'the neutral ground.' His services could not be acknowledged and he was suspected by patriots and Tories alike.

SQUADRON (OF. *esquadron*, Fr. *escadron*, from It. *squadrone*, squadron, augmentative of *squadra*, squad, square). Ordinarily two troops of cavalry. It occupies the same position to cavalry that battalion does to infantry. The actual strength of a squadron varies with that of the component troops and ranges from 120 to 200 swords. See Army Organization. For the use of the term in naval affairs, see Tactics, Naval.

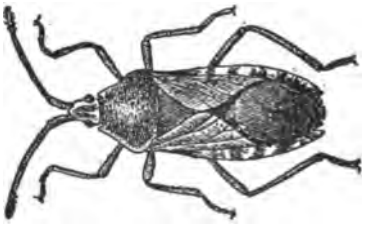
SQUALODON (Neo-Lat., from Lat. *squalus*, sort of sea-fish + Gk. *ὀδούς*, *odous*, tooth). An extinct genus of whale based on fossil skulls and teeth found in Miocene and Pliocene deposits. See Cetacea; Mammalia, Fossil.

SQUALORAJA (Neo-Lat., from Lat. *squalus*, sort of sea-fish + *raja*, ray, skate). A fossil shark of the Lower Lias of England, ancestral to the modern chimæra (q.v.).

SQUARCIONE, skwär-chō'nā, Francesco (1394-1474). An Italian painter of the Early Renaissance, founder of the school of Padua. He was a teacher rather than a painter. From the large number of his pupils he has been styled the 'Father of Painting,' and the influence of his school was dominant throughout Northern Italy. His method of teaching differed from that of other masters in that he had his pupils copy antique statues rather than his own works. The chief characteristics of their art are the statuesque character of the figures and the wealth of antique ornamentation, combined, however, with a trenchant realism. It is impossible to distinguish the works ascribed to him at Padua and elsewhere from those of his pupils, only one, a "Madonna," in possession of the Lazzari family, Padua, being signed.

SQUARE (in geometry). See Parallelogram.

SQUARE ROOT. See Involution and Evolution.



SQUARING THE CIRCLE. See Circle; Quadrature.

SQUARES, Method of Least. See Least Squares, Method of.

SQUASH (abbreviation of *squanter-squash, squonter-squash*, from North American Indian *askutasquash, asquash*, plural of *asq*, green, unripe). The common name for the fruits and plants of various varieties of *Cucurbita Maxima, Cucurbita Pepo*, and *Cucurbita Moschata*. The term is frequently applied in America to what are known in Europe as pumpkins. Squashes are cooked as a vegetable and also used for making pies. They are of divers forms, with early, late, and mid-season varieties of each. Squashes like a warm fertile soil. They are planted about the same time as corn in hills eight feet apart each way. From four to six seeds are put in each hill, which should be made rich with a few shovels of well-rotted manure placed in the bottom. The winter varieties are gathered upon the approach of frosty weather and left in the sun to cure for a while, being covered at night with hay or like material. Before cold weather sets in the fruits should be stored on shelves one deep in a dry, cool, not cold, room. See Plate of CUCUMBER ALLIES.

SQUASH. A ball game belonging to the family of tennis, which it is considered to have preceded in origin. It is played with a racquet the ball in an inclosed court of varying size without any affixed standard, but generally less than 40 feet by 20 feet, divided by a central line on the floor and a cross line into four spaces. The underlying principle of squash is that two players try alternately to hit the ball up against the front wall above a 'tell-tale' line. Whichever first fails to do so before the ball's second bounce from the floor loses the point. There are various rules governing the placing of the ball and of scoring, which will best be studied in *The Game of Squash*, by Eustace Miles (New York, 1901).

SQUASH INSECTS. The insect fauna of the squash and the pumpkin are practically identical, and several insects which feed upon these plants also attack melons, cucumbers, etc. (See MELON INSECTS.) The most important in the United States are the squash-bug (*Anasa tristis*) and its closely similar relative, the horned squash-

COMMON SQUASH-BUG (*Anasa tristis*).

bug (*Anasa armigera*), the squash-vine borer (*Melittia satyriniformis*), and the squash ladybird (*Epilachna borealis*). The squash-bug is a dull grayish brown musky-smelling bug of the family Coreidæ, a little over half an inch long, which hibernates in the adult stage. Its large golden brown eggs are laid in the spring upon the foliage. The young bugs, which grow rapidly and molt five times, suck the juices of the plant. Hand-picking the bugs before eggs are laid, kerosene sprayed upon vines started very early to act as decoys, and destruction of the bugs on the vines and fruits after the crop has been gathered, are the only feasible remedies. The squash-vine borer, a clear-winged moth of the family Sesiidæ, has an orange or red and black and bronze abdomen and hairy hind legs, red or orange on the outer surface, and black inside. The young caterpillars hatched from eggs laid on the stems in late spring bore into the stem, which wilts and dies. In midsummer they pupate in a tough cocoon beneath the surface of the ground, whence the adult emrges in spring. In the South a second generation appears in August. The best preventive measures consist in late fall harrowing and deep spring plowing. The squash ladybird, belonging to the genus Epilachna, which contains the only plant-feeding species of the family Coccinellidæ (see LADY-BIRD), is a black-spotted, yellow, hemispherical species of wide geographical distribution. The adult beetles hibernate and lay their eggs upon the leaves in May or June. The yellow, spiny larvæ chew circular holes in the leaves, reach full growth in from two to four weeks, and transform to pupæ, attaching themselves by the tip of the body to a leaf or stem. There are two or more generations each year, and the insect is readily controlled by an arsenical spray.

The pickle-worm, melon caterpillar, certain plant-bugs, and flea-beetles (qq.v.) are also troublesome. Consult: Smith, *Manual of Economic Entomology* (Philadelphia, 1896); Chittenden, *Bulletin 19, Division of Entomology, Department of Agriculture* (Washington, 1899).

SQUATTER SOVEREIGNTY. See POPULAR SOVEREIGNTY.

SQUAWFISH. A fresh-water fish (*Ptyochelus Oregonensis*) of California, where it is locally known as 'Sacramento pike.' It is the largest American species of the carp family (see CYPRINIDÆ), and reaches a length of from three to five feet. See Plate of DACE AND MINNOWS.

SQUEERS, WACKFORD. In Dickens's *Nicholas Nickelby*, the heartless, ignorant Yorkshire schoolmaster of Dotheboys Hall.

SQUETEAGUE, or DEEP-WATER TROUT. A fish (*Cynoscion regalis*) latterly far more widely known as weakfish (q.v.).

SQUID (of uncertain etymology). A cephalopod mollusk, differing from the nautilus in having no outer shell, the body being supported by an inner pen-shaped horny structure, or, in the cuttle of the Mediterranean, by a calcareous 'bone,' flattened oval in shape. The body of the squid is somewhat fish-like, pointed behind, with two fins, while the head is rather large and armed with ten long arms, bearing cup-shaped suckers, two of the arms being longer than the others. The eyes are large and perfect. The mouth is armed with two powerful black teeth, shaped like the jaws of a parrot. At the base of the smaller jaw is the lingual ribbon (radula). With this they divide their food. The squid is provided with an ink-sac, and when attacked it will discharge the water in its mantle through its siphon, the ink passing out with the water as if from a syringe; in this way the water is colored, and under cover of the inky cloud the squid darts backward. Squids are very active and powerful in their movements; they will enter a school of fish, dart to the right or left, and seize a fish, biting it in the nape of the neck and killing it instantly. The body is beautifully tinted and spotted with all the colors of the rainbow, and the animal rapidly changes

(See METACHROSIS.) Flying squids (q.v.) are oceanic decapods of the genus Ommastrephes.

Ordinary squids are from 1 to 2 feet in length. The largest squid known is *Architeuthis princeps*, nearly 19 feet long in body; the longer arms measure about 29 feet, the entire animal, with extended arms, reaching a length of 40 feet. Another species (*Architeuthis monachus*) has a body about 7 feet long, with the two longer arms 24 feet in length. (For fossil squids, see BELEMITES.) Consult Verrill, "The Cephalopods of the Northeastern Coast of America," in *Transactions of the Connecticut Academy*, vol. v. (New Haven, 1879-80). Compare CEPHALOPODA and DECAPODA.

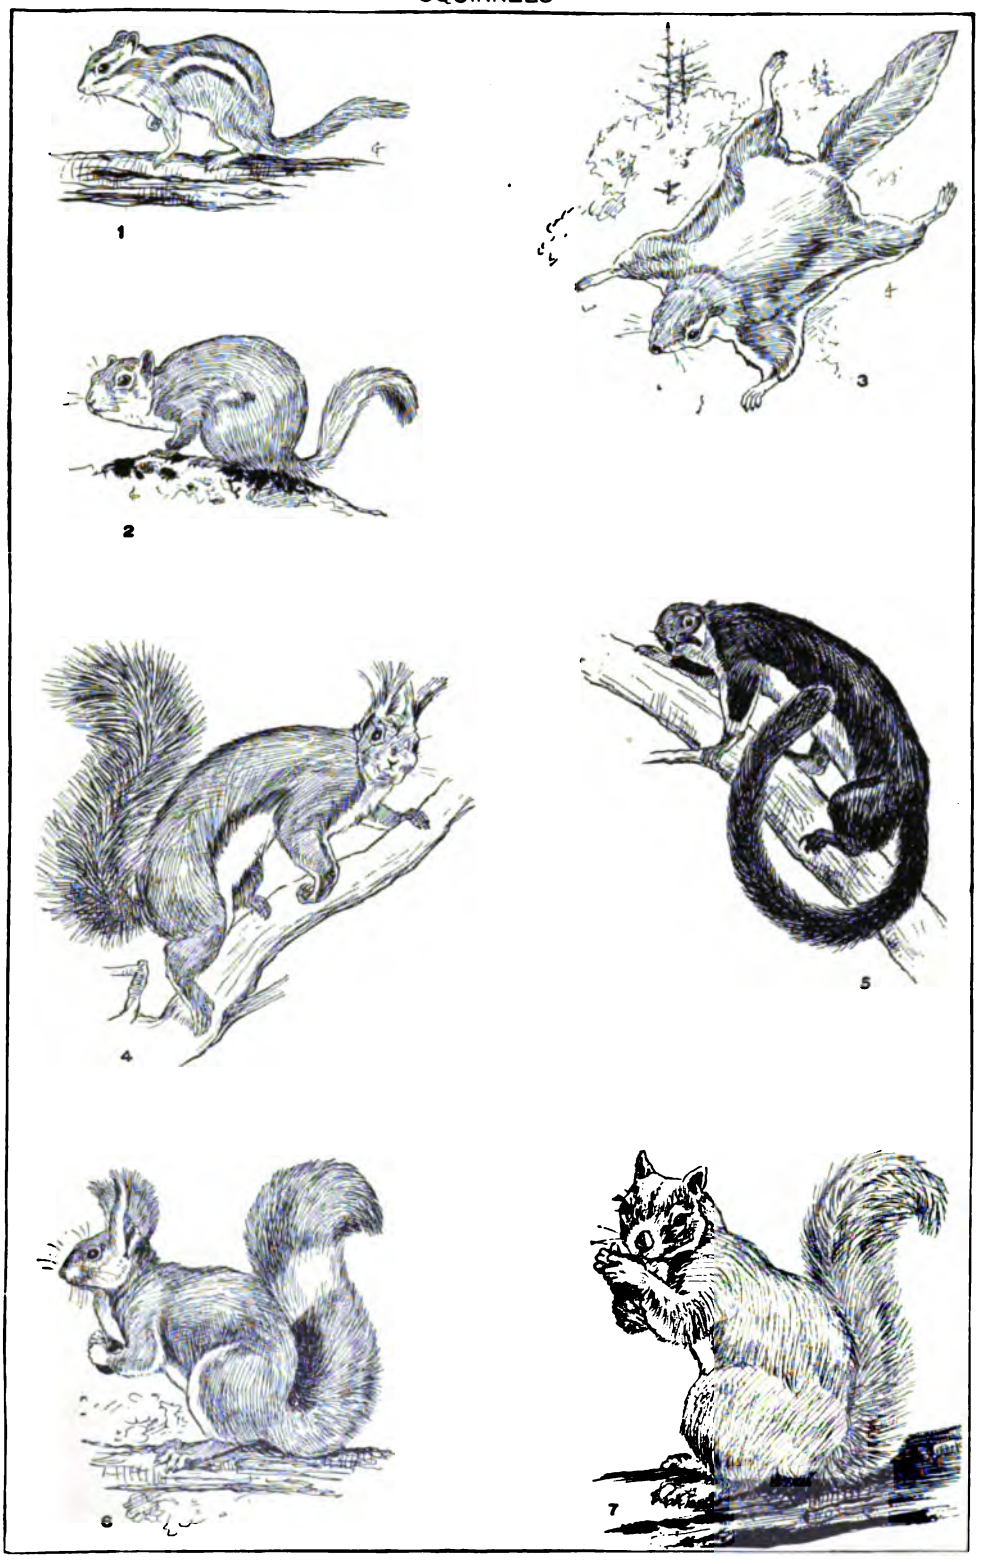
SQUIER, skwīr, EPHRAIM GEORGE (1821-88). An American archæologist and traveler, born at Bethlehem, N. Y. After varied experience he became known to science through his study of the antiquities of the Mississippi Valley. In 1849 he went on a diplomatic mission to Central America, which he revisited in 1853 in the interest of an interoceanic railway and of archæology. In 1863 he was appointed United States commissioner to Peru, where he investigated Inca remains. He was first president of the Anthropological Institute (1871). He made extensive contributions to the *Encyclopædia Britannica* and published: *Serpent Symbols* (1852); *Nicaragua, Its People, Scenery, and Monuments* (1852; *The States of Central America* (1857 and 1870); *Tropical Fibres and Their Economic Extraction* (1861); and *Peru, Incidents and Explorations in the Land of the Incas* (1877).

SQUILL (from Lat. *squilla, scilla*, from Gk. *σκίλλα, skilla*, squill), *Scilla*. A genus of bulbous-rooted plants of the natural order Liliaceæ, with a spreading perianth, stamens shorter than the perianth, smooth filaments, a three-parted ovary, and a three-cornered capsule with three many-seeded cells. Many of the species are plants of humble growth, with scapes like those of hyacinths and beautiful flowers.

SQUILLA. A mantis shrimp (q.v.).

SQUINTING. See STRABISMUS.

SQUIRREL (OF. *esquirel, escureuil*, Fr. *écureuil*, squirrel, from ML. *sciuriolus, sciurellus*, diminutive of Lat. *sciurus*, from Gk. *σκίουρος, skiouros*, squirrel, shadow-tail, from *σκιά, skia*, shadow + *οὐρά, oura*, tail). A rodent mammal of the family Sciuridæ, subfamily Sciurinæ. The Sciurinæ are a group of seven genera with compressed incisors, rather slender bodies, and long, hairy tails. The number of species is still a matter of doubt, owing to the remarkable range of color-variation among the individuals. Squirrels are found in all parts of the world except Australia, and are most abundant in India and Southern Asia. They range from the size of a mouse to that of a cat. In color squirrels tend toward gray, reddish brown, or black, though many species are white underneath, and the Oriental species are often handsomely variegated. The pelages differ locally in texture, being affected apparently by the climate. Some of the northern species have a fine, dense fur, and their skins have considerable commercial value, while some of the tropical species have the hair scanty and rather stiff, and in one three-fourths of all known squirrels, and all but five of the American species.



The commonest and most widely distributed of these is the red squirrel or chickaree (*Sciurus Hudsonius*), which ranges from the northern and the mountainous parts of the United States to the limit of trees in British America. It is a small species only eight inches long, not including the tail. Its upper surface is bright ferruginous or chestnut red; the lower surface is pure white, and there is a black stripe along the sides. The ears are commonly tipped with a little tuft of hairs. In its habits the chickaree is a typical squirrel, very active, almost exclusively arboreal, and very fond of nuts, which are one of the most important items in its bill of fare. The diet is, however, diversified, as is true of most squirrels, for while nuts and grains are doubtless the staple articles, birds and their eggs and young, insects, young twigs, and fruit are often eaten. Many ornithologists, indeed, consider this squirrel one of the most deadly enemies of the common song birds, and this enmity is frequently expressed by the birds themselves. The home of the chickaree is usually in some hollow tree, though frequently a special nest is constructed out of branches, twigs, and leaves. The young are born in the spring, three or four in a litter. The chickaree is a rather noisy little animal, and though not gregarious, several are usually found within calling distance of each other. The sounds uttered are rapidly repeated notes, making a shrill, scolding chatter.

East of the great plains and south of the chickaree's range occur the fox squirrels, the largest and handsomest of the American Sciuridæ. They are a foot or more in length, besides the beautiful bushy tail, which is somewhat longer than the head and body. The color ranges from gray with a reddish tinge to jet black. The largest form is the black squirrel (*Sciurus niger*) of the South Atlantic and Gulf States, which is usually very dark colored, but always has the nose and ears white. The fox squirrel of the Middle States (*Sciurus cinereus*) is usually reddish, with the tips of the hairs whitish, giving it a grizzled appearance, but black specimens are common. The fox squirrel of the Mississippi Valley (*Sciurus Ludovicianus*) is more strongly and constantly reddish and is rarely, if ever, black. These large squirrels all agree in their habits, which are not essentially different from those of the chickaree, except that fox squirrels seem to do less harm to the birds. They are intelligent and in captivity make interesting pets. They have a considerable antipathy to the chickaree.

The 'gray' squirrels are a third group of common American species, somewhat smaller than the fox squirrels and more widely distributed, ranging as far west as California. They have a considerable tendency toward melanism in certain regions. They are white or whitish underneath. The common Eastern species (*Sciurus Carolinensis*) is about ten inches long, besides the somewhat longer tail. It is one of the popular game animals of New England, where the fox squirrel is very rare, and not only is it prized for food, but the skin has some commercial value. It is also often kept as a pet, and, like the fox squirrel, can be taught simple tricks. Two or

SQUIRRELS

1. GROUND SQUIRREL: CHIPMUNK (Tamias striatus).
2. RED SQUIRREL (Sciurus Hudsonius).
3. FLYING SQUIRREL (Sciuropterus volans).
4. NEW MEXICAN SQUIRREL (Otoxiurus Aberti).
5. BLACK-MUSTACHED EAST INDIAN SQUIRREL.
6. COMMON EUROPEAN SQUIRREL (Sciurus vulgaris).
7. AMERICAN GRAY SQUIRREL (Sciurus Carolinensis).

three other species of gray squirrel occur in the Southwestern United States and California, of which the chestnut-backed gray squirrel (*Sciurus Aberti*) is notable for having the ears tufted as in the chickaree. This is a very handsome species, with a broad band of chestnut on the back and a black stripe on each side; melanistic specimens are common. The California gray squirrel (*Sciurus fossor*) is remarkable for its large size and black tail.

Of the remaining sixty or seventy members of the genus Sciurus the most important is the common squirrel of Europe (*Sciurus vulgaris*), which ranges from Ireland to Japan and from Northern Italy to Lapland. It is a little larger than the chickaree, and, like that species, it is brownish red above and white beneath. In winter it undergoes some change of pelage, becoming gray or even almost white. The ears are tufted with little pencils of hair. A handsome Oriental squirrel (*Sciurus caniceps*) is remarkable as the only known instance among mammals of the temporary assumption during the breeding season of a distinctly ornamental pelage. During most of the year this squirrel is gray, but in December the back becomes a beautiful orange yellow, which becomes gray again late in March, after the breeding season is over. Of the other five genera one contains only a single species, a large and very handsome Bornean species (*Phithrosciurus macrotis*), which is very remarkable for certain peculiarities of the skull and particularly for the vertical grooves on the front surface of the incisors. The tail is also unusually long, the ears have long tufts, and the coloration is peculiar, the sides being banded with black and white. The genus Xerus includes four species known as 'spiny squirrels,' on account of the pelage, which is coarse and prickly, the hairs being intermingled with spines. They are ground-loving species, and live in burrows which they themselves dig. They are somewhat larger than the chickaree and are all natives of Africa. The genus Tamias includes the small ground squirrels, chiefly American, which connect the tree squirrels with the spermophiles. They are all similar in size and habits to the common chipmunk (q.v.). The remaining genera, mainly Old World species, are remarkable for their powers of sailing from one tree to another. They are described in the article FLYING SQUIRREL.

Consult: Coues and Allen, *Monograph of North American Rodentia* (Washington, 1877); Stone and Cram, *American Animals* (New York, 1902).

SQUIRREL-FISH (so called from the sound made by the fish when taken from the water, which resembles the bark of a squirrel). Any of several brilliantly colored tropical fishes. One group is the family Holocentridæ, allied to the mullets, many species of which abound about coral reefs and are numerous in American tropical waters. The best-known species (*Holocentrus Ascensionis*) is about two feet long and bright red, with shining streaks along the rows of scales. Another group is the genus Diplectrum of the sea-bass family, among which one very handsome species (*Diplectrum formosum*) is common from Charleston to Montevideo, and is also called 'sewano' and 'sandfish.' It is about a foot long and brownish, with many blue markings.

SQUIRREL-MONKEY. One of the names applied to certain small, active, bushy-tailed tropical American monkeys of the marmoset group, and especially of the golden-haired genus Chrysothrix, because of their squirrel-like size, manners, and appearance. A well-known species is one of the titis (*Chrysothrix sciureus*), whose crown, muzzle, and rings about the eyes are black, giving a comical likeness to a human skull, so that it is known as the death's-head squirrel-monkey.

ŚRADDHA, shrăd'hȧ (Skt. *śrāddhā*, faith, connected with Lat. *credere*, to believe). The funeral ceremony of the Hindus, in which balls of rice are offered to the deceased ancestors of the sacrificer, or to the pitris (q.v.) collectively. It is especially performed for a parent recently deceased, or for three paternal ancestors, represented by three Brahmans, and secures the residence of the souls of the dead in the heaven of the pitris at the end of a year. The term śraddha is also applied to the daily offerings to the manes in general, and to offerings performed on various domestic occurrences, as on the birth of a son. There are likewise voluntary śraddhas performed for a special object, such as the hope of religious merit. The presentation of the ball of food to the deceased, and to his progenitors in both lines, is the office of the nearest male relative. If, however, sons have divided their patrimony contrary to their father's wishes, they may be excluded from the śraddha. The widow can inherit only on condition that she has the ceremony duly performed. The śraddha is still offered in certain parts of India, as at Gaya in Behar. The entire ceremony is based on the fear of malignant ghosts, since if the śraddha is not performed, the dead man will return to seek revenge for the neglect shown him. See GHOSTS. Consult: Caland, *Ueber Todtenverehrung bei einigen der indogermanischen Völker* (Amsterdam, 1888); id., *Altindischer Ahnenkult* (Leyden, 1893); Jolly, *Recht und Sitte* (Strassburg, 1896); Hillebrandt, *Ritual-Litteratur* (ib., 1897).

ŚRAVAKA, shrä'vȧ-kȧ (Skt. *śrāvaka*, Pali *sāvaka*, disciple, from *śru*, to hear). Originally any true disciple of Buddha. The term was later applied to those who were on the four-fold road to Nirvana (q.v.). The four classes of śravakas are the *śrōtāpannas* (Pali *sōtāpanna*), neophytes or converts; the *sakarāgāminas* (Pali *sakadāgāmin*), who are so far purified that they need be reborn on earth only once; the *anāgāminas* (Pali also *anāgāmin*), who will be reborn in a Brahmaloka, not in an inferior heaven or on earth; and the *arhats* (Pali *arahā*), who have attained such sanctity that they are freed from reincarnation. The general name among the Northern Buddhists for the Southern sect is śravakas.

SRINAGAR, srē'nȧ-gŭr', or **SERINAGUR,** se-rē'nȧ-gŭr'. The capital of the native State of Kashmir, India, on the Jhelam River, 195 miles by rail northeast of Rawal Pindi (Map: India, C 2). It is in the 'Vale of Kashmir,' a region noted for its picturesque lakes, lofty mountain peaks, and interesting ruins. The Jhelam River flows through the city, and the numerous canals extend in all directions. Within the wall-girt citadel are the city fort and a summer residence of the Maharaja. Dal Lake, a beautiful sheet of water on the eastern border of the city, was

formerly a favorite resort of the Mogul rulers. Srinagar is surrounded by a rich agricultural section, and manufactures shawls, papier maché, and leather. The city was founded in the sixth century, and came under British protection in 1846. Population, in 1901, 122,618.

SRIRANGAM, srē-rŭng'ăm, or **SERINGHAM**, sē-rĭng'hăm. A town in the Province of Madras, India, two miles north of Trichinopoli, on an island of the same name in the Kaveri River (Map: India, C 6). It is connected with the mainland by a bridge of 32 arches and is noted for its great temple to Vishnu. (See INDIAN ART.) The temple of Jambukeshwar, about a mile distant, and the neighboring anikuts or dams of the Kaveri River are also noteworthy. Population, in 1891, 21,632; in 1901, 23,039.

SRIRANGAPATAM, srē-rŭng'ă-pă-tăm'. A town of Mysore, India. See SERINGAPATAM.

ŚRUTI, shrōō'tē (Skt., hearing, revelation). In Sanskrit literature, the technical term for those works which are regarded as divine revelation. It originally applied only to the texts of the Vedas (q.v.) and to the Brahamanas (see BRAHMANA), but at a later period it included also the Upanishads (q.v.). The term *śruti* is therefore contrasted with *smṛti*, or tradition. See SMRITI.

SS, COLLAR OF. A collar composed of a series of the letter S, either linked together or set in close order, on a blue and white ribbon, with the ends connected by two buckles and a trefoil-shaped link, from which hangs a jewel. Such collars have been much worn in England by persons holding great offices in the State, as well as by gentlemen of various ranks, from esquires upward. The origin of the device has not been satisfactorily explained. Among the numerous conjectures regarding its meaning, one is, that the letter S stands for "Souveraigne," the favorite motto of Henry IV.; others have suggested "seneschal"; and it may, with equal probability, owe its origin to the swan of the De Bohuns, that badge being found in one of the earlier examples of this collar (1402), pendent around the neck of the poet Gower, in St. Saviour's Church, Southwark. The collar had, without doubt, originally a Lancastrian character. Collars of SS are still worn, with certain recognized distinctions, by the Lords Chief Justices, the Lord Chief Baron of the Exchequer, the Lord Mayor of London, the heralds, and the sergeant-at-arms.

STAAL, stäl, MARGUERITE JEANNE [CORDIER] DELAUNAY, Baronne de (1684-1750). A French writer of memoirs and letters of much historic value. She was born in Paris. Her father was an artist. Having studied in a convent at Rouen, she became maid to the Duchess of Maine (1711), took part in Cellamare's plot to deprive the Duke of Orleans of the Regency, and was imprisoned (1718-20) in the Bastile. Through her verses and dramatic plots she attained prominence in court circles and finally a leading rôle in Paris society. She afterwards married (1735) Baron de Staal, captain in the guard of the Duke of Maine. She spent the rest of her life at the ducal Court at Sceaux and died in Paris. Her *Mémoires* (Paris, 1755, best edited by Lescure, 2 vols., 1878) are remarkable for keen observation, sincerity, and irony, as well as for their style. Her letters and two comedies are in her *Œuvres* (Paris, 1821). Consult: Sainte-Beuve, *Portraits littéraires*, vol. iii. (2nd ed., Paris, 1864), and a monograph by Frary (ib., 1863).

STA'BAT MA'TER. One of the most famous of the great mediæval hymns, describing the sufferings of the Virgin Mary as she stood by the cross of Jesus. It is generally spoken of by the above name, from the words with which it begins:

> Stabat mater dolorosa
> Juxta crucem lacrymosa,
> Dum pendebat Filius.

It was formerly attributed to various authors, including Pope Innocent III., Saint Bonaventura, and Saint Bernard; but it is now generally ascribed to Jacopone da Todi (q.v.). It was adopted as the sequence for the feast of the Seven Sorrows of Mary in many places, and came into the Roman missal, as one of the few sequences retained in it, in 1727, when the feast was extended to the entire Church. It is a magnificent example of the rhyming Latin poetry of the Middle Ages, deservedly famous for the beauty both of its language and of its thought. Well-known musical compositions on this text are those of Palestrina, Astorga, and Pergolese. Rossini's version, although popular, is of too secular a character to rank with those of his predecessors. Monographs on the hymn have been written by Lisso (Berlin, 1843) and Ritter (Leipzig, 1883), the latter covering the music also.

STABILITY (Fr. *stabilité*, from Lat. *stabilitas*, steadfastness, from *stare*, to stand). The property of a body by virtue of which it tends to return to a position of equilibrium if it receives an impulse acting to displace it from this position, or, in other words, where work must be done to alter the position of its centre of gravity. Thus a pendulum would be said to be in stable equilibrium, as also would be a well-ballasted ship. To satisfy this condition the centre of gravity must occupy such a position that when it is displaced it is raised with respect to its original position. If under the action of a force the centre of gravity is moved to a lower position the body is said to be in unstable equilibrium. Stability of floating bodies is an important consideration in shipbuilding (q.v.). See BUOYANCY; EQUILIBRIUM; HYDROSTATICS; MECHANICS; METACENTRE.

STABLE FLY. A biting fly (*Stomoxys calcitrans*) of the family Muscidæ, probably introduced into the United States from Europe long ago. It closely resembles the common house fly, so closely, in fact, as to deceive most untrained observers. It does not frequent dwellings except late in the autumn and on the approach of a rainstorm, a circumstance which gives rise to the common expression that flies begin to bite before a rain. The larvæ feed in fresh horse manure, and the flies live chiefly on the blood of vertebrate animals, frequently causing much an-

STABLE FLY.

noyance to horses and cattle, and biting human beings. Another cosmopolitan muscid fly (*Muscina stabulans*) is sometimes known as 'stable fly.'

STACCATO, stȧ-kä'tō (It., detached). In music, a term implying a detached, abrupt mode of performance. A certain amount of time is subtracted from the proper value of any note played staccato, and a rest substituted. A dot placed over a note indicates that it is to be played staccato. A dash implies a greater degree of staccato; and a very light degree of staccato is expressed by uniting the dot with the slur.

STACHYS, stā'kis (Lat., from Gk. *στάχυς*, woundwort, ear of corn, spike). A genus of plants of the natural order Labiatæ, containing numerous species widely distributed in temperate and tropical climates except Australia and New Zealand. *Stachys sylvatica*, hedge nettle, common in shady places, is a coarse herb from 2 to 3 feet tall with ovate, heart-shaped leaves on long stalks and whorls of purple unpleasant smelling flowers. *Stachys elatior*, common in moist places, sometimes proves a troublesome weed in meadows. It was formerly used as a vulnerary, hence the name woundwort. Several species are cultivated in flower gardens. To this genus some botanists refer the common betony or wood betony (*Stachys Betonica*), plentiful in woods and thickets in Europe. It is a hairy-stemmed plant one or two feet high, has oblong heart-shaped leaves, whorls of purple or white flowers, and a fetid smell. A Japanese species (*Stachys Sieboldi*, often called *Stachys tuberifera*) has small edible tubers an inch or two long used as a vegetable in China and Japan; in the latter country they are known as chorogi, under which name they have been introduced into America.

STADE, stä'de. A town in the Province of Hanover, Prussia, on the Schwinge, an affluent of the Elbe, about 4 miles from its mouth (Map: Prussia, C 2). It manufactures machinery, ships, trimmed lumber, salt, bricks, wine, and cigars. Stade was designated a city as early as the tenth century. Population, in 1900, 10,575.

STADE, BERNHARD (1848—). A German theologian, born at Arnstadt and educated at Leipzig and Berlin. In 1875 he was appointed professor of theology at Giessen. He wrote *De Isaiæ Vaticiniis Æthiopicis Diatribe* (1873), *Ueber die alttestamentlichen Vorstellungen vom Zustand nach dem Tode* (1877), *Lehrbuch der hebräischen Grammatik* (1879), and *Geschichte des Volkes Israel* (vol. i. 1881-84; vol. ii., with O. Holtzmann, 1888). In collaboration with Karl Siegfried (q.v.) he published (1893) a *Hebräisches Wörterbuch zum alten Testament*. In 1871 he became the editor of the *Zeitschrift für alttestamentliche Wissenschaft*.

STADIA (ML. *stadia*, station, from Lat. *stadium*, from Gk. *στάδιον*, standard of length, furlong). An attachment fitted to the telescope of a transit and used in surveying to measure distances. Stadia surveying is a modification of transit surveying, and is effected by the use of the stadia or gradienter attachment. The telescope of the ordinary transit (see ENGINEERING INSTRUMENTS) contains a vertical and a horizontal wire dividing the field of vision into four quadrants; but the stadia telescope contains extra horizontal wires mounted on an independent diaphragm, so that the distances between the respective wires are adjustable. The principle of its operation is simple. If the space between two auxiliary wires, one on each side of the horizontal wire of the telescope, is so adjusted as to subtend a foot on a rod at a distance of 100, the space will subtend two feet on a rod at two hundred feet, and so on. Thus by proper adjustment the approximate distances to various near-by points can be calculated at once by reading the rod. If from any convenient point in a field the corners are all visible, and the stadia instrument be set at this point, the distance to each corner can at once be read and also the angles between these lines. Thus with two sides and the included angle of each triangle, the areas of the different parts and that of the whole field can be calculated. This plan is known as the method of *radiation*. The gradienter attachment is a micrometer screw which takes the place of the tangent screw to the axis of the telescope. A mounted scale registers the number of turns of a micrometer screw. The value of the thread is usually such that one revolution of the screw moves the horizontal wire of the telescope over a space of one foot on a rod at the distance of a hundred feet. If the micrometer screw is divided into one hundred spaces, it is clear that when the screw is turned through 25, 50, or 75 spaces, or $\frac{1}{4}$, $\frac{1}{2}$, or $\frac{3}{4}$ of a space on the scale, the wire of the telescope will pass over $\frac{1}{4}$, $\frac{1}{2}$, or $\frac{3}{4}$ of a foot on the rod, and so on. See SURVEYING.

STADIMETER (from Gk. *στάδιον*, *stadion*, standard of length, furlong + *μέτρον*, *metron*, measure). A nautical instrument invented by Commander B. A. Fiske, United States Navy, and designed for measuring the distance of objects when their height is known. It is somewhat similar in principle to the sextant, but its readings are in yards instead of angular measure. See RANGE-FINDER.

STADIUM (Lat., from Gk. *στάδιον*, standard of length, furlong, race-course, from *ἱστάναι*, *histanai*, Skt. *sthā*, Lat. *stare*, to stand; ultimately connected with Eng. *stand*). The name for the Greek race-course, within which also other athletic contests took place. It was used only for contests, not apparently as a place for exercise. The spectators stood or sat on the high banks of earth at the sides and across the ends. In some cases one end was curved like a horseshoe, and at times one end was open. At Olympia there seems to have been no permanent seats at the sides, but we hear that at Athens Herodes Atticus (see ATTICUS) fitted the stadium with Pentelic marble seats. The floor of the stadium was sand or loose earth. The course was straight away, and at each end was usually a long strip of marble which served to mark the start and finish. The length of the course was always 600 Greek feet, but, as the foot varied in different localities, the stadium was not of uniform length. At Athens the standard foot seems to have been 0.2957 meter, like the Roman foot, and the stadium was 177.42 meters. This seems to be the length of the stadium used commonly as a measure of distance, of which 8⅓ made a Roman mile, and a little more than 9 an English mile. Consult: Hultsch, *Griechishe und römische Me-*

trologie (2d ed., Berlin, 1882); Dörpfeld, in *Mittheilungen des deutschen archäologischen Instituts Athens* (Athens, 1882).

STADTHOLDER (Dutch *stadthouder*, Ger. *Stadthalter*, stead-holder, lieutenant, viceroy, governor of a province). The title bestowed on William of Orange (q.v.) by the Dutch provinces which rose in revolt against the tyranny of Alva in the sixteenth century. (See NETHERLANDS.) On the assassination of William in 1584 his son Maurice of Nassau was appointed to the office. The stadtholderate was considered to be at an end on the death of William III. in 1702, but in 1747 William IV., descended from a collateral branch of the House of Nassau, was proclaimed stadtholder, captain-general, and admiral-in-chief of the United Provinces. His son, William V., the seventh stadtholder, was driven from the country by the French in 1795 and resigned his office in 1802.

STAËL-HOLSTEIN, stä'ĕl hōl'stīn, *Fr. pron.* stäl ôl'stĂN', ANNE LOUISE GERMAINE, Baronne de, commonly called MADAME DE STAËL (1766-1817). A famous French authoress, born in Paris, April 22, 1766. She was the daughter of the Genevese banker and distinguished French Minister of Finance, Jacques Necker (q.v.), and of his wife, Suzanne Churchod, Gibbon's youthful beloved. She passed her childhood in one of the most brilliant literary salons of Paris, where her naturally active mind was stimulated by association with the keenest wits and critics of the pre-Revolutionary decade, chief among them F. M. Grimm, Thomas, Marmontel, and Raynal. In this vortex of disintegrating ideas she assimilated more than any other of her generation the intellectual spirit of that age. She married in 1786, in obedience to her mother's wish, the Swedish Minister, Baron de Staël-Holstein, by whom she had three children. But she kept the tenor of her independent way, always positive and self-assertive, a little boisterous and rather vain, writing much, but publishing nothing until the appearance of her *Lettres sur Jean Jacques Rousseau* (1788), whose social ideas she warmly admired. She had fallen also under the spell of Goethe's *Werther*, and thus she sympathized with the Revolution till the imprisonment of the King caused a revulsion to an equally indiscreet 'incivism.' She abused her ambassadorial right of asylum, and, in fear of the consequences, left Paris before the massacres of September, 1792, going to Coppet, near Geneva, where she gathered some political sympathizers. In 1793 she tried to make herself the centre of a more important group in England, not without some personal scandal. For nine years (1794-1803) she played at politics in Paris, with brief visits to Coppet. She was amicably separated from Baron de Staël in 1788, and irritated Napoleon by biting epigrams till the consular police banished her from Paris (1803). She went to Germany, which then 'ruled the kingdom of the air' (Richter), and in her unwearying search for noted people to talk to she came in the winter of 1803-04 to Weimar. Goethe, after at first excusing himself on the score of ill health, saw much of her and later on in his *Annalen* spoke of "her brilliant way of showing her readiness of thought and repartee." On the whole, in spite of her 'passionate demands' for ready information on the most important subjects, he admitted that "one could get on with her easily and pleasantly if she was taken in her own way." Schiller found her "with little ideality or poetry and no feminine reserve." The Romanticists were more attracted, and A. W. Schlegel (q.v.), an eccentric prophet of the new school, became her devoted companion and counselor. Thus the German ideas that she introduced into France were seen through Schlegel's eyes, far from impartially, as is constantly obvious in her *De l'Allemagne*, written in 1809-10 and printed in England in 1813. Before her exile Madame de Staël had written two essays, *De l'influence des passions* (1796) and *De la littérature considérée dans ses rapports avec les institutions sociales* (1800), the latter curious for its marks of the close association with Benjamin Constant (q.v.), who gave his impression of their relation in *Adolphe*. Her literary power was first revealed in the novel *Delphine* (1802), a half-autobiography of the 'misunderstood woman,' to be exploited later by George Sand. Much finer is a second story, *Corinne* (1807), wherewith she made the novel carry artistic discussion, as Goethe and Richter had done in Germany.

In 1810 she published her *De l'Allemagne* in Paris, but Napoleon condemned the entire edition and expelled her from France. She retired to Coppet, and there, in 1811, she married secretly a young officer, De Rocca, more than twenty years her junior. In the same year she set out on her travels in Russia, Sweden, and England, and after Napoleon's fall returned to France, though she still spent much time abroad, for her health was gradually failing, as her last book, *Considérations sur la révolution française* (1818), witnesses. She died in Paris, July 14, 1817. Of her three children by her first husband, Auguste (1790-1827) became known as the author of *Lettres sur l'Angleterre;* Albertine (died 1838) married the Duke Achille de Broglie, and Albert became a Swedish officer and fell in a duel. By her second husband (Rocca) she had one child.

In her person, excepting her fine eyes and well-formed figure, Madame de Staël was not attractive. In conversation she often repelled even those who appreciated her talents. If one considers only language and style she was not a great writer, but she had great enthusiasms, faith in human progress, and in democracy. Thus she did much to free French literature from the self-imposed fetters of the classical criticism. Studiously cosmopolitan, she compelled France to contrast and compare her ideals of letters and art with those of Germany and England. The French spirit, she said, needed to be regenerated by some more vigorous sap. It was artistic, rationalistic. They were idealistic, individually subjective. To establish in France Ossian, Byron, Goethe, Richter, was to complete the work begun by Rousseau. Thus the French romantic movement, one of the greatest literary regenerations in history, is in large measure the work of Madame de Staël.

BIBLIOGRAPHY. Madame de Staël's complete works, edited by her son, Baron Auguste de Staël-Holstein, and with a biography by her cousin Madame Necker de Saussure, 17 vols. (Paris, 1820-21). There are *Lives* by Norris (London, 1853); Stevens (ib., 1880); Lady Blennerhasset, trans. (ib., 1889); Sorel (Paris, 1891; trans. London, 1892). Consult also Count d'Haussonville, *Le salon de Madame Necker* (Paris, 1882;

trans., 1882); Sainte-Beuve, *Causeries du lundi*, vol. iv.; Brunetière, *Evolution de la critique* (Paris, 1890); Dejob, *Madame de Saussure et l'Italie* (ib., 1890); Faguet, *Politiques et moralistes*, vol. i. (ib., 1898).

STAFF (AS. *stæf*, staff, Goth. *stafs*, rudiment, letter, OHG. *stap*, Ger. *Stab*, staff; connected with OChurch Slav. *stabŭ*, staff, Lith. *stúbas*, *stóbras*, pillar, Skt. *sthāpay*, to make stand, from *sthā*, to stand, and ultimately with Eng. *stand*). In military and naval usage, the aides or assistants of a commanding officer. The staff of an army comprises the assistants of the general-in-chief and of his generals, and their duties are to relieve the chief of the details to which he cannot personally attend.

In the *United States* this body is divided into the *military* staff and the *administrative* staff. The former is charged with the more purely military duties, and comprises the chiefs of staff (the assistants and executive officers of the generals in the office and in the field), the adjutants-general (who attend to the correspondence, orders, etc.), the inspectors-general (who are charged with the inspection of the troops), the chief of artillery (the assistant and adviser in all matters relating to the artillery, and responsible for the artillery materiel and personnel), the chief of cavalry, the chief of engineers, the chief signal officer (responsible for the military telegraph, signal stations, and balloons), the provost-marshal-general (who has charge of the police, prisoners, deserters, secret service, and post-office), and the aides-de-camp (attached more directly to the person of a general, assisting him by carrying orders, studying and reporting on portions of the field, and attending to a part of the correspondence). The administrative staff is charged with the service of administration and supply, and comprises the judge advocate (who supervises the proceedings of military courts and boards), the commissary of musters (who supervises the muster and pay rolls, and makes musters into and out of the service), the chief ordnance officers (who are charged with the supply of ordnance material), the chief quartermasters (providing transportation, forage, clothing, and camp and garrison equipage), the chief commissaries (providing commissary stores), the chief paymasters, and the medical directors and their respective assistants.

GENERAL STAFF CORPS. Since the passing of the General Staff Bill, which was approved on February 14, 1903, and which entered into legal effect August 15 of the same year, a general staff organization has been instituted as follows: The General Staff Corps establishment consists of officers detailed from the army at large under such rules as may be prescribed by the President. The duties of the General Staff Corps are to prepare plans for national defense and mobilization of troops in time of war; to investigate and report on questions relating to the efficiency of the army and its preparation for war; to aid and assist the Secretary of War or other general officers and commanders, and to act as their agents in informing and coördinating other officers, who are subject to the supervision of the chief of the staff; and to perform such other military duties as may be prescribed by the President.

The General Staff Corps consists of one chief of staff, and two general officers chosen from the army, not below the grade of brigadier-general, four colonels, six lieutenant-colonels, and twelve majors from corresponding grades, twenty captains from grades of captain and first lieutenant, to have rank, pay, and allowances of captains mounted. Time of detail, four years, unless otherwise relieved. When relieved these officers return to their former branch of the army, and are not eligible for service in the General Staff Corps until they have served two years in that branch of the army in which they hold their commission, except in case of war or emergency.

The chief of staff supervises all troops of the line, and the adjutant-general's, inspector-general's, judge-advocate's, quartermaster's, subsistence, medical, pay, and ordnance departments, corps of engineers and signal corps, and performs such other military duties as may be assigned by the President. All duties previously prescribed by statute for the commanding general, as member of the Board of Ordnance and Fortification and of the Board of Commissioners or of the Soldiers' Home, are performed by the chief of staff or other officers designated by the President. Acts or sections of acts authorizing aides-de-camp and military secretaries do not apply to officers of the General Staff Corps.

The chief of artillery serves as an additional member of the general staff and enjoys the rank, pay, and allowances of a brigadier-general.

In *England* the regular army officers, non-commissioned officers, and men doing duty with a militia, volunteer, or yeomanry corps correspond very nearly to the French *cadres complémentaires*. The English up to 1902 had no regular staff institution, answering to that of the French or Germans, but strong efforts were being made to secure the organization of such a system. The staff college prepares officers for staff duty, but officers are frequently thus employed who have not passed the staff college. Officers of the British army desirous of serving with the native army in India join what is called the *Indian Staff Corps*, from which they are appointed to any regiment to which they may be assigned.

In *Germany* the Prussian general staff organization is known as the general staff of the army, Bavaria, Württemberg, and Saxony maintaining their own establishments, but subordinate to the Prussian corps. It consists of the chief of the general staff, usually a high ranking officer, subject only to the Kaiser; the *Haupt-Etat*, or principal establishment of the general staff; and the *Neben Etat*, or auxiliary establishment of the general staff. The duties and functions of the general staff are as follows: Collecting, adding to, and arranging military information necessary for the knowledge of the German Empire and all foreign States, and the further training of officers of the general staff and of the officers attached to it for duty. The great general staff consists of a central and six other sections. The central section is under a major-general, who is the principal assistant of the chief of the general staff. The first section keeps informed about everything that would be useful in case of war with Russia, Austria, Sweden, Norway, Denmark, the Balkan Peninsula, and Asiatic Russia. The second section deals with corresponding details regarding Germany itself.

The third section deals with England, France, Italy, Belgium, Holland, Switzerland, Spain, Portugal, America, and Asia exclusive of Russian Asia. The fourth section covers the subject of fortifications and fortresses and technical engineering affairs. The fifth class is a military historical section, and the sixth has charge of all railway questions. Each section is in charge of the chief of section, whose staff varies according to the work in hand. All general officers must have served on the general staff, an important essential being that they must have held regimental command. In order that officers of other corps or arms of service may be eligible for the rank of general officer, every major in the general staff, independent of the arm of the service to which he belongs, is assigned for a period to the command of a battalion of infantry.

In *France* the general staff is not a permanent organization, but is composed of officers temporarily assigned from the line. It is directly under the Minister of War as chief, and comprises the military household of the President, the special staff of the military governments of Paris and Lyons, the staff of the army corps, divisions, and brigades, the staffs of the fortification commands, the staffs of the marshals of France, the military attachés abroad, and the staffs of the artillery and engineer commands. The general staff of the army is under the chief, who has three brigadier-generals as assistants, and comprises four military bureaus (one for organization and mobilization, one for studying foreign armies, one for military operations and education, and one for railroads), and five sections (one for personal matters relating to the general staff, one for matériel, one for Algiers and Tunis, one for history, and one for land survey). The general staff together with the Ministry of War administers the affairs of the army. The War Ministry is subdivided into bureaus corresponding to the sections of the German greater general staff. The *army staff* itself is under a general of division, called the chief of staff, who is himself assisted by three other superior officers with their subordinates. The staff has its own sections, bureaus, and special services, and is occupied with the organization and mobilization details of the army, the procuration of information regarding that of foreign armies, instruction, railways.

In the *Italian* army system the general staff constitutes the second division of the war university and has in charge the preparations for war. It is subdivided into divisions and sections which are known as the 'office in charge of the Eastern or the Austro-Italian frontiers,' the 'office in charge of the Western or Swiss and French frontiers,' etc. The staff has charge of the archives, geography department, information, intendance, transport, and the Turin War Academy. The chief of staff in time of war is also chief of the intelligence department.

In *Russia* the higher general staff is not practically an independent organization, as is the German Grosser Generalstab, but instead acts entirely under the Ministry of War, which latter consists of various branches. The general staff has to do principally with army organization, manœuvres, camps, fortifications, promotions, rewards, equipment, remounts, geography, and topography, home and foreign, transport, literature, etc. When it happens that the Czar is not an active military leader the War Ministry is dominated by the Minister or some conspicuous and concededly able general officer, who is also a member of the council of war.

REGIMENTAL STAFF. The commissioned staff of a regimental commanding officer would consist of such officers as are not duty officers in the battalion squadron or regiment, as the regimental adjutant, quartermaster, commissary, etc.

The aides-de-camp of a general officer constitute his staff, together with such departmental and technical officers as may be temporarily detailed to assist the general in some specific undertaking.

THE NON-COMMISSIONED STAFF consists of non-commissioned officers not forming part of the company establishment proper and who have relationship only to the battalion, squadron, or regiment, as sergeant major (battalion or regimental), quartermaster-sergeant (regimental), commissary sergeant (regimental), chief musician, chief trumpeters, and principal musician. In the United States army non-commissioned officers doing duty as part of the permanent establishment of an army post or fort are termed the *post non-commissioned staff*, which ordinarily consists of an ordnance sergeant, post quartermaster-sergeant, electrician-sergeant, hospital steward, etc. Throughout the armies of Europe battalion, regimental, and post (depot or fortress) staffs, commissioned or non-commissioned, include practically the same descriptions of officers. See STAFF COLLEGES AND SCHOOLS; ARMY ORGANIZATION.

In the navy the staff does not play as important a part as in the army, nevertheless what is essentially a general staff is required to control the *personnel* and direct the movement of fleets, etc. In the United States Navy the term staff officer is applied to those officers who do not belong to the executive or line branch, as surgeons, paymasters, chaplains, etc.

STAFF (in music). See MUSICAL NOTATION; NEUMES.

STAFFA, stăf'fâ. A celebrated but uninhabited Scottish islet, one of the Inner Hebrides (q.v.), seven miles west of Mull (Map: Scotland, B 3). It rises to a height of 144 feet, is 1½ miles in circumference, and oval in shape. Except on the northeast its cliffs hollowed by caverns rise from the water 84 to 112 feet high. There are seven caves, of which the most remarkable is Fingal's or Great Cave. The entrance, formed by regular basaltic columnar ranges on each side, supporting a lofty arch, is 33 feet wide and 65 feet high. The length of the cave is 230 feet. As one of the most perfect and beautiful specimens of natural architectural phenomena it is much frequented by tourists.

STAFF COLLEGES AND SCHOOLS. Military training schools for officers candidates for staff appointments. To prepare officers for duty on the staff of an army special colleges or schools have been instituted by all the leading military nations of the world. (See MILITARY EDUCATION.) In the United States there is the General Service and Staff College at Fort Leavenworth, Kan., to which officers are ordered for their technical and professional instruction, and students showing marked proficiency in their studies are considered to be eligible for staff or other duties for which they are best fitted. In

FINGAL'S CAVE, ISLAND OF STAFFA

England officers desirous of qualifying for staff appointment must have had five years' service in the army, undergo the two years' course at the Staff College at Sandhurst, and serve at least four months at Aldershot in some arm of the service other than the one to which they belong. The rule in Germany is to select officers for the general staff from among the graduates of the military colleges having the best qualifications and the highest percentages in examination. The training is received at Berlin and Munich. In France staff officers are educated at the Higher War School at Paris, which was first organized as a staff college at the beginning of the nineteenth century, and reorganized in 1875 as the permanent college for general staff candidates. Austria-Hungary sets apart the Kriegsschule at Vienna for instruction in staff work. The Italian general staff school is at Milan, where about 24 officers graduate each year. The Saint Nicholas Academy at Saint Petersburg is the staff school of Russia, entrance to which is competitive to all officers of three years' service and upward. See STAFF.

STAFFORD. The county town of Staffordshire, England, on the Sow, 29 miles northwest of Birmingham (Map: England, D 4). Tanning and the manufacture of cutlery and of shoes are the chief branches of industry. Population, in 1891, 20,270; in 1901, 20,900. Stafford was of importance before the Conquest, is mentioned in Domesday, and King John confirmed and enlarged the privileges of an old charter.

STAFFORD. A town, including the borough of Stafford Springs, in Tolland County, Conn., 20 miles north by west of Willimantic, on the Willimantic River, and on the Central Vermont Railroad (Map: Connecticut, F 2). It is a summer resort, with mineral springs. It manufactures woolens. There is a public library. Population, in 1890, 4535; in 1900, 4297.

STAFFORD, HENRY, second Duke of Buckingham (c.1454-83). An English nobleman and political intriguer. He was the grandson of the first Duke and succeeded to the title in 1460. He was a prominent adherent of the Duke of Gloucester, afterwards Richard III., while the latter, then Protector, was conspiring to seize the throne, and assisted him in his efforts against Earl Rivers and Lord Grey. After the downfall of those noblemen he received as a reward for his services the office of Chief Justice and constable of the royal castles in Wales, and later that of Lord High Constable of England. A few months later, however, he joined the Lancastrians in an effort to overthrow Richard, but his projects were frustrated, and he was summarily tried and beheaded at Salisbury in 1483. He is "the deep revolving wily Buckingham" mentioned in Shakespeare's *Richard III.*

STAFFORD, WILLIAM HOWARD, Viscount (1614-80). An English statesman. He was the fifth son of Thomas, Earl of Arundel and Surrey, and was educated as a Roman Catholic. In 1634 he married a sister of the thirteenth Baron Stafford, and on the latter's death assumed the title. This marital claim was afterwards disputed, but finally decided in his favor, and a new creation was made by the King, declaring him Baron and afterwards Viscount Stafford. During the Civil War he was a firm adherent of the King, but after the Restoration (q.v.) frequently opposed the royal will from his place in the House of Peers. In 1678 Stafford was one of those denounced by the infamous Titus Oates (q.v.) as a conspirator in the pretended popish plot. He was impeached on a charge of high treason, and, despite a spirited defense against suborned testimony, was found guilty and publicly executed on Tower Hill. In 1824 the act of attainder was reversed by Parliament.

STAFFORDSHIRE. An inland county of England, bounded on the west and northwest by Shropshire and Cheshire (Map: England, D 4). Area, 1128 square miles; population, in 1891, 1,083,408; in 1901, 1,234,382. In the north wild moorlands in long ridges, separated by deeply cut valleys, extend from northwest to southeast. The surface is low and undulating in the midland regions, but becomes hilly again in the south. The Pottery coal field occupies the north, and the Dudley coal field, remarkable also for its abundant and rich iron ores, occupies the south. The Trent, flowing first southeast through the county, then northeast along its eastern border, is the chief river. The climate is humid, much of the soil is clayey, and agriculture is in a backward condition. The manufactures, however, are extensive and varied, including cutlery and ironware, pottery, shoes, and glass, and cotton, silk, and leather goods. Stoke-upon-Trent and Burslem are the chief seats of the pottery industry. Capital, Stafford.

STAG, or RED DEER. See DEER; ANTLERS.

STAG-BEETLE. Any member of the Lucanidæ, a family of beetles including 500 to 600 species. The common name is derived from the shape of the mandibles of the males, which are developed in some species so as to equal in length nearly that of the entire body, and are armed with spines or teeth. The males are of varying size and exhibit remarkable differences in the development of the head and mandibles. In each species in which these extraordinary variations occur there are no subtle intergradations, so that distinct 'forms' or 'states' occur, the largest being termed 'teleodont,' the smallest 'priodont,' and two intermediate forms 'mesodont' and 'amphiodont.' *Lucanus cervus* is the common English species. *Lucanus dama* is the commonest North American species. In the Southern States *Lucanus elaphus,* the giant stag-beetle, occurs. See Colored Plate of BEETLES.

STAGE, THE (OF. *estage,* Fr. *étage,* stage, floor, loft, from Lat. *stare,* to stand; ultimately connected with Eng. *stand*). A term frequently employed to designate the profession of the actor. This will accordingly be discussed in the present article, with reference especially to the life and training of actors, past and present; while in the article THEATRE will be found details of the construction and management of theatres as they affect the audience. Until the beginning of the nineteenth century the actor was classified by English law with vagabonds. In the Middle Ages actors, like poets and musicians, were more or less upon a footing with the household servants of the great; in fact, often were the servants of the nobility. Until 1875 in great English houses it was not uncommon to see a silken cord placed somewhere in one of the drawing rooms to separate the artists or performers at a formal soirée from the invited guests. If this

was the feeling toward acknowledged artists, it can be readily believed that the strolling player from Shakespeare's time down to the beginning of the last century was looked upon as but one step above the tramp. Within the last fifty years the social status of the actor has vastly improved, because of the more universal interest taken in stage performances, the higher salaries paid to actors, and the better organization of the theatrical business as a whole. For the first time in the history of England an actor, Sir Henry Irving, has been knighted for his services to the stage. With the growth of importance of the theatrical business, the character of its management has changed, with a decided loss in some directions and a gain in others. The old-time manager from Shakespeare's day to that of Sir Henry Irving in England, and of Lester Wallack in this country, was always an actor and not a business man. Within the last twenty-five years the management of most American theatres has fallen into the hands of business men, with a consequent loss in artistic quality and a gain in financial stability. The permanency of theatrical enterprises, and the fair certainty that contracts will be carried out, have made the profession less of a hazardous undertaking than it formerly was. At the same time, the fact that theatrical contracts are seldom made but for one season, commonly of forty weeks, that few plays please the public for more than a year, and that there are always several thousand unemployed actors and actresses in the United States alone, renders the actor's life, for the rank and file at least, a more or less uncertain one. Among the other disadvantages of the stage as a profession may be mentioned the absence of home life, nine-tenths of the profession having to travel from town to town, and the loss of earning capacity after a certain age. The advantages of the profession are that it requires no capital, and that there is always a possibility of earning a much larger salary than the average man or woman can expect in other businesses or professions.

Within the last thirty years the number of theatres in this country has increased from hundreds to thousands, and according to trustworthy statistics there are now about 10,000 stage performers in the United States, to which number must be added about as many more persons employed as musicians, scenic artists, stage hands, costumers, and theatrical employees, making an army of about 20,000 persons who look to the stage for support. The people on the stage are employed by 400 theatrical companies, with an average of twenty persons to each company. The Actors' Fund of America, the charitable organization of the dramatic profession in the United States, has a record of 17,000 persons employed in capacities entitling them to its recognition. Few plays are given in Germany and France for more than a few weeks at a time. In England and the United States the same play is performed as long as it attracts a playing audience, and most American companies are organized for one particular play, which is given throughout the season. This system entails constant traveling, which is one of the hardships of the actor's life. Scores of companies play the 'one-night stands,' as they are called, for month after month right through the season, traveling by day and acting at night. Miss Clara Morris, in her reminiscences, speaks of traveling all day without food to get to a town where she had to play the light-hearted daughter of a millionaire in the evening; she had to wear a low-necked dress upon a stage in Winnipeg, with Arctic blasts sweeping the stage; while a month later in Texas, with the thermometer at 100°, the part called for furs.

The number of women stage performers now exceeds that of men. Until 1660 they were forbidden upon the English stage, the female parts in Shakespeare's day being taken by boys or young men, which was also the custom in France and Germany. Women so soon became popular as actors that one of Dryden's comedies was produced in 1668 in London with all the parts, both male and female, played by women. With the employment of women greater attention was paid to costuming. A Parisian dancer, Mlle. Sallé, raised a storm in 1740 by appearing in the ballet of Pygmalion in Greek costume. Paris audiences objected to the innovation, but London accepted it. It was not, however, until Talma insisted in 1800 upon playing Brutus at the Théâtre Français in Roman costume and without a powdered wig that classical plays were costumed according to the epoch represented. It may also be supposed that the appearance of women as actors led to a more natural style of acting. So far as may be inferred from the books of the seventeenth and eighteenth centuries, acting in England and France was then as stilted and artificial as the manners of the time. Talma, Rachel, and Lemaître in France, Garrick, Kean, and Macready in England, instituted more natural methods. In more recent years what is known as 'realism' has made itself felt in acting as well as in literature. The old-time actor underwent a long training in the traditions and technicalities of the art; he was expected to play many parts. The actor of to-day has usually a narrower range.

Whether to trust to study and calculation or to inspiration when on the stage is a question on which experts differ. The noted French comedian Coquelin teaches that all acting is a distortion of nature so regulated by study and experience that it will seem to be nature when seen by an audience. The actor, says Bronson Howard, the American playwright, must make the people in the audience, some of them a hundred feet away, think that he is moving, appearing, and speaking like the character he assumes, and to do so he must do something that he would never think of doing in real life in the same circumstances. His talk and gesture must be as false as his complexion in order that they may seem real. Such exaggeration is an art that must be learned like any other. The foremost dramatic school of Europe has been that of the Paris Conservatoire, whose prize winners are engaged by the Paris Théâtre Français and the Odéon. In the United States the stage is now partly recruited from schools in New York, Boston, and Chicago, which graduate yearly several hundred pupils who have studied elocution, acting, make-up, costuming, etc., and have taken part in constant rehearsals of standard plays. Of these schols the oldest is the American Academy of Dramatic Arts (q.v.), founded in New York in 1884 by Franklin H. Sargent. Many actors who have retired from the stage also make a business of teaching.

A prosperous theatre in the city of New York may in a favorable season do a business of about $400,000 and keep in employment 150 persons. Only a few theatres, and those in large cities, now maintain stock companies of their own; local managers accept the performance given by an American or English company which comes for a shorter or longer period, taking as its pay a certain share of the receipts. As a rule the dramatic author receives from five to ten per cent. of the gross receipts in return for the use of his play. There is also an arrangement called the 'sliding scale,' by which the author's royalties are in a changing ratio to the gross receipts. The employees of the theatre consist of actors, stage hands, or men who move the scenery, manage the lights, etc., musicians, door-keepers, ticket-sellers, and ushers. Where stock companies are maintained there are also a number of scene-painters and costumers employed. Costumes are sometimes provided by the manager and sometimes by the actor. In costume plays—those in which scenery and elaborate costumes of another age are used—the manager provides them; where modern plays are the rule, the male members of the company generally provide their own clothes.

The salaries paid vary according to the standing of the company. In a first-class New York theatre the leading four or five people in the company may receive from $100 to $250 a week. From these figures, which are five times what actors were paid half a century ago, there is a gradual drop to $20 or $25 a week for the people who have but a line or two to say. In companies playing burlesque or light opera, the chorus girls receive from $12 to $20 a week, while the male chorus singers average $20. The star, as the leading actor of the company, male or female, is called, usually makes a special arrangement to take a share of the receipts in lieu of salary. All companies include a stage manager, who often plays one of the parts; for elaborate productions a special stage manager at a salary of from $75 to $100 a week is engaged to arrange the stage pictures. The cost of mounting a new play may vary from $2000 to $20,000, according to the number of people employed upon the stage, their costumes, the scenery, and properties. It is not unusual for the three or four costumes used by a chorus singer in one play to cost $100; the costumes for the dozen or more important characters may cost $500 for each player. The expense of putting on a big London Christmas pantomime, which sometimes employs 250 people on the stage, seldom falls short of $40,000. If a play proves to be a great success a second, third, and even fourth company may be organized to give it on 'the road,' one company going south, another north, thus covering the country before the fame of the original performance has died out.

The arrangement between the owner of the theatre and the manager of the company is a sharing plan. The latter furnishes the play, the actors, such special scenery and properties as have to be carried, the costumes, the street bills, and window advertisements; he also employs a man known as the advance agent to go ahead of the company to awaken interest in the performance by the insertion of newspaper articles and by any other devices that may serve. The manager of the theatre furnishes everything else, including as many extra stage hands as may be necessary to handle especially heavy scenery. The average division of receipts is 60 per cent. to the manager of the company and 40 per cent. to the theatre. A very popular actor may insist upon better terms.

The business of carrying a company through the country is so complicated that it has now largely fallen into the hands of a few large firms, who undertake to lay out the route, to make the engagements with local managers, and the contracts with the railroads for transportation. To lay out a route for a traveling company it is necessary to know (1) the seating capacity of every theatre in order that the company may not be sent to a house which it might pack and still lose money; (2) the number, character, and taste of the population, in order that a play wholly unsuited to it may not be offered; (3) the cost of railroad transportation. The company has to be kept going. In some places it can play a week, in others three nights, in others only one. The manager of the company has to pay all railroad fares, so that the nearer the towns in which he plays the better. Furthermore, he must as far as possible know what other attractions will be offered against him; a circus in a country town will 'kill' any play. The dramatic agencies do all this work for the companies, receiving a certain share of the profits in return and also payment from the managers of theatres to whom they furnish attractions. The most important agencies some years ago organized themselves into a syndicate, which made it almost impossible for any outside manager to engage 'time' in any of the best houses of the larger cities. The syndicate refused to send companies to any theatre which received an outsider. It not only controlled theatres, but it produced plays, recognizing only such playwrights and actors as consented to its terms. As the members of this powerful syndicate are business men rather than artists, art has suffered. A few prominent actors and managers, tired of the syndicate rule, have within the last year or two cut loose from it and have encouraged the building of independent houses in the largest cities of the country. There are now such independent theatres in New York, Philadelphia, Boston, and a few other cities.

The ordinary dramatic company is divided somewhat as follows: (1) leading man and woman, to whom are allotted the most important parts of the play; (2) juvenile man and woman, who play the two parts next in importance; (3) character actors, men or women, who play parts requiring eccentric acting or appearance; (4) old man and woman; (5) heavy man, who is mostly the villain of the piece; (6) utility people, minor actors who can be trusted with small parts; (7) walking gentlemen and ladies, people who simply appear but have nothing to say beyond a few unimportant words; (8) supernumeraries, commonly known as 'supes,' people who fill up stage pictures, but have no lines to speak and are usually under the direction of a 'captain;' (9) the stage manager. Other necessary employees in every theatre are the wardrobe woman, who cares for all the costumes, the property man, who looks out for the furniture and any articles needed upon the stage, the stage carpenters, the electricians, who attend to the lights,

and the scene-shifters. The stage manager is responsible for the smooth working of the performance. He sees that the stage is properly prepared for each act, he 'rings' the curtain up and down, and makes sure that each actor is ready for his cue to come on. The stage manager usually plays a small part that will give him time to attend to his other duties. In large companies there is also a stage director, who rehearses the play, calls extra rehearsals when he thinks they are necessary, and is generally responsible for the artistic part of the performance. Each part is studied by two persons in the company, so that in case of sickness the understudy can step in. Rehearsals made necessary by the substitution of an understudy are conducted by the stage manager, who also has charge of the music, the behavior of the supernumeraries, stage hands, etc.

The 'greenroom,' where in the old days the actor could wait while not on the stage, has been sacrificed in most modern theatres to the need of room for the elaborate scenery now used. In Europe it is still an institution and in important theatres, such as the Théâtre Français of Paris, it is a reception room handsomely fitted up, to which the favored patrons of the house are admitted. All important European theatres maintain stock companies, the important members of which are State employees. The company as a whole seldom plays outside of the home theatre, but leading actors are allowed to appear elsewhere as 'guests,' when they receive double pay. This visiting system, which is much in vogue in Germany, enables the chief actors to see what is done in rival theatres and provides variety of entertainment.

BIBLIOGRAPHY. Pougin, *Dictionnaire historique et pittoresque du théâtre* (Paris, 1885), a good account of French theatres and actors; Malone, *History of the Stage* (London, 1821), an exhaustive account of the English stage to the beginning of the nineteenth century; Lewis, *On Actors and the Art of Acting* (New York, 1880); Dunlop, *History of the American Theatre and Anecdotes of the Principal Actors* (ib., 1832), the best account of the early American theatres; Hubert, *The Stage as a Career* (ib., 1900), an account of the actor's life, its requirements, rewards, and hardships; Blum, *Allgemeines Theater-Lexikon* (Leipzig, 1842).

STAGGER BUSH. See ANDROMEDA.

STAGGERS. Various affections of animals. In horses, mad or sleepy staggers is attributed to inflammation of the brain and is considered fatal. Grass or stomach staggers is said to result from indigestion. In sheep a tapeworm in the brain cavity is held accountable for the phenomenon.

STAGHOUND. See HOUND.

STAGING. Staging and scaffolding are interchangeable terms for the temporary frameworks of timber erected about a building under construction or repair, to furnish platforms for the workmen and for the materials and implements of construction required for immediate use. For exterior work the staging may be built up in one of three ways: by series of movable trestles or 'horses' supporting planks, in successive tiers or stages; by 'putlogs' projecting horizontally through temporary holes in the masonry, to support the platforms; or by rows of lofty poles or posts standing on or in the ground, to which are nailed, bolted, or lashed with ropes the necessary girts and cross-pieces, with braces to prevent the sidewise racking of the frame. In cities a very heavy staging is also built of heavy timbers over the sidewalk for the protection of passers-by. Materials are hoisted by derricks, or in France by means of scaffold-towers of poles, often of elaborate construction. For the erection of interior trusses, as in railway stations, stagings on wheels or rollers are often used, being moved from one truss to the next, as each is completed. Similar stagings are used in decorating and repairing the vaults, domes, or ceilings of lofty interiors. The construction of stagings often calls for a high degree of engineering skill. The stagings erected to support the trusses of bridges while building are called *falsework*.

STAGI'RA or STAGIRUS. An ancient town in southeastern Macedonia, on the Strymonic Gulf, celebrated as the birthplace of Aristotle. It was founded in the seventh century B.C. by a colony from Andros, but declined during the Peloponnesian War. The modern village of Stavro is on its site.

STAGIRITE, THE. A name frequently given to Aristotle from his birthplace, Stagira.

STAGNELIUS, stâg-nā'lê-ụs, ERIK JOHAN (1793-1823). A Swedish poet born on the island of Onland, and educated at Upsala and Lund. He was deeply interested in Gnosticism and treated all sides of this question in his books. He is considered a master of form. He published the epic poem *Wladimir den store* (1817), the philosophico-religious *Liljor i Saran* (1821), *Martyrene, his best drama* (1821), and the tragedy *Bacchanterna* (1822).

STAHL, stäl, ERNST (1848—). A German botanist, born near Strassburg, and educated there, at Halle, and at Würzburg. He became professor in Strassburg in 1880, and professor and director of the botanical gardens at Jena the following year. He visited Ceylon and Java in the winter of 1889-90. Among his books are *Entwickelung und Anatomie der Lenticellen* (1873), *Einfluss des Lichtes auf den Geotropismus einiger Pflanzenorgane* (1884), *Zur Biologie der Myxomyceten* (1884), and *Regenfall und Blattgestalt* (1893).

STAHL, FRIEDRICH JULIUS (1802-61). A German politician and political philosopher. He was born in Munich of Jewish parents, turned Protestant in 1819, studied at Würzburg, Heidelberg, and Erlangen, and in course of time became professor of law at Erlangen, Würzburg, and Berlin. In 1849 he was made a member of the Upper House of the Prussian Legislature, and in 1850 he was a member of the Erfurt Parliament. Stahl was a leader in the Lutheran Church, and became one of the most powerful influences for reaction in Germany. He stood for an absolute monarch and an absolute Church that should control the monarch. The basis of his political philosophy was the conception of the subserviency of all things lay and clerical to the will of God as expounded by the clergy. His most important work is the *Philosophie des Rechts nach geschichtlicher Ansicht* (1830). Some of his other works are *Ueber Kirchenzucht* (1845), *Das monarchische Prinzip* (1845), *Der*

christliche Staat (1847), *Die Revolution und die konstitutionelle Monarchie* (1848), *Die lutherische Kirche und die Union* (1859).

STAHL, GEORG ERNEST (1660-1734). A German physician and chemist, born at Ansbach. He was called in 1694 to the chair of medicine, anatomy, and chemistry in the newly founded university of Halle, whence he removed to Berlin in 1716, and was appointed physician to the King of Prussia. Stahl was one of the ablest chemists of his time, and destroyed numberless absurd opinions which had found their way into science, and propounded the first general theory of chemical transformations (see CHEMISTRY), which was universally accepted till the time of Lavoisier. His works, according to Haller, number 250, the most important being *Theoria Medica Vera* (1707, and 1831-33), which contains his medical theory, and *Experimenta, Observationes et Animadversiones Chymico-Physicæ* (1731), in which his chemical opinions are set forth. An account of his opinions is found in Lemoine, *Le vitalisme et l'animisme de Stahl* (Paris, 1864). Consult also Lasègue, *De Stahl et sa doctrine médicale* (ib., 1846).

STAHR, stär, ADOLF (1805-76). A German author, born in Prenzlau, Prussia. After study at the University of Halle he went to the gymnasium at Oldenberg, and in 1836 became professor there. While on a tour through Italy in 1845, which was afterwards described in *Ein Yahr in Italien* (1847-50), he met the author Fanny Lewald, whom he married in 1855, after separating from his first wife. Perhaps the most noteworthy of his writings are his classical studies, which include translations from Aristotle, Suetonius, and Tacitus, and *Bilder aus dem Altertum* (1863-66). His miscellaneous works, some of which have been translated into English, include: *Charakteristik Immermanns* (1842); *Die Republikaner in Neapel* (1849); *Die preussische Revolution* (1850); and *G. E. Lessing, sein Leben und seine Schriften* (1858).

STAIGG, RICHARD M. (1820-81). An American genre and portrait painter. He was born at Leeds, England, and studied drawing in an architect's office before coming to America in 1831. He began painting miniatures on ivory, and soon attained a high degree of excellence. He was elected member of the National Academy of Design in 1861. In 1867-69 he studied at Paris, and after his return he ceased miniature painting and devoted himself to portraiture and coast scenes. His work is pleasing in color and detailed in execution. His genre pictures, characterized by an unaffected simplicity and grace, include "Learning to Slide" and the "Sailor's Grave," Stuart collection, Lenox Library, New York City, and the "Cat's Cradle."

STAINED GLASS The process of coloring glass requires particular care. When it is to be of full color (as commonly for windows of rich decorative effect) it is called 'pot metal;' but, while colored glass of many hues and tints is used in which the whole mass of the glass is equally stained throughout, certain colors are prepared by covering one side of a piece of colorless glass with pot metal of the color required. Crimson and ruby glass for windows is made in this way, the process being called 'flashing.' Opaline glass, much used for windows in America since 1885, though known and used long before, when very much clouded or stained so as to be nearly opaque, for utilitarian purposes, has some of the opal's power of giving at once the general color and its complementary color; thus glass of smoky blue shows also a spark of orange or of pinkish light. It has been found practicable to give the opaline character to glass of the full color of pot metal; and upon this depends much of the splendor of recent American windows. Glass so colored is often not of the same degree of translucency throughout. Some pieces of opaline and other glass prepared for windows vary much in the same piece with regard to this matter of translucency. The designer, while directing the choice of glass for a rich mosaic window, will sometimes be in doubt just where to cut off the sheet, and will experiment with rays of sunlight falling upon the glass to see where it becomes too nearly opaque for his use. Some of these sheets of glass prepared for rich windows have much change of color in their mass, cloudings, and veinings of different hues, the contrasts being enhanced by the varying thickness of the parts of the same sheet. The composer of a rich window knows how to utilize these contrasts and gradations.

Iridescence, as found on the surface of ancient glass vessels and fragments which have been long buried in the earth, is the result of a curious process of decay, in the course of which the substance of the glass becomes disintegrated, forming thin laminæ, which are no longer brittle as a thin piece of undecayed glass would be, but have rather the crumbling texture of flakes of mica or the like; that is to say, this part of the glass has lost its vitreous qualities. Modern attempts to produce iridescence are, of course, not in that direction; the attempt has been to give the changing play of colored light to the surface of perfect glass. They are of different character, according to the greater or less degree of translucency desired. The ancient and partly decayed glass is of course mainly non-transparent, but still allows some light to pass through it. Thus in a phial or plate of that pale green transparent glass so common in the Greco-Roman period, parts will be brilliantly iridescent when the piece is found, and still other parts will have a whitish degeneracy which is incipient change of mass. These parts will be comparatively opaque, not allowing a small object to be clearly seen through their substances, while other parts of the same vessel will be entirely transparent as soon as the earthy deposits have been removed. The most common iridescent glass of modern manufacture is, however, entirely clear, and an iridescent effect of the surface, like that of the surface of a soap-bubble, is given by some process which is often kept secret. During the last two decades of the nineteenth century a very brilliant glass was made in America by a single establishment. In this glass, the uniting of successive layers of the material, one imposed upon another while hot, allows of giving to one or both surfaces a brilliant iridescence which, when fully developed, makes the whole mass entirely non-translucent. It is full of the play of brilliant color, nearly like a rich piece of mother-of-pearl. This process differs wholly from enameling

(q.v.). in that the glass to be made iridescent is not allowed to lose its high degree of heat. It is continually returned to the furnace at very brief intervals, and the layers of glass become a solid mass, although close examination will often reveal their once separate existence and their number. The idea may have been taken from the Greco-Roman pieces, which are often amber or violet in the natural state of the glass, like modern pot metal, and rendered opaque and iridescent by the gradual decay of the exterior surface.

In the course of experiments upon iridescent and lustrous surfaces, much was done in the way of depositing iron, tin, and other metals in a nearly pure state. By way of producing *tours de force* for exhibition pieces, these metallic deposits were sometimes carried to surprising extremes; thus about 1890 a vase was exhibited which was of glass within, but had its outside almost wholly non-vitreous and showing only an opaque and rough surface of warm brown; and this piece was described by the exhibitor as containing as much iron as glass could possibly receive and retain.

STAINED GLASS WINDOWS. By far the most important use of stained glass is its application to the artistic decoration of windows, usually termed glass painting, though properly speaking it is not painting at all. Originally, there was but one method of making ornamental glass windows, and that was to produce the pattern in outline with finely made leaden frames, into the grooves of which pieces of colored or stained glass were fitted. It appears to have been a branch of art unknown to antiquity and to have been used in a primitive fashion in churches of the fourth and following centuries, the different colors forming not figures, but ornamental patterns. These are described by early authors such as Prudentius, Sidonius, Apollinaris, and Gregory of Tours, but nothing of this period has been preserved. The majority of windows up to the eleventh century were closed by thin slabs of alabaster or other translucent material often pierced by holes arranged to form patterns, as at Santi Vincenzo ed Anastasio and other Roman churches.

One of the best known of the early examples of the use of figures in glass windows is of the eleventh century in the former monastery of Tegernsee (Bavaria); like all of the first attempts, they were only tasteful arrangements of colored glass in imitation of the stone mosaics used for floors, etc. Shortly afterwards in the twelfth century the monk Theophilus describes in his treatise the method of making such windows as the earliest ones at Chartres, Saint Denis, and Vendôme. The centre of the steady progress throughout the twelfth and thirteenth centuries was in Northern France, where the use of Gothic architecture, with its immense increase in the size of the windows, suddenly brought stained glass windows into prominence, not only as one of the most important accessories of architecture, but as the one prominent color factor in the great Gothic interiors. As the windows occupied the entire wall-space between the piers, both in the aisle-walls and clerestories of the churches, they afforded the same opportunity for composition that the solid walls had previously offered to fresco-painting. The French cathedrals of the thirteenth century at Le Mans, Chartres, Bourges, and to a less degree Rheims and Rouen, preserve whole series of contemporary windows, which gave the type to other countries and to the succeeding century. Those of the Sainte Chapelle in Paris are also of extreme beauty. The characteristics of the earliest Gothic windows are: multiplication of small figures in many separate compositions grouped in tiers or rows of framed medallions; rich and dark coloring; wide decorative borders; heavy leads bent so as to outline the figures or cut them in the deep shadows.

The development during the fourteenth century was toward lighter coloring, larger figures, narrow borders, more ornamentation in the body of the windows, more delicate gradations of color, and increase of modeling, loss of simplicity, and tendency to mannerisms, while in the fifteenth century much clear glass was introduced into the backgrounds, and inscribed ribbons and architectural accessories became conspicuous, whereas the earlier windows are composed of many small and distinct pictures set in a groundwork of grisaille or of color ornament, the later ones comprising a single figure or picture for each light or even a composition occupying the whole window. The designers of the Gothic age did not, to any great extent, give the details of their pictures on glass as their successors—Renaissance and modern—mistakenly attempted to do, but obtained their superb effects by a clear knowledge of the interaction of colors, by juxtaposition of complementary colors, and the effect of distances; the technique being that of glass colored not on the surface, but in the mass either by stain or incorporation. This branch of art was, therefore, governed by totally different artistic principles from those governing opaque painting (fresco, oil, tempera, tapestry, etc.), and these principles were thoroughly understood.

The practice of painting on glass, i.e. of applying color with the brush on fusible pigments fixed by heat, began in the use of grisaille, a browning pigment, for cross-hatching and outlining on clear glass the ornamental details of the backgrounds, in order to soften the glare of the clear glass without introducing disturbing color-elements. It was then applied, even in early French windows, to the faces and hands to indicate the features and fingers; and its use extended gradually to all the shaded details, the inscriptions and ornaments, of the later windows. The perfection of the French work of the thirteenth century has never been equaled. These series of cathedral windows were also one of the principal branches of Christian iconography (q.v.), joining with sculpture in expressing the subjects of religious thought in art.

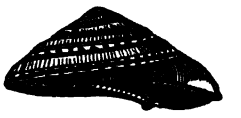
During the latter part of the thirteenth century the art was carried to England, Germany, and Italy, where it did not really flourish before the following century. In Italy the imperfect understanding of Gothic methods did not allow of the use of such immense windows, and the art never became thoroughly acclimated. At Arezzo Cathedral are some windows by a French artist, Guillaume de Marcillati, proving the transmission from France. Other interesting examples are in San Francesco at Assisi, San Petronio in Bologna, and the Cathedral and Santa Croce in

Florence. Many of the best Italian examples belong rather to the early Renaissance than to the late Gothic. England would have possessed some very fine series, as is shown by the examples at York and Canterbury, had it not been for the vandalism of the Reformation. In Spain there are fine windows at Toledo and Leon, very close to French models. Germany, however, ranks next to France in the importance of its remaining windows, beginning in the fourteenth century, with those of the choir of Cologne Cathedral, those of the cathedrals of Freiburg, Strassburg, and Regensburg, and the churches at Oppenheim, Esslingen, and Nuremberg. German works, however, do not approach the French in quality either of technique or art.

As the fifteenth century approached the use of *grisaille* or light colorless monochrome windows increased. This process had always been in use for smaller windows or borders with geometric designs, as at Obasine and Auzerre in France, Heiligenkreuz in Austria, and Sainte Gudule at Brussels, but it became more popular and was used in larger windows as the Renaissance period approached; the brown enamel on the white or greenish ground became lighter, all the glass less opaque, and the leads more delicate. In colored glass windows a brilliant window became very popular, while green and violet went out of fashion. The donor's window at the Cathedral of Evreux shows how the fourteenth-century artist substituted realism for the older conventions, and introduced profusely architectural forms as framework and background of the figures. The increased use of the white line and background and the invention of the yellow stain, used profusely in place of the applied enamel, increased the light effect. With the approach of the fifteenth century the increased perfection in drawing and naturalism does not compensate for the loss of the special methods of glass painting, for which artists commenced to substitute effects taken from wall and other forms of opaque painting. In Germany a peculiar novelty popular during the Renaissance was the use of coats of arms as the exclusive or almost exclusive design. The extreme of possible realism was then reached in the architectural and landscape effects of the windows at Gouda in Holland. Jean Cousin in France; Holbein, Ghiberti, and Paolo Uccello in Italy; Dürer and Baldung Grün in Germany—were among the prominent artists of the Renaissance who designed windows. At the same time this very fall of the glass-painter to the rank of an artisan and the influence of painting on his art hastened its fall in the seventeenth century.

The attempts to revive it during the two following centuries, as exemplified by Sir Joshua Reynolds's remarks, were based upon the same mistaken principles. The glass windows produced to the middle of the nineteenth century were paintings on glass in imitation of oil or water-color pictures—of opaque effects in painting. The majority are, therefore, inadequate and commonplace, works of industry rather than art. The Munich School bettered the process somewhat; the revival of the study of Gothic art between 1850 and 1875, especially that initiated in France by Viollet-le-Duc, led to a better appreciation of and an attempt to revert to mediæval processes. The French first rediscovered them, and American artists, of whom the most prominent is John La Farge, have done perhaps more than any others during the last decade to replace glass painting again in the sphere of real art. Besides studying again the irradiation of colors, the special requirements of transparent painting, and the consequent grouping of complementary colors, artists like La Farge and Tiffany have produced wonderful effects in iridescence with an increase of richness in tones similar to glass mosaic-work. A questionable but extremely popular American innovation has been the introduction of what may be called modeled glass, to reproduce the effects of shading by its purposed or accidental variations of thickness. American artists also make large use of the accidental streakings of vari-colored glass ('pot metal') to produce pictorial effects without painting and without too minute subdivision and leading of the picture.

(Paris, 1878-81). The first historic study, really scientific and artistic, was Viollet-le-Duc's article "Vitraux" in his great *Dictionnaire raisonné de l'architecture française* (Paris, 1858-68). Consult also: Lasteyrie, *Histoire de la peinture sur verre d'après ses monuments en France*, with 110 plates (ib., 1853-57), and Geyling and Löw, *Meisterwerke der kirchlichen Glasmalerei* (Vienna, 1895 et seq.). A model publication of one of the great series of Gothic windows is Hucher, *Vitraux peints de la cathédrale du Mans* (Le Mans, 1864), with 100 immense plates. For American work consult Sturgis, "Decorative Windows in England and America," in *Architectural Record*, vol. vi. (New York, 1896-97); La Farge, *The American Art of Glass* (New York, 1893), and the same author's article "Window" in Sturgis, *Dictionary of Architecture* (New York, 1901).



STAINER, stīn'ẽr, JAKOB (1621-83). A German violin-maker, born at Absam, Tyrol. He was the son of poor peasants, but at an early age began to make violins and subsequently studied at Cremona under the best makers of his time. His extravagances kept him in continual poverty and he died in an insane asylum in Absam. Stainer violins are rare and command high prices, though they do not rank with the instruments of Guarnerius, Stradivarius, or the Amati (qq.v.).

STAINER, Sir JOHN (1840-1901). An English composer and organist, born in London. In 1854 he became organist and choirmaster of Saint Benedict and Saint Peter's Church, and two years later was selected by Sir Frederick Ouseley as organist for the newly founded College and Church of Saint Michael, Tenbury. He held this appointment for three years, during which time he had matriculated at Christ Church, Oxford, and had taken his degree of bachelor of music. He next became organist of Magdalen College, Oxford, at the same time entering the university as an undergraduate. In 1863 he took his degree and was appointed

organist of the university and conductor of t
two musical societies. In 1865 he was m
doctor of music, and in 1866 became one of
examiners for musical degrees. He succe
Sir John Goss as organist of Saint Paul's,
don, from 1872 to 1888, when he was kni
by Queen Victoria, and the following yea
appointed to the chair of music at Oxfor
versity. He was also professor in the
College of Music. In 1878 he was

after the abduction of Prince Alexander in August, 1886, until the election of Prince Ferdinand, in July, 1887, then became Premier, and for nearly seven years ruled autocratically, establishing amicable relations with the Porte, but antagonizing Russia. In time his masterful course gained him bitter enemies and aroused the dissatisfaction of Prince Ferdinand. In May, 1894, the Minister resigned. On July 15, 1895, Stambuloff was set upon by three assassins in the streets of Sofia and was left for dead, expiring three days later. The murderers were sentenced to nominal terms of imprisonment. A confession made by one of them in 1902 implicated several men then in power, and tended to cast suspicion on Prince Ferdinand. Consult: Hulme-Beaman, *M. Stambuloff* (London, 1895); id., *Twenty Years in the Near East* (ib., 1898).

STAMEN (Lat., warp, thread, fibre, stamen). The organ in flowers which produces pollen (q.v.). It is usually differentiated into two regions: (1) A stalk-like portion, called the filament, and (2) the terminal anther which bears the pollen sacs. See FLOWER.

STAMFORD. A market town in Lincolnshire, England, on the Welland, 16 miles by rail northwest of Peterborough (Map: England, F 4). It is remarkable for its history and its antiquities, of which four fine churches, two old gateways, and the ruins of a priory remain. Its charter dates from 982. Population, in 1901, 8300. Consult Neirnson, *History of Stamford* (London, 1879).

STAMFORD. A city in Fairfield County, Conn., 33 miles northeast of New York City, on Long Island Sound, and on the New York, New Haven and Hartford Railroad (Map: Connecticut, A 5). It is attractively situated, and contains the homes of many New York business men. There are the Ferguson Library, with more than 10,000 volumes, and the Stamford Hospital. Stamford is especially known for its manufactures of hardware, including locks and keys. Dyestuffs, drugs, pianos, typewriters, and foundry and machine-shop products are also extensively manufactured. In the census year 1900 there was invested in all industries capital to the amount of $5,189,195. The output was valued at $4,743,704. The government, under the revised charter of 1899, is vested in a mayor, chosen annually, and a unicameral council. Population, in 1900, 15,997. Stamford was settled in 1641 by a company from Wethersfield, some of whom were natives of Stamford, England. Until 1662, when the Connecticut and New Haven colonies united, it was under the jurisdiction of the latter. Out of part of Stamford, Darien was created in 1820. Stamford was incorporated as a city in 1893. Consult: Huntington, *History of Stamford* (Stamford, 1868), and an article, "Stamford—1641-1900," in *Connecticut Magazine*, vol. vi. (Hartford, 1900).

STAMMERING (from *stammer*, OHG. *stammalōn*, *stamalōn*, Ger. *stammern*, *stammeln*, to stammer; connected with OHG. *stammal*, *stamal*, stammering, *stam*, Ger. *stumm*, mute, Goth. *stamms*, stammering). An imperfect enunciation of words due to irregular or spasmodic action of the muscles of articulation. The trouble is sometimes a form of chorea (q.v.), sometimes entirely an emotional incoördination. In many sufferers, difficulty lies in the enunciation of the initial syllables of certain words, especially if they begin with *b*, *p*, *t*, or *d*. In some cases, when once pronounced, the syllable is involuntarily repeated again and again. This variety of stammering is sometimes termed *stuttering*. The latter is physical, while stammering is mental. The trouble often begins merely as hesitancy with a disposition to avoid certain words, or a little imperfect articulation and stumbling over certain words. Many regard their condition as hereditary because there are other members of their family who stammer. This is probably an error. Mimicry is the cause in many cases. Some begin at the time of an illness, some are due to fright. The great majority of stammerers begin at the age of five years or earlier. Very rarely is the habit formed after twenty years of age. The proportion of males to females is as 4½ to 1. Malformation of organs of speech in stammerers is so rare that it may be denied. In the very rarest instances disease or defect in the hypoglossal nerve and its muscles exists. Emotion, fear, anger, argument, and embarrassment all increase stammering and are in some instances entirely accountable for it. If the bodily condition is improved, the stammerer acquires more self-control and prevents the occurrence. Out-of-door exercise, mental and moral hygiene, avoidance of all undermining influences, and great care result in conquest of the condition in most cases. Boldness and self-reliance will render it impossible. Measured tones, care in attacking each word, and thoughtful deliberation are almost always absolutely successful. Stammerers can always sing without difficulty. Some learn to enunciate distinctly while performing an associated movement, as tilting the head or lifting a finger with each word. It is stated that in the United States there are over 400,000 cases of this speech defect. Consult Lewis, *Practical Treatment of Stammering and Stuttering* (Detroit, 1902).

STAMP (from AS. *stempan*, OHG. *stamfōn*, Ger. *stampfen*, to stamp; connected with Gk. *στέμβειν*, *stembein*, to stamp, *στείβειν*, *steibein*, to tread, Skt. *stambh*, to make firm or steady). A piece of paper upon which a mark or device has been printed or impressed by authority of law, and which is adapted for the purpose of attaching it to some object chargeable with a duty or tax of some nature. The stamp is usually gummed on the back and attached to the instrument or article by adhesion. Such stamps are usually made to represent different values to suit the requirements of the tax law or revenue act under which they are imposed.

The British Government has long employed stamps for the above purposes, and the United States Government for the purpose of raising revenue during the Civil War imposed a stamp tax upon legal instruments and a great variety of other articles of property. The method is to require a stamp to be affixed to an article before it can be sold, which duty is usually performed by the manufacturer of the article. During the Spanish-American War the United States Government passed a war revenue act requiring stamps on legal instruments and certain articles of commerce. This law was repealed when the necessity for the increased revenue had ceased. However, internal revenue stamps are still required on tobacco, snuff, liquors, cigars, etc., under excise laws, and this is considered to be the

most satisfactory method of collecting revenue upon such articles. Where a stamp tax is imposed on legal instruments the revenue act usually provides that an instrument shall be void unless it has the proper stamp. However, the courts are liberal in their construction of such provisions, and will usually hold an instrument good if the parties inadvertently have omitted to affix the stamp. Consult: Cooley, *Constitutional Limitations;* Parsons, *Contract.* See POSTAGE STAMPS.

STAMP ACT. In American history, an act passed by the British Parliament and signed for George III. (then insane) March 22, 1765, "for granting and supplying certain stamp duties, and other duties, in the British colonies and plantations in America, towards further defraying the expenses of defending, protecting, and securing the same." This act, which was to go into effect on November 1st, prescribed (1) that stamped paper be used for legal and official documents, diplomas, and certificates; (2) that stamps be placed on playing cards, dice, books (excepting those used in the schools), newspapers, pamphlets, calendars, almanacs, and various other articles; and (3) that jury trial be denied to offenders at the discretion of the authorized prosecuting officers. Lord Grenville had given notice in March, 1764, of an intention to introduce such an act, and the various colonies had protested vigorously through their authorized agents, but had been unable to suggest any satisfactory substitute. News of its actual passage reached America early in May, 1765, and immediately a fierce opposition everywhere manifested itself on the ground that the colonists were not represented in Parliament and therefore could not legally be taxed without their formal consent. It was urged, moreover, that the duties would be exceedingly burdensome and would cause the withdrawal from circulation of what little specie there was in various colonies. The stamp agents were nearly everywhere compelled by the 'Sons of Liberty' (q.v.) to resign or to destroy their stamps, or both, while many of them were mobbed and much property was destroyed; so that by the time it was to go into effect the act had been virtually nullified. Resolutions, moreover, were passed by many of the colonial assemblies, notably by Virginia (May 30th) (see HENRY, PATRICK), insisting on the general rights of the colonists as British subjects, and denying the jurisdiction of Parliament over the colonial pocketbook. The famous Stamp Act Congress, composed of delegates from New York, Massachusetts, Connecticut, Rhode Island, New Jersey, Pennsylvania, Delaware, Maryland, and South Carolina, assembled at New York on October 7th, in pursuance of a circular letter sent out June 8th by Massachusetts, and issued a dignified "Declaration of Rights and Grievances," a formal address to the King, and petitions to each House of Parliament. In addition many able pamphlets were written to oppose the act, and on November 1st, when it was to go into effect, bells were tolled, flags were placed at half-mast, and newspapers were put in mourning. Finally, on March 18, 1766, after a long and bitter debate, Parliament repealed the objectionable measure, having previously, however, passed (March 7th) a "Declaratory Act" asserting a right to "bind the colonies and people of America . . . in all cases whatsoever." The repeal caused great rejoicing throughout America, though dissatisfaction was soon expressed with regard to the Declaratory Act. The whole affair has been regarded as one of the chief immediate causes of the Revolution. For the text of the act, consult Pickering's *Statutes at Large,* XXVI. Consult also Frothingham, *Rise of the Republic* (Boston, 1872), and Tyler, *Literary History of the American Revolution* (New York, 1896).

STAMPING OF METALS. See DIES AND DIE-SINKING; MINT.

STAMP MILL. See GRINDING AND CRUSHING MACHINERY.

STANBERY, HENRY (1803-81). An American lawyer and jurist, born in New York City. He was educated at Washington College, Pa., was admitted to the bar in 1824, and for several years was in circuit practice in Lancaster County, Ohio. In 1846 he became the first Attorney-General of the State, and in 1866 was appointed Attorney-General of the United States under Andrew Johnson. This office he held until 1868, when he resigned to act as counsel for the President during the impeachment proceedings. He was then nominated for the Supreme Court bench, but the appointment was not confirmed by the Senate, and he resumed his professional labors in Cincinnati.

STANDARD. A battle-flag; in a broader sense, the emblem of a ruler or a nation. On the Egyptian monuments are representations of standards, usually consisting of the image of some sacred animal, a fan or semicircular disk, an ostrich feather, the symbol of victory, the name of the king, or some other symbolic device. The standard-bearer was an officer of approved valor, and distinguished by a badge representing two lions symbolizing courage, and two other emblems of doubtful meaning. In an Egyptian representation of the siege of a town of the Khita, the enemy appear to have as a standard a shield pierced with arrows. The Bible also refers to the use of banners or standards to mark the divisions and subdivisions of the children of Israel on their march from Egypt to Palestine. The Assyrian monuments show standards attached to the chariots. These are circular disks mounted on a pole, and bear the image of two bulls galloping in opposite directions, a disk supported on two bulls' heads, or the god Asshur represented as an archer standing on the back of one or two bulls. According to Xenophon the Persian standard was a golden eagle. The Greeks do not seem to have used flags or standards of any kind, though we hear on some occasions that the signal was given by displaying a scarlet cloak on a spear or pole.

Legend claimed that the first Roman standard was a wisp of hay (*manipulus*) on a pole. In historic times, however, we find a thorough system of military standards or signa. One of these belonged to each maniple (consisting of two centuries), and their details naturally differed from the legion and the nature of the troops, for the auxiliaries and cavalry naturally bore ensigns not like those of Roman legionaries. As represented on the monuments, the *signum* of the maniple of the legion was a long pole, shod with metal, and near the top a

cross-bar, on which seems to have been a plate with the name of the company. From the ends of this bar hung ribbons tipped with silver oak-leaves. Below the bar along the pole are a number of metal disks, which seem to have been marks of distinction, and consequently vary with the legion and company. Above the bar is sometimes a disk, or a hand, the emblem of fidelity, or the figure of an animal, though these latter seem to appear on the standards of native troops in the Roman service. Another standard bore the image of the Emperor. The standard of the legion was a golden eagle, with spread wings, and usually holding a thunderbolt in its claws. It was placed near the commander in battle, and in the camp had a special shrine, for, like all the standards, it was sacred. Another form of standard was the vexillum, a piece of fringed cloth, hanging from a cross-bar on a pole. This was a very old form, as it was the banner hoisted when the Comitia Centuriata was in session. It gave the signal for battle when raised over the general's tent, and was used by any division on detached duty. It was carried by the cavalry of the legion, and seems sometimes to have been attached to the *signum*. The color of the cloth was red or white. For modern standards and national emblems, see FLAG, and HERALDRY, section on *National Coats of Arms*.

STANDARD, BATTLE OF THE. A name frequently given to the battle fought between the English and the Scotch, August 22, 1138, at Northallerton (q.v.).

STANDARD OF LIVING. In economics, the term used to designate the degree of comfort or enjoyment derived from the use of material goods which each social class regards as essential to tolerable existence. Those have a 'high standard of living' who demand control over a large and varied quantity of consumption goods; those whose wants are few and tastes inexpensive have a 'low standard of living.' The terms are usually used without moral connotations, injurious and degrading modes of consumption entering into a 'high' standard of living, as well as consumption of goods which exercise a refining influence. In some sociological studies, however, the test of a high standard of living is its moral influence. Students of the housing problem (q.v.) regard the development of a higher standard with respect to house room as an advance in the standard of life, although such a development may result in checking expenditure in other directions. In a developing society like that of the United States, the gradations of standards of living are as numerous as those of social classes. In a rough way it may be said that the professional and business classes have a higher standard of living than artisans; and the standard of the latter is higher than that of the laborer. Comparing societies as wholes, the American standard of living is higher than the European, which in turn is higher than the Asiatic. While preserving a certain fixity within relatively brief periods of time, the standard of living of classes or of nations tends to rise or fall as a result of general economic conditions. Throughout the Western world standards of living have been rising for the past hundred years, although the standards of isolated classes have fallen.

In recent discussion much emphasis has been laid upon the influence of the standard of living upon wages. If a social class has a high standard, each individual in it will exert himself to the utmost to maintain the same control over goods as his fellows. A rising standard thus acts as a spur to those whose individual wants would demand no great degree of exertion. To raise the standard of backward races or classes is therefore regarded as a prerequisite to industrial improvement. In the second place, a high standard, assuming that it consists in the consumption of goods which improve the physical and mental condition of the laborer—e.g. good food, clothing, housing, a thorough education and technical training for children—tends in the long run to increase industrial efficiency. Thus the native American workman, owing to his high standard of life, is capable of more effective work than underfed and ignorant immigrants. Thirdly, it is difficult for an employer to beat down wages of laborers whose standard is high. Thus a greater share in the social dividend may be diverted to labor. Fourthly, men whose standard is high refuse to marry until they have a fair prospect of bringing up their children in a way in keeping with class standards. Hence the supply of labor is kept from exceeding the demand for it and wages are kept from falling to a subsistence level. See WAGES; POLITICAL ECONOMY.

STANDARD TIME. See TIME, STANDARD.

STANDARD-WING. Either of two African nightjars of the genus Macrodipteryx, in which the second primary wing-quill of the male is enormously elongated, so as to look like a pennant floating from the wing as the bird flies. In one species it has no vane except near the tip; and when the bird sits upon the ground these feathers stand upright. See Plate of NIGHTJARS, ETC.

One of the birds of paradise (*Semioptera Wallacii*) is also known by this name.

STANDING STONES. See MEGALITHIC MONUMENTS.

STANDISH, MILES or MYLES (1584-1656). An American colonist, born in Lancashire, England. He served in the English army in the Netherlands, and emigrated to America in 1620, being one of the passengers on the *Mayflower*. He was active among the Plymouth colonists as an explorer and Indian fighter and became military leader of the colony. In the summer of 1625, the colony being in great straits, Standish was sent to England to secure the intervention of the Government against the merchant adventurers, but was unsuccessful. He returned to the colony in the following year with supplies and became one of the proprietors and settlers of Duxbury, Mass., where he held the office of magistrate for the remainder of his life. A granite monument to his memory has been erected in Duxbury. The second courtship of Standish has been made the subject of one of Longfellow's best known poems, *The Courtship of Miles Standish*. Consult Bradford, *Plymouth Plantation* (last ed., Boston, 1898).

STANDPIPE. See WATER-WORKS.

STANFIELD, CLARKSON (1793-1867). An English marine and landscape painter. He was born of Irish parents in Sunderland, Durham, and was a sailor and a scene-painter. In 1835 he became a member of the Royal

Academy, and in 1848 settled at Hampstead, where he executed some of his finest pictures. The "Battle of Trafalgar," painted for the United Service Club, is his best work. He painted in a broad style, but his coloring is cold, and he was seemingly untouched by the sentiment of the sea. His realism brought to him the approval of Ruskin, but more recent critics do not find the same pleasure in his works.

STAN'FORD, CHARLES VILLIERS (1852—). A British composer, born in Dublin. In 1872 he became organist of Trinity College. In 1883 he received the appointment of professor of composition and conductor of the orchestra at the Royal College of Music; in 1885 he became conductor of the Bach choir, and in 1887 succeeded Macfarren as professor of music at Cambridge. In 1897 he became conductor of the Leeds Philharmonic Society and in 1901 of the Leeds Festival. He received the degree of doctor of music from Oxford and Cambridge, and in 1902 was created a knight. His compositions include many operas, notably *Savonarola* (1884) and *Shamus O'Brien* (1896), but he appealed to a larger public in his oratorios and choral works.

STANFORD, LELAND (1824-93). An American capitalist, born at Watervliet, N. Y. In 1849 he removed to Wisconsin and for a time practiced law in Port Washington. In 1856 he established a commercial business in San Francisco. He was elected Governor of California on the Republican ticket in 1861. In the same year he became president of the new Central Pacific Railway Company, and, repairing to Washington, successfully lobbied for the passage by Congress of the bill granting Government aid to the project. In the construction of the road he personally undertook the responsibility and supervision of that part of the road crossing the ridge of the Sierra Nevada Mountains, and as a result 530 miles of mountain road were constructed in 293 days. The road was completed in 1866 to Ogden, Utah, where it was subsequently connected with the Union Pacific system. Stanford was elected United States Senator in 1884 and in 1890. He founded Leland Stanford, Junior, University (q.v.) at Palo Alto, California, as a memorial to his son.

STANG, stäng, EMIL (1838—). A Norwegian statesman, son of Frederik Stang. He studied law in Christiania and in 1884, two years after his election to the Storthing, was reckoned the leader of the Conservative Party. In 1891 he was forced to retire after two fairly successful years as Prime Minister and became an assessor of the Christiania Supreme Court. He was called upon again in 1893 to form a Ministry, and stayed in office through the confusion of the early part of 1895, when the task of forming a new Cabinet was declined by nearly every leader of the Radical Party. The dispute as to the division of the consular offices between the two parts of the kingdom caused his overthrow. Stang then returned to his former post in the Supreme Court.

STANG, FREDERIK (1808-84). A Norwegian statesman, leader of the Conservative Party and Norway's first Prime Minister. He represented Christiania in the Storthing in 1859-60; in 1861 formed a Ministry; and in 1873 became first Prime Minister under the new Cabinet regulations. He became popular owing to his part in the introduction of railroads and telegraphs and kept office in spite of a large radical majority in the Storthing until 1880, when he voluntarily resigned. Stang was a national authority on jurisprudence and constitutional law, his principal works being *Systematisk fremstilling of Kongeriget Norges konstitutionelle eller grundlovsbestimmte ret* (1833) and *Om den kongelige sanktionsret efter Norges grundlov* (1883).

STANHOPE, stän'op, CHARLES MAHON, third Earl Stanhope (1753-1816). An English statesman and scientist. He was born in London and was educated at Eton and at Geneva. Returning to London, he married the eldest daughter of Lord Chatham (1774), was elected to Parliament (1780), and succeeded to his father's peerage (1786). Sympathizing with the French Revolution, he introduced into the House of Lords a motion against English interference in the affairs of France. As his motion had no support, he was thereafter known as 'the minority of one.' He was caricatured as 'Citizen' Stanhope. He devised several mechanical inventions, of which the most important was an iron hand press, called the Stanhope printing press. He also perfected a process of stereotyping, and constructed two calculating machines. Consult Fletcher, *Earl Stanhope's Opinions* (London, 1819).

STANHOPE, EDWARD (1840-93). An English statesman, second son of the fifth Earl Stanhope, born in London, and educated at Oxford. He was appointed by Lord Salisbury (1886) Secretary of State for the Colonies. In the following December he was transferred to the War Office and introduced nearly all of the important measures for army reform in England and for the reorganization of the War Department. His administration was sustained in Parliament and the Ministry, but did not enjoy popular support.

STANHOPE, Lady HESTER LUCY (1776-1839). The eldest daughter of Charles, third Earl Stanhope. In 1803 she went to reside with her uncle, William Pitt, as superior of his establishment, and became his most trusted confidant and private secretary. Till his death she had full scope for the exercise of her imperious instincts. On the death of Pitt a pension of £1200 a year was assigned her by the King. Conceiving a disgust for society, she left England and wandered for a year or two in the Levant, finally settling among the semi-civilized Druses of Mount Lebanon in a convent, which she fortified, at the village of Djoun. Here she adopted Eastern manners and by the force and fearlessness of her character obtained a curious ascendency among the rude races around her. She was regarded with superstitious reverence as a sort of prophetess, and gradually came so to consider herself. Assuming the garb of a Mohammedan chieftain, she adopted a religion which seems to have been sincere and profound, and was compounded in about equal proportions from the Koran and the Bible. The main sources of information about her are the notes of the frequent travelers, including Lamartine and Kinglake, who visited her in her strange seclusion, and of Dr. Meryon, her occasional medical attendant. Consult: Meryon, *Memoirs of Lady Hester Stanhope* (3

vols., London, 1845); id., *The Seven Years' Travels of Lady Hester Stanhope* (ib., 1846).

STANHOPE, James, Earl (1673-1721). An English soldier born in Paris and educated at Oxford. He took a prominent part in the siege of Barcelona in 1705, and in 1706 was appointed Minister to Spain. In 1708, under Eugene's orders, he captured Port Mahon, and in 1710 saw the final success of his policy of offensive action in the victories of Almenara and Saragossa. But at the close of the year, separated from his allies and surprised by the swift approach of the Bourbon army under Vendôme, after a brief defense he surrendered at Brihuega. Upon his return to England (1712) he entered politics; became Secretary of State for the Southern Department in 1714; and, after being Chancellor of the Exchequer, was again Secretary of State. His foreign policy was vigorous and excellent, especially in the formation of the Quadruple Alliance in 1718.

STANHOPE, Philip Dormer. An English statesman and letter-writer, fourth Earl of Chesterfield (q.v.).

STANHOPE, Philip Henry, Earl (1805-75). An English historian, born at Walmer. To his efforts are largely due the National Portrait Gallery, the Historical Manuscript Commission, and the copyright law. Though not a great historian, as Macaulay said, he was clear, concise, and exhibited "great diligence in examining authorities, great judgment in weighing testimony, and great impartiality in estimating characters." His most important works are: *The War of the Succession in Spain; A History of England from the Peace of Utrecht to the Peace of Versailles, 1713-1783*, in 7 vols.; *The History of England, Comprising the Reign of Queen Anne, Until the Peace of Utrecht* (4th ed. 1872). The two works last named are the most elaborate of his writings, but are perhaps not so valuable as his *Life of the Right Hon. W. Pitt*.

STANIMAKA, stä'nē-mä'kȧ. A town of Eastern Rumelia, 12 miles southeast of Philippopolis (Map: Balkan Peninsula, E 3). It has a trade in wine. Population, in 1893, 13,089.

STAN'ISLAS I. LESZCZYNSKI, lyĕsh-chĭn'y'skē (1677-1766). King of Poland from 1704 to 1709, and again in 1733. He was born at Lemberg, Galicia, of one of the greatest among the old Polish noble families. He was Palatine of Posen at the time of the war between Augustus II. (q.v.) of Saxony and Poland and Charles XII. (q.v.) of Sweden, which cost Augustus the Polish throne, and conducted negotiations between them in such a manner as to win the regard of the Swedish King, who secured the election of Stanislas to the Polish throne in 1704. In 1709, when Charles XII. was crushed by Peter the Great in the battle of Poltava, Augustus recovered Poland. The property of King Stanislas was confiscated and he joined Charles at Bender, in Bessarabia. He was Governor of Zweibrücken, in the Palatinate, from 1714 until the death of Charles XII., when he took up his residence in Alsace. His daughter Maria became the wife of Louis XV. of France in 1725, and this alliance enabled Stanislas to obtain the election to the Polish throne on the death of Augustus II., in 1733. The latter's son, Augustus III., was, however, installed with the support of a Russian army. The War of the Polish Succession ensued, and by the preliminary treaty of Vienna, in 1735, Augustus III. was recognized as King of Poland. Stanislas retained his estates and received the duchies of Lorraine and Bar, which after his death were to fall to France, together with a pension of two million francs. He was also allowed to retain the title and dignity of King of Poland. He maintained a court at Lunéville and Nancy, encouraged letters, established institutions of learning, and earned the title *le bienfaisant*. He left four volumes, *Œuvres du philosophe bienfaisant* (1767).

STANISLAS II. AUGUSTUS (1732-98). The last King of independent Poland (1764-95). He was the son of Count Stanislas Poniatowski (q.v.) and was born at Wolczyn. In 1752 he was elected to the Diet and afterwards was sent as a representative to the Russian Court. There he gained the favor of the future Catharine II., who, after the death of Augustus III. of Poland (1763), successfully exerted her influence to bring about the election of Stanislas to the throne in September, 1764. He lacked the force of character to impose submission on the turbulent nobles, and the anarchic condition of the country during his reign rendered its spoliation by Russia, Austria, and Prussia easy. On the third and final partition of the kingdom, in 1795, he laid down his crown. See Poland.

STANISLAU, stän'ĭs-lou (Pol. *Stanisławów*). A town in the Crownland of Galicia, Austria, on the Bistritza, 75 miles southeast of Lemberg (Map: Austria, J 2). There are railway construction shops, flour mills, dye works, and tanneries. Population, in 1900, 29,628.

STAN'LEY, Arthur Penrhyn (1815-81). An English scholar and divine. He was born at Alderley, of which his father (afterwards Bishop of Norwich) was rector. From 1829 to 1834 he was at Rugby, where he was profoundly impressed by the extraordinary influence of Dr. Arnold, then head master, which molded his whole life. His own position in the school was one of marked power, the impression of which is reproduced in Hughes's *Tom Brown's School Days*, though Hughes and Stanley were not, as is frequently supposed, intimate friends at Rugby. He went up in 1834 to Balliol College, Oxford, where he achieved a brilliant reputation. In 1838 he was elected a fellow of University College, was ordained deacon in 1829, and priest in 1843, and soon acquired a great influence, taking a definite stand in favor of latitude and liberality in religious matters, defending both Ward and Hampden, as in later years he defended Jowett and Colenso. He was made Canon of Canterbury in 1851, regius professor of ecclesiastical history and Canon of Christ Church in 1856, and Dean of Westminster in 1864. Here he assumed a commanding position, and used it, as the recognized leader of the Broad Church party in England, for widening the bounds of the national Church. His preaching was more ethical than doctrinal, and his intercourse with those outside the Church of England, whom he welcomed to the Abbey and even to its pulpit, although it offended many strict churchmen, gained him a wide popularity. He accompanied the Prince of Wales (now King Edward VII.) on his tour through the East in 1862, and was closely

associated with Queen Victoria, whose chaplain he was for many years. In 1863 he married Lady Augusta Bruce, daughter of the Earl of Elgin; her death in 1876 gave him a shock from which he did not recover. He visited the United States in 1878, traveled widely, and made many memorable addresses which were published under the title of *Addresses and Sermons in America.* His most important literary work was his *Life and Correspondence of Dr. Arnold* (1844). Other noteworthy books were his *Sinai and Palestine* (1856); *Lectures on the History of the Eastern Church* (1861); *Lectures on the History of the Jewish Church* (1863-76); *Essays on Church and State* (1870); and *Christian Institutions* (1871). Consult: Prothero, *Life and Correspondence of Dean Stanley* (London, 1893); id., *Letters and Verses of Dean Stanley* (ib., 1895); Bradley, *Recollections of A. P. Stanley* (ib., 1883).

STANLEY, David Sloane (1828-1902). An American soldier, born in Cedar Valley, Ohio. He graduated at West Point in 1852. During 1861 he served in Kansas and Missouri, taking part in several engagements, including the battle of Wilson's Creek, and on September 28, 1861, was appointed brigadier-general of volunteers. In 1862 he commanded a division of the Army of the Mississippi in the operations against New Madrid and Island Number 10, and in the battles of Iuka and Corinth. On November 24, 1862, he became chief of cavalry of the Army of the Cumberland, and on November 29th was promoted major-general of volunteers. He took part in the battle of Stone River, in most of the battles of the Atlanta campaign, in the movement of concentration about Nashville, and in the battle of Franklin, November 30, 1864. A wound received at Franklin terminated his active campaigning in the war. For gallantry in this battle he received the brevet of major-general, U. S. A. After the war he became colonel of the Twenty-second Infantry and was actively engaged in campaigning against the Indians in the Northwest. In 1884 he became a brigadier-general, retiring in 1892.

STANLEY, Edward Henry Smith. An English statesman, fifteenth Earl of Derby (q.v.).

STANLEY, Frederick Arthur, Earl of Derby (1841—). An English statesman, second son of the fourteenth Earl of Derby. He was born in London and was educated at Eton. Elected to Parliament in 1865, he sat in that body as a member for various Conservative constituencies until 1886, and was nominated to several important offices, including Secretary of State for the Colonies (1885-86). In 1886 he was raised to the peerage as Baron Stanley of Preston, and from 1888 to 1893 was Governor-General of Canada. In 1893 he succeeded his brother as sixteenth Earl of Derby. Upon the accession of King Edward VII. Lord Derby was nominated supernumerary aide-de-camp to his Majesty and Lord Lieutenant of Lancashire.

STANLEY, Sir Henry Morton (1841-1904). An African explorer. He was born at Denbigh, Wales, the son of John Rowlands, who died when the boy was two years old. When sixteen years old he worked his way on a sailing vessel to New Orleans, where he found employment in the office of a merchant, named Stanley, who became his friend. For this reason the youth changed his name to that of his benefactor. He enlisted in the Confederate Army and in the battle of Shiloh (1862) was taken prisoner, but managed to escape and soon after returned to his Welsh home. In 1863 he went to New York, enlisted in the Federal Navy, was assigned to the flagship *Ticonderoga,* and soon became secretary to the admiral. For gallantry in swimming 500 yards under fire to fix a line to a Confederate steamer he was made an officer. After the war he left the navy and in 1867 acted as newspaper correspondent in one of the Indian campaigns in the West. In 1868 he was sent by the New York *Herald* to Abyssinia with the British expedition under Sir Robert Napier. In 1869 the *Herald* dispatched Stanley to find David Livingstone (q.v.) in Central Africa. After spending a year in traveling through various countries of the East, Stanley started from Zanzibar February 5, 1871, with about 200 men, and on November 10th met the feeble and almost helpless Livingstone at Ujiji, on Lake Tanganyika (q.v.), nursed him back to better health, and, as he declined to return to Europe, gave him the supplies needed to continue his explorations. After taking part with Livingstone in an exploration of the northern end of Lake Tanganyika, Stanley returned to Europe in 1872, and in 1873 was sent by the *Herald* to West Africa to report the British campaign against the Ashantis.

In 1874 Stanley determined to take up the exploration of Africa where Livingstone had left it. The New York *Herald* and the London *Daily Telegraph* shared the expense of fitting out this expedition. On November 12, 1874, Stanley left Bagamoyo, near Zanzibar, with 356 men in his caravan, including three young white men. Stanley's first great work was a boat survey of the coasts of the Victoria Nyanza (q.v.). He also spent some time with the Waganda on the shores of the Victoria Nyanza. To the west of the Victoria Nyanza Stanley discovered the Muta Nzige (Lake Albert Edward), one of the head reservoirs of the Nile. He found that the Kagera or Alexandra Nile, rising near Lake Tanganyika, was the most important feeder of the Victoria Nyanza. Arriving at Tanganyika (1876), he sought in vain for its outlet, the fact being that the level of the lake was then so low that no water was passing through the Lukuga into the Congo (q.v.). His expedition had been greatly enfeebled by fever and smallpox, but he pushed westward to Nyangwe, on the Lualaba, which Livingstone and Cameron had visited. Stanley determined to make his way down the great river, and in November, 1876, embarked on the perilous journey. He was frequently attacked by cannibals, thousands of whom sometimes pursued him in canoes, and if it had not been for his guns his expedition would undoubtedly have perished. After a voyage of over 1500 miles, in the course of which he twice crossed the equator, he emerged on the Atlantic coast, having lifted the veil that had hitherto hung over the Congo, which was thus shown to be the same river as the Lualaba. On August 9, 1877, the party marched into Boma, on the lower Congo, 999 days after leaving Zanzibar, having traveled over 7000 miles. Besides his three white companions Stanley lost 170 of his porters. In the spring of 1879 Stanley sailed again for Africa

under the auspices of the Africa International Association (q.v.), and began five years of incessant toil, founding his stations from Vivi, on the lower Congo, to Stanley Falls, about 1300 miles up the river, making treaties with 450 native chiefs, carrying all his supplies and steamboats in sections on the heads of men 235 miles around the rapids of the lower Congo, building station houses, and planting gardens. The years 1885 and 1886 were a period of comparative rest for the explorer, who had now been the recipient of honors from learned societies all over the world and was the most distinguished of living explorers.

In 1886 Stanley was placed at the head of an expedition for the relief of Emin Pasha (q.v.), Governor of the Equatorial Province of the Egyptian Sudan. In March, 1887, he reached the mouth of the Congo, ascended it to the Aruwimi, pushed on to the head of navigation on this tributary, and then struck out through the equatorial wilderness in the direction of the Albert Nyanza. The party marched for months through interminable tropical forests, where they had literally to hew their way, and did not reach the Albert Nyanza until December 13, 1887. Out of 389 men only 174 were left, and they were little more than skeletons. In April, 1888, the intrepid Emin Pasha made his appearance on the shores of the lake. Stanley now retraced his steps to the Aruwimi in order to bring up a detachment of men which he had left there. He found but a remnant of them. For the third time he crossed the vast forest, and in January, 1889, he rejoined Emin, with whom he proceeded to the coast. On this journey Stanley made his second crossing of Africa, emerging at Zanzibar after discovering the extent of the great forest, the water connection between Lake Albert Edward and the Albert Nyanza, the snow-capped Ruwenzori mountain chain between the two lakes, and the southwestern prolongation of the Victoria Nyanza. This expedition ended his active career in Africa, of which he had given to the world more information than any other man, excepting Livingstone. Stanley was patient and kind to the natives, and his success in founding the Congo Free State (q.v.) was largely due to the confidence he inspired and the friendships he won by his unfailing tact. At the same time he did not hesitate to fight the Africans with every resource at his command if their hostility threatened the destruction of his expeditions or imperiled his enterprises.

Stanley was married to Dorothy Tennant, the artist, in 1890. In 1892 he became a naturalized citizen of Great Britain, and in July, 1895, he entered the British Parliament for North Lambeth as a Liberal Unionist. In 1899 he received a Knighthood of the Bath. His books, which were published in London and New York, and most of which have been translated into several languages, are: *How I Found Livingstone* (1872); *My Kalulu* (1872); *Coomassie and Magdala* (1874); *Through the Dark Continent* (1878); *The Congo* (1885); *In Darkest Africa* (1890); *My Dark Companions* (1893); *Slavery and the Slave Trade in Africa* (1893); *My Early Travels and Adventures in America and Asia* (1895); and *Through South Africa* (1898).

STANLEY, Thomas (1625-78). An English translator, born at Cumberlow, Hertfordshire, and educated at Cambridge. During the Civil War he traveled on the Continent, returning near its close and taking rooms in the Middle Temple, where he devoted himself to literature. He wrote considerable verse, and translated many classical writers. Long famous were his edition of Æschylus with a Latin translation (1663) and his compilation under the title *History of Philosophy* (4 vols., 1655-62). Consult Stanley's *Poems and Translations,* edited with memoir by S. E. Brydges (London, 1814-15), and his translations of Anacreon, edited by A. H. Bullen (Bohn's Classical Library, ib., 1893).

STAN'NARD, Henrietta Eliza Vaughan (Palmer) (1856—). An English novelist, born at York. She became well known under the pseudonyms John Strange Winter and Violet Whyte. In 1884 she married Arthur Stannard, a civil engineer. Her first great successes were *Sketches of Cavalry Life* (1881), *Bootles' Baby* (1885), and *Houp-la* (1885). Till she threw off the mask of anonymity, these stories were supposed to have been written by an army officer. Among her later novels are: *On March* (1886); *Garrison Gossip* (1887); *A Siege Baby* (1887); *Beautiful Jim* (1888); *A Blameless Woman* (1895); *Heart and Sword* (1898); *The Married Miss Binks* (1900); *A Blaze of Glory* (1902); and *Marty* (1903).

STANOVOI (stä'nô-voi') **MOUNTAINS.** A mountain range of Eastern Siberia. It begins on the Mongolian frontier south of Lake Baikal, where it merges with the **Altai** Range and is known as the Yablonoi Mountains (Map: Asia, O 2). Thence it extends northeast in a large zigzag line 2400 miles, following for a part of its length the shores of the Sea of Okhotsk, and terminating in the East Cape on the Bering Strait. For a long time imperfectly explored, it is now known to be not a true mountain range, but a plateau or height of land forming the water-parting between the Pacific and Arctic Oceans. It reaches its highest altitude, over 8000 feet, in Mount Tehokhondo, or Sokhondo, in the extreme southern part, where it consists of rounded ridges covered with birch and larch forests. Farther north its mean elevation is only 3000 feet.

STAN'TON, Edwin McMasters (1814-69). An eminent American statesman, born at Steubenville, Ohio, December 19, 1814, of Quaker descent. He studied at Kenyon College from 1831 to 1833, later studied law, and was admitted to the bar in 1836. He first practiced in Cadiz, Ohio, and in 1837 became prosecuting attorney of the county. Later he practiced in Steubenville, Ohio, and in Pittsburg, Pa., where he became the leader of the bar, and gained a high reputation, in particular, for his conduct of the case of the State of Pennsylvania vs. the Wheeling Bridge Company. In 1856 he removed to Washington and practiced extensively before the United States Supreme Court. In 1858 he was in California acting as counsel of the United States in certain important land cases. After President Lincoln's election in 1860, on the reorganization of Buchanan's Cabinet, Stanton was appointed Attorney-General to succeed Jeremiah Black. In politics he was originally a Jacksonian Democrat, but later he became a stanch antislavery advocate, and while a member of Buchanan's Cabinet took a firm stand for the Union, declaring that the surrender of Fort Sumter would be a public

the other members of the Cabinet, but in January, 1862, was recalled by Lincoln, and was given the portfolio of Secretary of War, in which office he shared with the President the burden of the vast war operations of the Government. His administration was marked by a course of integrity, comprehensive judgment, determination, and force which won for him the admiration of his countrymen, although at the same time provoking criticism on the part of his opponents.

Shortly after the assassination of President Lincoln, Stanton tendered his resignation, but was induced by President Johnson to remain at the head of the War Department. After the breach between President Johnson and Congress over the various questions growing out of the reconstruction of the Southern States, Stanton took sides against the President and supported Congress. The President called for his resignation on August 5, 1867. Stanton refused to resign, on the ground that his withdrawal would seriously interfere with the execution of the reconstruction acts, to which the President was strongly opposed, and was encouraged by leading men of the Republican Party to hold to the office. On the 12th of August the President suspended him, but Stanton still refused to surrender the office, after which the President removed him in spite of the Tenure of Office Act (q.v.), and designated a Secretary *ad interim*. Again Stanton refused to give up the office and continued to hold it until after the impeachment and acquittal of the President, when he sent in his resignation and turned the office over to his successor. He then resumed the practice of his profession, but his health had been broken by his long and arduous labors. On December 20, 1869, President Grant nominated him an associate justice of the Supreme Court, and he was at once confirmed by the Senate. He died four days after this appointment. The most comprehensive *Life* is that by Gorham (2 vols., Boston, 1899).

STANTON, Elizabeth (Cady) (1815-1902). An American reformer and promoter of the woman's rights movement, born at Johnstown, N. Y. She was educated at Johnstown and at Troy, N. Y., and married Henry B. Stanton (q.v.), the anti-slavery reformer. She became interested in the anti-slavery and other reform movements at an early age, and through acquaintance with Lucretia Mott (q.v.) was led to sign the call for the first woman's rights convention, which was held in Seneca Falls, N. Y., in July, 1848. This convention made the first formal demand for the extension of the suffrage to women, and of the National Woman's Suffrage Association there formed Mrs. Stanton became the first president, retaining that office until 1893. From 1848 she devoted a greater part of her time to traveling from State to State, addressing political conventions, State Legislatures, and educational bodies in behalf of woman's rights. In 1868 she was a candidate for Congress. She was connected editorially with various reform periodicals, was a frequent contributor to magazines, and was joint author of *A History of Woman's Suffrage* (3 vols., 1880-86). *Eighty Years and More*, an autobiography, was published in 1895.

STANTON, Frank Lebby (1857—). An American poet and journalist, born at Charlestown, Stanton was connected editorially with newspapers in Atlanta, and finally became an editor of the Atlanta *Constitution*. He contributed to many magazines, and some of his poems were collected in volumes such as *Songs of the Soil* (1894) and *Comes One With a Song* (1898). Stanton's verse, appearing at random, and mostly in newspapers, has distinct literary merit, in that it presents faithfully the folk-lore and crude poetry of the Southern negro. In this field, though at present less conspicuously (especially in the North), his position is not unlike that of Joel Chandler Harris and Thomas Nelson Page.

STANTON, Henry Brewster (1805-87). An American reformer and journalist, born in Griswold, Conn. In the abolition movement he became prominent and allied himself with the political abolitionists in opposition to the followers of William Lloyd Garrison, who did not believe that anything could be accomplished by political action. In 1840 he married Elizabeth Cady, and proceeded to London, where he was secretary of the World's Anti-Slavery Convention. Later he studied law, and practiced first in Boston, and then in Seneca Falls, N. Y., being elected from the latter place to the State Senate in 1849 and 1851 as a Free-Soil Democrat. He took part in the organization of the Republican Party. In addition to his connection with various anti-slavery papers, he was a member of the staff of the New York *Tribune* for several years, and was an editor of the New York *Sun* from 1868 until his death. He published *Sketches of Reforms and Reformers in Great Britain and Ireland* (1849), and *Random Recollections* (1886).

STANTON, Oscar Fitzalan (1834—). An American naval officer, born at Sag Harbor, N. Y. He graduated at the U. S. Naval Academy in 1855, and after considerable service in Mediterranean and African waters, cruised with the Pacific Squadron from December, 1860, to March, 1862. Promoted to be lieutenant-commander in June, 1862, he commanded the steamer *Tioga* of a squadron operating on the James and Potomac rivers, and from December, 1863, to November, 1864, was with the West Gulf Blockading Squadron in command of the *Panola*. After ordnance duty at the Brooklyn Navy Yard, and some service with the East Gulf Blockading Squadron, he held the command of various vessels and served at the Norfolk Navy Yard, the United States Naval Station, the New London Naval Station, and at the Naval Academy. In 1891 he was made commodore and in 1893 was given the command of the North Atlantic Station with the rank of acting rear admiral. In 1894 he was retired.

STAN'WIX, John (1690-1766). An English soldier. He entered the army in 1706, and in 1756 he came to America as commander of the Sixtieth or Royal Americans, and was put in charge of the southern district with headquarters at Carlisle, Pa. He was sent to Albany in 1758 and erected Fort Stanwix at the Oneida portage. At the time of Wolfe's expedition against Quebec Stanwix commanded in Pennsylvania and restored Fort Duquesne, now Pittsburg. He returned to England in 1760, and was appointed Governor of the Isle of Wight. He was drowned while crossing the Irish Channel.

STAN'YHURST, RICHARD (1547-1618). A translator of Vergil, born in Dublin, Ireland. He was educated at Oxford. He contributed a "Description of Ireland" and a "History of Ireland" (during the reign of Henry VIII.) to Holinshed's *Chronicles* (1577). Two years later he passed over to the Continent never to return. At Leyden he published his translation of the first four books of the *Æneid* into English hexameter verse (1582). The work is curious as an attempt to base English verse on quantity rather than on stress or accent. He thereafter devoted himself to histories and theological treatises in Latin prose. Having become a Roman Catholic, probably not long after he had left England, Stanyhurst was appointed chaplain to Archduke Albert, the Spanish ruler of the Netherlands, and was involved in the intrigues against Elizabeth. He died at Brussels. Consult the reprint of the *Translation of Vergil*, edited, with introduction, by Arber (London, 1895).

STAPFER, stäp'fâr', PAUL (1840—). A French essayist, born in Paris, where he was educated at the Bonaparte Lyceum. He was tutor in the family of Guizot, and afterwards obtained a position in the faculty of Grenoble as a professor of foreign literature. In the same capacity he went to Bordeaux in 1883. Stapfer's essays are remarkable for their clearness of style, perfection of finish, and accuracy of detail. Among his works are: *Petite comédie de la critique littéraire de Molière selon les trois écoles philosophiques* (1866); *Causeries guernesiaises* (1881); *Shakespeare et l'antiquité* (1883); *Gothe et ses deux chefs-d'œuvre classiques* (1881); *Racine et Victor Hugo* (1886); *Rabelais, sa personne, son génie, son œuvre* (1889); *Montaigne* (1894); and *La grande prédication chrétienne en France: Bossuet, Adolphe Monod* (1898).

STAPH'YLOCOC'CUS. See BACTERIA.

STAPH'YLO'MA (Neo-Lat., from Gk. *σταφύλωμα*, defect of the eye within the cornea, from *σταφυλή*, *staphylē*, bunch of grapes, swollen uvula). A term employed to signify a protrusion of one of the coats of the eye, chiefly of the sclera or cornea. Staphyloma of the sclera may be anterior, equatorial, or posterior. *Posterior staphyloma* usually results from choroiditis or is associated with myopia. Ophthalmoscopic examination shows a crescentic white patch at the temporal side of the optic disk. *Anterior* and *equatorial staphyloma*, bulging of the sclera at its anterior or middle portion, are the result of increased intraocular tension, caused by inflammatory processes. If the entire cornea is involved the staphyloma is called *total;* if only a portion protrude, it is spoken of as *partial.*

STAPLE (AS. *stapel, stapol, stapul*, prop, post, OHG. *staffal, staphal*, Ger. *Staffel*, step, from AS. *stapan*, OHG. *stephan, staphōn*, to go, step; ultimately connected with Eng. *stand*). In England, a town officially designated by the Government as a market for sale and exportation. All towns were not staple towns. They were originally for the convenience of the tax collector, but their inhabitants appreciated the monopoly and jealously guarded their privileges.

STAPLES, stā'p'lz, WILLIAM READ (1798-1868). An American jurist and historian, born in Providence, R. I. He graduated at Brown University in 1817, studied law, and in 1819 was admitted to the bar. He rose rapidly in his profession, was an associate justice of the Supreme Court of Rhode Island from 1835 to 1854, and from 1854 to 1856 was Chief Justice. He was an authority on Rhode Island history and published *Annals of Providence to 1832* (1843); *Documentary History of the Destruction of the "Gaspé"* (1845); *Proceedings of the First General Assembly for the Incorporation of Providence Plantations in 1647* (1847); and *Rhode Island Form-Book* (1859). He edited vol. ii. of the Rhode Island Historical Society's *Collections*, and Samuel Gorton's *Simplicities' Defense Against Seven-Headed Policy* (1835).

STAPPEN, *Fr. pron.* stä'pän', CHARLES PIERRE VAN DER (1843—). A Belgian sculptor, born at Saint Josseten-Noode, near Brussels. He began his artistic training in 1860, under the painter Portaels, but afterwards formed an independent style in Paris under the influence of Rude, Mercié, and Carpeaux. His first successful production, the bluntly naturalistic "Faun's Toilet" (1869, gold medal, Brussels), brought him the election to the Brussels Academy. It was followed by "The Sorceress" (1872) and the "Man with the Sword" (1876, Brussels Museum). A sojourn of several years in Italy, during which he studied Donatello and Michelangelo, resulted in maturer works, of which a youthful "David" (Munich Academy) is the most remarkable. Upon his return to Brussels, in 1883, he was appointed professor at the Academy, and thereafter produced in rapid succession the allegorical group of "Instruction in Art" (Palais des Beaux-Arts), "Saint Michael Overcoming Satan" (Staircase, Hôtel de Ville), and the statue of "William the Silent" (Place du Petit Sablon). Gradually developing an individual style of his own, which combines severe and lofty conception with a wholly untrammeled naturalistic treatment, he aimed especially at a vigorous dramatic expression. His most noteworthy creations of this kind include "The Wrestlers," "The City Builders," and the "Chimera Fountain" (Parc du Cinquantenaire, Brussels). He also fashioned numerous portrait busts of great vivacity, genre figures, allegorical and realistic reliefs, designs for épergnes, candelabra, and various other objects of industrial art, and contributed actively to the revival of the chryselephantine statuary of Greek antiquity, recently inaugurated in Belgium. In 1898 he was appointed director of the Brussels Academy.

STAR (AS. *steorra*, OHG. *sterro, sterno*, Ger. *Stern*, Goth. *staírnō*, star, connected with Lat. *stella*, Gk. *ἀστήρ, astēr*, Corn., Bret. *steren*, Arm. *astł*, Skt. *tāra*, star, Av. *star∂*, star, and possibly with Skt. *star*, to strew). One of those heavenly bodies which remain *apparently* immovable with respect to one another. Hence they were early called *fixed* stars, a name which they still retain, although their perfect fixity has been completely disproved in numerous cases, and is no longer believed in regard to any. Twinkling or scintillation is another mark which distinguishes stars from planets. The first thing that strikes the observer is the apparent daily motions of the stars. The greater part appear to rise in the east, describe smaller or greater arcs in the heavens, and set in the west; while others describe complete circles around the pole of the heavens. These apparent motions arise

from the rotation of the earth on its axis. (See EARTH.) With few exceptions the distance of the fixed stars is still unknown, and must in all cases be enormously great. Since the time of Bradley many attempts have been made to measure what is called the annual parallax (q.v.) of the stars, and thus determine their distances. When we consider that the motion of the earth round the sun alters our position in space a whole diameter of its orbit (185,000,000 miles) in six months, we should expect a change in the relative positions of certain stars as seen from two opposite points of the orbit. But no such change is seen to take place, and this was one of the early objections to the theory of Copernicus (q.v.). The only answer that the Copernicans could give was that the distance of the stars from us is so great that the diameter of the earth's orbit shrinks into insignificance when compared with it. The detection of the parallax of the fixed stars depended upon the perfection of instruments. The parallax of a star is the minute angle contained by two lines drawn from it, the one to the sun, the other to the earth. If that angle amounted to a second the distance of the star would be at least 206,000 times that of the sun; and when the measurement of angles came to be reliable to a second and still no parallax was discernible astronomers could say that the distance of the nearest stars must be more than 206,000 times that of the sun, i.e. 206,000 times 93,000,000 miles.

The method now in use for measuring stellar parallaxes was first applied successfully by Bessel (q.v.) in 1838. He employed in his observations a remarkably fine heliometer (q.v.) and adopted what is called the differential method. Having selected a star which he suspected might be near us, and therefore have a parallax large enough to measure, he proceeded to determine every clear night its position in the sky relatively to two neighboring very small stars. Such relative (differential) determinations of positions can be made with far greater accuracy than measures with the meridian circle (q.v.); and Bessel judged rightly that the two minute comparison stars were really so immeasurably far away that they would themselves suffer no appreciable parallactic displacement. Sure enough, he found his 'parallax star,' 61 Cygni, slowly describing day after day a tiny oval curve in the sky, reproducing there the earth's orbit in space. But the comparison stars did not move. The proof was complete that 61 Cygni had an apparent motion due to the real motion of our earth, and that it was *measurable*. This observation of Bessel's is one of the most famous in the annals of astronomy.

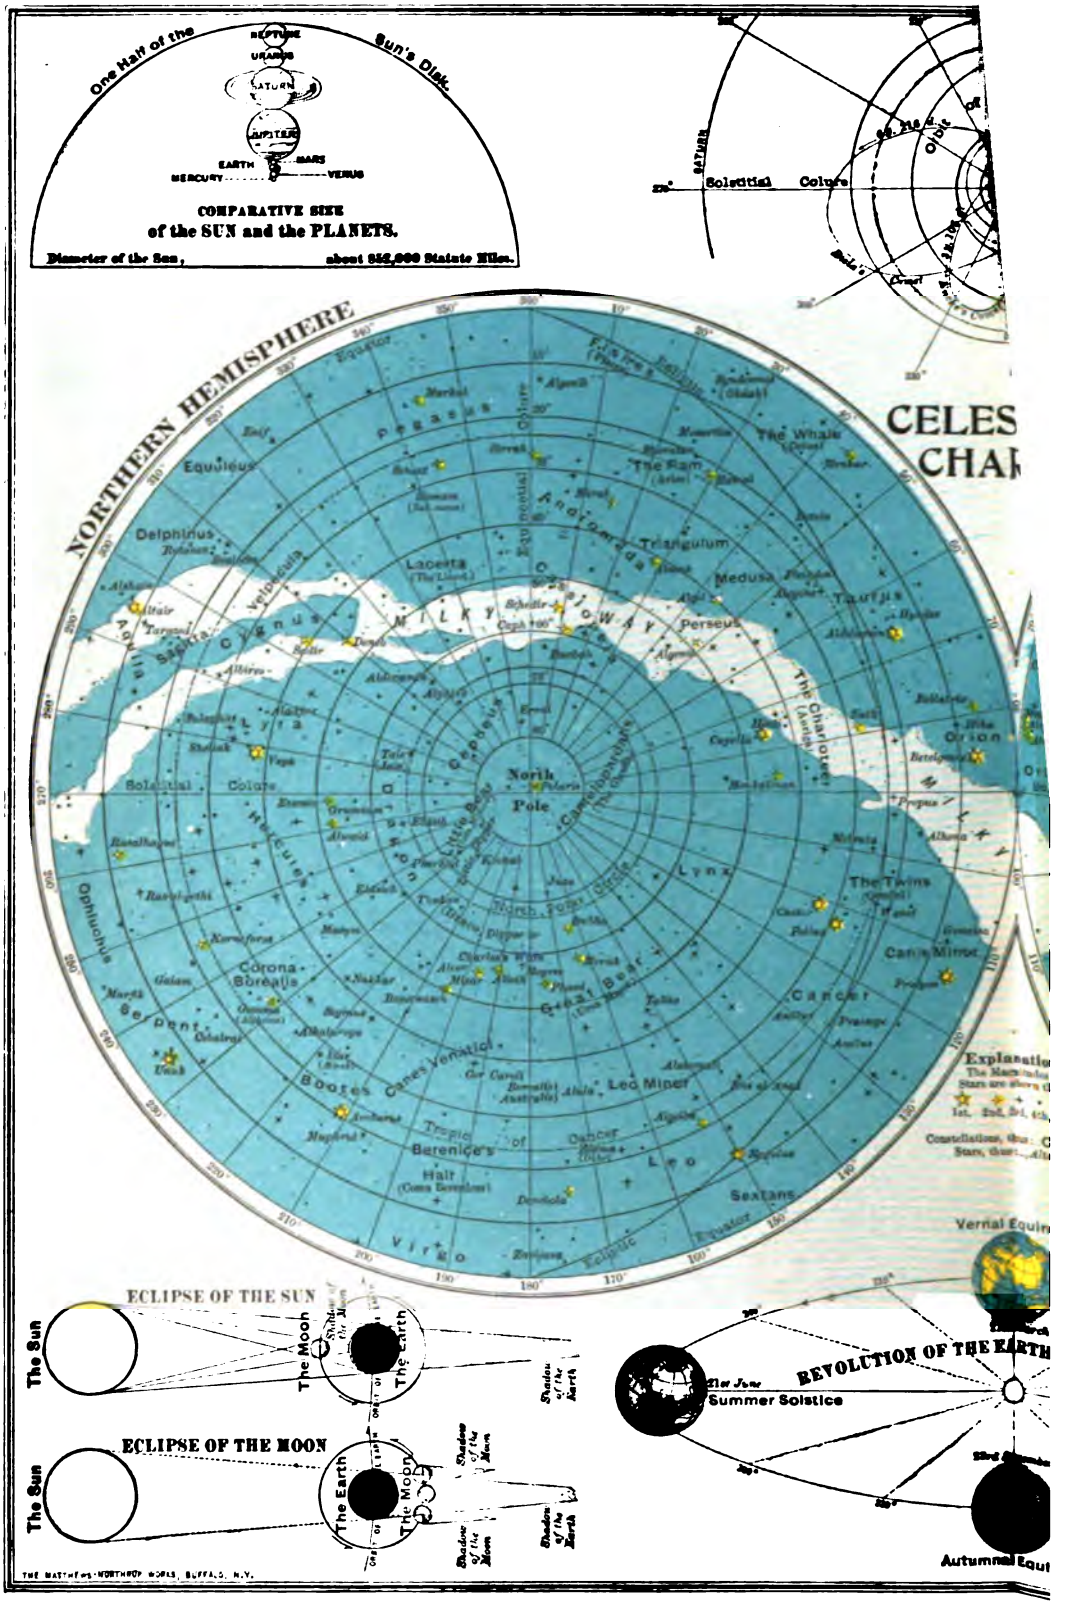
When other astronomers had succeeded in repeating Bessel's observations, and quite a number of stars came to have known parallaxes, their distances were found to be too great to be expressed conveniently in miles, or any other linear unit. Therefore astronomers invented a new unit, the 'light-year,' being a distance equal to the space traversed by light in one year. As light moves about 180,000 miles per second, it will be seen that the light-year is a unit of stupendous magnitude, and will be fitted to measure the profound distances of stellar space. A few of the larger stellar parallaxes at present known are as follows:

STAR	Magnitude	Parallax	Distance in light-years
Centauri α	1	0″.75	4.4
Lalande 21,185	6.9	0 .50	6.5
61 Cygni	5.1	0 .40	8.1
Sirius	1	0 .39	8.4

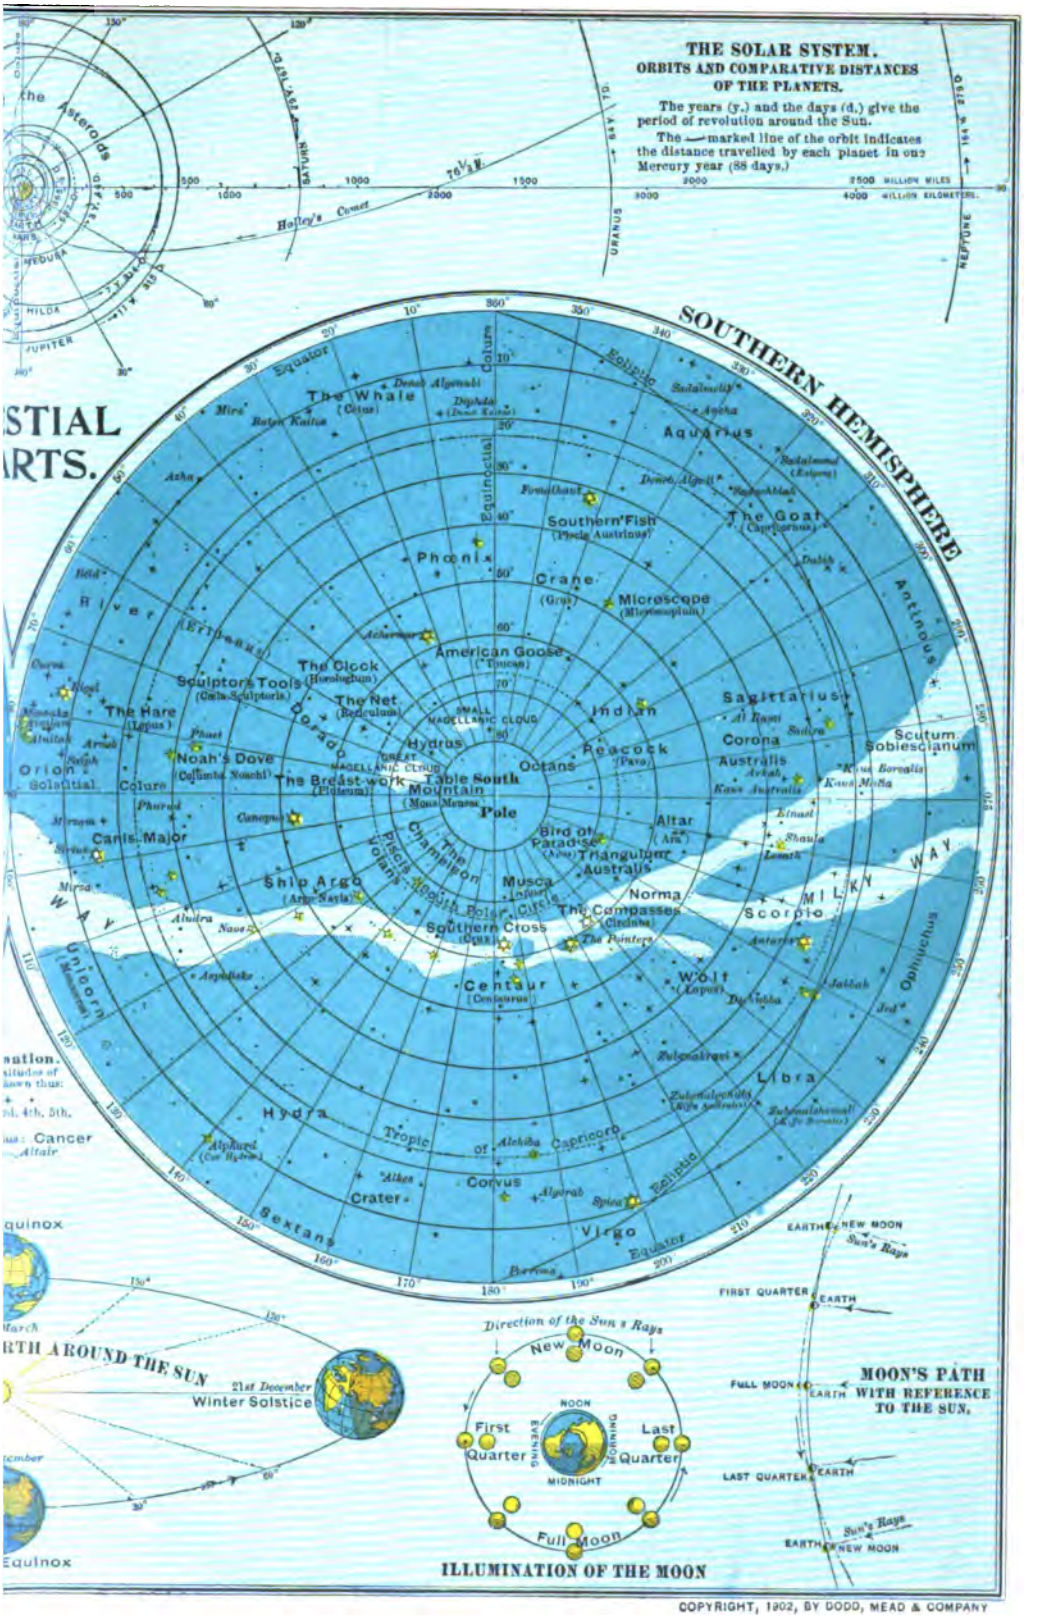
In this table the second column gives the 'magnitude' of the stars. The third column gives the parallax, or angle subtended by the earth's orbit-radius at the star. The corresponding distance in light-years is in the last column. Thus we do not see the stars as they are to-day, but as they appeared so many years ago.

The principal constellations north of the Zodiac (q.v.) are:

Ursa Major.	Boötes.
Ursa Minor.	Corona Borealis.
Draco.	Hercules.
Cepheus.	Lyra.
Cassiopeia.	Cygnus.
Camelopardus.	Vulpecula.
Andromeda.	Aquila.
Perseus.	Antinoüs.
Auriga.	Delphinus.
Leo Minor.	Pegasus.
Canes Venatici.	Ophiuchus.
Coma Berenices.	



The principal constellations south of the Zodiac are:



Cetus.	Canis Minor.
Orion.	Crux.
Lepus.	Argo-Navis.
Centaurus.	Hydra.
Lupus.	Crater.
Monoceros.	Corvus.
Canis Major.	Eridanus.

For the constellations of the Zodiac, see ZODIAC. The several stars belonging to the same constellation are usually distinguished from one another by Greek letters, beginning the alphabet with the brightest; and when these are not sufficient by Roman letters and by numbers. Many of the most brilliant stars have special names. They are also divided according to their brightness into stars of the first, second, third, etc. magnitudes, a division which is necessarily somewhat arbitrary. The smallest stars discernible by the unaided eye are usually called stars of the fifth magnitude; but an unusually sharp eye can discern those of the sixth and even seventh magnitude. All below are telescopic stars, which are divided down to the twentieth magnitude. The quantity of light given by a star of any magnitude is taken as 2.512 times as great as the quantity given by a star one magnitude fainter. This number is called the 'light-ratio,' and it is so chosen that a diminution of five magnitudes corresponds to a division of stellar light by just 100 ($2.512 = \sqrt[5]{100}$). In other words, 100 average stars of the sixth magnitude should give as much light as one of the first.

But the whole matter of stellar photometry is subject to some uncertainty. According to the *Harvard Photometry* the following are the brightest stars in the order of lucidity: Sirius, Canopus*, Arcturus, Capella, Vega, α Centauri*, Rigel, Procyon, Eridani*, β Centauri*, α Orionis, Altair, Aldebaran, α Crucis*, Antares, Pollux, Spica, α Piscis Austria*, Regulus. Those marked with an asterisk are not visible in our northern latitudes. No real magnitude in the proper sense of the word has yet been observed in any star. In the best and most powerfully magnifying telescopes, even the brightest stars of the first mag-

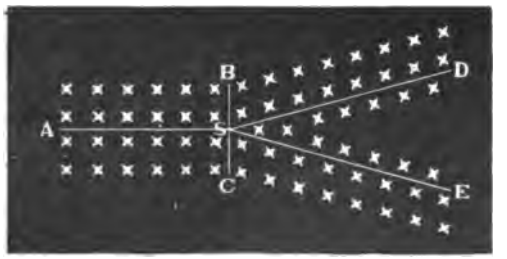
nitude appear, not with small disks as all the planets do, but as luminous points without any visible diameter, and always the smaller the better the telescope. We are, therefore, totally ignorant of the real size of the fixed stars; nor could it be determined though we were sure of their distances, for the apparent diameter is an essential element in the calculation. We cannot, then, say whether the greater brilliancy of one star, when compared with another, arises from its greater nearness, its greater size, or the greater intensity of its light. But it is certain that the fixed stars are self-luminous. The number of the stars is beyond determination. Those visible to the unaided eye in the Northern Hemisphere amount only to about 3000. Stars of the first magnitude visible north of 35° south declination are reckoned by Heis at 14, of the second at 48, of the third at 152, of the fourth at 313, of the fifth at 854, and of the sixth at 2010. But in the following classes the numbers increase rapidly, so that it is impossible to say how many there are. Recent photographic observations seem to indicate that if the exposure of the sensitive plate in the telescope was continued long enough the entire plate would be light-struck. If this be so we must conclude that the entire heavens would be found covered with stars if we were able to see the faintest ones in existence.

That the fixed stars are not really immovable, as their name would imply, is seen in the phenomenon of *double* or *multiple* stars, which are systems of two or more stars that revolve about one another, or rather about their common centre of gravity. As they can be seen separate only by means of a telescope, and in most cases require a very powerful one, their discovery was possible only after the telescope was invented. Galileo himself discovered their existence and proposed to make use of them in determining the yearly parallax of the fixed stars. After a long lapse of time, Bradley, Maskelyne, and Mayer again directed attention to the phenomena of double stars, but nothing important was made out respecting them until the elder Herschel made them the subject of a protracted series of observations, which led to the most remarkable conclusions as to their nature. At present over 10,000 stars are known to be double; and in many cases more than one companion accompanies the principal star. The apparent angular distance between two stars must be less than about thirty seconds in order that they may be counted a double. The theory of probabilities renders it almost certain that this vast number of double stars could not exist unless there were some real physical connection between the component numbers of a double. Still, there is always a possibility of duplicity being merely apparent, the two stars lying nearly in the same direction in space, but at widely different distances from the earth. Such apparent doubles are called *optical* doubles, and those in which a real physical connection has been demonstrated by observed gravitational rotation of the component members are called *binary stars*. Of these only about 250 are known. In some cases one of the components of a double star is much larger than the other, as in the star Rigel, in Orion, and in the polar star; but very often the connected stars are nearly equal in luminous power. The two members of double stars are mostly of one color when the two components are nearly equal; but a difference of color is often observed when the components are widely different in size. In many of these cases the one color is the complement of the other. It was Sir W. Herschel who first advanced the view, which has been confirmed since, that double stars are connected systems of two or more stellar bodies revolving in regular orbits around one another, or rather round their common centre of gravity. Their motions are found to follow the same laws as prevail in the solar system, and the orbits are elliptical. These distant bodies are therefore subject to the Newtonian law of gravitation. The period of revolution has, in many cases, been computed; the shortest is estimated at 5½ years; others are set down at hundreds. In cases where the parallax is known the size of the orbits can be determined, and thus the astronomer is able to assert in regard to the double star α Centauri that the orbit described by the two components about each other is 24 times as large as that of our earth around the sun. Even the masses of these stars have been calculated as being together 2, that of our sun being 1. It is a consequence of these revolutions that some stars are now seen double that formerly seemed single, and vice versa. If the plane of revolution has its edge presented to the earth the stars will seem to move in a straight line, and at times to cover one another. In addition to these double stars that can be seen to revolve and change their relative positions there are others of which the components are so close together that even our most powerful telescopes fail to separate them. These doubles are known to exist from peculiarities in their spectra. They show a doubling of the spectral lines that must be caused by a duplicity in the source of light, and where this doubling is shown to occur periodically we must conclude that the two sources of light are revolving in some way or other.



The proper motion of stars is of another kind. It consists in a displacement in various directions of the individual stars, so that the configuration of constellations is slowly changing. The annual proper motions yet observed vary from nothing to 8.7″. The proper motion of the binary star 61 Cygni amounts to 5.2″, so that in 360 years it would pass over a space equal to the moon's diameter. It must thus take thousands of years to alter sensibly the aspect of the heavens; although, taking into account the enormous distances, the actual velocities must be great. But the observed proper motions of the stars do not give us very accurate information as to their real motions and velocities. In the first place, it is only the *angular* change of the star's position that we observe; and we cannot tell the corresponding linear shift unless we know the distance of the star from the earth. And even where this distance (parallax) is known we can obtain only the transverse motion, as projected on the sky. There may be also a component of motion directly toward us or away from us. This *radial* component remained entirely unknown until recently, when it became possible to measure it with the spectroscope.

It was first observed by Sir W. Herschel that there is a perceptible tendency in the proper motions, as observed, to make the stars generally diverge or open up in one quarter of the heavens, and draw together in the opposite quarter; and

with his planets in the direction of the former point. The apparent motion thus caused is complicated with the real independent motions of individual stars. The point toward which the motion is directed, which is called the 'solar apex,' was fixed by Herschel in the constellation Hercules; and the result of subsequent and independent researches gives a nearly coincident point. The velocity has been calculated at about 11 miles per second, a figure still very uncertain.

Coming now from a consideration of stellar motions and velocities to their physical characteristics, we must again have recourse to information derived from a study of star spectra. Fraunhofer was the first to study them, and his researches have been followed by Rutherford, Huggins, Secchi, Vogel, Pickering, and others. It has thus been possible to identify in the stars many of the terrestrial chemical elements. Many stars exhibit well-marked periodic alterations of magnitude, and are hence called *variable* stars. A considerable number have been observed, of which perhaps the most remarkable are Mira (the wonderful) in Cetus, and Algol in Perseus. The first attains its greatest lustre every 334 days, and sometimes appears for 14 days as a star of the second magnitude; it then decreases for two or three months, till it becomes of the sixth and even tenth magnitude, so as to be for half a year invisible to the naked eye. After this it begins to increase, but more rapidly than it decreased. It is visible to the naked eye for three or four months of its period. Of all the variable stars yet observed Algol has the shortest period, being 2 days 20 hours 48 minutes 55.4 seconds. It appears for about 60 hours a star of the second magnitude, then decreases for four hours, and appears for a quarter of an hour of the fourth magnitude, after which it increases again for four hours. Various explanations have been offered of these mysterious appearances; that generally accepted postulates a large dark body revolving about the luminous one, so as to intercept more or less of its light in different positions and making of Algol-type variables simple eclipse phenomena.

Allied to the variable stars are the *new* or *temporary* stars that appear suddenly in great splendor, and then disappear without leaving a trace. Fourteen instances are on record. It is not improbable that these also may be periodic.

STAR SYSTEM.

STAR SYSTEMS. From the appearances connected with the Milky Way or Galaxy (q.v.), Sir W. Herschel came to the conclusion that the stars forming our firmament do not extend indefinitely into space, but are limited in all directions. conceived the shape to be something like that of a huge millstone, having one side cleft, and the two luminæ set apart at a small angle. Let the diagram represent a vertical section of such a broad flat stratum, suppose the solar system situated as at S to a spectator looking on either side, in the direction of the thickness, as SB, the stars would appear comparatively sparse, but all round in the direction of the breadth (as SA) there would appear a dense ring, which would separate into two branches (SE, SD) in the direction of the cleft side. This supposition accounts for the appearance of the Milky Way, and subsequent observations have tended to confirm the conjecture.

(Oxford, 1890); Newcomb, *The Stars* (New York, 1901); on the constellations, consult Walentiner, *Sternbilder* (Breslau, 1901).

STAR. A frequent charge in heraldry (q.v.). See ESTOILE.

STAR AND GARTER. A former London Tavern on Pall Mall, the meeting place of the Literary Club.

STAR ANISE. See ILLICIUM.

STAR APPLE (*Chrysophyllum Cainito*). A West Indian tree about 20 or 30 feet high, introduced in other warm countries, beyond which it is not hardy. It is named from the star-like cross-section of its large white or rose-colored, green, and yellow fruits, with an agreeably flavored soft, sweet pulp. The tree is very beautiful in foliage.

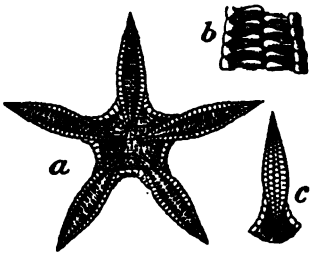
STARAYA LADOGA, stä'rȧ-yȧ lä'dô-gȧ. A small village in the Government of Saint Petersburg, Russia, on the Volkzhov, a few miles south of Lake Ladoga. It is one of the oldest Russian settlements and has considerable historic interest.

STARAYA RUSSA, rụs'sȧ. An ancient town and noted health resort in the Government of Novgorod, Russia, 181 miles south-southeast of Saint Petersburg (Map: Russia, D 3). It is well built, and has a number of fine parks. The saline springs are used both for drinking and bathing. Population, in 1897, 15,234.

STARBOARD. A naval term to denote the right side of a vessel to an observer looking forward. See HELM.

STARCH (assibilated form of *stark*, stiff, strong, AS. *stearc*, OHG. *starc*, Ger. *stark*, strong, stiff, Goth. *ga-staúrknan*, to dry up; connected with Lith. *stregti*, to become rigid, Pers. *suturg*, strong). A form of carbohydrate (see CARBOHYDRATES), occurring as stored food in many plants. Its composition corresponds to the empirical formula $C_6H_{10}O_5$, but its molecular formula, and, of course, its constitution, are as yet unknown. The number of atoms in its molecule is probably very large. Starch is formed as a condensation product from sugar by the action of certain specialized portions of the protoplasm of plant cells. The typical starch-formers are leucoplasts (q.v.), which occur in all cells where starch is permanently stored. But the chloroplasts of the leaves may form starch when the green cells become overloaded with sugar. Thus

leaves are often found to contain large quantities of starch, especially at the end of a long period of bright illumination. The sugar formed by the process of photosynthesis (q.v.) is constantly diffusing away into other parts of the plant, but during periods of bright light it is formed more rapidly than it can diffuse, and it is then condensed by the chloroplasts to form starch. During periods of darkness or of weak illumination, when the photosynthetic process ceases or lags, the starch of leaves is reconverted into sugar by the enzyme diastase (q.v.), and then diffuses to other regions of the plant. Thus leaves seldom contain starch in the morning or on cloudy days. But by far the greater part of the starch found in any plant is organized into grains by leucoplasts. By the action of these bodies, sugar which comes from the green leaves is condensed or polymerized into starch. Starch is thus formed in all parts of plants, being especially plentiful in tubers, in thickened roots, and in the endosperm and embryo of seeds.



STAR CHAMBER. A celebrated English tribunal, which met in the council-chamber of the old palace of Westminster. The origin of the name is unknown. According to Sir Thomas Smith it was derived from a decoration of gilded stars on the ceiling. This theory is unsupported by evidence, but it is now well established that since the middle of Edward III.'s reign the star chamber (Camera Stellata) was the usual meeting place of the King's Council, or Privy Council, as it was afterwards known. The history of the Star Chamber Court is particularly associated with the act of 3 Henry VII., c. 1. By this statute the "chancellor and treasurer of England for the time being and keeper of the King's privy seal, or two of them, calling to them a bishop and a temporal lord of the King's most honorable Council and the two chief justices of the King's Bench and Common Pleas for the time being, or other two justices in their absence," are given jurisdiction in seven offenses: Unlawful maintenance; giving of liveries, signs, or tokens; retainers by indentures, oaths, writings, or otherwise; embraceries of the King's subjects; untrue demeanings of sheriffs in the making of panels, and other untrue returns; taking of money by juries; and great riots and unlawful assemblies. Since the days of Elizabeth it has been very commonly held that the historical Star Chamber was created by this act; and that its proper jurisdiction was restricted to the offenses just enumerated. Recent research has shown that such was not the case. The Star Chamber possessed the entire jurisdiction of the King's Council. During the reigns of Henry VII. and Henry VIII. neither the membership nor the jurisdiction of the court conformed to the statute of 3 Henry VII., c. 1, as usually interpreted. Moreover, the King's Council is seen performing the same functions as the court, whether sitting in the Camera Stellata or elsewhere; and, conversely, the powers of the Star Chamber appear to be equivalent, even in State matters, to those of the Council itself. The Star Chamber, in fact, claimed its vast jurisdiction on the ground that it was the King's Council. As a criminal court, it could inflict any punishment short of death, and had cognizance of all cases that might be brought under the head of contempt of the royal authority. Jurors were there punished for verdicts against the Crown. Offenders against the royal proclamations or the religious laws were there condemned. The form of proceeding was by written information and interrogatories, except when the accused person confessed, in which case the information and proceedings were oral; and out of this exception grew one of the most flagrant abuses of this tribunal in the later period of its history. Regardless of the existing rule, that the confession must be free and unconstrained, pressure of every kind, including torture, was used to procure acknowledgments of guilt; admissions of the most immaterial facts were construed into confessions; and fine, imprisonment, and mutilation were inflicted on a mere oral proceeding, without hearing the accused, by a court consisting of the immediate representatives of prerogative. The proceedings of the Star Chamber had always been viewed with distrust by the commons; but during the reign of Charles I. its excesses reached a height that made it absolutely odious to the country at large; and in the last Parliament of that sovereign a bill was carried in both Houses (16 Car. I., c. 10) which decreed its abolition. See especially Burn, *The Star Chamber* (London, 1870).

STARE DECISIS, stā'rē dē-sī'sĭs (from the Latin *Stare decisis, et non quieta movere*—"to stand by decisions and not to disturb matters once settled"). A phrase employed to describe a doctrine prevailing in most judicial systems of modern times, which, briefly expressed, is that the courts will follow the principles of law declared in former decisions where they are not contrary to the ordinary principles of justice. The theory on which this doctrine was established is that when a point of law is once decided it will be followed by the public as a guide. The doctrine of *stare decisis* does not apply to a decision until the time for appeal has elapsed; and a superior court may at any time overrule or repudiate the principles of a case previously decided in an inferior court and never appealed. Under such circumstances the original case erroneously decided would not be affected, and would remain *res judicata* between the parties thereto, but would no longer be cited as an authority. Courts of equal jurisdiction in the same State are not bound by each other's decisions, and one United States circuit court is not bound by the decisions of another. The United States courts will usually follow the decisions of the courts of the various States where an interpretation or application of their laws is involved. The courts of one State are not bound by the decisions of the courts of another, nor by those of a foreign country.

The courts are especially averse to disturbing the principles of law involving titles to and interests in real estate. The policy seems to be not to do so where it is only a question of expediency, and to do so with caution where the principles of a decision are erroneous and will tend to work injustice in the future. Consult: Wells, *The Doctrines of Res Adjudicata and Stare Decisis* (Des Moines).

STARFISH. Echinoderms with a star-like or pentagonal body, with two or four rows of ambulacral feet or tentacles on the oral side. The body is covered with small, short spines, often arranged in groups. The nervous system is pentagonal, with nerves extending into the

arms. Most of the species are bisexual; the young usually pass through a metamorphosis, the starfish budding out from the water-vascular system of the pluteus, bipinnaria, or brachiolaria form, which previously passes through a

A PALEOZOIC STARFISH.

a, Ventral aspect of *Aspidosoma petaloides* (Lower Devonian); *b*, ambulacral surface of an arm, in detail; *c*, dorsal plates of an arm.

morula, gastrula, and cephalula stage. Starfishes are covered with scattered pedicellariæ, pincer-like spines consisting of two prongs. Sense organs (sphæridia) are also present. Starfish have the sense of smell, which is supposed to be localized in the suckers at the back of the eye-plate.

Starfish crawl or glide by means of from two to four rows of slender tubular processes or 'feet,' with a sucker at the end. These ambulacral feet are thrust out, fastened to the bottom, and by means of them the body is warped or pulled along over mussel or oyster beds, rocks, or weeds, the arms being capable of slightly bending. At the end of each arm is the red eye, terminating the radial nerve. Starfish are very destructive to oysters, clams, mussels, barnacles, snails, worms, and small crustacea. To devour an oyster or clam the starfish grasps both valves of the shell, and by persistently exerting a constant steady strain, finally fatigues the adductor muscles closing the valves so that they slightly gap open. Then the stomach is protruded between the shells or valves and the soft body of the mollusk is digested. The injury to the oyster beds of Rhode Island caused by starfish in one year was estimated at $100,000. See ECHINODERMATA (and Plate); OYSTER.

Fossil starfish are found first in the Ordovician rocks, and they occur sparingly in later formations, with some increase in the Devonian and Carboniferous, but they are never of geological importance. Some Mesozoic sandstone formations of Middle Europe have furnished abundant casts, and they are found also in a few Tertiary localities. The Paleozoic species are grouped in the subclass Encrinasteriæ, in which the ambulacral ossicles alternate with each other along the middle line of the ambulacra; while the Mesozoic and Tertiary species, and also the recent, are included in the Euasteriæ, which have the ambulacral ossicles opposite each other.

Consult: Romanes, *Jellyfish, Starfish, and Sea Urchins* (New York, 1885); Mead, *29th Report Rhode Island Commissioners of Inland Fisheries* (Providence, 1899).

STARGARD, stär'gärt. A town in the Province of Pomerania, Prussia, situated on the navigable Ihna, 22 miles east-southeast of Stettin (Map: Prussia, F 2). It is the most important town in the eastern part of the province. The Marienkirche and town hall are noteworthy. The town manufactures railway supplies and other machinery, has foundries, and is a woolen and cotton market. It belonged to the Hanseatic League and was strongly fortified. Population, in 1900, 26,858.

STAR GRASS. A popular name for several grass-like plants whose flowers or other parts resemble stars in outline. Among them are species of Hypoxis, Chelone, Callitriche, Aletris, and Rhinchospora. See Colored Plate of AMARYLLIDACEÆ.

STARHEMBERG, stä'rem-bĕrk, ERNST RÜDIGER, Graf (1638-1701). An Austrian general, born at Gratz and educated for the army by Montecuccoli. He took part in the last campaigns of the Thirty Years' War, was present at Saint Gotthard in 1664, and gained especial glory by his brave defense of the city of Vienna for nine weeks in 1683, against the Turkish army. The Emperor Leopold made him a field-marshal and a Minister of State. Three years afterwards he was wounded at Bude and forced to retire from active service. He settled in Vienna and became president of the Council of War. Consult Thurheim, *Feldmarschall Ernst Rüdiger, Graf Starhemberg* (Weimar, 1882).

STARK, JOHN (1728-1822). An American soldier, born at Londonderry, N. H. In early life he worked on his father's farm. During the French and Indian War he served with Rogers' Rangers first as a lieutenant, and later as a captain. Reporting at Cambridge early in 1775, he was commissioned colonel, and, with a regiment raised in one day by himself, took part in the battle of Bunker Hill. Later he served in the Canada expedition and then under Washington in New Jersey, distinguishing himself at Trenton and Princeton; but, resenting the promotion over himself of a number of officers, he resigned in April, 1777, and returned to his home. On the approach of Burgoyne, he accepted an independent command from New Hampshire, and defeated a force of Hessians in the battle of Bennington (q.v.), August 16, 1777. For this he was made a brigadier-general, and was formally thanked by Congress. With a force of New Hampshire recruits he took an active part in the Saratoga campaign, and in 1778 and again in 1781 he commanded the Northern Department. Consult his biography by Edward Everett in Sparks's *American Biography*, and his *Life and Official Correspondence* by Caleb Stark, his grandson.

STARLING (diminutive of *stare*, AS. *stær*, OHG. *stara*, Ger. *Star*, *Staar*, *Stahr*, starling; connected with Lat. *sturnus*, starling). A European bird (*Sturnus vulgaris*) of the family Sturnidæ, famous for its song and powers of mimicry. It is rather smaller than the American meadowlark, its nearest analogue in the New World, and is brown finely glossed with black, with a pale tip to each feather. It has been introduced into America and seems to have become established in and around New York City.

The starling family is a large one, containing about 200 species, mostly living in the tropics of Africa and Asia. They fall between the Corvidæ and Icteridæ, and are divisible into two sections: one containing the more typical terrestrial starlings, the oxpeckers, the pastors, the mynas, pied

starlings (Sturnopastor), and wattled starlings (Dilophus). In the second group, often regarded as a separate family (Eulabetidæ), distinguished by the absence of rictal bristles and by the fact that they lay spotted eggs, whereas the 'true' starlings lay blue unspotted eggs, are the African glossy starlings (Lamprotornis), with richly colored plumage, and the grakles or hill-mynas. Consult writers upon African and East Indian ornithology, summarized in Lydekker, *Standard Natural History* (London, 1895). See Plate of LARKS AND STARLINGS.

STARNBERGER (stärn'bĕr-gĕr) **LAKE.** A lake south of Starnberg, in Southern Bavaria. Its length from south to north is about 18 miles; its altitude nearly 2000 feet. The Würm flows through the lake. The shores are picturesque and covered by lordly villas affording splendid views.

STARNINA, stär-nē'nȧ, GHERARDO (c.1354-c.1410). A Tuscan painter, born at Florence. After painting the histories of Saint Nicholas and Saint Anthony on the ceiling of the Castellani Chapel in Santa Croce, he was involved in the Ciompi intrigues and fled in 1384 to Spain. There he enjoyed royal favor, which enabled him to return to Florence in 1387. Frescoes in Santo Maria del Carmine have been attributed to this period—scenes from the life of Saint Jerome, of which only the "Death" remains. Starnina was commissioned to paint a Saint Denis on the façade of the Guelph palace at Pisa, the city having surrendered on the day of that saint. The last work of the artist is to be seen in the right choir chapel of the Duomo at Prato—the "Birth of the Virgin," the "Presentation of the Virgin," and the "Preaching of Saint Stephen." This series was finished by his pupil Antonio Vite, by whom and by his more famous pupils, Antonio da Pistoia, Masolino, and Masaccio, he is chiefly remembered.

STAR-NOSED MOLE. See MOLE.

STAR OF BETHLEHEM (so called from its star-shaped flowers, which are white within), *Ornithogalum*. A genus of about seventy species of bulbous-rooted plants of the natural order Liliaceæ. The species are natives almost exclusively of the Eastern Hemisphere. Only a few species are grown in flower gardens. The common star of Bethlehem (*Ornithogalum umbellatum*), a native of France, Switzerland, Germany, the Levant, etc., has racemes of six to nine large white fragrant flowers, which open about eleven o'clock in the morning and close again about three or four in the afternoon. The plant is very hardy and may be grown three or four years without being disturbed. *Ornithogalum arabicum* is a tender species often grown in glasses like hyacinths. It produces large creamy white flowers, with a fragrance not agreeable to all persons. The hardy species flourish in ordinary well-drained garden soil. Propagation is effected by offsets from the bulbs, which are planted in the fall about nine inches deep in sheltered places.

STAR OF INDIA, ORDER OF THE. A British order with three classes founded by Queen Victoria in 1861, consisting of the sovereign, the Viceroy of India, and 246 members, in addition to an unrestricted honorary membership. The decoration is an oval medallion bearing a bust of Victoria in onyx, surrounded by a blue band with the device *Heaven's Light our Guide*, and surmounted by a diamond-studded crown.

STAROKONSTANTINOV, stä'rô-kŏn'stȧn-tyĕ'nôf. A district town in the Government of Volhynia, Russia, 86 miles southwest of Zhitomir. The chief manufactures are tobacco and soap; mineral waters are marketed. Population, in 1897, 16,527.

STARR, ELIZA ALLEN (1824-1901). An American poet and lecturer on art. She was born of Puritan ancestry at Deerfield, Mass., and was educated at Deerfield Academy. In 1854 she left the Unitarian Church, in which she had been reared, and became a convert to Catholicism. In 1856 she settled in Chicago, where she became a teacher of drawing and painting. In 1877 she began the series of lectures on Christian art for which she is best known. She published *Poems* (1867); *Patron Saints* (1st series 1871, 2d series 1881); *Pilgrims and Shrines* (2 vols., 1883); *Isabella the Catholic* (1889); *Christian Art in Our Own Age* (1891); *Three Keys to the Camera della Signatura* (1895); and *The Seven Dolors of the Blessed Virgin Mary* (1898). Her works on Christian art are elaborately illustrated.

STARR, FREDERICK (1858—). An American anthropologist, born in Auburn, N. Y. He studied at the University of Rochester and at Lafayette, where he graduated in 1882. He was registrar of Chautauqua University in 1888-89, and after two years in charge of the American Museum of Natural History in New York City (1889-91) in 1893 became professor of anthropology in the University of Chicago. His publications include: a *Catalogue of Collections of Objects Illustrating Mexican Folklore* (1899); *Some First Steps in Human Progress* (1895); and *Indians of Southern Mexico* (1900).

STARR, MOSES ALLEN (1854—). An American neurologist, born in Brooklyn, N. Y. He graduated from Princeton College in 1876; from the College of Physicians and Surgeons, New York City, 1880; served as interne in Bellevue Hospital, 1880-82; was professor of nervous diseases, New York Polyclinic, 1886-88; clinical professor of nervous diseases, College of Physicians and Surgeons, New York City, 1888-89; and professor of the same since 1889. He is the author of many articles contributed to medical journals, as well as of *Familiar Forms of Nervous Disease* (1891); *Brain Surgery* (1893); *Atlas of Nerve Cells*, with Dr. Strong (1899); *Organic Nervous Diseases* (1903); and other works.

STAR ROUTE FRAUDS. Certain frauds connected with the management of the star route postal service during the administration of President Hayes. The term 'star routes' was applied to those routes over which, owing to the lack of railroads and steamboats, the mail was carried on horseback or in wagons, such routes being commonly marked, in the books of the Post Office Department, with an asterisk or 'star.' A 'ring,' including Brady, the Second Assistant Postmaster-General, and Senator S. W. Dorsey, of Arkansas, on the one hand, and certain mail contractors on the other, was alleged to have been

formed for the purpose of defrauding the Government by increasing unduly the remuneration of certain mail contractors. The sphere of operations of the combination included 135 mail routes on which the compensation for carrying the mail was increased from $143,169 to $622,808. This increase was accomplished by securing numerously signed petitions from the localities interested praying for an increase in the number of trips, after which the schedule time for each trip was shortened. Estimates from the contractors largely in excess of the actual cost were allowed, and the profits were alleged to have been divided between the contractors and the members of the ring at Washington. The frauds were brought to light early in Garfield's administration, and the chief participants were prosecuted. Dorsey was tried, but the jury failed to reach a decision. Upon a second trial in 1883 he was acquitted. Brady was also tried, but was not convicted. Of all those prosecuted only one was ever punished. The ring was eventually broken up, but not until a number of those interested had acquired fortunes.

STARS AND BARS. The popular name applied to the flag adopted by the Confederate States of America early in 1861. See FLAG.

STAR SPANGLED BANNER, THE. The national hymn of the United States, written by Francis Scott Key (q.v.) on board the frigate *Surprise* during the bombardment of Fort McHenry, Md., by the British, in 1814. He directed that the words should be sung to the tune of "Anacreon in Heaven," composed in England by John Stafford Smith between 1770 and 1775. "The Star Spangled Banner" was first sung in a tavern near the Holiday Street Theatre, Baltimore, by Ferdinand Durang. Consult Johnson, *Our Familiar Songs* (New York, 1881); Fitz-Gerald, *Stories of Famous Songs* (London, 1898).

STARVATION (from *starve*, AS. *steorfan*, OHG. *sterban*, Ger. *sterben*, to die, Icel. *starf*, trouble, toil, work), or INANITION. Emaciation, enfeeblement, lowered vitality, and finally death, resulting from insufficiency of or total deprivation of food. The fact is stated, as quoted from Chossat, that death from starvation occurs after the loss of four-tenths of the body weight. The same observer recounts the most prominent phenomena during or after the death of animals who were starved, as follows: (1) Dropsical effusion. (2) Softening and destruction of the mucous membrane. (3) Blackening of the viscera, especially of the liver. (4) Bluish, livid, yellow, and reddish stains during life in the transparent parts of the skin. (5) Hectic fever, and a continuous decrease in the power of the body to resist cold. (6) At first a scanty excretion of dry, bilious, grass-green fæces, and afterwards diarrhœa of liquid saline matter. (7) Convulsions similar to those in death by hemorrhage. (8) Death by starvation seems to be in reality death by cold; since the temperature of the body is not much diminished until the fat is nearly consumed, when it rapidly falls, unless it be kept up by heat applied externally. (9) Young animals succumbed far sooner than adults. (10) The results of insufficient food were in the end the same as those of total deprivation, the total amount of loss being almost the same, but the rate being less, so that a longer time was required to produce it.

Chossat did not find that much influence was exerted on the duration of life by permitting or withdrawing the supply of water; but there is no doubt that in man, and probably in mammals generally, death supervenes much earlier when liquids as well as solid food are withheld. During the famine of 1847 in Ireland, the following were the most striking symptoms observed in the starving: Pain in the stomach, relieved by pressure; pallor and emaciation; bright and wild eyes; hot breath; parched mouth, thick and scanty saliva; intolerable thirst; fœtor from the skin, which becomes covered with a dark-brown secretion; tottering gait, weak and whining voice, the tears starting easily; imbecility.

The time during which life can be supported under entire abstinence from food and drink varies much. In one case, reported by Sloan, a healthy man, aged 65 years, survived 23 days' imprisonment without food in a coal-mine, having impure water for the first ten days of this period. He died three days after rescue. The average healthy individual will survive a week or ten days of complete abstinence from food and water. Consult: Fernet, "Amaigrissement extrême et mort par inanition," in *Bulletin et mémoire, Société médicale de l'hôpital de Paris* (1901); Leeson, "Death from Starvation," in *Dublin Medical Press* (1847); Davies, "Starvation," in *Popular Science Monthly*, vol. xxvi. (New York, 1884-85).

STARWORT. See CHICKWEED.

STARY-OSKOL, stä'rĭ ŏs-kôl'. A district town in the Government of Kursk, Russia, on the river Oskol, 92 miles east-southeast of Kursk. It has tanneries and tobacco factories. Population, in 1897, 16,662.

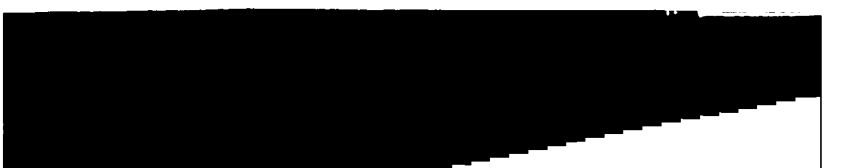
STAS, stȧs, JEAN SERVAIS (1813-91). A Belgian chemist. He was born in Louvain, studied under and later assisted Dumas, and was for many years professor of the Military Academy in Brussels. He was one of the earliest investigators of the constitution of organic compounds, such as acetal. Subsequently he devoted a number of years to the determination of the atomic weights of the elements, and it is principally for these classic researches that he is celebrated in the history of science. The impulse to these researches was given by the discussion as to whether the atomic weights are or are not exact multiples of the atomic weight of hydrogen—a question connected with Prout's hypothesis, according to which the several chemical elements are derived from hydrogen and are not essentially different substances. But the results of Stas's work have been of much further-reaching importance, and its precision has hardly as yet been surpassed. His collected works appeared in three volumes (Brussels, 1894). Consult Spring, *Notice sur la vie et les traveaux de J. S. Stas* (Brussels, 1893).

STASSFURT, stäs'fo͝ort. A town in the Province of Saxony, Prussia, on the Bode River, 20 miles south of Magdeburg (Map: Prussia, D 3). There are iron mills, and the important royal salt works, which mine potash and rock salts. Extensive chemical works are also found here. Population, in 1900, 20,031. The town has been known since 806.

STATANT (heraldic Fr., standing). In heraldry, a term applied to an animal standing still, with all the feet touching the ground. If

the face be turned to the spectator, it is said to be *statant gardant*, or in the case of a stag, *at gaze*. See HERALDRY.

STATE (OF. *estat*, Fr. *état*, from Lat. *status*, state, condition, from *stare*, to stand; connected with Gk. *ἱστάναι*, *histanai*, Skt. *sthā*, OChurch Slav. *stati*, OHG. *stān*, *stēn*, *stantan*, Ger. *stehen*, Goth., AS. *standan*, Eng. *stand*), THE. The theory of the State in its broadest sense may be taken to cover the whole field of political philosophy, involving the comprehensive examination of the laws underlying political phenomena. (See POLITICAL SCIENCE.) In a narrower sense, the theory of the State is concerned primarily with the essential nature of the State, its origin and basis, its various forms, and proper function or purpose.



The essential elements of the State, together distinguishing it from other social groups, are generally considered to be the following: a territorial basis serving as the physical foundation of the State, a population constituting its citizenship, and a more or less complete form of political organization exercising the power of life and death. Finally, the State is a sovereign body, being supreme over all persons on its territory and independent internationally. It is also held by some authorities that the State is an organism or a person.

The origin and basis of the State have been explained in various ways for the purpose of justifying or condemning various political systems. It has been held that the State owes its genesis and continuance to the will or command of God, a doctrine that has been used in the defense of all forms of government, including democracy. The origin of the State has been traced by others to the family, and explained as a development of the power of the early patriarchs. Others have maintained that the State was created by and exists in virtue of a voluntary contract to which the parties were either (1) the government on the one hand and the people on the other; or (2) separate individuals who agreed to form a political society and a government by a contractual process. Again it is argued that the foundation and support of the State is superior force, which in its first and last analysis is the essential fact in a political system. The modern theory is that the State owes its being to an historical process in which many or all of the foregoing factors may have played a part as the varying conditions required. The explanation of the present existence of a coercive power over individuals is generally found in a variety of motives for obedience. Of these the principal ones are custom or habit, fear, utility or the calculation of accruing advantages and disadvantages, and the element of conscious and rational consent. The general tendency of political development is toward a State based on general perception of its utility, and consequent consent to its laws. It may be added that the anarchistic school denies the existence of any rational justification for the State, demanding its complete abolition, and the substitution of some such principle as that of 'justice' or 'humanity' for that of coercive power.

The forms of the State are three, monarchy, aristocracy, and democracy, according as political power rests with one, the few, or the many. All other forms of government may be resolved into the three

speculation centred was the true and proper relation between Church and State. Thomas Aquinas (*Summa Theologica* and *De Regimine Principum*) was the most successful champion of the Church; Marsilius of Padua (*Defensor Pacis*) and Dante (*De Monarchia*) of the State. During the Renaissance and the Reformation political theory made important advances. By the work of Machiavelli (*Il principe, Discorsi*) politics was divorced from theology and ethics, and elevated to the position of an independent science. Jean Bodin, reviving the method and spirit of Aristotle, laid the foundations of modern systematic politics in his epoch-making treatise, *De Republica*. In the revolutionary period of the seventeenth and eighteenth centuries the so-called natural-law philosophy was dominant. The fundamental premise of this system was the universal prevalence of an immutable law of natural justice, under which and independently of any government all men hold certain natural rights, e.g. life, liberty, and property. From this premise followed the theory of a contract as the basis of all legitimate government, the administration of government for the good of the parties to the contract, and the right of revolution whenever government is perverted to selfish ends by the rulers. Of these doctrines John Locke (*Two Treatises of Civil Government*) and Jean Jacques Rousseau (*Le contrat social*) were the most influential expounders. During the same period the opposing doctrines of the divine right of kings and governmental absolutism were developed by Robert Filmer (*Patriarcha*) and Bossuet (*Politique tirée de l'écriture Sainte*), while Thomas Hobbes turned the natural-law theory to the defense of absolutism (*The Leviathan*). As opposed to the *a priori* conception of these writers, Montesquieu (*Esprit des lois*) placed the study of political science upon an historical basis.

The modern theory of politics, dating from the reaction against the excesses of the French Revolution, is based on the historical-scientific premise that all institutions are the product of an evolutionary movement in which the conscious will of individuals plays a comparatively unimportant part. The method followed is historical and comparative, in contrast to the deductive style of the preceding school. The numerous problems arising out of the development of modern democracy, those involved in Nationalism, Federalism, and Imperialism, and the determination of the proper function of government, are the questions upon which general attention is fixed.

BIBLIOGRAPHY. The most important works on the history of political theory are: Dunning, *A History of Political Theories* (New York, 1902); Janet, *Histoire de la science politique dans ses rapports avec la morale* (Paris, 1850, 1872); Bluntschli, *Geschichte der neueren Staatswissenschaft* (Munich, 1864); Mohl, *Geschichte und Litteratur der Staatswissenschaften* (Erlangen, 1855-58); Pollock, *Introduction to the Study of the Science of Politics* (London, 1890). Consult also: Lieber, *Manual of Political Ethics* (Boston, 1838-39); id., *Legal and Political Hermeneutics* (ib., 1839); Woolsey, *Political Science; or the State Theoretically and Practically Considered* (New York, 1877); Wilson, *The State* (Boston, 1889); Sidgwick, *Elements of Politics* (London, 1896); Willoughby, *The Nature of the State* (New York, 1896); Bosanquet, *The Philosophical Theory of the State* (London, 1899).

STATE, DEPARTMENT OF. One of the nine executive departments of the Government of the United States, presided over by a Secretary who is a member of the Cabinet and first in the line of succession to the Presidency after the Vice-President. In rank the Department of State stands first among the other departments and is also the oldest in point of origin. It was in fact the logical successor of the old Department of Foreign Affairs created in 1781 and presided over first by Robert R. Livingston and afterwards by John Jay. The Department of State is the organ of communication between the Government of the United States and all foreign governments, as well as with the Governors of the individual States. The Secretary of State conducts all such correspondence; has charge of the negotiation of all treaties and conventions; he preserves the originals of all treaties, public documents, and correspondence with foreign governments as well as of the laws of the United States; he publishes all statutes and resolutions of Congress and proclamations of the President; he is the custodian of the great seal which is affixed to all commissions of appointment requiring the consent of the Senate, proclamations, warrants for extradition, pardons, etc., emanating from the President; he issues and keeps a record of passports granted to American citizens traveling abroad; issues warrants for the extradition of criminals to be delivered to foreign governments; presents foreign ministers to the President; etc. He makes an annual report of the conduct of foreign affairs for the year, publishes the consular reports and the 'foreign relations' of the United States, and performs such other duties relative to the conduct of foreign affairs as the President may direct.

To aid the Secretary of State, an Assistant Secretary was provided for in 1853; in 1866 a second assistant was created, and in 1874 a third, each charged with the supervision of a particular branch of the department. The business of the department is distributed among seven bureaus, namely, a diplomatic bureau, a consular bureau, a bureau of indexes and archives, a bureau of accounts, a bureau of rolls and library, a bureau of foreign commerce, created in 1897 (formerly the bureau of statistics), and a bureau of appointments, created in 1898. The name of each bureau indicates broadly the nature of the business assigned to it. Besides the Secretary and the three assistant secretaries there is a solicitor, detailed from the Department of Justice, an assistant solicitor, created in 1900, seven chiefs of bureaus, two translators, sixty-three clerks, and a number of messengers, making a total force of about one hundred employees.

The following is a list of the Secretaries of State from the organization of the department in 1789 to the present, with the dates of their appointment: Thomas Jefferson, September, 1789; Edmund Randolph, January, 1794; Timothy Pickering, December, 1795; John Marshall, May, 1800; James Madison, March, 1801; Robert Smith, March, 1809; James Monroe, April, 1811; John Q. Adams, March, 1817; Henry Clay, March, 1825; Martin Van Buren, March, 1829; Edward Livingston, May, 1831; Louis McLane,

May, 1833; John Forsyth, June, 1834; Daniel Webster, March, 1841; Hugh S. Legaré, May, 1843; Abel P. Upshur, July, 1843; John Nelson, February, 1844; John C. Calhoun, March, 1844; James Buchanan, March, 1845; John M. Clayton, March, 1849; Daniel Webster, July, 1850; Edward Everett, November, 1852; William L. Marcy, March, 1853; Lewis Cass, March, 1857; Jeremiah S. Black, December, 1860; William H. Seward, March, 1861; Elihu B. Washburne, March, 1869; Hamilton Fish, March, 1869; William M. Evarts, March, 1877; James G. Blaine, March, 1881; Frederick T. Frelinghuysen, December, 1881; Thomas F. Bayard, March, 1885; James G. Blaine, March, 1889; John W. Foster, June, 1892; Walter Q. Gresham, March, 1893; Richard Olney, June, 1895; John Sherman, March, 1897; William R. Day, April 1898; John Hay, September, 1898. Consult: *History of the Department of State* (Washington, 1901); Schuyler, *American Diplomacy* (New York, 1886).

STATEN (stät'*en*) **ISLAND.** An island of New York constituting Richmond County, and since 1898 the Borough of Richmond, New York City (q.v.). It is distant a little more than five miles from the southern extremity of Manhattan Island, and is separated from Long Island on the east by the Narrows, which connect the Upper New York Bay with the Lower Bay.

STATE PUBLIC SCHOOL. A model institution at Coldwater, Mich., for the education and support of dependent and ill-treated children of the State. It was established by an act of the State Legislature in 1871, but was not formally opened until 1874. It is the object of this institution to receive, care for, educate, and place whenever possible in family homes all the dependent children of the State of sound mind and body between the ages of two and twelve. The board of control, however, has the discretionary power vested in it of admitting children under two, where circumstances warrant such an exception. Since its foundation it has received over 5000 children, and in 1902 there were in the school 155 inmates. The school is located on a farm of 160 acres, covered partly by orchards, ornamental trees, and gardens. The buildings consist of an administration building, schoolhouse proper, and nine cottages among which the inmates are distributed. This system of cottages, under the superintendence of matrons who are specially qualified for that work, has the tendency to foster a love for home life. The State of Michigan was first in establishing this type of school. Similar institutions have since been established in Iowa, Minnesota, Kansas, Montana, Colorado, Wisconsin, Texas, Nebraska, Alabama, Rhode Island, and Nevada.

STATES, Popular Names of.

Badger State. Wisconsin, from the animal.

Bay, or Old Bay, State. Massachusetts. The name Massachusetts Bay, though later used in a more extended sense, was originally restricted to Boston Harbor, and as early as 1622 persons from Plymouth spoke of 'the Bay.' Under the first charter, the government was called the Colony of the Massachusetts Bay; and under the second charter, the Province of the Massachusetts Bay. Hence the nicknames Bay Colony, Bay Province, and Bay, or Old Bay, State.

Bayou State. Mississippi, from the number of its bayous, a word derived from the Indian *bayouc(k)*, meaning a rivulet.

Bear State. Arkansas, from the animal.

Blackwater State. Nebraska, from the dark color of its rivers, owing to the black vegetable mold which covers large areas.

Blizzard State. South Dakota. The word 'blizzard,' of obscure origin, was used as early as 1829 in the sense of a blow or a discharge from a gun. In its present sense the word was recorded in 1876, and is said to have been current in Dakota for a decade previous.

Blue Grass State. Kentucky, from its celebrated blue grass.

Blue Hen State. Delaware. The term is said to have originated in the Revolutionary War, when an officer in a Delaware regiment raised famous gamecocks from a breed of blue hens; hence the members of his regiment were called 'Blue Hen's Chickens,' and so the name came to be applied to the State; but the story lacks proof.

Blue Law State. Connecticut. See Blue Laws.

Bread and Butter State. Minnesota, from its wheat and dairy products.

Buckeye State. Ohio, because of the horse-chestnut, which grows there in great profusion and which for more than a century has been popularly called *buckeye*.

Bullion State. Missouri, from the sobriquet 'Old Bullion,' applied to Senator Thomas Hart Benton of that State on account of his advocacy of gold and silver currency.

Centennial State. Colorado, because it was admitted into the Union in the Centennial year, 1876.

Central State. Kansas, from its location with reference to the other States of the Union.

Corn Cracker State. Kentucky, perhaps because the poor whites subsist chiefly on corn.

Cotton State. Alabama, because it is the central State of the cotton belt.

Cracker State. Georgia, from the poor whites, who for more than a century have been called Crackers.

Creole State. Louisiana, from its many inhabitants descended from the French and Spanish settlers.

Dark and Bloody Ground. Kentucky, because in its early days it was the scene of frequent Indian wars. The name has been known for more than a century.

Diamond State. Delaware, from its diminutive size.

Dominion, Ancient or Old. Virginia. In early documents we read of 'the Colony' or 'the Plantation' or 'the Colony and Plantation' of Virginia; while later, about 1674, there are allusions to 'the Colony and Dominion' of Virginia, about 1682 to 'the Dominion' of Virginia, and about 1697 to 'the Ancient Colony and Dominion' of Virginia. Hence, in time, came the nicknames Ancient Dominion and Old Dominion merely. According to some, the name is due to Virginia's loyalty to the Stuarts during the Civil War.

Egypt. Southern Illinois, either from its alleged intellectual darkness or from the fertility of its soil.

El Dorado. California. El Dorado (q.v.) was the name of a fictitious region or city, abounding in gold, supposed to exist in South America. Hence it was sometimes, after the discovery of gold in California in 1849, applied to that State.

Empire State. New York, from its size, wealth, and number of its inhabitants.

Empire State of the South. Georgia, from its enterprise.

Evergreen State. Washington.

Excelsior State. New York, from the motto on its seal (adopted 1778).

Freestone State. Connecticut, from its freestone quarries.

Golden State. California, from its gold-mines.

Gopher State. Minnesota, from the animal.

Granite State. New Hampshire, from its granite hills.

Green Mountain State. Vermont, from the Green Mountains.

Hawkeye State. Iowa. The name arose about 1839, apparently in allusion to J. G. Edwards, familiarly known as 'Old Hawkeye,' editor of the Burlington *Patriot*, the name of which paper was changed September 5, 1839, to the *Hawkeye and Patriot*.

Hoosier. Indiana. In use as early as 1833, but its origin is obscure.

Jayhawker State. Kansas. The word, of obscure derivation, appears to have originated with a party on its way to California in 1849, but no instance of its use is recorded prior to 1858, when it was used in Kansas, where it was derisively applied to James Montgomery and his men, who, in retaliation for the atrocities committed on Free-State settlers by the 'border ruffians,' raided the pro-slavery settlers and their abettors from Missouri. Later it was applied to marauders on both sides during the Civil War, and finally was applied to the people of Kansas.

Keystone State. Pennsylvania, probably because it was the central State of the Union at the time of the formation of the Constitution.

Lake State. Michigan.

Land of Steady Habits. Connecticut. See BLUE LAWS.

Little Rhody. Rhode Island, from its diminutive size.

Lone Star State. Texas, from the single star in the flag of the Texas Republic (1836-1845).

Lumber State. Maine.

Mormon State. Utah.

Mother of Presidents. Virginia, because the birthplace of seven Presidents.

Mother of States. Virginia, because the first settled of the States.

New England of the West. Minnesota.

Nutmeg State. Connecticut, in allusion to the alleged manufacture of wooden nutmegs in that State.

Old Colony. That part of Massachusetts which from 1620 to 1692 was the Plymouth Colony.

Old Line State. Maryland, probably from the 'Maryland Line' which won distinction in the Revolutionary War.

Old North State. North Carolina.

Palmetto State. South Carolina, from the device on its seal.

Panhandle State. West Virginia, from the irregular section of the State projecting northward between Pennsylvania and Ohio.

Pelican State. Louisiana, from the device on its seal.

Peninsula State. Florida, from its location.

Pine Tree State. Maine, from the device on its seal, adopted in 1820.

Prairie State. Illinois, from its prairies.

Sage-Brush State. Nevada, from the plant.

Silver State. Nevada, from its silver-mines.

Sucker State. Illinois, because in the early days the men went up the Illinois River to the mines and returned at the season when the sucker migrated. The term was first used about 1833.

Sunflower State. Kansas.

Turpentine State. North Carolina, from the turpentine produced in it.

Web-Foot State. Oregon, from the quantity of rain which falls there.

Wolverine State. Michigan, from the animal.

STATE'S EVIDENCE (or, in England, KING'S or QUEEN'S EVIDENCE). A popular phrase used to denote the testimony given by an accomplice in the commission of a crime against the other accomplices on their trial, under an agreement or understanding with the prosecuting officer that the witness shall not be brought to trial for his part in the crime, in consideration of his aid to the State. Such an agreement or understanding on the part of the prosecution is not valid and enforceable as a matter of law, but in practice such agreements are usually adhered to by the prosecutor as a matter of good faith and are countenanced by courts as a justifiable and proper means of securing convictions for crime. In several States there are statutes providing that there shall be no conviction for crime upon the uncorroborated testimony of an accomplice. In applying this statute, whether a witness is an accomplice whose testimony requires corroboration is a question for the jury, unless the facts are undisputed or the question rests upon some rule of law, where it must be passed upon by the court. See ACCOMPLICE; PRINCIPAL; ACCESSORY.

STATES-GENERAL (Fr. *états généraux*). The name given to the convocation of the representative body of the three orders of the French kingdom, representing the nobility, clergy, and bourgeoisie or *tiers état* (Third Estate). As far back as the time of Charlemagne, there were assemblies of clergy and nobles held twice a year to deliberate on matters of public importance, and in these assemblies the extensive body of laws bearing the name of the Capitularies of Charlemagne was enacted. These national convocations seem to have ceased to be held at the time of the final disruption of the Carlovingian realm, about seventy years after Charlemagne's death. From that time forward there is no trace of any national assembly in France till 1302, when the *états généraux*, including the three orders of clergy, nobles, and citizens, were convoked by Philip the Fair, with the view of giving greater weight to the course adopted by the King in his quarrel with Pope Boniface VIII. In 1308 Philip obtained from the states-general a condemnation of the Knights Templars. During the period of the Hundred Years' War (1337-1453) the states-general were frequently convoked, and the exigencies of the Court enabled them to play an important rôle in connection with the revenue and taxation. But they were not a law-making body, although they enabled the voice of the nation to assert itself against abuses of the royal power. As the royal authority became more and more absolute, and a standing army made the sovereign less dependent upon financial grants made by his subjects, the summoning of the states-general gradually ceased to

be regarded as indispensable. The advisers of Louis XIII. convoked the states-general, after a long interval, in 1614, but the body was soon dismissed for looking too closely into the finances; and from that time there was no convocation of the states-general till the memorable meeting in 1789, which initiated the French Revolution. The states-general voted by orders, but in 1789 the Third Estate refused to abide by a regulation which enabled the other two orders to combine against it and to thwart its purposes. They insisted that the vote should be by members in a single body (with the Third Estate as numerous as the other two orders combined), and they achieved their object by constituting themselves the National Assembly. See FRENCH REVOLUTION.

The name States-General is also applied to the existing legislative body of the Kingdom of the Netherlands (q.v.), as was formerly the case in the Republic of the Netherlands from 1593 to 1795.

STATES OF THE CHURCH. The territory in Central Italy formerly under the temporal sovereignty of the Holy See. For their history, see PAPAL STATES; and for the theory involved, TEMPORAL POWER.

STATES' RIGHTS. A political term having reference to the rights of the individual States as compared with the central Government in countries having a federal form of government. In the history of the United States, the term is used to denote the view prevailing in the South prior to the Civil War with regard to the nature of the Union. According to this view the Union was a compact of sovereign and independent States; the central or Federal Government was the mere agent of the States, which were regarded as the principals; and the primary allegiance of the individual was to his State rather than to the United States. In effect this view upheld the right of a State to interpose its authority when the central Government enacted oppressive or unconstitutional laws. (See NULLIFICATION.) Southern statesmen and political leaders contended for this view with particular insistence in connection with the long controversy over slavery. Prior to the Civil War, a large proportion of the people of the Southern States held to the States' rights view of the Constitution, although many of them were not nullifiers. In the early part of the nineteenth century, particularly at the time of the War of 1812, the States' rights view was also strong in the North and East, and was not abandoned until it became the view and support of the slavery interest. The Civil War settled the issue adversely to the States'-rights view, and it is no longer a constitutional question in the old sense of the term. In the German Empire, States' Rights, or Particularism, as the Germans call it, is very strong, and has been at the bottom of many great constitutional struggles in that country. The Imperial Constitution recognizes a large sphere of autonomy of the individual States, and some of those in South Germany enjoy rights which are survivals of the Confederation.

STATESVILLE. The county-seat of Iredell County, N. C., 156 miles west of Raleigh, on the Southern Railway (Map: North Carolina, B 2). It is in the centre of a rich grain and tobacco growing section, with some mineral deposits. One of the State experiment farms is just outside the city limits. There are furniture factories, flour mills, cotton mills, tanneries, foundries, and iron works. The water works and the electric light plant are owned by the municipality. Population, in 1900, 3141.

STATE TRIALS. In English law, a phrase employed to denote trials involving offenses against the State, or which determine questions concerning the duties and privileges, etc., of important officers of the Crown. The first collection of State Trials appeared in 1719; a second in 1730; a third in 1742; *Hargrave's* edition in ten volumes in 1776-81; and between 1809 and 1826, the fifth edition in thirty-three volumes was published. This edition is the one now used, and is known as "Howell's State Trials," after the real editor, Thomas Bayley Howell, who compiled the work, although the name of one Cobbett appears as editor on the title-page of volume i. These reports contain much learning in criminal and constitutional law. A new series is being prepared under the supervision of a Parliamentary Committee, and all important cases in constitutional and international law will be included.

STATIC ELECTRICITY. See ELECTRICITY.

STATICS (from Gk. *στατικός, statikos*, relating to standing, from *στατός, statos*, placed, standing, from *ἱστάναι, histanai*, to stand). That branch of dynamics which treats of the properties of material bodies when, under the action of forces, their motion is not changing. They are then said to be in equilibrium. See MECHANICS and EQUILIBRIUM.

STATIC SENSE. In close anatomical connection with the cochlea of the inner ear there are in man and most other vertebrates three bent tubes of bone inclosing three membranous tubes, filled with and floating in a fluid, the endolymph and perilymph. These tubes, known as the semicircular canals, lie approximately in the three planes of space. At the termination of each canal is a flask-like swelling (ampulla), within which are to be found certain specialized nervous end-organs. The ingoing fibres from the three ampullæ constitute the main portion of the vestibular branch of the eighth or auditory nerve. Arguing from these anatomical features, it was long supposed that the canals served some auditory function such as the sensation of noise or the perception of localization of sounds. But we now have abundant evidence for regarding them as the organ of the 'static sense'—by which is meant (1) that they constitute a *physiological* apparatus for the maintenance of equilibrium (and some would add, for the maintenance of muscular tonicity); (2) that any irregularity in their operation makes itself felt *mentally* as giddiness or dizziness; and more doubtfully (3) that an acceleration or a diminution of the rate of movement of the body as a whole so affects them as to set up sensations which are interpreted as what has very loosely been termed a 'sense of translation.'

STATIONERS' HALL. The guildhouse of the 'Master and Keepers or Wardens and Commonalty of the Mystery or Art of Stationers of the City of London,' now situated near Ludgate Hill in London. This company, which had been

preceded by a voluntary association as early as 1403, was incorporated in 1556. For nearly three hundred years it regulated the publication of all books in England. Since the passage of the copyright law (1842), registration is no longer compulsory, but it is necessary for securing copyright. For a history of the company, consult the first volume of E. A. Arber's valuable *Transcript of the Stationers' Registers, 1554-1640* (5 vols., London, 1875-94).

STATIONS (Lat. *statio*, from *stare*, to stand). A name applied in the Roman Catholic Church to certain places reputed of special sanctity, which are appointed to be visited as places of prayer. The name is particularly applied in this sense to certain churches in the city of Rome. The word is employed in reference to a popular devotional practice of the Roman Catholic Church, known as that of 'the stations of the cross.' Carved or painted representations, the subjects of which are supplied by scenes from the passion of Christ, are called stations of the cross, and are found in every church. The origin of this devotional exercise, like that of local pilgrimages, is traceable to the difficulty of access to the holy places of Palestine, consequent on the Turkish occupation of that country. The number of the stations is commonly fourteen; the subject of all is a sort of pictorial narrative of the passion. The devotional exercise is performed by kneeling at the several stations in succession, and reciting certain prayers at each, or joining in their recitation by the priest.

STATISTICAL CONGRESS, INTERNATIONAL. An organization of the most eminent statisticians of all countries, which convenes from time to time to define and systematize investigations. The first meeting was held at Brussels in 1853.

STATISTICS. Etymologically, the science of States. The word seems to have been introduced into England about the beginning of the nineteenth century. It came into use in Germany about half a century earlier, and was there applied to lectures or books upon descriptive political science, of which the *Statesman's Year Book* and the *Almanach de Gotha* are typical modern representatives. If either of these annual publications be imagined stripped of the numerical statements so frequent in them, a very fair notion is left of Achenwall's *Outlines of Modern Political Science* ("Abriss der neuesten Staatswissenschaft," etc., 1749), which opens with the statement: "The notion of statistics so called, that is, the political science of the several kingdoms, is very differently understood, and among the many books on the subject it is not easy to find any one that agrees with the rest in the number and the arrangement of its parts," a complaint which might be made to-day with almost equal correctness. The title Statistics thus adopted by Achenwall established itself as the prevailing name for a sort of descriptive political science, which had existed long before as the Elzevir *Republics* and the writings of Conring illustrate, and which maintained itself at the universities and before the public in Germany until into the nineteenth century.

Meantime in England a different line of work had begun about the middle of the seventeenth century, after the recurrent and disastrous visitations of the plague had roused interest enough in the mortality it did so much to swell to cause weekly reports of the burials and later of the christenings in London to be made and published. The keen interest in the methods of observation and measurement which culminated in and were reinforced by the Royal Society, chartered in 1662, induced Captain John Graunt to apply methods of observation, induction, and measurement to the births and deaths of London. He presented to the Royal Society in 1662 his "Observations on the Bills of Mortality," the foundation of statistics as that word is now understood. But at that time the new study was baptized by his friend and collaborator, Sir William Petty, 'Political Arithmetic.' Interest in this line of work grew and spread gradually to the Continent, where Achenwall's contemporary Süssmilch in 1741 hailed Graunt as a scientific Columbus who had discovered a new continent and confessed himself Graunt's disciple, but showed no knowledge of Achenwall's work and made no use of the name statistics. Gradually the word statistics spread to Great Britain, where, in 1798, Sir John Sinclair published his *Statistical Account of Scotland*. The word was taken up by Malthus in editions of his *Principle of Population* after the first, and in such connection as to indicate that he borrowed it from Sinclair. Malthus's subject-matter was in the line of previous writers on political arithmetic, and his adoption of the term statistics may have been instrumental in leading to its gradual displacement of the lengthier phrase in English writing. Meantime the study of political arithmetic, born in England, extended to the Continent, gradually displacing the older statistics of Achenwall, sometimes called 'university statistics,' from its prevalence as a subject of university lectures, and, to add insult to injury, usurped its name. Perhaps the most striking difference between the two notions of statistics, the older and the newer, is that the former is purely descriptive and takes no account of the underlying notion of modern science, the notion of causation, while the latter subordinates description to explanation, or an attempt at explanation. At the same time it would be inconsistent with present usage to limit the word statistics any further than to say that it refers to the results obtained in any field of reality by methods of counting and that these methods are mainly employed in the study of societies politically organized into States.

Methods of counting apply especially to the study of human societies, because in them the individual units are widely different, and it is with the differences almost as much as with the resemblances between individuals that science is concerned. In the inorganic sciences and to a less extent in the sciences of plant and animal life, the units taken for purposes of investigation resemble one another far more closely than human individuals do, or at least their resemblances are far more obvious and for man's purposes more important than their differences. In other than the social sciences, therefore, the observation of one or a few units may serve as a basis for general statements about the group, but in human societies it is frequently necessary to ascertain the existence, or non-existence, of a particular characteristic in every member of the group. This involves counting, and results in a

statement in some numerical form, as a percentage, an average, or a series of figures showing the distribution of the characteristic among the members of the group. This indicates a fundamental reason for the imperfect development of methods of measurement in the social sciences and a reason that statistics or the science of measuring aggregates of units, as distinct from individual units, is more necessary and has a wider range of applications in the study of social sciences than it has in the study of natural sciences. There is, therefore, much ground for the opinion of those who define statistics as the numerical study of social facts, or the numerical investigation of man's social life. But it seems more correct to hold that, for example, an enumeration through the century of the number of auroras observed each year and an observation through the same period of the extent of spots on the sun, and an arrangement of these two measurements in such a way as to show that they have fluctuated in close conformity, is to be included in statistics.

THEORY. The United States Census reported in 1890 22,329,990 persons in the country over 15 years of age and married; in 1900 this class of the population numbered 27,765,707. On computing the ratios it is found that among each 1000 adults 553 were married in 1890 and 557 in 1900. The same authority reported at the Eleventh Census 875,521 deaths during the preceding year, of which 6756 were caused by railroad accidents, and at the Twelfth Census 1,039,094 deaths, of which 6930 were due to the same cause, so that railroad accidents caused in 1890 657 deaths and in 1900 667 deaths out of each 100,000 reported. The foregoing will serve to illustrate a regularity or uniformity often, but not always, traceable in the distribution of conditions or the recurrence of events in society. Upon this uniformity in the characteristics of, and this regularity in the events occurring in, social groups, which has been not very felicitously called 'the law of large numbers,' the statistical method rests. These uniformities and regularities do not exist in the individual or even in the small group, and if they could not be traced in the large group the laborious and uninviting statistical method would add nothing to the information obtainable from examination of a few individuals or instances, and therefore, however important for political ends, would have no significance for science. It is this 'law of large numbers,' or the permanence of numerical relations in social life, that makes it possible to describe human societies with accuracy in quantitative terms, to frame inductions from their past, which are found to hold for their future, to forecast the influence of a given change upon their life and so in multitudinous ways to control that life. Perhaps the best illustration of the importance of the 'law of large numbers' is found in the business of insurance, which could not exist were it not for that law as a foundation. This principle stands in somewhat the same relation to the possibility of a science of society that the principle of the uniformity of nature does to the possibility of natural science. In social phenomena it is seldom if ever possible to carry the isolation of causes to the degree of perfection it has reached in the natural world. The presence of a few drops of hydrochloric acid is practically the only difference between a transparent solution of nitrate of silver and a turbid white fluid, so the acid is said to cause the precipitate. But the marriage of an individual man or woman is influenced by so many complex considerations that it is impossible to perceive in the vast majority of marriages taken separately any effect of so subsidiary a cause as the price of bread or the spread of business depression. What this subsidiary cause loses, however, in power over each individual instance it gains by the number of individuals it reaches and the fact that its effect is uniformly in the same direction, while the influence of age, of example, of personal affection, of gain or loss of property, etc., though in many individual cases far more powerful, is felt sometimes in one direction and sometimes in another. Such causes, therefore, are as powerless on the aggregate as they are potent on the individual, and, on the contrary, the society as a whole betrays the undeniable effects of slight causes, which perhaps few individuals therein would admit to have swayed their action. The 'law of large numbers' thus assumes that the causes of any social phenomenon may be divided into two groups, the individual, accidental, or disturbing causes, and the essential or primary causes, and that causes of the former sort have no constant tendency to act in one direction rather than another, and, accordingly, no tendency to move the group as a whole in any one direction. If a sufficiently large number of instances be taken, the disturbing or individual causes cancel and allow the influence of the essential or group causes to be traced. How large a number of instances must be enumerated to eliminate these individual causes with any specified degree of completeness is a mathematical problem dealt with by the calculus of probabilities.

BIBLIOGRAPHY. For the only survey of the history in English, see Falkner's translation of Meitzen's *Geschichte, Theorie und Technik der Statistik*, published by the American Academy of Political and Social Science in 1891. For the theory of the subject, see the latter part of the foregoing book; Bowley, *Elements of Statistics* (London, 1901), strong in English methods, in wage statistics, and in the mathematical basis of the subject; and Westergaard, *Theorie der Statistik* (Jena, 1890). See also Mayo-Smith, *Statistics and Sociology* and *Statistics and Economics*.

STATIUS, stā'shĭ-ŭs, PUBLIUS PAPINIUS (c.40-c.96 A.D.). A Roman poet, born at Naples. He became famous for his poetic gifts, especially for his skill in extemporaneous verse, and three times gained the prize in the Alban contests. But finally, having been vanquished in the quinquennial games, he retired with his wife, Claudia, to his birthplace, Naples, where he died about A.D. 96. He is polished and correct, but one often feels the note of artificiality in his verse. He wrote a very dull and laborious epic entitled *Thebais;* the *Silvæ*, five books of miscellaneous poems; and an epic of the Trojan cycle, *Achilleis*, of which only a portion has survived. The best modern editions are: of the *Silvæ*, by Bachrens (Leipzig, 1876), Vollmer (with extensive German commentary, Leipzig, 1898), and Klotz (Leipzig, 1900); of the *Achilleis* and *Thebais*, by Kohlmann (Leipzig, 1879). There are English translations, in whole or in part, by Pope, Howard, Stephens, and Lewis.

STATUTE (Lat. *statutum*, statute, neu. sg. of *statutus*, p.p. of *statuere*, to set up, establish, from *statum*, supine of *stare*, to stand). A law enacted or promulgated in writing by the supreme legislative body of a government, or by its authority. Statute law is sometimes spoken of as written law to distinguish it from the common or unwritten law, which is established exclusively by judicial decision. All statutes have their source in the official action of the legislative body, the form of which may vary according to the particular form of government under which it acts. The validity of a statute in any given case depends not only upon the legislative body's being lawfully constituted, but upon its constitutional authority to act. (See CONSTITUTIONAL LAW.) Statutes may be enacted by indirect legislation, that is, by some subordinate legislative body whose acts derive their validity from the sanction of the supreme legislative body. Thus, in England Orders in Council and the various rules of court adopted under the judicature acts, and in the United States the ordinances of Boards of Aldermen, and the ordinances of Boards of Health under the various public health acts, are examples of statutes enacted by indirect legislation.

The procedure by which statutes are created by legislative enactment has been fully discussed under the topics PARLIAMENT; CONGRESS; LEGISLATION; etc.; to which reference is here made. In England the acts of Parliament have the full force of statutory law without the approval of the sovereign, although it is the established custom for the sovereign to promulgate all statutes "by and with the advice and consent of the Lords Spiritual and Temporal in this present Parliament assembled." In the United States the acts of Congress require the assent of the President of the United States, and the acts of the various legislatures require the assent of the Governors of their respective States to give them validity as statutes. See VETO.

Statute laws may be classified with reference to the purpose for which they are enacted, with reference to the subject-matter of the statutes, and with reference to the compliance with the statute required. With reference to their purpose, statutes are said to be (a) Declaratory, when passed for the purpose of affirming a rule of the common law which is uncertain or indefinite, or a statute of doubtful meaning; (b) Remedial, when passed for the purpose of remedying defects or supplying omissions in the statute or common law; (c) Penal, when passed for the purpose of prohibiting acts specified in the statute and imposing a penalty for its violation. With reference to their subject matter, they are said to be (a) Public, when applicable to the entire community, and (b) Private (see the explanation of these terms under the titles LAW; LEGISLATION; PUBLIC LAW; etc.), as distinguished from public when applicable to a single individual or corporation, or to a limited number of individuals. The distinction between public and private statutes, first made as early as the reign of Richard II., now has considerable importance, owing to various statutory and constitutional provisions requiring the publication of public and private statutes separately. Statutes have also been classified with reference to the extent of territory in which they are applicable. Those statutes are said to be (a) General, when they apply to the entire territory subject to the legislative jurisdiction of the law-making body, and (b) Local, when they extend only to a single or limited political division of such territory, as statutes enacted by State legislatures which apply only to a single town, city, or county.

With reference to the subject matter also, statutes are classified as Enabling acts, which confer rights or privileges, as the Married Women's Enabling Acts; and Disabling acts, which take away rights or privileges hitherto enjoyed, as statutes requiring legal voters to have new or additional qualifications.

With reference to the compliance required statutes are said to be (a) Mandatory, when they direct an act to be done with the consequence that if it is not done all acts or proceedings taken under the statute are invalid. Thus statutes formulating the procedure for organizing corporations, or authorizing civil arrest, are mandatory, since they must be strictly complied with, or all acts done under them have no validity.

(b) Directory, when failure to comply with the statute does not affect the validity of acts done under it or entail the imposition of any penalty for failure to comply with the statute. Thus many statutes specifying the time and manner of filing official reports are directory only. There is no penalty for failure to comply with the statute, and compliance with it can be compelled only by mandamus (q.v.).

(c) Prohibitory, when they forbid the doing of any act either with or without penalty for failure to comply with the statute.

(d) Permissive, when they allow acts to be done not before permitted, or give to them some additional legal effect, although such acts are not required to be done, as the various statutes permitting the disposition of property by will.

A statute may contain four distinct parts—the title, the preamble, the enacting clause, and the purview. The title is a short form of description of the statute, as for example, 'An Act Prohibiting Sabbath-Breaking.' In some States the title is of great importance, because of constitutional provisions requiring statutes to have titles descriptive of the subject matter of the statute. In the absence of such provision, it is now the usual practice to omit the title.

The preamble is an introductory and explanatory statement setting forth the reason and purpose of the statute. It is of service only as an aid in interpreting the purview of the statute which follows. All the early English statutes included the preamble, but it is now seldom used.

The enacting clause is a brief direction that the statute be enacted by the legislative body; as, "Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled."

The purview is that portion of the statute following the enacting clause, and is the only part of the statute which has the effect of law. It may contain various subdivisions or clauses known as provisos, exceptions, the saving clause, the repealing clause, terms which are self-explanatory.

At common law a statute was deemed to take effect as upon the first day of the session in which it was enacted. This was modified by

Statute 33, Geo. III., c. 13, which provided that all statutes should become operative from the date of their receiving the royal assent. It is now generally the rule in the United States that statutes shall become operative from the date of their receiving the assent of the Executive, unless a different date is otherwise specified in the statute itself.

Courts will take judicial notice of all public statutes operative within their jurisdiction, and it is therefore not necessary generally to plead a public statute upon which a litigant founds an action or defense. Some rule of public policy may, however, require a public statute to be pleaded in special cases, as the Statute of Limitations (q.v.) and Statute of Frauds (q.v.). Private statutes, however, are required to be pleaded, and the statutes of foreign States and countries, being regarded as matters of fact, are required to be pleaded and proved like other matters of fact.

For discussion of the *amendment* and *repeal* of statutes, consult those topics respectively; and for a discussion of the interpretation of statutes, see INTERPRETATION; CONSTITUTIONAL LAW; LAW; etc.

Consult the authorities referred to under LEGISLATION; LAW.

STATUTE OF FRAUDS. See FRAUDS, STATUTE OF.

STATUTE OF LIMITATIONS. See LIMITATION OF ACTION.

STATUTE OF PARLIAMENT. See ACT OF PARLIAMENT.

STATUTES OF JEOFAILS. English statutes permitting amendments to pleadings or curing certain mistakes or omissions in the proceedings in an action. The name was derived from the old phrase *jeo faile* (I have failed), by which the pleader acknowledged an error in his pleadings or proceeding, after which he could take advantage of the provisions of these statutes. The procedure acts in practically all of the United States provide for the amendment of pleadings and the arbitrary waiver of defects and irregularities in certain cases, but the term *jeofails* is not commonly applied to such acts. Consult Chitty on *Pleading;* Stevens on *Pleading.*

STAUBBACH, stou'bäĸ. A celebrated waterfall in the southern part of the Canton of Bern, Switzerland, 8 miles south of Interlaken. It is one of the highest in Europe, having a descent of between 800 and 900 feet. Long before it reaches the bottom it is blown into a dust of spray, whence its name *Staubbach* (dust-stream).

STAUNTON, stạn'ton. The county-seat of Augusta County, Va., 135 miles northwest of Richmond, on the Baltimore and Ohio and the Chesapeake and Ohio railroads (Map: Virginia, E 3). It is the seat of the Western State Hospital for the Insane, and of the State Deaf, Dumb, and Blind Institution; and has the Mary Baldwin Seminary, Virginia Female Institute, and Kable's Military Academy. Other prominent features are the City Hall, Court House, Masonic Temple, Columbian Hall, and Gypsy Hill and Highland Parks. Staunton manufactures organs, flour, overalls, wagons, machine-shop products, and agricultural implements. The government, under the revised charter of 1879, is vested in a mayor, chosen biennially, and a unicameral council. The waterworks and the electric-light plant are owned and operated by the municipality. Population, in 1890, 6975; in 1900, 7289.

STAUNTON, Sir GEORGE THOMAS (1781-1859). An English traveler and Orientalist, born at Salisbury. In 1792 he went with his father, Sir George Leonard Staunton (1737-1801), to China, where he learned to speak and write the language. After two terms at Cambridge he was appointed writer in Canton for the East India Company's factory. He introduced vaccination into China in 1804, by translating George Pearson's treatise. He translated from Chinese: *La Tsing lew lee, being the Fundamental Laws of China* (1810), the first book translated from Chinese into English; the *Narrative of the Chinese Embassy to the Khan of the Tourgouth Tartars* (1821), and wrote *Miscellaneous Notices Relating to China* (1822), *Notes of Proceedings and Occurrences During the British Embassy to Peking* (1824), *Observations on Our Chinese Commerce* (1850), and *Memoir of Sir J. Barrow, Bart.* (1852).

STAUNTON, HOWARD (1810-74). An English chess master and Shakespearean scholar. In 1843 he defeated St. Amant, then the chess champion of Europe, and three years afterwards won from the German experts Harrwitz and Horwitz. His plans at all times displayed great originality in attack, fertility in defense, and untiring patience. He founded the *Chess Player's Chronicle* in 1840, which he edited until 1854, and from 1844 until his death conducted the chess column of the *Illustrated London News.* His Shakespearean researches resulted in an edition of the plays and poems (1857-60), edited and analyzed with shrewdness and good taste, a facsimile of the 1623 folio, and a series of articles contributed to the *Athenæum,* on "Unsuspected Corruptions of Shakespeare's Text" (1872). His other writings include: *Chess Player's Hand-Book* (1847); *Chess Player's Companion* (1849); *Chess Praxis* (1860); *Great Schools of England* (1865).

STAUPITZ, stou'pĭts, JOHANN VON. A friend and spiritual guide of Martin Luther (q.v.).

STAUROLITE (from Gk. *σταυρός, stauros,* cross + *λίθος, lithos,* stone), or FAIRY STONE. A mineral hydrated iron-aluminum silicate crystallized in the orthorhombic system. It has a sub-vitreous to resinous lustre and is dark brown to black in color. The crystalline varieties are frequently cruciform, owing to twinning. On account of their resemblance to a cross these forms are popularly believed to have fallen from heaven, and are used to some extent not only as ornaments, but also as charms. They occur in crystalline schists, and are usually associated with garnet, syenite, and tourmaline. Staurolite is found in Switzerland, the Tyrol, Moravia, Ireland, and in the United States at various localities in New England, New York, North Carolina, Georgia, and elsewhere along the Appalachian range of mountains.

STAUROSCOPE (from Gk. *σταυρός, stauros,* cross + *σκοπεῖν, skopein,* to view). A variety of polariscope (q.v.) adapted to the study of crystals, and consisting essentially of a mirror, two Nicol's prisms, and a revolving stage. By it sections cut from crystals along any desired

direction are examined by use of parallel rays of plane polarized light. See CONOSCOPE; CRYSTALLOGRAPHY.

STAVANGER, stä'vàng-ẽr. A seaport of Southwestern Norway, on the south shore of the wide entrance to the Stavanger or Bukken Fiord, 190 miles southwest of Christiania (Map: Norway, A 7). It has a Gothic cathedral, one of the finest in Norway. The town produces woolen, linen, and cotton goods, soap, preserves, oleomargarine, hardware, pottery, and bricks. There are iron foundries, and the harbor is provided with ship-yards. Fisheries and the curing of fish are important industries. The shipping at the harbor amounts to about 325,000 tons annually, and the trade in 1899 was valued at $3,867,100, the principal exports being fish, preserved foods, butter and margarine, marble, and manure. Population, in 1891, 23,899; in 1901, 30,541.

STAVROPOL, stäv'rô-pôl-y'. A government of Ciscaucasia, bounded by the Province of the Don Cossacks and the Government of Astrakhan on the north, the Territory of Terek on the east and south, and the Territory of Kuban on the west (Map: Russia, F 5). Area, 23,430 square miles. The surface is largely steppe-like in character, and only the southwestern part is mountainous, the highest point being about 2200 feet. The principal rivers are the Kuma and the Great Egorlyk. Agriculture and stock-raising are the principal occupations. The chief cereals are wheat, oats, and barley. In 1898 there were in the government over 3,800.000 head of live stock, including over 2,600,000 sheep. Population, in 1898, 912,639, of whom the Russians constituted 90 per cent.

STAVROPOL. The capital of the Russian government of the same name, situated about 700 miles south-southeast of Moscow (Map: Russia, F 5). Farming and gardening are the main occupations. Population, in 1897, 41,621, chiefly Russians.

STAWELL, stą'el. A town of Borung County, Victoria, Australia, 179 miles northwest of Melbourne, in the centre of the richest gold-mining region of the province (Map: Victoria, B 4). There are important freestone quarries. Population, in 1901, 5296.

STAY (OF. *estaie, estaye,* Fr. *étai,* from MDutch *staeye,* a stay). In law, a suspension of legal proceedings by order of a court. A stay is usually granted by the court in which an action or proceedings are pending, and is commonly ordered for the purpose of compelling a party to an action to comply with some condition or order of the court, as to pay costs on some interlocutory motion, or to give security for costs, etc. In a few instances the courts may grant absolute stays, as, for example, where an unfounded action is commenced merely to harass or annoy the defendant. It is customary for the United States courts to stay the proceedings in all actions pending against a bankrupt in State courts during the pendency of the bankruptcy proceedings. A temporary stay of execution may usually be obtained, especially where the defeated party desires to appeal. No rights are destroyed by a stay, as it only operates to suspend proceedings and does not involve their merits. See Chitty, *On Pleading; New York Code of Civil Procedure.*

STEAD, WILLIAM THOMAS (1849—). An English journalist, born at Embleton, Northumberland. After a brief schooling he went into business, but in 1871 was appointed editor of the *Northern Echo* (Darlington). Here he remained until 1880, when he was called to be assistant editor, under John Morley, of the *Pall Mall Gazette.* He was editor of this paper from 1883 to 1889 and in the next year founded the *Review of Reviews* (monthly). He established similar publications in the United States (1891) and Australia (1894). As editor of the *Pall Mall Gazette,* a daily, he introduced American journalism into England, in the way of the interview, illustrations, and 'extras.' Though regarded as thoroughly sincere and intensely earnest in his treatment of public affairs, he aroused criticism by these methods and by injudicious conclusions. He became known as a vigorous opponent of social evils, a steadfast advocate of international peace, and, though patriotic, an apologist of Russia. His *The Truth About the Navy* (1884) led to the laying down of more ships in the following year. In 1885 his *The Maiden Tribute of Modern Babylon,* an exposure of legally permissible outrages upon women and children, landed him for a three months' term in Holloway Gaol, but it was followed by the enactment of the Criminal Law Amendment Bill. In 1898 he started *War Against War,* a weekly devoted to the opposition of the Anglo-Boer War. His publications include: *The Truth About Russia* (1888); *The Pope and the New Era* (1889); *The Story that Transformed the World* (1890); *If Christ Came to Chicago* (1893); *The Labor War in the United States* (1894); *Satan's Invisible World: A Study of Despairing Democracy* (1897); *Mr. Carnegie's Conundrum* (1900); *The Americanization of the World* (1902); *The Last Will and Testament of Cecil John Rhodes* (1902).

STEALING. See LARCENY.

STEAM (AS. *stēam,* Fris. *stoame,* Dutch *stoom,* steam; of unknown etymology). Water in a gaseous condition. It is a dry, colorless gas with a specific gravity of 0.625 as compared with air at the same pressure. The white cloud of vapor which rises from boiling water and which is commonly called steam is a vapor composed of minute particles of water suspended in the air and formed by the condensation of the steam coming in contact with the cool air. When water is subjected to the action of heat, it is converted into steam. Though a change takes place in the physical condition of the substance, the chemical composition of the steam is in no way different from that of the water from which it was generated. If heat be applied to the bottom of a vessel containing water, the air contained in the water will first appear as little bubbles which rise to the surface. Then the water in immediate contact with the heated portion of the vessel will be converted into steam, which will form as bubbles on the bottom of the vessel, and these will rise through the liquid, but at the commencement of the operation they will be at once condensed by the cold upper layers of water. Finally, however, the water becomes heated through when the bubbles rise to the surface and the steam exudes upon the air, and we have the phenomenon known as boiling. As the steam

passes into the air, it is cooled and collects into small particles of water which are visible as a white cloud above the surface, and the phenomenon is called condensation. If all the particles of this white cloud were collected into one mass, there would be a volume of water equal to the volume of water in the original vessel which had been converted into the steam forming the cloud. Boiling occurs only when the water in the vessel has reached a certain temperature. This temperature varies with the pressure. At the atmospheric pressure of 14.7 pounds at mean sea level, it is 212° F., but it would be somewhat less on the top of a high mountain and somewhat greater at the bottom of a deep mine. See HYPSOMETER; HYPSOMETRY.

The boiling temperature or boiling point of water thus varies with the pressure upon it. At a pressure of 5 pounds per square inch, it is as low as 162.3° F., and at a pressure of 100 pounds per square inch, it is as high as 327.58° F. Condensation takes place at any temperature lower than the boiling temperature.

To explain more fully the action of heat in the formation of steam, reference will be made to the accompanying diagrams. In Fig. 1, let the cylinder contain one pound of water at 32° F., and let the pressure of the atmosphere be represented by the weighted piston. Then if heat be applied to the bottom of the cylinder, the temperature of the water will rise higher and higher until it reaches 212° F.; the piston will up to this point remain stationary except for the small expansion of the water. On continuing the heat, the water shows no further rise in temperature, but steam begins to form and to force the piston upward as shown by Fig. 2, and this continues until the last drop of water is converted into steam and we have the condition illustrated by Fig. 3.

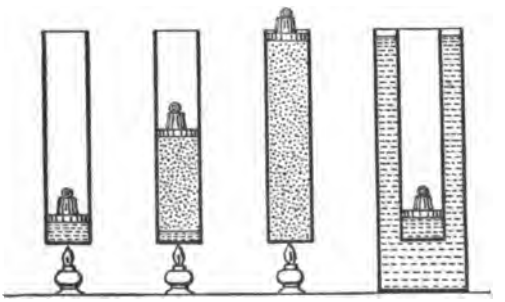

Fig. 1. Fig. 2. Fig. 3. Fig. 4.

Before proceeding further, we must note first that no steam began to form until the water reached a temperature of 212° F., hence this is evidently the lowest temperature at which steam will form under normal atmospheric pressure. Second, we must note that in the condition illustrated by Fig. 3 we have one pound of steam occupying the least possible volume at atmospheric pressure. In actual figures this volume is 26.36 cubic feet. Steam in this condition is known as *saturated steam*. If now we continue to heat the steam in the cylinder Fig. 3, its temperature will rise above that of saturated steam, and the piston will move upward, and we will have *superheated steam*. If now we take the cylinder Fig. 3 and plunge it into a vessel of cold water, as shown by Fig. 4, the heat will be taken away from the steam and it will condense to water. When this water has cooled to 32° F., the whole heat taken away is exactly equal to the whole heat added during the operations illustrated by Figs. 1, 2, and 3.

The amount of this added and abstracted heat may now be considered. First, let us assume that the cylinder Fig. 1 has an area of 1 square foot and that it contains 1 pound of water. The height to which the water rises in the cylinder is 0.016 foot. The pressure on the piston from the air is 14.7 pounds × 144 square inches = 2116.8 pounds. Now on applying heat to the water it will at first gradually rise in temperature from 32° F. to 212° F. before evaporation commences. Then 212° — 32° = 180 are the number of heat units required to raise water from 32° F. to the boiling point at atmospheric pressure. Steam now begins to form and the piston to rise until all the water is converted into steam at a temperature of 212° F. This steam, as before stated, occupies a space of 26.36 cubic feet. The heat required to perform this operation is 966 units. Hence the total heat required first to raise the water from 32° F. to 212° F. and then to convert it into steam is 180 + 966 = 1146 units. It is quite clear how the heat required to raise the water from 32° F. to 212° F. has been expended, but it is not so clear how the 966° F. required to convert the water at 212° F. into steam at 212° F. has been expended. It will be observed that two things have happened in this last operation. First, the water has been converted into steam, which occupies 1644 times the space occupied by the water from which it was generated. Second, the piston has been raised from the surface of the water in Fig. 1 to the surface of the steam in Fig. 3. Therefore, the heat has been expended in two ways: First, in overcoming the internal molecular resistance of the water in changing its condition from water to steam, and, second, in overcoming the external resistance of the piston to the increasing volume of the steam during formation. The first task performed is called the internal work of the steam and the second task is called the external work. Now the share of the heat expended in each operation may be calculated as follows: The total heat expended is, as already stated, 1146 units. To raise the piston with a pressure on it of 2116.8 pounds through a height of 26.36 feet requires 55,799 foot-pounds of energy. As the energy of one heat unit is 772 foot-pounds, then 55,799 ÷ 772 = 72.3 heat units expended in raising the piston. Adding this to 180, the number of heat units required to raise water from 32° F. to 212° F., we have 252.3 units consumed in heating the water and raising the piston. This amount subtracted from the total heat expended gives 1146 — 252.3 = 893.7, which is the number of heat units expended in internal work. We can now summarize the distribution of the heat as follows:

In raising temperature of water	180 units
In doing internal work	893.7 units
In doing external work	72.3 units
Total	1146.0 units

Having gone through the phenomenon of steam generation in detail, we can summarize some of the general facts that have been brought out. The temperature of the water gradually rises until it reaches the temperature at which steam

the pressure or the load on the piston. If this pressure is the normal atmospheric pressure of 14.7 pounds per square inch, steam begins to form at a temperature of 212° F.

As soon as 212° F. is reached, steam will begin to form and the piston will steadily rise, but no matter how hot the fire may be, the temperature of both water and steam will remain at 212° F. until all the water is evaporated. We had one pound of water at 32° F. and at 14.7 pounds absolute pressure, and found that steam formed at a temperature of 212° F. and remained at that temperature. We added 180.9 B. T. U. (British Thermal Units), the heat of the liquid, to bring the water from 32° to the boiling point. To convert water at 212° into steam at 212°, we added 965.7 B. T. U. more. This quantity, known as the latent heat, or heat of vaporization, makes the total heat 1146.6 B. T. U. If we should measure the volume carefully after all the water was evaporated, we should find that there was just 26.36 cubic feet of dry saturated steam. We had one pound of water, and therefore must have one pound of steam, for none of it could escape; hence one cubic foot will weigh $\frac{1}{26.36} = 0.03794$ pound, which is known as the density of steam. Density is the weight of a unit volume of a substance, and the density of steam is the weight of one cubic foot of steam. Volume is the space occupied by a substance, and the volume of steam is the number of cubic feet occupied by one pound of steam.

Suppose now we place a weight of 85.3 pounds on the piston. The pressure is 85.3 pounds plus 14.7 pounds, or 100 pounds absolute. We shall now find that no steam will form until a temperature of 327.58° is reached. Starting with water at 32°, it will be necessary to add 297.9 B. T. U. before a temperature of 327.58° is reached, and also we must add 884 B. T. U. more to vaporize it, making a total heat of 1181.9 B. T. U. Under this greater pressure the steam occupies a volume of only 4.403 cubic feet, or one cubic foot of it weighs $\frac{1}{4.403} = 0.2271$ pound.

We have already seen that any change in the temperature of saturated steam produces a change of pressure, and that every change of pressure corresponds to a certain change in temperature. There are several properties of saturated steam that depend upon the temperature and pressure; and the values of all these different properties when arranged for all temperatures and pressures are called steam tables. The

TABLE OF PROPERTIES OF SATURATED STEAM

PRESSURE IN POUNDS PER SQUARE INCH ABOVE VACUUM	Temperature in degrees, Fahrenheit	Total heat in heat-units from water at 32°	Heat in liquid from 32° in units	Heat of vaporization, or latent heat in heat-units	Density or weight of cubic foot in pounds	Volume of 1 pound in cubic feet	Factor of equivalent evaporation at 212°	Total pressure above vacuum

following are the principal items that are found in the tables:

(1) The absolute pressure in pounds per square inch; it is equal to the gauge pressure plus the atmospheric pressure of 14.7 pounds.

(2) The temperature of the steam, or boiling water, at the corresponding pressure.

(3) The heat of the liquid; or the number of B. T. U. necessary to raise one pound of water from 32° F. to the boiling point corresponding to the given pressure.

(4) The heat of vaporization, or the latent heat; this is the number of B. T. U. necessary to change one pound of water, at the boiling point, into dry saturated steam at the same temperature and pressure.

(5) The total heat; or the number of B. T. U. necessary to change one pound of water from 32° F. into steam at the given temperature or pressure. The total heat is evidently equal to the sum of the heat of the liquid and the heat of vaporization.

(6) The density of the steam; that is, the weight in pounds of one cubic foot of steam at the given temperature or pressure.

(7) The specific volume; or volume in cubic feet of one pound of steam at the required temperature or pressure. Evidently the specific volume is equal to $\frac{1}{\text{density}}$.

All these properties have been calculated by means of various formulas which have been deduced from the results of actual experiment.

We have seen that a saturated vapor contains just enough heat to keep it in the form of a vapor; if it loses heat it will condense. A superheated vapor is one that has been heated after vaporization; it can lose this extra heat before any condensation will take place. A vapor in contact with its liquid is saturated; one heated after removal from the liquid is superheated.

For saturated steam there is a fixed temperature for every pressure. If we know either the pressure or the temperature, we can find the other in the steam tables. For instance, if the gauge pressure of a boiler is 60.3 pounds and we wish to know the temperature, we simply add atmospheric pressure and turn to our tables and find it to be 307° (approximately).

With superheated steam the case is entirely different, for there is no longer the same direct relation between the temperature and pressure. In fact, the relation between temperature and pressure of superheated steam depends upon the amount of superheating. Superheated steam at 60.3 pounds gauge pressure may have a temperature considerably above 307° F. At a given pressure the temperature and volume of a given weight of superheated steam are always greater than the temperature and volume of the same weight of saturated steam. The properties of superheated steam at given pressure are not constant as is the case with saturated steam.

If superheated steam were a perfect gas, we could determine the relation of p, v, and t by the equation $pv = ct$; but superheated steam is not a perfect gas, hence we must modify our equation. By experiment it has been determined that the following equation is nearly correct:

$$pv = 93.5\ t - 971\ p^{\frac{1}{4}},$$

in which p = absolute pressure in pounds per square inch,
t = absolute temperature, and
v = volume of 1 pound in cubic feet.

STEAM CARRIAGE. See AUTOMOBILE.

STEAM ENGINE. A motor in which the expansive force of steam is employed as the medium for transforming the energy of heat into useful work. Ordinarily the steam acts upon a piston inclosed within a cylinder in such a manner as to be capable only of *reciprocating* motion, but in certain rare forms of engines it acts upon an inclosed piston or vane, which *rotates* around an axis. The rotary engine has the advantages of compactness and of being capable of applying its power directly, while the reciprocating engine has to have the rectilinear motion of the piston transformed into the rotary motion of a fly wheel or shaft by a cumbersome intermediate mechanism. These advantages of the rotary engine are, however, more than counterbalanced by its decided lack of economy in steam consumption, which prevents it from successfully competing commercially with the reciprocating engine. Only the latter is here treated.

EARLY HISTORY. The first instance of the use of steam as a motive power is generally assumed to have been the æolipile of Hero of Alexandria (q.v.). As early as 1543 a Spanish captain, named Blasco de Garay, is reputed to have shown in the harbor of Barcelona a steamboat of his own invention. A French engineer, Salomon de Caus, describes in 1615 a steam machine, which was merely a contrivance for forcing the water contained in a copper ball through a tube by applying heat. An Italian engineer, Giovanni Branca, invented, in 1629, a sort of steam windmill; the steam, being generated in a boiler, was directed by a spout against the flat vanes of a wheel, which was thus set in motion. See STEAM TURBINE.

In England the first successful effort was that of the Marquis of Worcester, who, in 1663, describes a steam apparatus by which he raised a column of water to the height of 40 feet. The first patent for the application of steam power to various kinds of machines was taken out in 1698 by Thomas Savery. His engines were the first used and seem to have been employed for some years in the drainage of mines in Cornwall and Devonshire. The essential improvement in them over the older ones was the use of a boiler separate from the vessel in which the steam did its work.

To Denis Papin, a celebrated Frenchman, is due the idea of the *piston*.

The next great step in advance was made about 1705 in the 'atmospheric' engine, conjointly invented by Newcomen, Calley, and Savery. In this engine, which is shown in Fig. 1, the previous inventions of the separate boiler and of the cylinder with its movable steam-tight piston are utilized, although in a new form. The 'beam,' which has ever since been in use in pumping engines, was used for the first time, and for the first time also the condensation of the steam was made an instantaneous process, instead of a slow and gradual one. To one end of a beam moving on an axis, I, was attached the rod, N, of the pump to be worked; to the other, the rod, M, of a piston moving in a cylinder, C, below.

The cylinder was placed over a boiler, B_1 and was connected with it by a pipe provided with a stop-cock, V, to cut off or admit the steam. Suppose the pump-rod depressed, and the piston raised to the top of the cylinder—which was effected by weights suspended at the pump end of the beam—the steam cock was then turned to cut off the steam, and a dash of cold water was thrown into the cylinder by turning a cock, R,

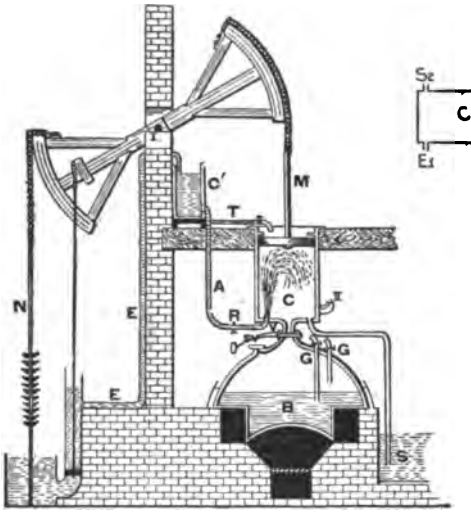

FIG. 1. NEWCOMEN'S ENGINE.

on a water pipe, A, connected with a cistern, C'. This condensed the steam in the cylinder, and caused a vacuum below the piston, which was then forced down by the pressure of the atmosphere, bringing with it the end of the beam to which it was attached, and raising the other along with the pump-rod. The cock was then turned to admit fresh steam below the piston, which was raised by the counterpoise; and thus the motion began anew. The opening and shutting of the cocks was at first performed by an attendant, but in 1713 a boy named Humphrey Potter devised a system of strings and levers by which the engine was made to work its own valves. In 1717 Henry Beighton invented a simpler and more scientific system of 'hand-gear,' which rendered the engine completely *self-acting*.

The next essential improvements on the steam engine were those of Watt. The first and most important improvement made by Watt was the separate condenser, patented in 1769. He had observed that the jet of cold water thrown into the cylinder to condense the steam necessarily reduced the temperature of the cylinder so much that a great deal of the steam flowing in at each upward stroke of the piston was condensed before the cylinder got back the heat abstracted from it by the spurt of cold water used for condensing the steam in the cylinder. The loss of steam arising from this was so great that only about one-fourth of what was admitted into the cylinder was actually available as motive power. Watt, therefore, provided a separate vessel in which to condense the steam, and which could be kept constantly in a state of vacuum, without the loss which arose when the cylinder itself was used as a condenser. The principal improvements since have been either in matters relating to the boiler or in details of construction consequent on increased facilities, improved machinery, and greater knowledge of the strength of materials.

ANALYSIS. The motor element of the engine is the cylinder and piston (Fig. 2). The cylinder, C, is a hollow cylinder of metal closed at

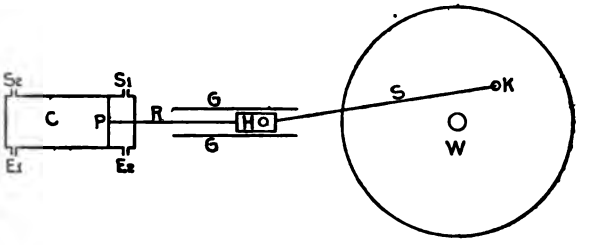

FIG. 2.

both ends, except for small openings for the entrance and escape of steam and for the passage of the piston rod. Inside the cylinder is the piston, P, a circular disk of metal fitting steam-tight and capable of movement lengthwise of the cylinder. The openings S_1 and S_2 provide for the admission of steam into the cylinder, and the openings E_1 and E_2 provide for the exhaust of steam from the cylinder. These passages are opened and closed by valves. These valves operate in pairs; when valves S_1 and E_1 are open valves S_2 and E_2 are closed and vice versa. If steam be admitted by opening valve S_1 its pressure forces the piston P to the opposite end of the cylinder. Valves S_1 and E_1 now close and valves S_2 and E_2 open, and steam entering at S_2 forces the piston to return and press, as it advances, the previous cylinderful of steam out of the exhaust port E_2. The repeated and alternate opening and closing of the two pairs of valves, as described, causes the piston to reciprocate back and forth in the cylinder. This motion is carried outside of the cylinder by means of the piston rod R. This is a cylindrical rod attached rigidly to the piston and passing out of the cylinder through a steam-tight orifice in the cylinder head. At its outer end the piston, rod is attached to a rectangular piece H, called the crosshead, which slides between two guides, GG. To the opposite end of the crosshead is hinged the rod S, called the connecting rod, the forward end of which is journaled to a crank K, which operates the fly-wheel W.

In the steam engine, as actually constructed, these different parts and their movements are variously modified, but the essential operating parts of all reciprocating steam engines are: The cylinder and piston; the valves and valve gear; the piston rod; the crosshead and guides; the connecting rod; the crank and crank-shaft or fly-wheel.

The ordinary unit of measure of the work done by a steam engine is the horse power, and it was originated by Watt. As defined by Watt a horse power is the work done in lifting 33,000 pounds one foot high in one minute. Now if the area of the piston P, Fig. 2, is w square inches and the pressure of the steam admitted to the cylinder is y pounds per square inch, then the pressure exerted by the steam against the pis-

ton is $w \times y$. If now the total travel or stroke of the piston is s feet, then the foot pounds of work for such stroke is represented by $w \times y \times s$, and if the piston makes n strokes per minute, the foot pounds of work of the piston per minute are represented by $w \times y \times s \times n$. This amount, divided by 33,000, gives the horse power of the engine. Assuming all of the other factors to remain the same or to be constant, the horse power of an engine may be varied by varying either the area of the piston, the length of the stroke, the pressure of the steam, or the number of strokes per minute. The whole of the theoretical horse power, however, is never available for useful work, owing to the friction of the moving parts and other causes.

CLASSIFICATION. Steam engines may be classified (I.) according to the nature of their mechanism, (II.) according to the manner in which the steam is used, and (III.) according to the use to which the engine is put.

I. Reciprocating engines may be grouped according to the position of the axis of the piston into horizontal engines, vertical engines, and inclined or diagonal engines. Fig. 2 shows the position of the parts of a *horizontal engine*, that is, an engine with the axis of the cylinder and piston horizontal. The advantages of such an engine are convenient access from the ground to all parts of the mechanism, distribution of the weight over a large area, and the location of the centre of gravity of the machine close to the foundation; its disadvantages are greater friction and wear of the cylinder owing to the fact that the piston is supported upon the bottom of the cylinder.

In the *vertical engine* the axis of the cylinder and piston is vertical; if the cylinder is carried by a frame above the crank shaft so that the piston rod extends downward, the engine is called an *inverted vertical engine;* and if the cylinder is below, with the piston rod extending upward to a crank shaft above, the engine is called a *direct vertical engine.* The advantages of the vertical engine are that the cylinder friction and consequent cylinder wear of the horizontal engine are largely avoided and that a comparatively small area of ground is occupied by the engine. Its disadvantages are that the weight of the piston, piston rod, crosshead, and connecting rod acts with the steam in one direction and against the steam in the other direction, thus producing unequal effort on the crank on alternate strokes, which has to be counteracted by special constructions; that the different parts of the mechanism are at different heights, requiring more attendants; that the centre of gravity of the machine is high, reducing its stability. The limited foundation area required for the vertical engine especially adapts it to places where room is scarce or expensive, as in steamships and city power houses. See STEAM NAVIGATION.

Inclined engines possess in a measure the advantages and disadvantages of both the horizontal and the vertical engine. In such engines the axis of the cylinder is at an inclination between the vertical and horizontal, and the cylinder is usually set below with the piston rod projecting diagonally upward to the crank shaft. They are used chiefly in side-wheel steamboats of shallow draught and in ferry-boats.

An engine in which the motion of the piston is transmitted by a connecting rod direct to the crank, as shown by Fig. 2, is called a *direct-acting engine.* As applied to pumps this term has a somewhat different meaning. (See PUMPS AND PUMPING MACHINERY.) In contradistinction to direct-acting engines we have *beam engines,* of which the engine shown by Fig. 1 is an early example. In the beam engine the connecting rod is journaled to one end of a beam rocking on a horizontal axis. To the other end of the beam is journaled a pitman rod which connects with the crank shaft. The engines for side-wheel steamboats are usually beam engines; and they are also used for pumping engines.

Besides the forms of engines mentioned there are various special forms, a few of which are sufficiently important to merit mention. The *oscillating engine* dispenses with the connecting rod, the piston rod connecting directly to the crank, and the cylinder is mounted upon suitable trunnions so that it can oscillate in conformation to the swaying of the piston rod in operating the crank. The *trunk engine* dispenses with the piston rod, the connecting rod being attached direct to the piston, which takes the form of a hollow cylinder closed at one end. The *back-acting engine* has the connecting rod extending back from the crosshead to a crank shaft back of the engine instead of extending forward as shown by Fig. 2.

II. The method in which the steam is used in the engine is also a basis for a scheme of classification. The fact that the same number of foot pounds of energy per minute may be secured by a small piston working at high speed or a larger piston working at a slower speed gives us our first classification, viz., *high-speed* and *low-speed* engines. The high-speed engine has the advantage of small dimensions and small weight for a given power, and, because the strokes are so frequent, of meeting variations in resistance more quickly than a slow-speed engine. Its disadvantages are its comparatively greater waste of steam, the greater wear of the moving parts, the greater danger of heating, and consequently the higher cost of construction and operation. Altogether, experience shows the slow or moderate speed engine to be superior to the high-speed engine where circumstances permit its use. Between 600 and 800 feet per minute is regarded as a moderate piston speed, and over 900 feet per minute as a high piston speed. Referring to Fig. 2, it will be observed that the steam acts first against one side of the piston and then against the other side. Such an engine is called a *double-acting engine.* When the pressure of the steam is exerted against one side of the piston only the engine is called a *single-acting engine.* The single-acting principle is utilized in the well-known Cornish engine for pumping and in certain high-speed rotative engines for electric light and power service. In the latter form of engine two cylinders are used which are coupled to separate cranks on the same shaft in order to secure continuous action. Two familiar forms are the Westinghouse and the Winans, and both are inverted vertical trunk engines. Owing to their single action and the omission of the connecting rod, these engines escape many of the disadvantages of the double-acting high-speed engine.

The Cornish single-acting pumping engine deserves particular notice because of its essentially

peculiar steam-cylinder mechanism. It appears in two forms, the beam form and the direct-acting form. The beam Cornish engine has a vertical cylinder from whose top the piston rod extends, and has the usual connecting-rod connection with one end of a beam pivoted at the centre, to whose other end are attached the pump rods. The direct-acting Cornish engine has the cylinder located directly over the mouth of the shaft and the piston rod passing out of its bottom connects directly with the pump rods. This form of Cornish engine is usually called the Bull Cornish, from the name of its first adopter. In both forms of Cornish engine the action of the steam is simply to raise the heavy pump rods, whose weight in falling displaces the water to be pumped. The cylinder of the Cornish engine has three valves, one for the admission of steam, one for the exhaust of the steam, and an equilibrium valve, these being shown in Fig. 3 at S, D, and E, respectively.

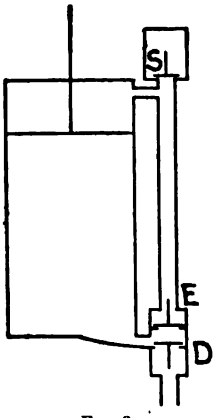

FIG. 3.

The cycle of operations is as follows: The pump rods being at the bottom of their stroke, the piston P of a beam Cornish engine will be at the top of the cylinder. The steam valve S and the exhaust valve D will be opened and the equilibrium valve E will be closed. The pressure of the steam drives the piston to the bottom of the cylinder, lifting the pump rods. When this operation has been completed, valves S and D are closed and valve E is opened. The opening of valve E permits the steam above the piston to flow freely beneath it, equalizing the pressure on the two sides of the piston and leaving it free to return to the top of the cylinder under the pull of the heavy pump rods. The valves of the Cornish engine are worked by a special device called a *cataract*. This consists of a weighted piston working in a cylinder, having a large intake valve and a small discharge valve, whose opening can be adjusted to various dimensions. During the working stroke of the pump this weighted plunger is lifted, drawing water into its cylinder through the large inlet valve. When the pump makes its return stroke the weighted plunger is released and gradually descends as its weight presses the water out of its cylinder through the small discharge valve. The return stroke of the weighted plunger actuates the valves of the steam cylinder of the pump so as to cause another working stroke.

The third subdivision of engines according to the method of using the steam comprises expansive and non-expansive working engines. To understand the nature of this subdivision it will be found convenient to refer to the diagram Fig. 4. In this diagram the full lines represent the cylinder, piston, and piston rod. Now if steam be admitted behind the piston it will force it forward to the position which it occupies in the diagram. The steam may be made to perform this operation in two ways, non-expansively and expansively. When used non-expansively the steam enters the steam port at boiler pressure, and as this port remains open until the piston has completed its stroke, boiler pressure is maintained behind the piston during the whole stroke. If we assume the broken line *ad* to represent the steam pressure and the broken line *dc* to represent the stroke, then the work done by the steam is represented by the dotted rectangle *abcd;* the pressure *bc* at the end of the stroke is the same

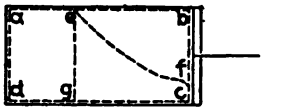

FIG. 4.

as the pressure *ad* at the beginning of the stroke, and a cylinderful of steam at full pressure has to be exhausted in order to make the return stroke. When using the steam expansively the steam valve is closed when the piston has reached some intermediate point, as *e*, called the point of cut-off, in its forward stroke, and no more steam is admitted into the cylinder. Full steam pressure is, therefore, maintained against the piston for the portion *ae* of its stroke, but afterwards this pressure gradually decreases as the steam expands until at the end of the stroke it is represented by the line *cf*. The work done by the steam is represented by the area *aefcd*, which, as will be readily seen, is less than the area *abcd*, representing the work done when using the steam non-expansively. In using the steam expansively, however, the amount at boiler pressure which is consumed at each stroke is represented by the rectangle whose base is *ae* and whose height is *ad*, as compared with the rectangle *abcd*, representing the amount of steam at boiler pressure consumed at each stroke in non-expansive working. Evidently, from the diagram, the amount of steam used in proportion to the work done is less in expansive working than in non-expansive working. This advantage has made the expansive working engine practically universal where circumstances will permit.

The fourth subdivision of steam engines according to the method of using the steam comprises condensing and non-condensing engines. In a non-condensing engine the waste steam from the cylinder is exhausted into the air at air pressure, or 14.7 pounds per square inch. In the condensing engine it exhausts into a vacuum and is condensed into water. Thus, in a non-condensing engine the steam has to force the piston against a back pressure of 14.7 pounds per square inch, while in a condensing engine this back pressure is obliterated, with a consequent gain of 14.7 pounds per square inch in the effective working pressure of the steam. The practical advantage of the condensing engine may, therefore, be expressed by saying that it will receive the same power with a smaller cylinder and greater power with the same cylinder, as compared with a non-condensing engine. (See CONDENSER.) A fifth subdivision of steam engines according to the method in which steam is used comprises simple engines, compound engines, and multiple expansion engines. In a simple engine the steam, after having done its work in forcing the piston through its stroke, is exhausted into the air or into a

condenser. In a compound or multiple-expansion engine the steam, after having done its work in one cylinder, is exhausted into a succeeding cylinder of larger size, where it continues to perform work. The operation may be explained by the diagram Fig. 5. Steam enters the cylinder HP, which is connected with cylinder LP by two passages *a* and *b* closed by valves, and here performs the work of driving piston P_1 to the front end of the cylinder. This steam, instead of being exhausted into the air or into a condenser to allow the return stroke of the piston P_1, is exhausted through the passage *a* into cylinder LP, where it acts to drive forward piston P_2. Were the size of the cylinder LP the same as that of the cylinder HP, it is evident that the propulsive effect of the steam on piston P_2 would be exactly counterbalanced by the back pressure on piston P_1, and, therefore, that there would be no increase, but rather a loss, in the work done. If, however, cylinder LP is made twice the diameter of cylinder HP, then the forward pressure on piston P_2 is greater than the back pressure on piston P, and a position or working effect is obtained by the second use of the steam. A two-cylinder engine like Fig. 5 using steam as described is called a *compound* engine. Were the exhaust steam from the second cylinder to enter a third and larger cylinder and continue working we should have a *triple expansion engine*. If a fourth cylinder were added to the set we should have a *quadruple expansion engine*. The expansive working of steam has not been successfully carried beyond four expansions. The cylinders of compound engines are generally arranged parallel to each other or side by side, or else one behind the other, or tandem. A tandem compound with the cylinders set vertical is called a *steeple engine*. When the cylinders are placed side by side, but some distance apart so as to allow space for a fly wheel between them, the engine is commonly called a *cross-compound engine*. Modern marine engines for screw vessels are nearly always inverted vertical compound or multiple expansion engines. (See Plates under STEAM NAVIGATION.) The arrangement of the cylinders of triple and quadruple expansion engines varies considerably. The great practical advantage of the compound or multiple expansion engine is the economy resulting from the expansive use of steam, as indicated in discussing expansive and non-expansive working engines. It is obviously possible to use the steam according to any of the methods discussed with any of the arrangements of mechanism previously discussed and thus make a great number of combinations.

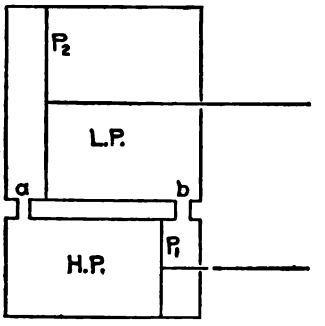

FIG. 5.

III. A very usual classification of steam engines is based upon the service or use to which the engine is to be put. It includes the following groups: *Stationary engines, locomotive engines,* and *portable engines*. The first group or stationary engines include mill engines, power-house engines, pumping engines, blowing engines, air compressors, hoisting engines, and others. Locomotive engines include locomotives, marine engines, traction engines, steam road rollers, self-propelled fire engines, and others. Portable engines include a wide variety of engines, such as agricultural engines, so designed that the engine and boiler are self-contained and do not require a foundation or permanent structure of any kind.

STRUCTURAL DETAILS. Structurally the steam engine consists of the working parts and the fixed structure or frame by which the working parts are supported and maintained in their relative positions. The supporting frame is usually a structure of cast or forged iron or steel varying in shape to suit the form of engine of which it is a part. The working parts of an engine comprise the cylinder and piston, the valves and valve gear, the governor, the piston rod, crosshead, and connecting rod, and the crank shaft and fly wheel. The function of the engine frame is to constitute a fixed link in a kinetic chain, and to perform this function it must be essentially rigid and strong. In a horizontal engine, as shown in Fig. 2, it will be evident that the duties of the frame are to support the cylinder C at one end, and the fly wheel W at the other end; and to steady and align the transforming mechanism connecting these two parts. The frame of a vertical engine performs an exactly similar duty, but of course differs in construction to suit the different arrangement of the moving parts. Thus in an inverted vertical engine there is a broad base plate, on which the crank shaft is directly supported. From this base plate rises a columnar structure supporting the cylinders and guiding the reciprocating parts. Cast iron and cast steel are particularly adapted to furnish the rigidity and massiveness desired, and are, therefore, the materials commonly employed for engine frames. In certain classes of engines, such as the locomotive and the marine engine, where lightness combined with great strength is an essential, forged steel frames are used.

Turning now to the working parts, the cylinder and piston as the motor elements naturally call first for consideration. The engine *cylinder* is a barrel-shaped or box-shaped casting, with its interior bored out into the form of a perfect cylinder. The ends of this cylinder are closed by cover-like castings fastened by studs or bolts to the body. The front head has a circular orifice at the centre to allow for the exit of the piston rod, and where a tail rod is used a similar orifice is necessary in the back head. The barrel or body of the cylinder has one or more orifices for the admission and exhaust of the steam, and these orifices are covered by a box-like chamber called the *steam chest*, inside of which work the *valves*, as will be described immediately. The body and often the ends of the cylinder casting are usually covered with a *lagging* or envelope of some material which is a poor conductor of heat and whose purpose is

inder by the loss of heat due to radiation from its outer walls. The *piston* is a circular disk of metal of sufficient strength to resist distortion by the steam pressure. In the edge of this disk are set rings of metal so arranged that they are constantly pressed outward against the walls of the cylinder, either by their own elasticity or by the elasticity of springs pressing against them from behind. These rings are called *packing rings*, and their function is to make the piston fit steam-tight in the cylinder and at the same time render its movement as free from friction as possible.

The function of the valves and valve gear is to control the admission and exhaust of the steam. The functions of the *valve* are both primary and secondary. The primary function is to admit the steam from the boiler to one side of the piston, while the exhaust steam filling the other end of the cylinder is permitted to escape with the least possible resistance. The secondary functions are to close the admission of steam at the point necessary to give the expansion desired and to close the exhaust orifice at such a point in the return stroke that a certain volume of steam shall be caught and compressed behind the piston to serve as an elastic cushion. It is necessary also that the opening of the inlets and outlets of the cylinder should be so timed with respect to the stroke of the piston that pressure may not be brought too soon against the piston head, nor the exhaust opened until the expanding steam has done its entire work for that stroke. The valves for admitting and distributing steam in an engine cylinder may open the ports which they control, either by lifting from their seats or by sliding upon their seats. When the engine is a double-acting one there must be provision to connect each end of the cylinder with the boiler and each end with the exhaust pipe. When the engine is single-acting it is only necessary to connect one end to the boiler and exhaust pipe alternately. Apparently the simplest arrangement would be to have four valves, as shown by Fig. 2, one at each end for steam, and one at each end for exhaust. This is the arrangement in the *Corliss engine*. An important type of engines makes use of a separate valve for admitting steam at each end, while the exhaust is controlled by a single valve for both ends. Such engines are called *three-valve engines*. Another arrangement is to have one valve for admitting steam to both ends and another controlling the exhaust for both ends. Such engines are called *two-valve engines*. A fourth class has one *single valve*, so designed as to perform the inlet and outlet functions for both ends. Such are the great majority of stationary engines and all locomotive and marine engines.

The simplest form and also the most common form of single valve is the D-shaped *slide valve*. In the diagram, Fig. 6, W represents a portion of the top wall of the cylinder, S and S_1 being the steam ports to the two ends of the cylinder. At the top these steam ports open into the inclosed space A, B, C, D, which represents the steam chest. The valve proper is represented by V, which is operated by the rod R passing out through a suitable orifice in the forward end of the steam chest. The steam from the boiler is admitted into the space above the valve. It valve exactly covers the ports S and S_1, and steam from the steam chest cannot enter the cylinder, nor can any steam contained in the

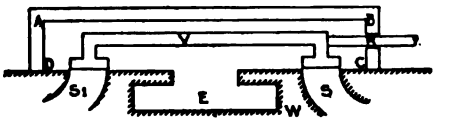

FIG. 6.

cylinder escape. If the valve is moved either to the right or left of the position shown, both ports are immediately uncovered. If the movement be toward the right, port S_1 is opened to the live steam space above valve V, and port S is opened to the exhaust space E, beneath the valve V. A reverse movement of the valve opens port S to the live steam space, and port S_1 to the exhaust space. The movement of the valve from 'centre' to the right and back again to 'centre' accomplishes the right-hand stroke of the piston; its movement from 'centre' to the left and back again to 'centre' accomplishes the left-hand stroke of the piston. These alternate right and left movements of the valve are accomplished by means of the rod R, and are eccentric. (See ECCENTRIC.) When the valve is at 'centre' the axis of the eccentric is at right angles to the fly-wheel crank, providing the valve is constructed, as shown, to cover exactly the steam ports, which is the construction for non-expansive working of the steam. This is the simplest form of slide valve. To provide for the expansive working of the steam, its use as a compression cushion and other desirable variations in admission and exhaust, the construction of the valve and the position of the eccentric have to be modified in various ways, an analysis of which is a matter of considerable mechanical intricacy.

The train of mechanism by which the opening and closing movements of the valves are effected is called the *valve gear*. This varies in construction and operation. The precise character of the gear adopted in any case is determined partly by the form of valve and partly by the nature of the general problem presented for solution. In some cases it is merely required that a fairly good steam distribution shall be se-

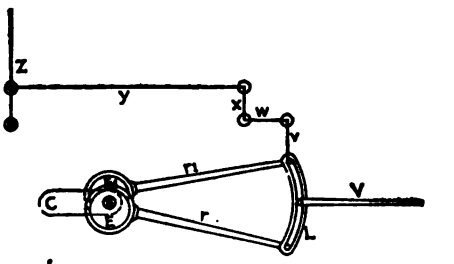

FIG. 7.

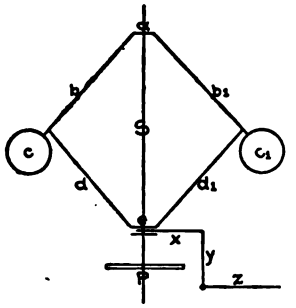
cured; in other instances a good method of expansion must be obtained; in still other cases the system must be capable of adjustment with a view to wise regulation of speed, and in all locomotive and marine engines easy and prompt reversal of the direction of motion is required. Different inventors have invented different forms

of valve gear designed particularly to meet one or the other of these conditions. Of these the link motion invented by Howe in 1843, and first used on Stephenson's engines, is perhaps the most familiar, it being the gear very generally used, either as originally designed or in some modified form, on locomotives and marine engines. Fig. 7 shows the Howe link, or, as it is more commonly called, the Stephenson reversing link valve gear. The two eccentrics E and E_1 are set on the crank shaft, S, at right angles to the crank, C. These eccentrics carry two rods r and r_1 diverging from each other at a slight angle and with their forward ends connected by the slotted, curved link, L. The valve stem, V, has a block or pin which connects it to the link by means of a sliding fit in the slot. If the link be lifted so that the rod r lies nearly in line with V, then the valve receives its motion merely as if driven directly by the single eccentric E; if the link be lowered so that rod r_1 lies nearly in line with V, then the valve acts practically as if driven by the single eccentric E_1. Now eccentric E_1 being set for forward motion of the engine and eccentric E being set for backward motion, it will be seen that the movement of the link gives a ready means for reversing the engine. It does more than this, however, since by putting the link in intermediate positions between full forward and full backward gear the cut-off of the valve can be adjusted for expansive working of the steam. The train of levers v, w, x, y, and z in Fig. 7 shows the means of operating this link in an ordinary locomotive engine.

The *governor* of a steam engine is a device whose function is to regulate the energy developed in accordance with the load propelled. If the admission and pressure of the steam be constant, the speed will vary as the load varies; with a light load the speed will be high and with a heavy load it will be slow. These fluctuations in speed are always undesirable and may easily become dangerous, as, for example, when the engine 'races' or 'runs away,' causing the fly wheel to burst from centrifugal force. Governors act to regulate the energy in two ways, first by cutting off steam from the boiler as the speed increases, which amounts to a reduction in boiler pressure, and second by reducing the quantity of steam admitted into the cylinder. The first are called *throttling governors* and the second are called *cut-off governors*. Governors are also classified according to their method of action and according to their form. The most common form of governor is the fly-ball or pendulum governor, which may operate either by throttling or by cut-off action. The diagram (Fig. 8) shows a form of pendulum governor. The stem or shaft, S, is given rotary motion by means of a belt embracing the pulley, P. Keyed to the top of the shaft is the plate a, carrying, by means of the arms b and b_1, the heavy balls c and c_1, and hung to the arms b and b_1 are the arms d and d_1 which connect with the plate e, which is free to slide up and down the shaft S. The balls and their connecting arms revolve with the shaft, and because of the familiar law of centrifugal force they tend to fly apart as the speed of rotation increases and to come closer together as this speed decreases. As the balls fly apart, due to increased speed, they lift the plate e, and this operates the train of levers x, y, and z in such a way as either to shut off steam from the boiler or from the cylinders. That is, as the speed increases the energy is decreased, and conversely as the speed decreases the energy is increased. In this way the energy is proportioned to the load at every instant, the exactness with which this proportion is maintained depending upon the sensitiveness of the governor.



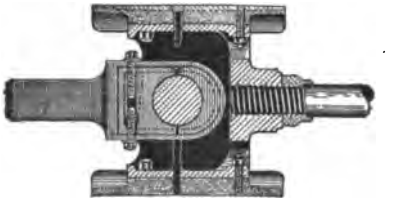


FIG. 8.

The *transmission mechanism* of a steam engine consists of the piston rod, the crosshead, and the connecting rod. The duty of the *piston rod* is to convey the energy developed by the piston outside of the cylinder so that it may be transmitted to the crank shaft or fly wheel. At its inner end the piston rod is attached rigidly to the piston at its centre and at its outer end it is rigidly attached to the crosshead. The rod passes out of the cylinder through an orifice in its front end, this orifice being so constructed that it is steam-tight. It is due largely to the fact that a circular orifice is more easily made steam-tight than any other form that the piston rod is universally cylindrical in form. The *crosshead* is the connecting link which permits the rectilinear motion of the piston rod to be transformed into the swaying motion of the connecting rod. The manner in which it accomplishes this is clearly shown by Fig. 9, which is a section through a familiar make of crosshead. The piston rod coming from the right is rigidly attached to the crosshead by a threaded connection, while the connecting rod is connected by means of a horizontal pin, so that it can swing up and down. The top and bottom of the crosshead are planed smooth and fit a groove or track in the upper and lower guides. These guides are a part of the engine frame, and serve to prevent any vibration of the outer end of the piston rod due to the swaying motion of the connecting rod. The connecting rod is commonly a rectangular or cylindrical bar having at each end a circular bearing, one to embrace the crosshead pin and the other to embrace the crank pin. Fig. 10 shows the construction described. The articles CRANK and FLY WHEEL describe the construction and functions of these parts of the engine's mechanism, and they will not be mentioned further. In concluding this section reference may be made to Fig. 11 as showing in a very plain manner the character and relation of the several structural details which have been described individually. In this

FIG. 9. SECTION OF CROSSHEAD.

engraving the different parts are designated by letters as follows: The engine frame, A; the cylinder, B; the piston rod, C; the crosshead, D; the connecting rod, E; the crank, F; the fly wheel, G; and the governor, H.

The first practical use of importance to which steam engines were put was the pumping of water, and the *pumping engine* still remains one of the principal forms of the steam engine. The various types of pumping engines are described in the article on PUMPS AND PUMPING MACHINERY. The next important use of the stationary steam engine was for driving the machinery of factories, mills, and workshops, and such establishments still consume an enormous aggregate of steam-engine power. The modern form of *mill engine* is the horizontal direct-acting fly wheel engine, in which the power is taken from the fly wheel and transmitted to shafting by means of belts. (See BELTS and POWER, TRANSMISSION OF.) For mill engines of large size present practice favors compound engines; simple engines are used when the unit of power which is required is small. Generally tandem compound and cross compound engines are preferred to engines using steam with three or four expansions, although multiple-expansion mill engines are not infrequent. A horizontal simple engine of comparatively small size which can be used for dynamo driving or other high-speed work, is shown by Fig. 11. A third type of stationary engine is the *hoisting engine*, which in its smaller sizes combines a vertical steam boiler and a duplex horizontal or vertical engine in one machine. Such engines do not have a fly wheel, but connect directly with a crank shaft which drives the drum upon which the hoisting rope is wound. Hoisting engines of larger size have separate boilers and often operate as many as eight separate drums. The largest sizes of hoisting engines are those used in raising ore from deep mine shafts. These mine hoists have capacities of from 2000 to 5000 horse power. Like the smaller sizes, they are either duplex vertical or duplex horizontal engines. A duplex engine consists of a right-hand and a left-hand engine, both of which couple to the same crank shaft. They are to be distinguished from cross-compound engines, which have a similar appearance structurally, by the important fact that each half of the machine is distinct from the other half so far as the use of the steam is concerned. In direct-acting mine hoists the drum or drums are mounted directly on the crank shaft; in general hoists the crank shaft drives a separate drum shaft by means of gearing. A fourth form of stationary engine is the *rolling-mill engine*, used for driving the trains of rolls in rolling mills. (See ROLLING MILL.) This is usually a horizontal simple engine of

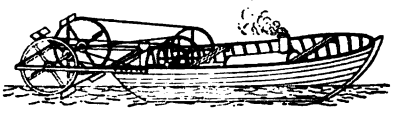
2. 5,000 Horse-power Westinghouse-Corliss Cross-compound Engine.

large size and especially sturdy construction. The largest stationary steam engines now used in any form are those employed for driving the generators of electric power plants. These large machines are almost universally of the inverted vertical direct-acting type, illustrated in the accompanying plate. A sixth important form of steam engine is the steam-driven air compressor described in the article AIR COMPRESSORS.

Engines other than stationary fall into one of two great classes, viz., locomotive engines for railways and marine engines for ship propulsion. The *traction engine* is essentially a locomotive engine designed to run on common roads, and the *portable engine* is practically a stationary engine and boiler plant of small size mounted on wheels so that it may be hauled from place to place. The growth and construction of the *locomotive engine* are described in the article LOCOMOTIVE. *Marine engines* fall into two separate classes. For paddle-wheel boats the beam engine and the inclined engine are universally employed. For screw-propelled vessels the inverted vertical direct-acting engine is almost universal. (See STEAM NAVIGATION.) For a discussion of the theory of steam engines and heat engines in general, see STEAM and THERMODYNAMICS. For descriptions of special applications of steam engines, see AUTOMOBILE; FIRE-ENGINE; BLOWING-MACHINES.



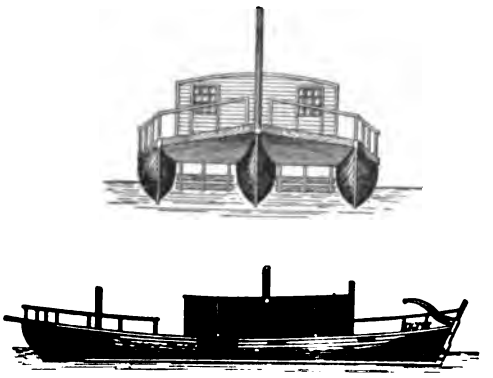
BIBLIOGRAPHY. For an account of the development of the steam engine, see Thurston, *Growth of the Steam Engine* (New York, 1879). Among the best theoretical and descriptive works are: Clark, *The Steam Engine* (London, 1890); Thurston, *Manual of the Steam Engine* (New York, 1892); Hutton, *The Mechanical Engineering of Power Plants* (ib., 1897); Seaton, *A Manual of Marine Engineering* (ib., 1895); Peabody, *Valve Gears for Steam Engines* (ib., 1892).

STEAMER DUCK, LOGGERHEAD, or RACEHORSE. A very large duck (*Tachyeres cinerus*), numerous about the southern extremity of South America, so called on account of its peculiarity of rowing itself along the surface of the water at great speed. This is said to be due to the remarkable fact that this bird loses its power of flight when it reaches maturity.

STEAM HAMMER. See HAMMER.

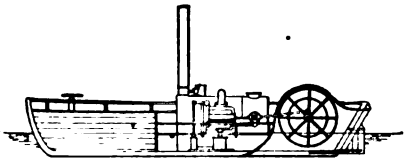
STEAM HEATING. See HEATING AND VENTILATION.

STEAM NAVIGATION. The Spaniards assert that as early as 1543 Blasco de Garay made an attempt to propel a vessel by steam in the harbor of Barcelona. In the absence of direct proof of the fact this may well be doubted. At the time mentioned the most advanced scientists in Europe had not yet begun seriously to consider steam as a source of power. The assertion is also made that Denis Papin (q.v.) in 1707 propelled a boat by steam on the River Fulda. Papin invented the safety valve and a single-acting steam cylinder pump, and made various improvements in steam pumps, but it does not appear that he ever built what might be called a steam engine. The boat which has been mentioned and which is frequently referred to had some sort of paddle wheels, but they were operated by the crew and not driven by steam power. In 1729 Dr. John Allen took out a patent in England for a method of propelling a boat by means of forcing water out of the stern with steam or other pressure. In 1736 the rather vague ideas of Allen were improved upon by Jonathan Hulls, a clockmaker of Campden, Eng-



HULLS' BOAT.
(From an old drawing.)

land, and he was granted a patent for mechanism to propel a boat by steam power. Like Allen, he apparently made no serious attempts to put his ideas into practice. In 1752 the French Academy of Sciences awarded a prize to the distinguished physicist Daniel Bernoulli for an essay on the manner of propelling boats without wind. In addition to other suggestions he proposed the use of the screw propeller.

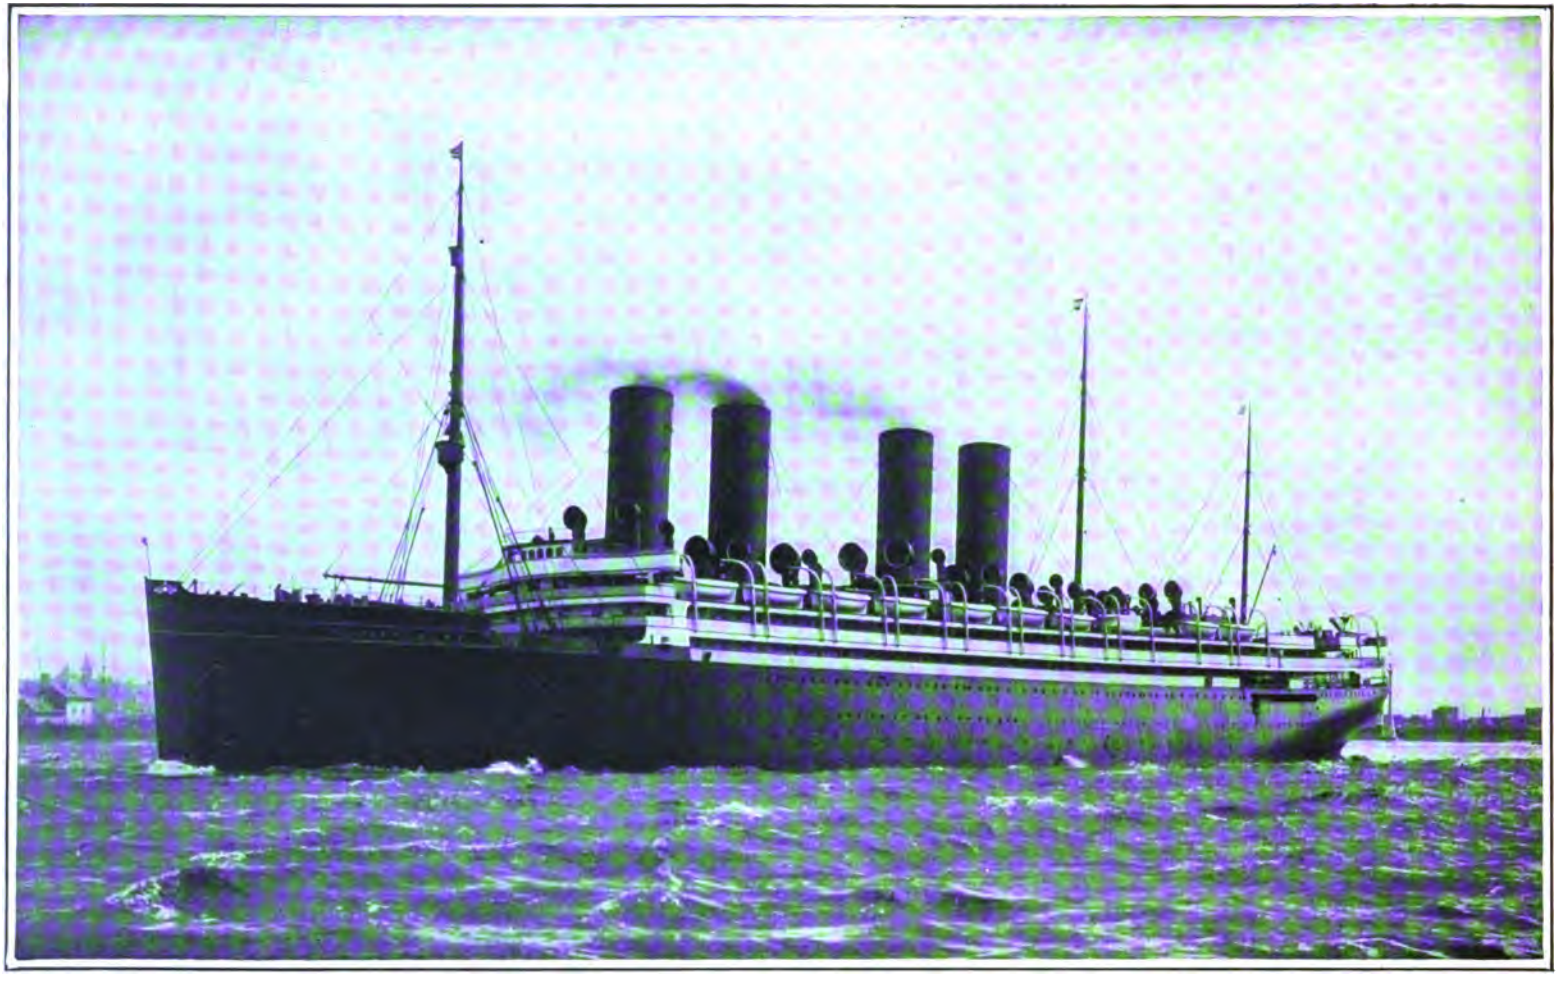


Up to this time successful steam navigation was impossible because a practical steam engine did not exist. This deficiency was supplied by Watt, who took out his first patent in 1769, but the engines contemplated were really single-acting pumps. In 1782, however, Watt brought out the double-acting engine, and developed the principle of expansive working by cutting off the steam at a suitable point instead of allowing it to follow full stroke. All the conditions for the propulsion of vessels by steam were now in existence and experimental boats rapidly appeared. In 1783 the Marquis de Jouffroy built one which was tried at Lyons, and it is said to have been successful; but before it could be developed into a form for practical use the Revolution overtook and ruined him. At the same time John Fitch, James Rumsey, and Oliver Evans were experimenting in America. Rumsey's boats, like the proposed vessel of Dr. Allen, were fitted with jet propellers, whereby a stream of water was discharged by a steam-driven pump. His first boat was tried in Virginia in 1784 and a second, which attained a speed of 4 knots, was completed in 1786. He died in London in 1792, just previous to the trial of a new boat built from his plans. Fitch's boats were fitted with various types of propelling machinery —with paddle wheels in 1785 and afterwards with long paddles which were given motion similar to that of the paddle of an Indian canoe. In 1790 one of Fitch's boats attained a speed of 7 knots, and afterwards was used on the Delaware to carry passengers. In 1793 Fitch went to France; in 1796, after returning to America, he built a small screw steamboat, but the exact measure of success that he attained is uncertain. Evans experimented with various peculiar types of steamboats, one of which was fitted with a rude screw and wheels with which to run on shore. In England Joseph Bramah obtained a patent in 1785 for propelling vessels by means of "a wheel with inclined Fans or Wings similar to the fly of a Smoke-jack or the vertical sails of a windmill." A patent for a similar invention was issued to William Lyttleton in 1784 and to Edward Shorter in 1800. In 1791 John Stevens of Hoboken, N. J., patented a multitubular steam boiler, and he soon after began experiments with steam propulsion of boats, in which he was assisted by the

celebrated engineer Mark Isambard Brunel, then an exile. Brunel left the United States in 1799, however, and it was not till three years later that Stevens completed a small screw-propelled boat which he used for his own pleasure. This little boat, only twenty-five feet in length, was the first successful screw-propelled craft built. Engines suitable for large screw steamboats were not yet invented, so that commercial success in this direction was not yet aimed at. Patrick Miller, a retired banker of Edinburgh, for several years experimented with boats of various types in a lake on his estate of Dalswinton in Dumfriesshire. These boats had two or three hulls con-

MILLER'S BOAT.

nected by a flying deck and driven by paddle wheels placed in the space between the hulls. In the earlier experiments men were employed to turn the wheels, but in 1788, partly at the instance of James Taylor, a tutor in his family, Miller engaged a Scotch engineer by the name of Symmington to fit the boats with steam power. A small boat was tried and gave such promises of success that a larger one was built in 1789. In October of that year this boat attained a speed of seven miles an hour on the Forth and Clyde Canal. Either because of lack of interest or of means, Miller ceased thereafter to interest himself in the matter and nothing further was attempted. But in 1801 Symmington was commissioned by Lord Dundas of Kerse to build a steamer for towing barges on the Forth and Clyde Canal. This was the celebrated *Charlotte Dundas*. She was a success in



CHARLOTTE DUNDAS.

all essential respects, but the proprietors of the canal refused to use her because they feared the effect of the wash from her paddles on the banks of the canal. She was therefore broken up and her disappointed designer turned his attention to land machinery.

The next development was Robert Fulton's *Clermont*, and her advent marks the beginning of steam navigation as a commercial success. In 1797 Fulton (q.v.) went to Paris from England and soon afterwards began experiments with submarine torpedoes and torpedo boats. About the year 1801 he secured the assistance of Robert Livingston, then the United States Minister to France, and they built a small steamboat. Her engines proved to be too heavy for the poorly constructed hull, which collapsed and sank. The engines were recovered, however, and placed in a larger boat 66 feet long and 8 feet broad, and on August 9, 1803, this boat was tried on the Seine, but the speed obtained was unsatisfactory. In 1804, as the agent of Livingston, Fulton went to England, where he ordered of Boulton and Watt the machinery for a much larger vessel which was to be built in the United States. In the autumn of 1806 Fulton returned to America, and the new engine followed him almost immediately. A hull, built in New York, was launched early in 1807, the engines were placed on board, and on August 7, 1807, the *Clermont* started on her trial trip. She proceeded without stopping to Clermont, the home of Livingston, on the Hudson, 110 miles away, and twenty hours later went on to Albany. The next day she started to New York and made the trip in thirty hours at an average speed of 5 miles an hour. Within a month she began to run regularly between Albany and New York.

The success of paddle steamers for sheltered waters was now assured, and they multiplied rapidly, particularly in the United States, where the conditions were particularly suitable. In Great Britain the use of steamers was less immediate. The first commercially successful one to be completed there was the *Comet*, built by Henry Bell in 1811-12. She went into service on the Clyde and was soon followed by others. In the meantime the use of steamers for ocean navigation was being tried. In 1813 Fulton began the war steamer *Demologos* (see UNITED STATES, section on *Navy*), which was the first steam war vessel as well as the first ocean-going steamer. Several steamers began to make regular trips along the British coast in 1818-19, but the voyages were all short. In 1819 a vessel fitted with steam power crossed the Atlantic. This was the *Savannah*, of 350 tons, with a length of 100 feet, which crossed from Savannah to Liverpool in 25 days. In her, however, the engines were purely auxiliary; she was fitted with full sail power, and when the wind was fair or the seas too boisterous for steaming the paddle wheels were unrigged and taken in on deck. The beginning of real transatlantic voyages under steam was made by the *Sirius* and the *Great Western*. The latter was built for transatlantic service and was the larger and more powerful, while the former was taken from the London and Cork line. The *Sirius* started on April 4, 1838, and the *Great Western* four days later. They arrived in New York within twenty-four hours of each other, the *Sirius* at 10 P. M. on the evening of April 22d and the *Great Western* the next afternoon at three o'clock. The average speed of the *Sirius* was 161 miles per day—the highest 220 miles and the lowest 85 (half day only); the amount of coal consumed was 450 tons. The *Great Western* averaged 208 miles per day and her highest run was 247 miles. Neither vessel carried much sail.

For two or three years the transatlantic

A TRANSATLANTIC LINER—NORTH GERMAN LLOYD STEAMSHIP "KAISER WILHELM II."

steamer service was rather irregular. The *Sirius* was withdrawn after making a few trips, and though the *Great Western* continued running, she lost money for the company that owned her. Other steamers made a few trips, but they also, like the *Sirius*, were withdrawn. In 1839 Samuel Cunard, of Halifax, N. S., went to England and succeeded in forming the celebrated Cunard Company. Assisted by a liberal Government mail subsidy, it was commercially successful from the start. The first vessels put in service were the paddle steamers *Britannia*, *Acadia*, *Columbia*, and *Caledonia*. They were of 1154 tons burden and their machinery was of 740 horse power. The *Britannia*, the first to sail, left Liverpool on July 4, 1840, and made the passage to Halifax in 12 days 10 hours; on her return voyage she did better, the time being but little over ten days. The Cunard Company enjoyed a practical monopoly of the transatlantic service until 1850, when the Collins (American) and Inman lines were started. The Collins Line lost two of its four steamers and was discontinued in 1858. Two other American steamship lines were started in 1850, the New York and Havre Steamship Company and the Vanderbilt Line. Both ceased running at the beginning of the Civil War.

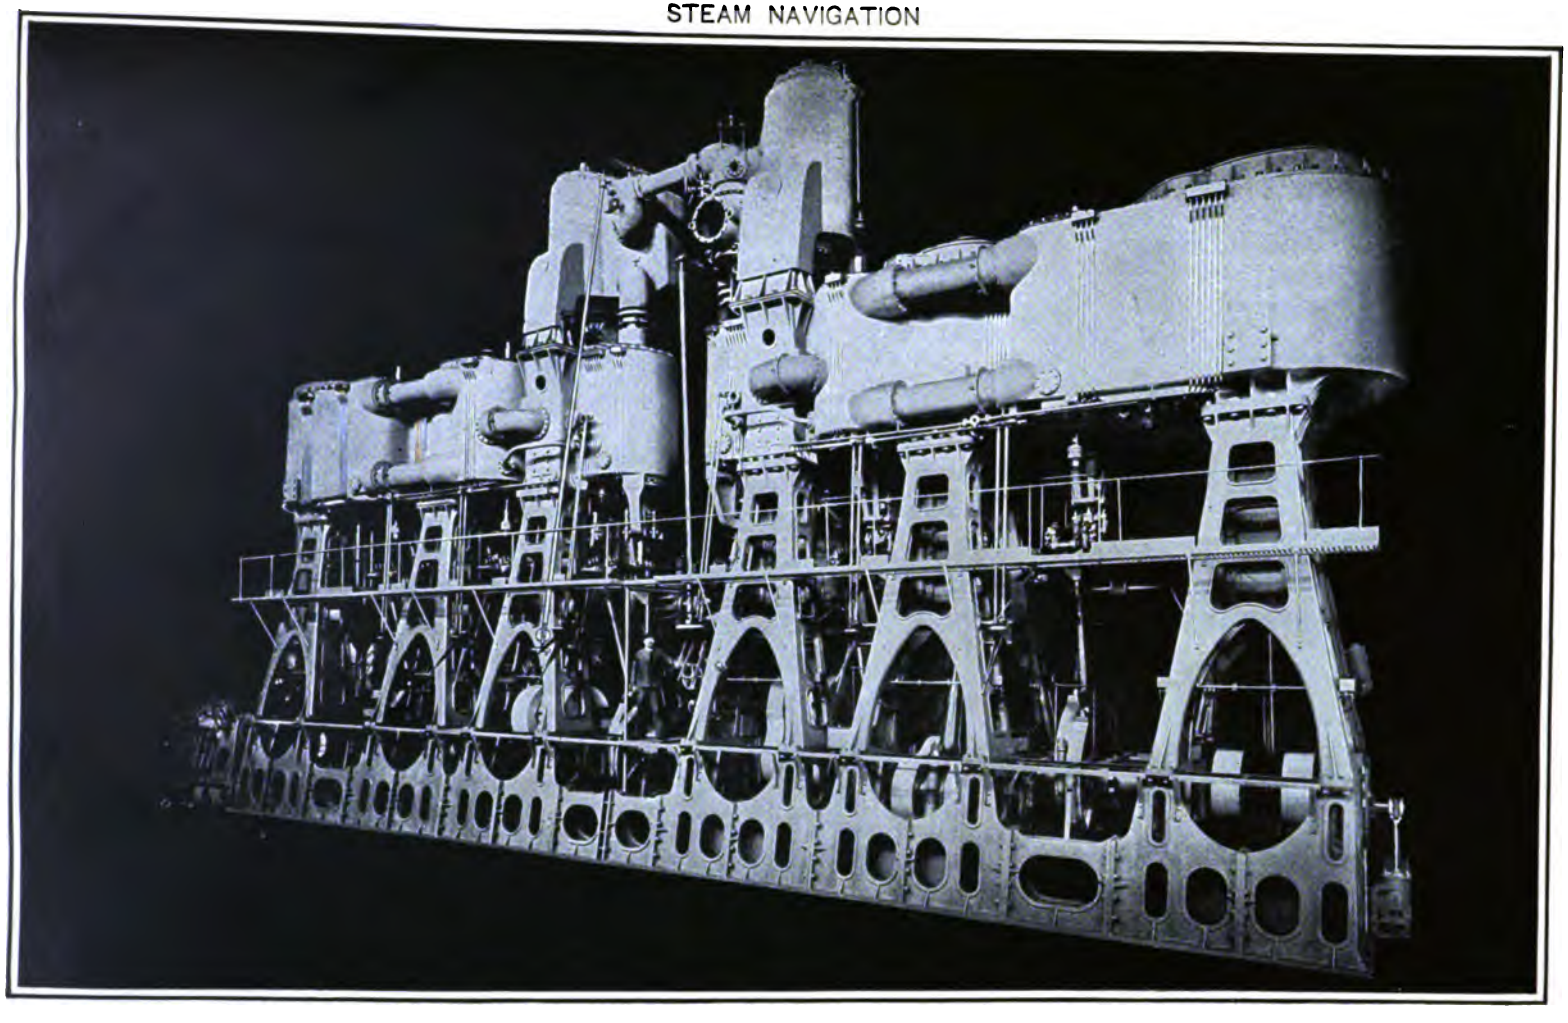
The Inman Line was more successful. It began its career with steamers built of iron and propelled by screws. Though no faster than the wooden paddle-wheel Cunarders, they were cheaper to operate. The screw propeller (q.v.) now began rapidly to displace the paddle wheel, though the Cunard Company launched the *Scotia*, their last and finest paddle steamer, in 1861. The rapid increase in size of ocean steamships led to the production of the *Great Eastern* (q.v.), but she was half a century ahead of the demands of ocean traffic and the adequate development of marine steam engineering. She was fitted with both screw and paddle engines, as it was thought impossible for either separately to deliver sufficient propulsive effect. The combination was not an economical one, and was a leading cause of her failure as a commercial venture. By 1860, in the fight for supremacy, the screw had become the unquestioned victor over the paddle wheel so far as ocean navigation was concerned, both in the merchant marine and in naval construction. Its advantages for war vessels were numerous, but the greatest of these was the possibility of placing all the propelling machinery of a screw steamer below the water line; and this alone was decisive. In merchant steamers the advantages of the screw were of a different kind. The efficiency of the paddle wheel depends upon the depth of immersion of the paddles; if too great or too little, the losses from slip, drag, and churning of the water are serious. The variation of draught consistent with economical propulsion was therefore very small—too small to admit of heavy loading. Very large wheels and feathering wheels reduced the losses somewhat, but introduced troubles of another type, while the rolling of paddle steamers in heavy seas greatly interfered with their speed and economy no matter what the character of the wheels. The draught and condition of lading of screw steamers was of much less importance and could be varied within much wider limits without perceptible loss of efficiency; rolling produced little effect, and though pitching might be serious in short vessels in which the screw was not deeply immersed, yet, owing to the small ordinary angle of pitch, the screw rarely rose high enough above the surface to give trouble.

Up to this time boilers were of the box type and the pressure of steam carried rarely exceeded 25 pounds per square inch—in many of the early steamers 10 pounds or less was the common practice. But the displacing of box boilers by cylindrical permitted a higher steam pressure, and this in turn demanded another form of engine to utilize it economically. The compound engine, which was built and patented by Hornblower in 1781 and revived by Woolf in 1804, had not been much used, because the conditions had not demanded it; but now it became a necessity. It consisted at first of two cylinders—and many compound engines are still so built—in which the steam was expanded in two stages, the first expansion taking place in the high-pressure cylinder, by which the pressure was reduced one-half, more or less, and the second expansion in the low-pressure cylinder, where the pressure was carried down to the atmospheric line or below it.

The demand for increased speed led to higher steam pressure and greater engine speed. The range of economical expansion in one cylinder being limited, the tri-compound or triple-expansion engine was designed to utilize the increased boiler pressures. The gain was twofold. The new engines, using a higher pressure of steam, were lighter than their predecessors of equal power and they were also more economical. The first large vessel to be fitted with them was probably the *Propontis*, which, in 1874, was supplied with engines designed by Mr. A. C. Kirk. By 1880 the use of triple-expansion engines became common, though compound engines were largely used for another decade and they are still fitted in certain steamers where the conditions favor their economical working.

The continued demand for increased power, particularly in small vessels (torpedo boats and the like), naturally pushed up the steam pressure again, and, although the locomotive boiler was used to some extent, the advantages of the water-tube boiler soon became apparent. (See section on *Boilers* below.) Its capability to furnish very high pressure steam reacted upon engine design and produced the quadruple-expansion engine. The water-tube boiler is not yet much used in the mercantile marine, but is rapidly displacing the cylindrical boiler in naval construction. It has not yet brought about the extended use of quadruple-expansion engines in large vessels, but this may follow in the course of time.

The length of the voyage and the vast amount of traffic has caused the transatlantic trade to be the principal field of steamship development. While the gain in size and speed of the vessels in this trade has been continuous from the start, a great impulse was given by the building of the *Britannic* and *Germanic* for the White Star Line in 1874. They at once reduced the average passage from Queenstown to New York to about eight days. They were followed in 1879 by the *Arizona* of the Guion Line, confessedly built to outstrip all competitors, and her success was the begin-



ning of a race for speed supremacy that has brought out a new 'record-breaker' almost every year since. As the vessels are increased in size it takes less horse power per ton to drive them at a given speed, and this has tended to augment the tonnage of the great liners so that the dimensions of the *Great Eastern* are now exceeded by nearly a dozen vessels, built and building. The accompanying table gives the principal features of the largest ships belonging to the great steamship companies, transatlantic and transpacific.

MARINE ENGINES. Marine engines have during recent years tended to one general type. For special services on inland waters a great num-

N.B.—The names of vessels which fly the American flag are printed in italics.

ONE OF THE TWO SETS OF MAIN ENGINES OF THE "KAISER WILHELM II."
Each set of engines develops 20,000 horse-power, and consists of two four-cylinder, three-crank, quadruple-expansion engines.

ber of various specialties are found, but in sea-going steamers the type in almost universal use is the vertical (i.e., the piston moves vertically), inverted (i.e. the cylinder is above the crank), direct-acting (i.e. the connecting rod joins the crosshead directly to the crank), triple (or quadruple) expansion engine. Engines differ as regards fittings and attachments, length of stroke and revolutions, weight, speed, etc., but a description of the general type will give the essential features of all.

Naval engines are built lighter, have a shorter stroke, and run at higher speeds than those in the merchant service. In a triple-expansion engine the steam works expansively in three successive stages, in a quadruple in four. The reason for the introduction of the multiple-expansion engine is the greater economy obtained when steam is used expansively over a greater range. This cannot be efficiently accomplished in a single cylinder owing to various causes chiefly due to liquefaction, hence compound (two stage) engines were introduced, then the triple and quadruple. The economy gained by the compound over the simple is about 50 per cent., by triple over compound about 25 per cent., and by quadruple over triple about 10 per cent. In the quadruple the gain in economy is obtained by considerable increase in weight, so that for most services the real gain of the quadruple is questionable. The type of engines will depend largely on the steam pressure employed. For a pressure of 40 to 90 pounds a compound; up to 190 pounds the triple; above 190, the quadruple may be used if space and weight are not very important. At present the pressure used is ordinarily between 140 and 250 pounds per square inch above the atmosphere. A great advantage of multiple-expansion engines, and a cause for their adoption, is the more even turning effect and better balancing obtained. The triple-expansion engine has either three or four cylinders, more often three, arranged in successive order, H.P. (high pressure), I.P. (intermediate pressure), L.P. (low pressure), each cylinder being attached by means of its piston and connecting rod to its own crank on the crank shaft, which is usually made in interchangeable sections, one for each crank. Cranks are usually set at 120° from each other to obtain even turning effect. Four cylinders are used when the L. P. cylinder would be too large to be conveniently fitted or built, or to obtain a better balancing of the engine and reduce vibrations. The sequence of the cylinders is then high pressure, intermediate pressure, low pressure, low pressure; or, on what is known as the Yarrow-Schlick-Tweedy system, low pressure, high pressure, intermediate pressure, low pressure, with cranks set at right angles. Here the crank shaft is generally in two sections.

The course of steam in a triple-expansion engine would be as follows: Leaves main steam pipe, passes through separator, then throttle, and into high-pressure valve chest. The movement of the valve opens and closes the steam ports at pressure cylinder for 0.6 to 0.75 of the stroke and then cuts off. The steam in the cylinder then expands, continuing to move the piston. Just before the end of the stroke the valve opens to exhaust and at about the same time begins to allow steam to enter on the other side of the piston; this results in cushioning at the end of the stroke. The steam having been reduced about 50 to 60 per cent. in pressure and correspondingly in temperature, leaves the high pressure cylinder, and passes to the intermediate pressure receiver, which is really the intermediate pressure valve chest. From here it enters through the intermediate pressure valve and does its work in the intermediate pressure cylinder, being again reduced in temperature and pressure. On leaving the intermediate pressure cylinder the steam is generally at about atmospheric pressure. Then it is conducted to the low pressure receiver and goes through its third stage of working and expansion. On leaving the low pressure it goes through the exhaust pipe to the main condenser where it is condensed, and then as water and vapor it is pumped by the air pump to the hot well or feed tank, and thence to the boiler, where it is re-evaporated.

A plate illustrating a four-cylinder triple-expansion engine of a modern second-class cruiser for the United States Navy is shown with various parts indicated. The engine framing is supported on a *bed plate* made in sections and bolted by *holding-down bolts* to structural parts of the vessel. The engine framing is made of *steel columns* braced by various *cross rods*. A more general practice is to have cast or wrought steel inverted Y frames on one side which support the guides, and in the merchant service the condenser is generally cast in one piece with lower portions of the Y frames. The *cylinders* are supported on top of framing and bolted to it by various fastenings. In large engines each cylinder is a separate casting; generally the valve chest is cast with the cylinder, making the whole a rather intricate casting. Cast iron is generally used for cylinders. Cylinders are fitted with liners, *a*, which form the bearing surface for the piston. The liners are bolted at the lower end to the bottom of the cylinder and the joint at the top is packed. Liners are of cast steel or cast iron; steel is stronger, but cast iron gives a better wearing surface. The space between the cylinder and liner is commonly used as a steam jacket. Lately the economy of steam jacketing, especially for fast-moving engines, has been questioned. All cylinders are fitted with covers, *c*, of cast iron or steel, and these are secured to the cylinders by bolts and nuts and the joints packed by gaskets. For large cylinders, smaller openings called bull's-eyes, *d*, are fitted for purposes of examination. The pistons are cone-shaped, made of forged or cast steel or cast iron, and fitted with cast iron spring packing rings, *e*. The piston rod is secured to the piston by its taper and the piston rod nut, *f*, on top. The opening in the bottom of the cylinder for the piston rod is fitted with a stuffing box, *g*, supplied with some form of metallic packing. The lower end of the piston is secured to the crosshead *h*, made of forged steel, which has a slipper, *i*, sliding on the crosshead guide, *j*. The crosshead also has journals, *k*, for the upper end of the connecting rod. The lower end of the connecting rod is attached to the crank pin, *l*, by means of the crank pin brasses, *m*. The crank shaft is supported by the main bearings, *n*, which are supported by a bed-plate. All large bearings are lined with anti-friction metal.

The valves *o* for the H. P. and I. P. cylinders are piston valves, either single or double ported, hollow or solid. For the L. P., the

double-ported flat slide valve, *p*, fitted with a relief ring is used. Piston valves are employed with high pressure because in them the pressure is on all sides and there is no force holding the valve against its seat. They are fitted with spring rings to make them tight. Valves are made of cast iron, cast steel, or forged steel. The valve seats are generally liners of cast iron. The valve stem is secured to the valve by its taper or shoulder and the nut *q* and the upper end *r* of the rod is fitted as a guide. The lower end of the valve rod is connected by means of a bearing to the link block *s*, which works in the link *t*. To the ends of the link are attached the eccentric rod *u*, and the lower ends of these rods are bolted to the eccentric straps *v*, which move around eccentrics *w*. The eccentrics are secured to the shaft and fitted so that the position can be slightly changed. There are two eccentrics, one to give go-ahead motion and the other backing. The link is moved by an arm attached to the reversing shaft *x*, which is operated by the reversing engine *y*, and this engine is controlled by the reversing lever. The link arm is attached to the adjustable cut-off block, by means of which the cut-off can be varied from .5 to .75 of stroke. This is the Stephenson gear, which is most generally used; others are Marshall's, Joy's, Morton's, etc.

In the cut shown, the air pump A is operated by a cross beam B attached to the L. P. crosshead. In many merchant vessels the circulating, bilge, and feed pumps are operated from such a beam. For large installments these pumps are as a rule independent and of the Blake, Worthington, Snow, or other patent type. The office of the air pump is to pump the condensed water and vapor from the condenser to the feed tank and produce a vacuum. Surface condensers are now always fitted, and the steam and condensed fresh water are kept separate from the circulating sea water. This keeps salt out of the system. The condenser consists of an approximately cylindrical vessel, having a water chamber and a tube sheet at each end. Brass tubes connect the two tube sheets and cold sea water is pumped through the tubes by means of the circulating pump, thus cooling and condensing the exhaust steam surrounding the tubes. Condensers are made of bronze or cast steel and the tubes of brass. Circulating pumps are centrifugal and operated by a vertical simple or compound engine.

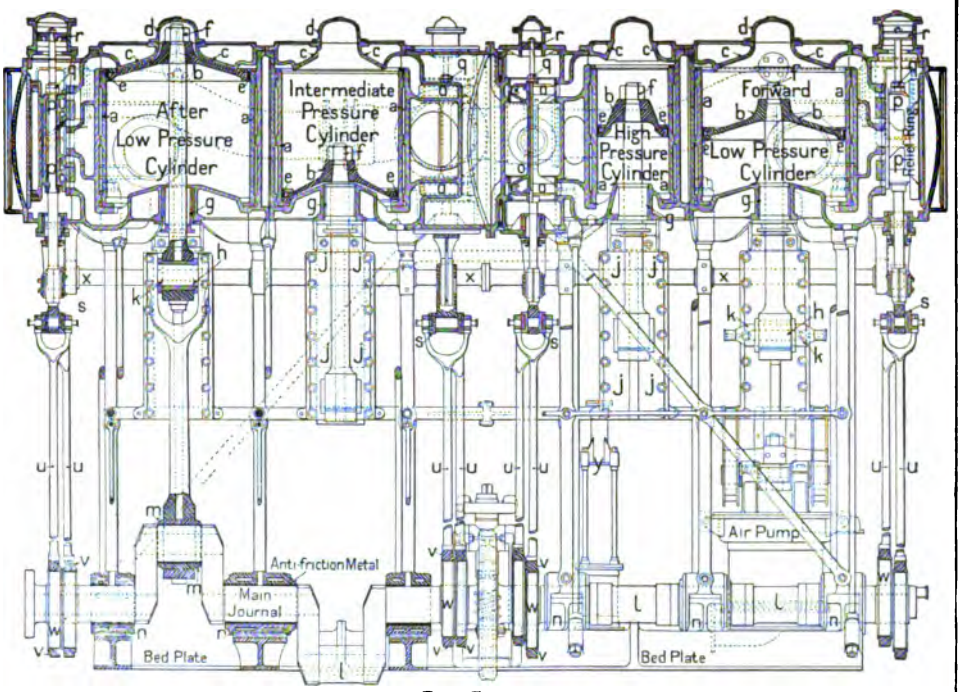
The feed tank is generally fitted with a filter chamber for purifying the water. Feed heaters, using auxiliary exhaust steam to heat the water before reaching the boilers, are fitted for purposes of economy and make the service less hard on boilers. The feed pumps are vertical, single, or duplex plunger pumps. Cylinders are lagged (i.e. covered with non-heat-conducting material) to prevent loss of heat. All cylinders are fitted with relief valves set at appropriate pressures, drains for conducting off any water that may accumulate, and indicator pipes, cocks, and reducing motion for taking indicator cards. Pressure gauges are supplied to indicate the pressure in the steam pipe, the various receivers, and the vacuum in the condenser. Revolution counters are attached, which automatically record the number of revolutions of the engines. A water service is supplied, consisting of a system of piping by means of which sea water can be circulated through such parts as the thrust bearing and crosshead guides, or sprayed on various other bearings where heating is likely.

The oil services on a modern engine are very elaborate, as all working bearings must be supplied with a lubricant. The best practice is the manifold system, where each bearing has a small pipe leading up to one of the several manifolds where it is fed by means of a wick. The manifold can be filled from a reservoir placed above the level of the engine. Besides oil, graphite and various preparations of tallow and grease are used for lubrication.

The steam pressures now used are 150-300 pounds. It is not likely that much higher pressures than 250 will be soon used, on account of the great strength of parts necessary to withstand the pressure, the difficulty of keeping tight joints, and the high temperature of steam, which heats the working surfaces and prevents proper lubrication.

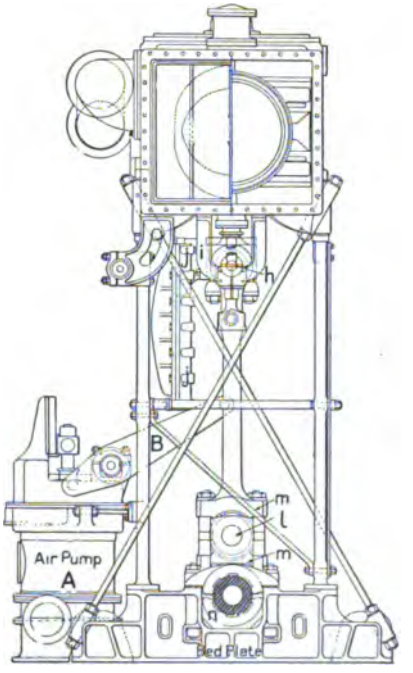
Steam is expanded in triple-expansion engines 6 to 9 times; in quadruple, 8 to 12 times. The ratio of the area of the H. P. to that of L. P. cylinder varies from 1 to 5 to 1 to 10, there being a greater ratio with increased pressures.

The revolutions vary from 80 or 100 per minute in very long stroke engines to 400 to 500 in high-speed torpedo boats. The piston speed is limited to about 1000 feet per minute. The length of stroke for large merchant vessels is four to six feet; for naval engines not over four feet; with smaller engines the stroke is less. A relatively long stroke results in greater economy.



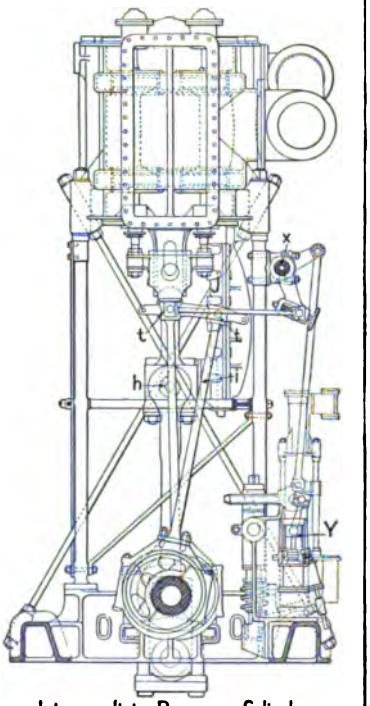
Of late the steam turbine is beginning to be introduced in place of the reciprocating engine for fast vessels. See STEAM TURBINE.

BOILERS. Modern marine practice is either to use the cylindrical fire-tube boiler carrying pressures of 150 to 200 pounds per square inch, or some form of water-tube boiler using pressures of 160 to 300 pounds. W.T. (water-tube) boilers are more largely used for naval purposes and fast passenger vessels and cargo vessels in fresh water, cylindrical boilers for general merchant service.



The substantial advantages of the cylindrical boiler are: reliability, simplicity; it is well made and generally understood; it can use salty or dirty water, and it will stand hard usage without serious loss or injury. The disadvantages are: great weight; steam cannot be gotten up or taken off quickly; it does not readily adjust itself to change of output; and heavy forced draught cannot be used.

The advantages of the water-tube boiler are: lightness; adaptability to high pressure; rapidity of raising steam or taking it off; it is readily adjusted to sudden change of output; forced draught can be used (in nearly all types); and repairs or removals are more easily made. Its disadvantages: it requires great care and attention; it cannot use salty or dirty water or experience hard usage; corrosion takes place very readily; it is complicated and many types require a large number of mechanical attachments; and being new, it is not well understood by men who handle it and best results are not obtained. The economy of fuel is about the same in the best of each type. For average running the cylindrical is probably the more economical.



The general form of a cylindrical boiler is the

Port Engine
(Side Elevation)

After Low Pressure Cylinder

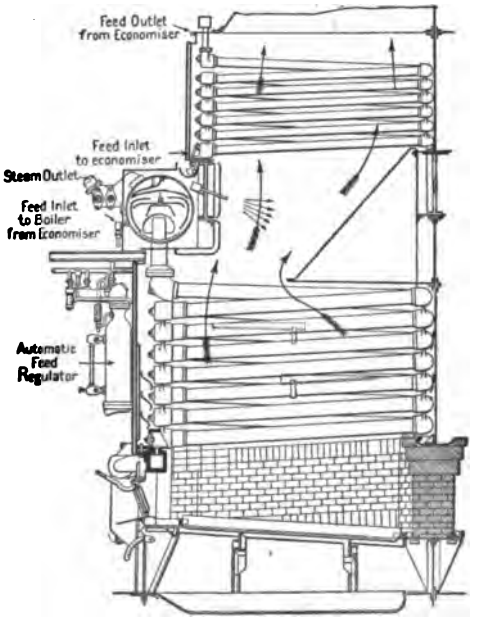
SECTIONS OF ENGINE OF UNITED STATES TWIN-SCREW PROTECTED CRUISER.

Displacement of Vessel, 3200 tons.
Indicated Horse-power, 4500.

Diameter of cylinders, 18, 29, and (2) 35 1-2 inches.
Stroke, 30 inches.

single or double ended return-tube boiler fitted with two, three, or four corrugated furnaces. Boilers vary from 9 to 20 feet in diameter, and 9 to 18 feet in length for single-ended, and 17 to 21 feet for double-ended. A cut of a single-ended boiler is shown; *aa* are the shell-plates, made in two courses of three sections each, with butt joints; *bb*, corrugated furnaces, either of Fox, Purves, or Morrison patent, into which the grate and bridge wall are fitted; *c*, stays supporting boiler front and combustion chamber;

SINGLE-ENDED CYLINDRICAL BOILER.



DD, tube sheets with tubes, *e*, expanded into them; some of these are stay tubes screwed into tube sheets which they help to support. F is the combustion chamber, where the gases of combustion are finally mixed and burned. The products of combustion pass through the tubes to the uptake and then to the smoke pipe. The heating surface is composed of the crown sheets (top of furnaces), top and sides of combustion chamber, and tube surface, the tube surface being by far the larger portion. H, H, H are steam space stays supporting the boiler ends. The back and sides of the combustion chamber are supported by short stay bolts, I, and the top by girder stays, J. The steam space is fitted with a dry pipe which collects the steam and discharges through the stop valve to the steam pipe.

The furnace front is fitted with furnace and ash-pit doors, the ash pit being the part of the furnace below the grate. Manholes, K, are fitted to obtain access to boiler for cleaning, etc. The coverings for manholes are called manhole plates. Practically all parts of a boiler, except the grate, furnace doors, and bridge wall, are built of mild steel.

The attachments of a boiler like the one shown are: main and auxiliary stop valves in the steam pipe; check valves through which feed water enters; surface and bottom blow valves, by means of which the boiler is blown down or pumped out; two water columns to show the height of the water; pressure gauge; spring safety valve; and circulating apparatus (generally a hydrokineter).

The grate surface of such a boiler develops 13 to 16 indicated horse power per square foot. Ratio of heating to grate surface, 30-35 to 1. Weight per I. H. P. including water, 90 to 120 pounds. Maximum coal burnt per square foot grate surface per hour about 40 pounds ordinarily 15 to 20 pounds. The efficiency of the boiler is about 70 to 75 per cent. in best condition.

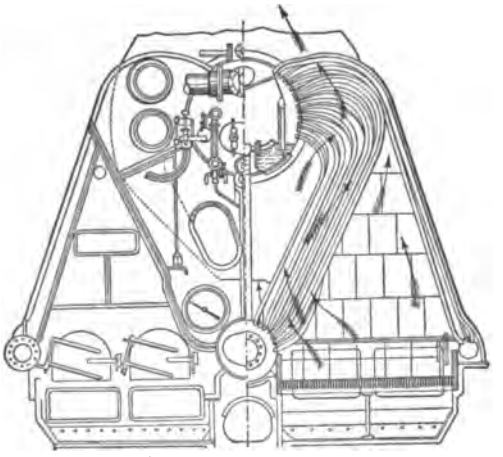
In water-tube boilers the water is contained within the tubes, and as these are relatively small great pressures can be carried and the boiler may be considerably lighter. Most types of water-tube boilers have a number of steam and water chambers connected by a system of tubes either straight or bent. The feed water usually enters the upper or steam drum and is conducted by

BELLVILLE BOILER—ECONOMIZER TYPE.

down tubes to a lower or water drum; from here the water, becoming heated, rises and passes up through steam-collecting tubes to the steam

drum. Thus a circulation is set up. The efficiency of a water-tube boiler depends in a large measure on proper circulation. As the distance of grate to smoke stack is rather short, most types of water-tube boilers have a system of baffle plates for conducting the gases among the tubes to increase the distance of travel. The economy depends in large measure on efficient baffling.

The boilers are fitted with a casing made of fire brick, asbestos, or other non-conducting material held in place by thin sheet metal.

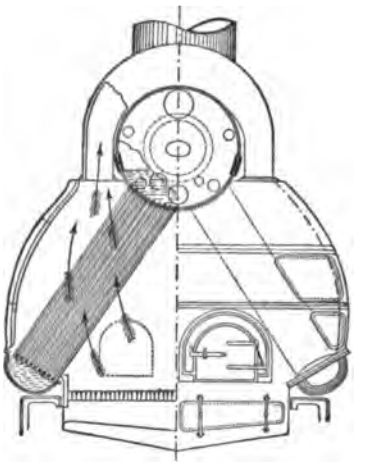


Water-tube boilers have all the attachments enumerated for the cylindrical fire-tube boiler. In addition nearly all except Babcock & Wilcox boilers have automatic feeding apparatus. Bellville boilers are fitted with reducing valves. Some types, especially Bellville, are fitted with feed heaters or economizers placed above the boiler proper, where the feed water is heated before entering the boiler. Others are fitted with superheaters. Most types have an arrangement of steam or air service for the removal of soot.

Down-tube boilers are those in which the steam-generating tubes discharge into a steam drum below the water line. Priming boilers are those where these tubes discharge at or above the water line. Such a boiler as the Schultz appears to be neither one nor the other.

Large-tube boilers use tubes varying from three to five inches in diameter. Small-tube boilers use tubes one to two inches in diameter.

Express boiler is a term applied to rapid steaming small-tube boilers, capable of large power on small weight and using heavy forced draught. This type is rather less economical and is chiefly used for very fast vessels such as torpedo boats.



Up to the present time the Babcock & Wilcox and Dürr of large-tube type, and the Thornycroft, Yarrow, and Normand of express type, have given the greatest satisfaction in service.

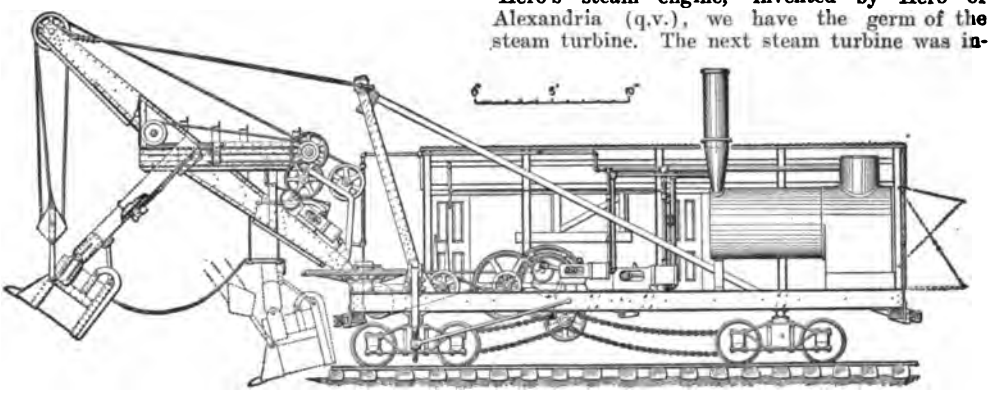
THORNYCROFT BOILER—DARING TYPE.

The Niclausse and Bellville appear to give satisfaction in some services and dissatisfaction in others.

The Babcock & Wilcox and Bellville are straight-tube priming boilers. The former is shown in section on the plate accompanying the article on BOILER (q.v.). The Niclausse, Dürr, Yarrow, and D'Allest are straight-tube 'drowned' tube boilers. The Thornycroft and the Schultz are express bent-tube priming boilers. The Normand is an express bent-tube 'drowned' tube boiler. Of these the Yarrow, D'Allest, and Babcock & Wilcox are simplest and the Bellville most complicated.

YARROW BOILER.

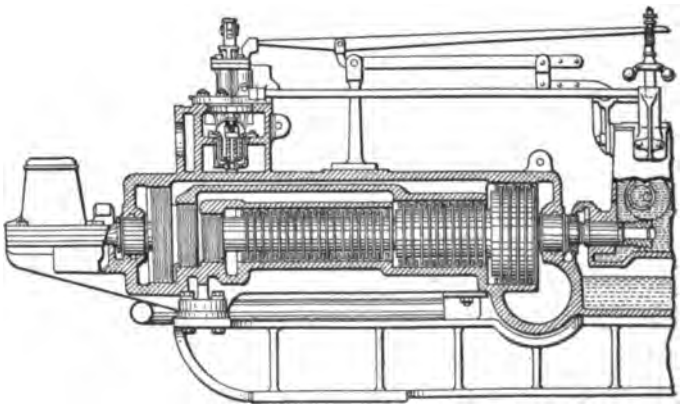
The systems of forced draught in use are the closed ash pit and closed fire room. Of induced systems generally fitted with air heaters we have various patent forms. Superheating is somewhat used, but does not meet with great satisfaction, owing to increased cost and weight and the rapid deterioration of such attachments.



The economic results and other data of water-tube boilers varies so much with different types and conditions that no average results can fairly be taken. As a rule there is a larger ratio of heating surface than in Scotch and a decrease in weight, so that among some of the best types the weight per indicated horse power, including water, is 50 to 90 pounds. See SHIPBUILDING; STEAM; STEAM ENGINE; SHIP, ARMORED; NAVIES; TRANSPORTATION.

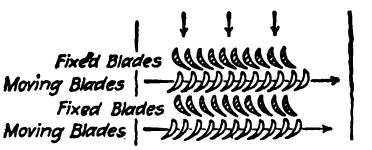
STEAM PUMP. See PUMPS AND PUMPING MACHINERY.

STEAMSHIP. See STEAM NAVIGATION.



STEAM SHOVEL. A modified form of dredge adapted for excavating material on dry land. The steam shovel was invented in 1840 by an American named Otis, but it did not come into general use until about 1865. The large increase in railway construction in the United States created an active demand for a rapid excavating machine. As will be seen from the accompanying outline drawing, the steam shovel consists essentially of a strong frame mounted on wheels to form a base to which the working parts are attached. The digging mechanism consists of a crane hinged to a mast or support at the front end of the car, and a dipper handle and dipper carried by the crane. The operating machinery consists of a main engine, which hoists the dipper and swings the crane, and of a thrusting mechanism for forcing the dipper into the earth. The operation begins with the dipper at the position shown by the dotted lines in the illustration. The engine man begins to hoist and thus swing the dipper

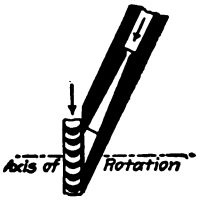
upward along a curved path; at the same time the crane man by means of the thrusting mechanism forces the dipper into the earth so that a layer is scooped off the face of the bank and falls into the dipper. The depth of the cut is so regulated by the crane man that the dipper is just filled when at its topmost position. The dipper is then hauled back and the crane is swung so as to carry the dipper over the car set alongside the shovel, and the latch is pulled, setting free the swinging bottom of the dipper, which falls open and permits the contents of the dipper to fall into the car. In actual operation these several movements are combined to a greater or less extent, and are accomplished by various devices which will be found described in Hermann, *Steam Shovels and Steam Shovel Work* (New York, 1894). The various parts of the shovel, body, mast, crane, and dipper handles, are constructed either of wood or steel, the latter material being most generally used for the heavier types of shovels. The dipper is always made of steel or iron plates, and its size or capacity varies from one to five cubic yards, but capacities of 1, 1½, 2, and 2½ yards are the ones most common. For digging blasted rock the front edge or lip of the dipper has steel teeth. The excavating capacity of steam shovels varies from 2400 cubic yards of sand to 600 cubic yards of loose rock per ten hours, with a 2½ cubic yard dipper. For extensive records of actual operation in various kinds of material, consult Hill, *The Chicago Main Drainage Channel* (New York, 1896).



SECTION SHOWING MECHANISM OF STEAM SHOVEL.

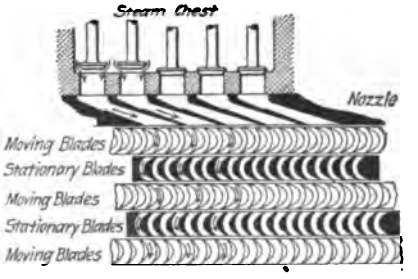
STEAM TURBINE. A form of prime motor in which the kinetic energy of expanding steam acts upon a wheel provided with vanes so as to cause rotation. The ordinary method of using steam to obtain power is to admit it into a closed cylinder, where it acts upon a movable piston. (See STEAM and STEAM ENGINE.) In this case work is performed by the static expansive force of the steam pressing against the piston; in the case of the steam turbine the work is developed by the kinetic energy of particles of steam which are given a high velocity by reason of the steam expanding from one pressure to a lower pressure. In the æolipile (q.v.) or 'Hero's steam engine,' invented by Hero of Alexandria (q.v.), we have the germ of the steam turbine. The next steam turbine was invented by Branca in 1629 and consisted simply of a jet of steam impinging upon the vanes of a paddle wheel and blowing it around. Branca's device was the first impulse steam turbine. Practically no attention was given to the steam turbine from this time until the last quarter of the nineteenth century, when several inventors began experimenting, among whom C. A. Parsons of England and Dr. de Laval of Sweden deserve particularly to be noted. Mr. Parsons built his first turbine in 1884, and Dr. de Laval recorded his first patent in 1889. The first Parsons turbine developed 10 horse power at 18,000 revolutions per minute, and proved entirely practical. The Parsons turbine consists of several successive turbine wheels, or rows of blades, on

SECTION OF PARSONS'S STEAM TURBINE.



ACTION OF STEAM ON BLADES OF PARSONS'S TURBINE.

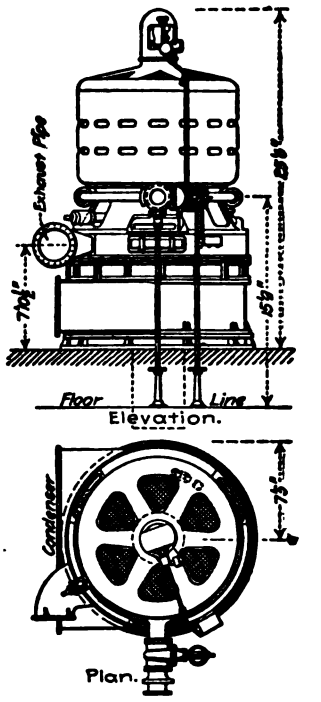
one drum or shaft within a concentric case having interior blades; the moving vanes or blades on the shaft are in circumferential rows projecting outwardly from the shaft and nearly touching the case, and the fixed blades on the casing are in similar rows, projecting inwardly from the case and nearly touching the spindle or shaft. This construction constitutes what practically amounts to a series of turbine wheels on one shaft, each one complete in itself, like a parallel flow or Jonval water turbine, through which the steam is forced to pass. Each successive turbine is also slightly larger in passageway than its predecessor, to allow for the increasing bulk of the elastic steam as it exerts its force on each turbine successively and expands with a consequent reduction of pressure. The steam in passing through the successive turbines transmits to each a rotative impulse partly by reaction and partly by impulse, and thus the Parsons turbine involves the germinal principles of both the Branca turbine and Hero's engine. The notable feature of the Parsons turbine is the 'compounding' of the steam, or its expansion in successive



ACTION OF STEAM IN DE LAVAL'S TURBINE.

SECTION OF NOZZLE OF DE LAVAL'S STEAM TURBINE.

stages, losing a few pounds in pressure at each stage. This quality of the machine permits a slow enough speed of rotation without serious loss of efficiency to allow the turbine to be coupled direct to a dynamo or even a screw propeller without the necessity of reduction gearing. It has been successfully employed in both these capacities.



The De Laval turbine is simply a highly improved form of Branca's impulse turbine. It consists of a divergent nozzle which directs the jet of steam upon suitably formed buckets which are attached to the periphery of a revolving wheel. The outer edge of the buckets is shrouded by a steel ring which prevents the centrifugal

ACTION OF STEAM BLADES OF CURTIS'S TURBINE.

escape of the steam. These turbines, especially in the larger sizes, are equipped with several nozzles. They are essentially of very high speed, the smaller sizes running at 30,000 revolutions per minute and the larger sizes at 10,000 revolutions per minute. A train of gearing reduces the speed to reasonable working velocities.

Two other turbines which have gained some prominence are the Seger turbine, a Swedish invention, which is similar in principle to the De Laval, but which employs two revolving vane wheels, instead of one, upon which the steam acts successively, and the turbine invented by J. H. Dow of Cleveland, O., which is notable as having the same principle of 'compounding' the steam as does the Parsons turbine, but which differs materially in construction from the Parsons machine.

CURTIS TURBINE OPERATING DYNAMO.

STEARIC ACID (from Gk. *στέαρ*, *stear*, tallow), $C_{18}H_{36}O_2$. One of the solid fatty acids. It exists as a glyceride (stearin) in most fats, and is especially abundant in the more solid kinds, such as mutton-suet. The stearic acid of commerce is in reality a mixture of stearic and palmitic acids. Pure stearic acid may readily be separated from this mixture by dissolving in hot alcohol and precipitating with a hot alcoholic solution of magnesium acetate, the precipitate being composed of practically pure stearate of magnesium; in this reaction, one part, by weight, of magnesium acetate should be employed for every four parts of commercial stearic acid treated. The magnesium stearate thus obtained is decomposed by boiling with hydrochloric acid, and the stearic acid set free is further purified by recrystallization from alcohol. Pure stearic acid is a colorless crystalline substance having neither taste nor odor; it melts at 69.2° C. (157° F.). It is insoluble in water, on which it floats, but dissolves in alcohol and ether, its solution reddening litmus powerfully. It may be distilled under diminished pressure. The only stearates soluble in water are the stearates of the alkalies, whose solutions are frothy and form a lather, but on

the addition of an excess of water separate into an acid salt which is deposited in silky crystalline plates, and the free alkali, or more probably a basic salt, which remains in solution. (See SOAP.) The stearates of the alkalies are soluble also in alcohol. Chloride of sodium (common salt) has the property of separating the alkaline stearates from their aqueous solution.

Free stearic acid has been found in decomposing pus and in the caseous deposits of tuberculosis. In adipocere and in fæces stearic acid occurs in the form of its calcium salt; in blood, chyle, and in serous fluids, in the form of sodium salts. See CANDLE; FATS; OILS; SOAP.

STEARIN (from Gk. *στέαρ, stear*, tallow), or TRI-STEARIN, $C_3H_5(C_{17}H_{35}CO_2)_3$. One of the chief constituents of fats. It is considerably harder than palmitin (q.v.) and is less soluble than both palmitin and olein, the other characteristic constituents of natural fats. It may be obtained in a tolerably pure state from mutton-suet, by repeated crystallization from ether. The only way in which it may be obtained chemically pure is by synthesis: first, anhydrous glycerin is heated with an equal weight of stearic acid, the product being a compound called mono-stearin; the mono-stearin, freed from the excess of glycerin, is then heated with a further excess of stearic acid, and the product, tri-stearin, is carefully freed from the excess of stearic acid. Like palmitin and certain other tri-glycerides, it presents a remarkable peculiarity in melting: it melts first if heated to 55° C.; on further heating, however, it resolidifies and then melts again when the temperature of 72° C. is reached.

STEARNS, WILLIAM AUGUSTUS (1805-76). An American clergyman and educator, born at Bedford, Mass. He was educated at Harvard and at Andover, and was ordained in the Congregational Church in 1831. In 1854 he became president of Amherst College, his term being marked by extensive improvements of the institution and by the establishment of more than fifty scholarships. His publications include *Discourses and Addresses* (1855), and *A Plea for the Nation* (1876).

STEATITE. See SOAPSTONE.

STEBBING, THOMAS ROSCOE REDE (1835—). An English naturalist. He was born in London and was educated at King's College, London, becoming a fellow of Worcester College in Oxford. In 1858-84 he was engaged in teaching, and thereafter devoted himself to literary and scientific pursuits. He made a special study of crustacea, and besides being a large contributor to various reviews wrote *Essays on Darwinism* (1871), *The Naturalist of Cumbrae, a True Story, Being the Life of David Robertson by His Friend* (1891), and *A History of Crustacea* (1893).

STECCHETTI, stĕ-kĕt'tē, LORENZO. The pseudonym of the Italian poet Olindo Guerrini (q.v.).

STEDMAN, CHARLES (1753-1812). An English military historian, born at Philadelphia. He was educated at William and Mary College and studied law. At the outbreak of the Revolutionary War he adhered to the Crown. He served in the British Army at Lexington and Bunker Hill and the subsequent operations about Boston, later became commissary to the army of Sir William Howe, and during the latter part of the war was with Cornwallis in the South. In 1783 he settled in England. He published a *History of the Origin, Progress, and Termination of the American War* (1794), which remains the best contemporary account of the Revolution from a British standpoint, and is of particular value for its military maps. It called forth from Sir Henry Clinton a reply, *Some Observations upon Mr. Stedman's History* (1794).

STEDMAN, EDMUND CLARENCE (1833—). An American poet, critic, and essayist, born at Hartford, Conn., and educated at Yale. In 1852 he entered journalism as editor of the Norwich (Conn.) *Tribune* and the following year he became editor of the Winsted (Conn.) *Herald*, where he remained till 1855. He then went to New York and in 1859-61 was on the staff of the *New York Tribune*. At the outbreak of the Civil War he was sent to the front by the New York *World* as war correspondent, and there continued till 1863. In the meantime he studied law and was for a time private secretary to Attorney-General Bates in Washington, D. C. In 1864 he was interested in constructing and financiering the first Pacific railroad. The following year he entered Wall Street, New York, as a broker and banker, becoming a member of the Stock Exchange and holding his seat till 1900. His chief volumes of verse are: *Poems, Lyrical and Idyllic* (1860); *Alice of Monmouth, An Idyll of the Great War* (1864); *The Blameless Prince* (1869); *Hawthorne and Other Poems* (1877); *Lyrics and Idylls* (1879); and *Poems Now First Collected* (1897). His prose works include *The Victorian Poets* (1875) and *The Poets of America* (1885) and *The Nature and Elements of Poetry* (1892), a work of sound appreciation and technical knowledge. These volumes of critical writing he supplemented by *A Victorian Anthology* (1895) and *An American Anthology* (1900). He was also editor, with Ellen M. Hutchinson, of *A Library of American Literature* (1888-90, 11 vols.), and, with George E. Woodberry, of the *Works of Edgar Allan Poe* (1895, 10 vols.). Upon the death of Lowell many accorded to Mr. Stedman the primacy among living American poets and critics.

STEEDMAN, CHARLES (1811-90). An American naval officer, born at Charleston, S. C. He was appointed a midshipman in the navy in 1828. He distinguished himself in the Mexican War at Vera Cruz and at Tampico. From 1847 to 1855, with slight interruptions, he was attached to the United States Naval Observatory at Washington, attaining the rank of commander in the latter year; and in 1859 he commanded the *Dolphin* in the Paraguay expedition. He was loyal to the Union during the Civil War. He took part in DuPont's attack and capture of Port Royal, and in the capture of the Savannah forts and of Fort McAllister. In October, 1862, he captured the Confederate batteries at the mouth of the Saint John's River, Florida. In 1865 he was placed in command of the Mediterranean Squadron, and in 1866 was made a commodore. He commanded the Boston Navy Yard from 1869 to 1872, became a rear-admiral in 1871, and was retired in 1873.

STEEDMAN, JAMES BARRETT (1818-83). An American soldier, born in Northumberland

County, Pa. In 1837 he settled in Ohio, where he became interested in the Wabash and Erie Canal. In 1856-60 he was printer to Congress. He led the Fourth Ohio Volunteers at the battle of Philippi, was promoted to the rank of brigadier-general, and at the battle of Perryville brought his troops on the field just in time to fill a dangerous gap in the Federal battle line. At Chickamauga he led the vanguard of Granger's reserve corps to Thomas's aid on the afternoon of the second day. He served under General Sherman during the Atlanta campaign and then rejoined Thomas at Nashville, where he was given command of a provisional division of negro troops, with which on December 15, 1864, he opened the battle of Nashville. He resigned from the service in 1866 with the rank of major-general of volunteers. During President Johnson's administration he was collector of internal revenue at New Orleans, and in 1879 he was elected to the Ohio State Senate.

STEEL. See IRON AND STEEL.

STEEL, FLORA ANNIE (WEBSTER) (1847—). An English novelist, born at Harrow. In 1867 she married a Bengal civilian and went to India, where she lived till 1889. She was for some time inspectress for the Government and aided schools in the Punjab. While in India she published, in conjunction with Lieut.-Col. Richard Temple, a collection of Punjab folk-tales, under the title *Wide-Awake Stories* (1884). After her return to England she began a series of novels and short stories illustrative of native and Anglo-Indian life. Among them are: *Miss Stuart's Legacy* (1893); *Tales from the Punjab* (1894); *Flower of Forgiveness* (1894); *On the Face of the Waters* (1896); *Voices in the Night* (1900); *The Hosts of the Lord* (1900); and *In the Guardianship of God* (1903).

STEEL, Sir JOHN (1804-91). A Scottish sculptor, born in Aberdeen. He first gained prominence by the bronze group of "Alexander Taming Bucephalus," in Saint Andrew's Square, Edinburgh, and his colossal statue of the Queen, surmounting the Royal Institute, brought the appointment as sculptor to her Majesty in Scotland (1838). Among other works by him in Edinburgh are the seated marble figure of Sir Walter Scott, the equestrian statue of the Duke of Wellington (1852), and the memorial statue of Prince Albert. In the United States are a bronze statue of Robert Burns and one of Walter Scott, in Central Park, New York City. He executed many portrait busts. Steel was the first to introduce bronze-casting into Scotland.

STEELE, stā'le. A town in the district of Essen, Prussia, 4 miles east of Essen, on the Ruhr River. In the town are sandstone quarries, coal-mines, grist-mills, brick-kilns, distilleries, breweries, gas-works, and water-works. Population, in 1900, 12,243.

STEELE, stēl, ANNE (1717-78). An English hymn-writer. She was the daughter of a lay Baptist preacher living at Broughton in Hampshire. Her life mainly passed quietly in her native shire. In 1760 appeared her devotional *Poems*, which were reissued after her death with additions, and a memoir by Dr. Caleb Evans (3 vols., Bristol, 1780). Many of her hymns are in common use. Among them are "Far from These Narrow Scenes of Night" and "Dear Refuge of My Weary Soul." Consult her *Hymns, Psalms, and Poems*, ed. with memoir by J. Sheppard (London, 1863).

STEELE, JOEL DORMAN (1836-86). An American educator and author, born at Lima, N. Y., and educated at Genesee College. From 1862 until 1866 he was principal of the Newark, N. Y., High School, and from 1866 until 1872 of the Elmira Academy. In 1866 he published a popular text-book entitled *Fourteen Weeks in Chemistry*. Its success led him to publish a series of books, likewise intended for terms of fourteen weeks, upon *Astronomy* (1867), *Natural Philosophy* (1869), *Geology* (1870), *Human Physiology* (1873), and *Zoölogy* (1875). With his wife, Esther B. Steele, he also wrote an even more successful series of school histories, known, from the name of the publisher, as *Barnes' Brief Histories*. He bequeathed $50,000 to Syracuse University to found the Steele chair of theistical science.

STEELE, Sir RICHARD (1672-1729). An English essayist, playwright, and politician, born in Dublin. In 1684 he was sent to the Charterhouse School, where he formed a memorable friendship with Addison. In 1690 he was enrolled at Christ Church, Oxford, but he passed to Merton College (1691). In 1694 he left Oxford without a degree, and enlisted in the Life-Guards. An elegy which he wrote on the death of Queen Mary (December, 1694), wisely dedicated to Lord Cutts, Colonel of the Coldstream Guards, led eventually to a captaincy in the regiment. "Finding the military life exposed to much irregularity," Steele wrote *The Christian Hero* (1701), a moral treatise for his own guidance. It was not taken seriously by his associates, and seems to have had little effect on its volatile author. He now wrote three comedies: *The Funeral* (1701); *The Lying Lover* (1703); and *The Tender Husband* (1703). Though rather too deliberate in their moral purpose, they contain much delightful wit. After some vain searches, it was said, for the philosopher's stone, he married (1705) a Mrs. Stretch, who owned an encumbered estate in Barbados. She died about a year after the marriage. In 1706 Steele became gentleman waiter to Prince George; in 1707 he was appointed gazetteer, and seems to have left the army. The two positions brought him £400 a year. He now secretly married (September 9, 1707) Miss Mary Scurlock, of Llangunnor, in Wales, who figures as 'Prue' in his curious letters. He took a house in Bury Street, and lived far beyond his means. The death of Prince George in 1708 put an end to his place at Court, and three years later he lost his gazetteership. But he was appointed commissioner of stamps in 1710, a post with £300 a year. Meanwhile (April 12, 1709) had appeared the *Tatler*, a tri-weekly containing sketches and short essays on manners, written under the pseudonym of Isaac Bickerstaff. The periodical came to an end on January 2, 1711, and was succeeded on March 1 by the more famous *Spectator*. Though the plan of these papers was Steele's, Addison had contributed to the *Tatler*, and Addison now became the more important figure. When the *Spectator* suspended publication on December 6, 1712, Steele had written 236 papers and Addison 274. The *Guardian*, started March 17, 1713, was followed by several other short-lived periodicals, of which the most noteworthy is the *Englishman*. In these later

undertakings Steele, a strong Whig, involved himself in political controversy, and was handled without mercy by Swift. He resigned his commissionership of stamps and entered Parliament, but he was expelled (March, 1714) for seditious libel contained in *The Crisis*, a pamphlet in favor of the Hanoverian succession. On the accession of George I. Steele was again elected to Parliament (1715). He also secured the patent of Drury Lane Theatre (worth £1000 a year), for which he wrote his last comedy, *The Conscious Lover* (1722). Broken in health, he passed his last years at Carmarthen, in Wales, where he died September 1, 1729. He was buried there in Saint Peter's Church.

As a man Steele possessed no dark vices. He was improvident, generous, and light-hearted. As a poet he won no place. His political pamphlets, though of interest, are not convincing. His comedies, notwithstanding their aim to purge the stage of immorality, are still read for the wit and gayety in special scenes. As an essayist he has often been compared with Addison to his disparagement. Addison was indeed his superior in taste and humor. But Steele possessed the kindlier heart. Of his generation he stands almost alone in the respect he everywhere shows to women. Anent Lady Elizabeth Hastings he wrote that "to love her was a liberal education." The same sincere heart spoke out in his affection for children. Addison was a stylist. Steele composed off-hand with little attention to form. But he preceded Addison and thus became the father of the essay and sketch dealing with contemporary manners, which, under the hand of Fielding, was transformed into the novel. See ADDISON, JOSEPH.

Consult the excellent biographies of Steele by Aitken (London, 1889) and by Dobson ("English Worthies," ib., 1886); Thackeray, *English Humourists* (ib., 1853); *The Spectator* (ib., 1898); *The Tatler* (ib., 1899); and *Plays* ("Mermaid" series, ib., 1893), all admirably edited by Aitken.

STEEL-ENGRAVING. See ENGRAVING.

STEELHEAD (from the color and hardness of the head), or HARDHEAD. The large sea-trout or salmon-trout of the Pacific Slope (*Salmo Gairdneri*). It is found in coastwise streams from Santa Barbara County, Cal., northward nearly to Alaska. It reaches a length of 30 inches. See SALMON.

STEEL SHAPES. Structural steel produced by a rolling mill in certain fixed shapes such as angles, I bars, tees, bulbs, etc. See illustrations of typical shapes and description of process of manufacture under ROLLING MILL. See also BEAM.

STEELTON. A borough in Dauphin County, Pa., 3 miles southeast of Harrisburg; on the Pennsylvania and the Philadelphia and Reading railroads (Map: Pennsylvania, E 3). It has a public library. It is known for its steel interests, the extensive works of the Pennsylvania Steel Company being here. Other establishments are shirt and hose factories, brick-yards, and a flouring mill. The government is vested in a chief burgess, elected every three years, and a unicameral council. The water-works are owned by the municipality. Steelton was settled in 1865 and was incorporated in 1880. Population, in 1890, 9250; in 1900, 12,086.

STEEL WOOL. An abrading material used as a substitute for sand, glass, or emery paper for polishing wood or metal work. It is composed of sharp-edged threads of steel, which curl up like wool or excelsior.

STEELYARD. See BALANCE.

STEEN, stān, JAN (c.1626-79). A celebrated Dutch genre painter, foremost among the delineators of low life, which he illustrated with rare mastery. Born at Leyden, he is said to have been instructed first at Utrecht by Nicolas Knupfer (1603-60), then at The Hague by Jan van Goyen, whose daughter he married in 1649. He lived at Haarlem from 1661 to 1669, in constant pecuniary difficulties, varying his pursuit of art by renting a brewery at Delft and keeping a tavern at Leyden. With regard to his artistic training it seems likely that he received impressions from Frans and Dirk Hals. The influence of the latter is plainly traceable in Steen's early productions, notably in the "Wedding Party" (Ducal Palace, Dessau), the most characteristic specimen, but also in the humorous "Bridal Procession" (1653, Six Gallery, Amsterdam), in "After the Carousal" and "Revelry" (both in Amsterdam Museum), and in "Dissolute Company" (Berlin Museum). All these transplant us to the sphere in which so many scenes depicted by Steen are enacted, the atmosphere of low taverns, where the changes on the theme "Wine, Woman, and Song" are rung in all imaginable variations. Indubitably Jan Steen is the most genial among the masters of the genre in the entire Dutch school. His dated pictures belong, with a few exceptions, to the decade from 1660 to 1671, his Haarlem period, the most brilliant of his artistic activity. Its beginning is marked by the ingenious domestic scene known as "The Menagerie" (1660, Hague Gallery), and in strong contrast to it "Prince's Day" (Amsterdam Museum), with numerous figures. Other noteworthy examples at The Hague are: "The Painter's Family" (c.1663), "Oyster Party in Steen's Brewery," and "Doctor's Visit;" and in Amsterdam: "Eve of Saint Nicholas," a favorite and often repeated subject of the master, "Family Scene" (2), "The Parrot's Cage," "Cat's Dancing Lesson," "Rural Wedding," and "Lovesick," one of his most perfect works. The Brussels Museum contains "A Gallant Offer" and "The Rhetoricians;" the Louvre, "Evil Association," "Family Repast," and "A Village Festival" (1674), with many figures. Besides similar subjects in the galleries of Berlin, Munich, and Vienna, there are to be mentioned "The Feast of Beans" (1668, Cassel Gallery) and "The Marriage Contract" (Brunswick Museum), perhaps his most remarkable work for size, dramatic feeling, and equably carried out execution. A cabinet piece in the manner of Terborch is the "Music Lesson" (1671), in the National Gallery, London, and several fine interiors may be seen in Buckingham Palace, London, while over ninety of his works are in private collections in England. Consult: Van Westrheene, *Jan Steen, Etude sur l'art en Hollande* (The Hague, 1856); Lemcke, in Dohme, *Kunst und Künstler*, etc. (Leipzig, 1878); and Rosenberg, *Terborch und Jan Steen* (ib., 1897).

STEENKERKE, stān'kĕr-k*e*, or **STEENKERKEN**. A village in the Province of Hainault, Belgium, on the Senne, 19 miles southwest of Brussels. It is noted for the disastrous defeat of the Dutch and English troops under William of Orange, who here attacked the French army commanded by Marshal Luxembourg, August 3, 1692.

STEENSTRUP, stān'strup, JOHANNES JAPETUS SMITH (1813-97). A Danish zoölogist and archæologist, born at Vang. In 1845 he was elected adjunct professor of zoölogy of the University of Copenhagen. In this year appeared the work in which he established the fact of the alternation of generations in the hydroids, and more especially in trematode worms, entitled *On the Alternations of Generations, or the Propagation and Development of Animals Through Alternate Generations*. He was also an authority upon the kitchen-middens (q.v.) of Denmark.

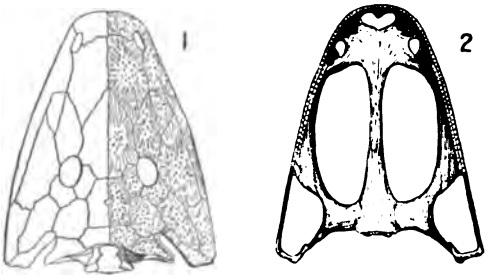
STEENWIJCK, stān'vĭk, **STEENWYCK**, or **STEINWICK**, HENDRIK VAN, the Elder (c.1550-c.1605). A Dutch architectural painter, born at Steenwijck. He painted many interiors of churches, and was the first to attempt the effect of artificial light on architectural forms. His works include: "Interior of Aix Cathedral" (1573, Schleissheim Gallery); "The Courtyard of a Palace" (1588, Dessau Gallery); and "The Liberation of St. Peter" (1604, Vienna Museum). His son, HEINDRIK, the Younger (c.1580-c.1650), was born in Frankfort and went early to Antwerp and Amsterdam, settling finally in London (1629). He, too, painted architectural subjects. Many of Van Dyck's backgrounds were executed by him, and Brueghel and Thulden put figures upon his own canvases. Examples of his work are: "A Church Interior" (1605, Vienna); "View of a Public Square" (1614, The Hague); and "Jesus with Mary and Martha" (1620, Louvre).

STEEPLECHASING. Flat racing over a course selected by reason of the obstacles, such as fences, hedges, hurdles, and ditches. It is popularly supposed to have originated in the hilarious spirit of excited fox-hunters, taking a bee line from the point where they were to a distant village church steeple. The Grand National Steeplechase of Liverpool, established in 1839, is the great event of the steeplechase year. In the United States the Meadowbrook Club has been the pioneer organization for steeplechasing.

STEER'FORTH. In Dickens's *David Copperfield*, a friend of the hero, and the seducer of Little Em'ly. He is drowned in a shipwreck, with Ham Peggotty, who attempts to rescue him.

STEERING. That branch of practical navigation which involves the actual control of the direction of a moving vessel. Steering usually involves the manipulation of the helm, or rudder, tiller, and necessary adjuncts, as described under HELM. In addition the effect of sails, paddle-wheels, screws, etc., must be considered, and sea, currents, winds, and other conditions taken into account, these varying from time to time, and different types of vessels requiring different methods. A double-screw steamer, for example, will steer differently from one with a single screw, having a greater power of manœuvring. The steering of a vessel depends upon the course followed. (See SAILINGS and NAVIGATION), and also upon the rules of the road (q.v.). An interesting practical discussion of the subject will be found in Knight, *Modern Seamanship* (3d ed., New York, 1903).

STEEVENS, GEORGE (1736-1800). An English Shakespeare commentator, born at Poplar. He was educated at Eton and at King's College, Cambridge, but left the university without a degree (1756). Inheriting a small fortune from his father, a director of the East India Company, he was able to give his time to the study of Shakespeare. He reprinted 20 plays from the quartos (4 vols., 1766), collaborated with Dr. Johnson on an edition of Shakespeare (1773), which was revised by Isaac Reed (1785), and, in conjunction with Reed, brought out a new edition (15 vols., 1793). Steevens mutilated the text, but his notes are still valuable.



STEEVENS, GEORGE WARRINGTON (1869-1900). An English journalist, born at Sydenham. He was educated at the City of London School and at Balliol College, Oxford. In 1893 he left Oxford for London, where he joined the editorial staff of the *Pall Mall Gazette*. In 1897 he became a special correspondent of the *Daily Mail*, for which he visited in succession the United States, Greece, Egypt, India, Rennes (the scene of the trial of Dreyfus), and South Africa. His letters to the *Daily Mail* were republished under the titles: *The Land of the Dollar* (1897), *With the Conquering Turk* (1897), *Egypt in 1898* (1898), *With Kitchener to Khartum* (1898), *In India* (1899), *The Tragedy of Dreyfus* (1899), and *From Cape Town to Ladysmith* (1900). The last volume, left incomplete, was edited by Vernon Blackburn. All this journalistic work has a distinct literary value from the author's remarkable perceptive and descriptive powers. Before his connection with the *Daily Mail* he had published *Naval Policy* (1896) and the clever *Monologues of the Dead* (1896). He died of enteric fever at Ladysmith, then besieged by the Boers.

STEFFANI, stā-fä'nē, AGOSTINO, Abbate (1655-1730). An Italian composer and statesman, born at Castelfranco, Venetia. He studied music in Venice and under Ercole Bernabei (c. 1620-87) in Munich, where he became organist in 1675 and director of the Elector's chamber music in 1681. He took holy orders in 1680, was appointed Court kapellmeister at Hanover in 1688, and brought out his Italian operas with great splendor in the garden of Schloss Herrenhausen. They were also produced in German at Hamburg, in 1690-1700. He is, however, chiefly remembered for his numerous chamber duets, set to Italian texts, which rank as models of their kind. His compositions are preserved in manuscript in the royal library, London; of the few that appeared in print, may be mentioned: *Psalmodia Vespertina*, for eight voices (1674); *Sonate da camera a due violini, alto e continuo* (1679); *Duetti da camera a soprano e contralto* (1683); and *Janus Quadrifons*, motets with basso continuo for three voices. In 1710 he resigned his post in favor of Handel, and, being made Privy Councilor by the Elector Palatine and bishop in partibus of Spizza, Dalmatia, by the Pope, devoted himself principally to diplomatic and ecclesiastical affairs and died at Frankfort.

STEFFECK, stā'fĕk, KARL (1818-90). A German animal and portrait painter, born in Berlin, where he studied under Krüger and Begas. In 1839 a pupil of Delaroche and of Horace Vernet in Paris, he continued his studies in Italy in 1840-42, and after his return to Berlin attracted attention first with historical, then with sporting subjects, and soon was reputed the foremost painter of horses. In 1880 he became director of the Academy at Königsberg. His principal paintings include: "Margrave Albrecht Achilles Fighting the Nurembergers, 1450" (1848); "Two Spaniels at Play" (1850), "Mare with Colt" (1877), all in the National Gallery, Berlin; "King William at Königgrätz" (1867), Royal Palace, Berlin; "Capitulation at Sedan" (fresco, 1884), Arsenal, Berlin; "Queen Louise with Two Sons" (1886), Breslau Museum; besides many portraits, especially equestrian.

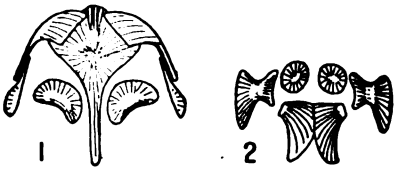
STEGANOPODES (Neo-Lat. nom. pl., from Gk. *στεγανόποδες, steganopous,* web-footed, from *στεγανός, steganos,* covered + *πούς, pous,* foot). A group of birds within the Ciconiiformes, characterized by having all four toes 'totipalmate,' or connected by a common web, also a more or less developed gular pouch. The skull is desmognathous and the wing is aquinto-cubital. The neck is without apteria; the tongue is rudimentary. The Steganopodes are cosmopolitan, aquatic piscivorous birds of large size. About 60 species are known, of which half are cormorants (q.v.). These constitute one of the six families, the other five being the pelicans, darters, tropic-birds, gannets, and frigate-birds (qq.v.).

STEGOCEPHALIA (Neo-Lat. nom. pl., from Gk. *στέγειν, stegein,* to cover + *κεφαλή, kephalē,* head). The name proposed by Cope to designate a well-defined order of fossil amphibia, found in strata from the Lower Carboniferous to the Upper Trias. They are distinguished from other amphibians by a dermal armor of overlapping bony scales which usually protects the ventral, and in some cases the dorsal surface. The group is important as representing the earliest and most primitive tetrapoda or four-footed vertebrates adapted to at least partial land-living habits, and breathing by means of lungs. The majority of stegocephalians are salamander-like or lizard-like in form, with a long tail, flattened head, and two pairs of limbs. The presence of gills in the young and grooves for sensory mucous canals on the skull-bones of some forms proves an aquatic habit. A carnivorous diet is indicated by the conical pointed teeth.

SKULL OF A STEGOCEPHALIAN.

1, Plates of roof of skull (*Capitosaurus*); 2, Palatal view (*Cyclotosaurus*).

The dermal armor, the most distinctive feature of the group, consists chiefly of bony scales, arranged in regular rows on the ventral surface, but scattered or wanting on other portions of the body. Three large plates, one median and two paired, on the pectoral region, represent the interclavicle and the clavicles. The skull, of flattened triangular form, is characterized by a solid roof of paired plates of dermal bone, and the cranial roof is always pierced by five openings — the paired nares and orbits, and the median opening for the pineal body, which may have served as a light-perceiving organ. The teeth are simple hollow cones in the smaller Paleozoic genera, but in many of the later types the dentine and cement exhibit a system of extremely complicated folds — hence the name Labyrinthodontia often applied to these forms. The vertebral column presents widely divergent conditions in different types, as regards the nature and degree of ossification of the centra. As a rule the Paleozoic genera have the notochord largely persistent, the vertebral column thus remaining permanently in the larval condition, while the large Triassic labyrinthodonts have well-developed centra. The limbs are known for but few forms, and in these they do not differ remarkably from those of modern urodeles. The hind foot is always pentadactyl, but, in the fore-foot (except in Keraterpeton, Melanerpeton, and a few related forms) the number is reduced to four, the fifth or outer digit probably being the one lacking. In any attempt to trace the phylogenetic relationships of vertebrate classes the Stegocephalia are of the greatest importance, since it is in this group only, with its solid skull-roof, that we find on the one hand a close approximation to the Paleozoic bony fishes, and on the other to the most generalized Permian reptiles, the Cotylosauria. See REPTILE.



LABYRINTHODONT TOOTH-STRUCTURE.

Cross-section of labyrinthodont tooth, showing the folded structure.

STEGOCEPHALIAN TEETH.

LIMB-GIRDLES IN STEGOCEPHALIA.

1, Pectoral arch; 2, Pelvic arch of Discosaurus.

The classification is as follows: A.—Suborder Leptospondyli. Small animals, usually salamandriform, occurring in the Carboniferous and Permian. The suborder is divided into three fam-

ilies: (1) Branchiosauridæ; (2) Microsauridæ; (3) Aistopodidæ, the serpent-like footless forms. Dolichosoma, which attained a length of three feet, and Ophiderpeton are the best known forms.

B.—Suborder Ganocephala or Temnospondyli. The most familiar type is *Archegosaurus Decheni* from the Lower Permian of Germany, a species which attained a length of four feet. Cricotus and Eryops, from the North American Permian, measure ten feet, and are the largest American amphibia.

C.—Suborder Labyrinthodontia or Stereospondyli. The true labyrinthodonts are clearly differentiated by the form of the teeth, which have the dentine infolded in a more or less complicated manner, and by the vertebræ, which are completely ossified, with biconcave centra sometimes perforated for the passage of the constricted notochord. A few genera occur in the Carboniferous and Permian, but the maximum development of the group is attained in the Trias, chiefly of Europe. The genera Labyrinthodon, Capitosaurus, Trematosaurus, and Mastodonsaurus, from the European Trias, are all enormous animals, the last-named, with a skull four feet in length, being the largest amphibian known. Consult: Woodward, *Vertebrate Palæontology* (London, 1898); Zittel, *Text-book of Palæontology* (ib., 1902).

STEG'OSAU'RUS (Neo-Lat., from Gk. *στέγειν, stegein*, to cover + *σαῦρος, saurós*, lizard). A Jurassic dinosaur of most peculiar appearance. Fossil skeletons are found in Wyoming and Colorado. It was from 25 to 30 feet long, had a very small head, highly arched back, short fore and long hind legs, and heavy long tail. The great bulk of the hinder part of the body depended for its nervous control upon a ganglion in the neural cavity of the sacrum, and this ganglion was of a size several times greater than the brain in the head, which latter is by comparison very small. See DINOSAURIA.

STEIER, stī'ẽr. A town of Upper Austria. See STEYR.

STEIN, stīn, CHARLOTTE VON (1742-1827). A friend of Goethe. She was platonically intimate with him from 1775 to the time of his Italian journey (1786), by which he won emancipation. To her he addressed the *Briefe aus der Schweiz* (1779), which are among the classics of travel, and a multitude of letters, first published in 1848, and best edited in the Weimar edition of his *Works* (1886). Her letters to Goethe were long supposed destroyed, but they have recently been recovered in part. After Goethe's union with Christiane Vulpius there was an estrangement between him and Frau von Stein, gradually overcome later on. Consult: Höfer, *Goethe und Charlotte von Stein* (Stuttgart, 1878); Düntzer, *Charlotte von Stein* (ib., 1874).

STEIN, HEINRICH FRIEDRICH KARL, Baron VOM (1757-1831). A Prussian statesman. He belonged to an old Franconian family, and was born at Nassau. He studied at Göttingen, entered the Prussian civil service, and in 1784 was at the head of the Department of Mines for Westphalia. In 1786 he visited England and made a study of its institutions, and his experiences bore fruit at a later period in his guidance of Prussian affairs. In October, 1804, he entered the Prussian Ministry as chief of indirect imposts, taxes, manufactures, and commerce. He introduced useful reforms in his department, particularly by abolishing various restrictions on the internal trade of the nation; but he was hampered in his endeavors by the spirit of Prussian conservatism. In 1807 he was dismissed from office by the King, but the Peace of Tilsit opened the eyes of the sovereign to the wisdom of Stein's policy, and he was recalled, with the approbation of Napoleon, who had as yet no idea of the deep and earnest patriotism of the Minister. Seeing clearly that, from a military point of view, Prussia was powerless for the moment, he set about developing her internal resources by initiating a series of administrative and political reforms, the principal of which were the abolition of serfdom, with indemnification to the territorial lords; the subjection of the nobles to manorial imposts; promotion in the State service by merit alone, without distinction of caste; and the establishment of a modern municipal system. While he was paving the way for German unity, the Prussian army was being reorganized by Scharnhorst and Gneisenau (qq.v.) As the result of a letter criticising Napoleon's policy, which was brought to the knowledge of the French Emperor, Stein was obliged to resign (November 24, 1808), and retired to Austria. In danger of being surrendered by Austria to Napoleon, Stein was summoned in 1812 to Russia by the Emperor Alexander, and contributed by his counsels to the formation of the coalition of the German States against Napoleon. After the battle of Leipzig, in 1813, Stein became head of the council for the administration of the reconquered German countries, as well as of the territory which France had annexed west of the Rhine. He was a leader in all the military diplomacy of that stirring time up to the Congresses of Vienna and Aix-la-Chapelle. After his retirement from political life he devoted himself to the promotion of German science and art and formed the society for the study of early German history whose publications are celebrated as the *Monumenta Germaniæ Historica*. He died at Kappenberg (Westphalia) June 29, 1831. Consult: Seeley, *Life and Times of Stein* (London, 1879); Pertz, *Leben des Freiherrn vom Stein* (1885).

STEIN, LORENZ VON (1815-90). A distinguished German political scientist, born at Eckernförde, in Schleswig. He studied law and philosophy at Kiel and Jena; became a professor in Kiel in 1846; and from 1855 till 1885 was professor of political science at Vienna. He published: *Französische Staats- und Rechtsgeschichte* (1846-48); *System der Staatswissenschaft* (1852-56); *Lehrbuch der Volkswirtschaft* (1858, 1878, 1887); *Lehrbuch der Finanzwissenschaft* (1885-86).

STEIN, MARK AUREL (1862—). An English Orientalist, archæologist, and educator. He was born at Budapest, Hungary. He studied at Vienna and Tübingen, and in England at Oxford and London. In 1888 he was appointed registrar of the Punjab University and principal of the Oriental College at Lahore, and in 1899 principal of the Calcutta Madrasah. He was deputed by the Indian Government to conduct archæological and topographical explorations in Chinese Turkestan. The first results of his discoveries on this journey are published in his *Preliminary Report* (London, 1901). On his return from

Turkestan he became inspector of schools in the Punjab. Among the more important of his publications are a critical edition of Kalhana's *Rājatarangiṇī, or Sanskrit Chronicle of the Kings of Kashmīr* (1892), together with an English translation and commentary on the same (2 vols. 1901); *A Classified Catalogue of Sanskrit MSS. in the Raghunath Temple Library, Jammu* (1894); and *The Sand-buried Cities of Khotan* (1903).

STEINAMANGER, stīn'ăm-äng'ĕr (Hung. *Szombathely*). The capital of the County of Eisenburg (Vas), Hungary, 68 miles south of Pressburg (Map: Hungary, E 3). It has a beautiful modern cathedral, a fine county building, and a theological seminary. Important State railway workshops are located here, and two factories for agricultural machinery. Steinamanger is on the site of the Roman *Sabaria*, and has ruins of a triumphal arch, amphitheatre, and aqueduct in the vicinity, with many remains in the local museum. Population, in 1900, 24,751.

STEINBOCK (Ger., stone-goat), or **STEINBUCK.** (1) The European ibex (q.v.). (2) In South Africa, by transference, the Dutch name (also 'steenbok') for the small antelopes of the genus Nanotragus, specifically the widespread *Nanotragus campestris*, which abounds in open or thinly wooded and hilly places from the Cape to the Zambezi River. It is of an indeterminate reddish hue, about 24 inches tall, long-necked, with short, erect, forward-curving ringed horns, and exceedingly swift and active, and skillful in hiding. Other species of the genus are the oribi, grysbok, and royal antelope (qq.v.), with still others in Zanzibar and Abyssinia. Consult *Proceedings of the Zoölogical Society of London* for 1900.

STEINER, stī'nĕr, JAKOB (1796-1863). A Swiss mathematician, born at Utzenstorf, near Solothurn. He studied at Heidelberg, gave private instruction in Berlin, and in 1834 was made assistant professor in the university and member of the Academy of Sciences. Steiner's chief work is the *Systematische Entwicklung der Abhängigkeit geometrischer Gestalten* (1832; in the Ostwald Classics, 1896). He also wrote: *Die geometrischen Konstruktionen ausgeführt mittels der geraden Linie und eines festen Kreises* (1833; in the Ostwald Classics, 1895). His *Vorlesungen über synthetische Geometrie* (3d ed. 1887) and his *Gesammelte Werke* (1881-82) appeared posthumously. Consult Graf, *Der Mathematiker Jakob Steiner von Utzenstorf* (Bern, 1897).

STEINHEIL, stīn'hīl, KARL AUGUST (1801-70). A German physicist and astronomer, born in Rappoltsweiler, Alsace. He studied law at the University of Erlangen, and astronomy at Göttingen and Königsberg. He became professor of physics and mathematics in the University of Munich; later entered the Austrian Government service, organized and perfected the telegraph system in that country, and brought about the Austrian-German Telegraph Association; performed a similar service for Switzerland; and in 1852 returned to Munich. In 1854 he founded an establishment for making superior optical and astronomical instruments, where the great telescopes of the observatories of Upsala, Mannheim, Leipzig, Utrecht, etc., were made, and where he began the making of the photograph objectives since known by his name.

Steinheil devised an electromagnetic telegraph, in 1836 constructed the first printing telegraph, and in 1838 discovered the possibility of leading back the current through the ground. He invented the electrical clock, constructed an excellent pyroscope, and made the first daguerreotype picture in Germany. He also completed the laws of electrotype, and constructed several optical instruments. Consult Marggraff, *Karl August Steinheil und sein Wirken* (Munich, 1888).

STEINITZ, stī'nĭts, WILHELM (1836-1900). A German chess master, born in Prague, Bohemia, and educated at the Vienna Institute of Technology. In 1866 he defeated Anderssen in a contest for the world's championship. At the London tournament of 1872 he won every game, and in 1873, at Vienna, he secured the Kaiserpreis of 2000 florins. After defeating Blackburne in England, he withdrew from active tournament play, but the increasing success of Zukertort, whom he had defeated in 1872, forced him back into the field. At a tournament in London (1883) Zukertort defeated him for first place, but at a second match in 1886 Steinitz won from his great rival with 10 to 5 games won and 5 drawn. He defended his title in 1889 at Havana against Tchigorin, but lost the championship in 1894 to Lasker, who again defeated him in 1897. Steinitz was the first to see the value of a steady development of position with an accumulation of minute advantages over the more dashing and open game. After 1883 he lived in the United States, and from 1885 to 1891 he was the editor of the *International Chess Magazine*. His published works were *Book of the Sixth Chess Congress of 1889* and *The Modern Chess Instructor* (1889).

STEINLE, stīn'le, EDUARD VON (1810-86). A German historical painter, born in Vienna, the son of an engraver. First instructed at the Academy, he then became a pupil of Kupelwieser, and from 1828 to 1834 worked in Rome under the influence of Veit and Overbeck. In 1843 he settled at Frankfort, where he had been commissioned to paint "The Judgment of Solomon" (1844), and the portraits of Albrecht I. and Ferdinand III. for the Kaisersaal in the Römer, and in 1850 was appointed professor at the Städel Institute. There Frederick Leighton was among his pupils. Steinle's creative sphere embraces with equal command subjects of profoundly religious aspect and scenes of the merriest playful humor. His works are distinguished by finished grace and beauty of form, masterly technique in drawing, and inexhaustible power of invention. After executing, at Cologne, the "Angel Choirs" (1844), in the cathedral, and the frescoes illustrative of "The Artistic and Cultural Development of the City" (1860-63), in the staircase of the museum, he painted in seven scenes the "Immaculate Conception" (1865-66), in Saint Mary's at Aix-la-Chapelle, designed mural decorations for Saint Ægidius at Münster, and frescoed the apsis of Strassburg Cathedral (1877-80). In Frankfort he designed and in part executed the entire decoration of the cathedral, also the cartoons for some of the stained-glass windows, besides many others for churches in Cologne,

Treves, Fürth, and Vienna. His oil paintings, of rare coloristic charm, include "The Visit of Mary to Elizabeth" (1848) and "Saint Luke Painting the Virgin," both in the Karlsruhe Gallery; "Sibylla Tiburtina" (1848, Städel Institute, Frankfort); "Madonna," altar-piece (Saint Boniface, Wiesbaden); "The Warder" (1858); "Loreley," "Adam and Eve," and "Tartini Playing on a Tower at Padua" (all in the Schack Gallery, Munich); and "Madonna in a Garden" (1884, National Gallery, Berlin). He also composed many cycles in water colors and sepia, such as the "Legend of Saint Euphrosine," Brentano's "Rheinmärchen," several from Shakespeare's plays, and "Parsifal" (Pinakothek, Munich). Consult: Wurzbach, *Ein Madonnenmaler unserer Zeit* (Vienna, 1879); Valentin, *Eduard von Steinle* (Leipzig, 1887); and Reichensperger, *Erinnerungen* (Frankfort, 1887).

STEINLEN, stān'lān', THÉOPHILE ALEXANDRE (1859—). A French draughtsman and illustrator, born in Lausanne, Switzerland. He first became known by his drawings in the newspapers, especially those done in color for the *Gil Blas Illustrée*. Afterwards he became a successful poster designer. He was also successful in portraying Paris street life, particularly about Montmartre. Some of the best of his later work is included in Pelletan's *L'Almanach du Bibliophile*. His publications include the album *Les Chats*.

STEINMETZ, stīn'mĕts, KARL FRIEDRICH VON (1796-1877). A Prussian field-marshal, born at Eisenach. He fought in the wars against Napoleon, and against Denmark in 1848; became lieutenant-general in 1858, and in the campaign against Austria of 1866 won great distinction as commander-in-chief of the Fifth Army Corps, by his victories at Nachod, Skalitz, and Schweinschädel. At the beginning of the Franco-German War he was made commander-in-chief of the First Army. Owing to his surpassing self-confidence, he engaged in disputes with other commanders and the general staff. After his rashness had almost caused a disaster at Gravelotte (q.v.), he was deprived of his command. In September, 1870, Steinmetz was appointed Governor-General of Posen and Silesia, and in April, 1871, he was made general field-marshal.

STEINSCHNEIDER, stīn'shnī'dĕr, MORITZ (1816—). A distinguished bibliographer and Orientalist, born at Prossnitz, Moravia. He studied at Prague, Vienna, Leipzig, and Berlin, and taught in Prague and Berlin. The most important of his publications are his catalogues, and among them the chief are *Catalogus Librorum Hebræorum in Bibliotheca Bodleiana* (1852-60), *Katalog der hebräischen Handschriften zu Leyden* (1857), and lists of the Semitic manuscripts in the Royal Library of Munich (1875; 2d ed. 1895), in the Hamburg Library (1878), and in the Berlin Royal Library (1878). He wrote *Hebräische Uebersetzungen des Mittelalters* (crowned by the French Academy, 1893); an article on Jewish literature in Ersch and Gruber's *Encyklopädie*, translated by Spottiswoode as *Jewish Literature from the Eighth to the Eighteenth Centuries* (1857); *Uebersetzungen aus dem Griechischen* (1891-96); and *Die arabische Litteratur der Juden* (1902). Consult the *Festschrift zum 80. Geburtstage M. Steinschneiders* (Leipzig, 1896), with a full bibliography by George Kohut.

STEINTHAL, stīn'tāl, HEYMANN (1823-99). A German philologist, born at Gröbzig, in Anhalt, and educated at Berlin, where he became privatdocent in 1850 and extraordinary professor in 1863, lecturing on language and mythology. After 1872 he also lectured on criticism of the Old Testament, ethics, and the history of religion at the school for the science of Judaism. With Lazarus he edited from 1860 to 1890 the *Zeitschrift für Völker-Psychologie und Sprachwissenschaft*, and his works include: *Der Ursprung der Sprache* (1851, 4th ed. 1888); *Die Entwickelung der Schrift* (1852); *Geschichte der Sprachwissenschaft bei den Griechen und Römern* (1863, 2d ed. 1889-91); *Die Mande-Negersprachen, psychologisch und phonetisch betrachtet* (1867); *Abriss der Sprachwissenschaft* (1871 et seq.); *Allegemeine Ethik* (1885); *Zur Bibel und Religions-Philosophie* (1890-95). Consult Achelis, *Heymann Steinthal* (Hamburg, 1898).

STEINWAY, stīn'wā, HEINRICH ENGELHARD (1797-1871). A German-American piano manufacturer, originally named Steinweg, born at Wolfshagen, Harz Mountains. He began to manufacture guitars and zithers in Brunswick, and finally undertook the making of pianofortes. In 1850 he went to New York City with his four sons—Charles, Henry, William, and Albert—leaving the German business to his oldest son, Theodor. In 1853 they established the firm of Steinway & Sons.

STEJNEGER, stī'ne-gĕr, LEONHARD (1851—). An American naturalist. He was born in Bergen, Norway, and graduated at the University of Christiania in 1871. Ten years later he came to the United States, and became connected with the United States National Museum, of which he became curator of reptiles and batrachians in 1889. He prepared the greater part of the fourth volume of the *Standard Natural History, Birds* (1885); the *Poisonous Snakes of North America* (1893); *Report of the Rookeries of the Commander Islands* (1897); *The Asiatic Fur Seal Islands and Fur Seal Industry* (1898); and *The Herpetology of Porto Rico* (1903).

STELLA. See SWIFT, JONATHAN.

STELLA. (1) The name applied by Sir Philip Sidney, in his splendid collection of sonnets, entitled *Astrophel and Stella*, to Penelope Devereux, Lady Rich. (2) The name given by Swift to Esther Johnson, who is generally known as Stella.

STELLENBOSCH, stĕl'len-bŏs. A town of Cape Colony, 25 miles east of Cape Town, with which it has railway connection (Map: Cape Colony, E 9). After Cape Town it is the oldest settlement of the colony, having been founded by Huguenot refugees near the close of the seventeenth century. Population, about 6000.

STELVIO (stĕl'vē-ō) **PASS** (Ger. *Stilfser Joch*). A lofty Alpine pass leading across the Ortler group of Tyrolese Alps on the boundary between Tyrol and Italy, 68 miles southwest of Innsbruck (Map: Austria, B 3). The carriage road passing through it is the highest in Europe, being 9055 feet above the sea. It forms part of the great road between Milan and Innsbruck, and

was completed by the Austrian Government in 1820-24, at an expense of 3,000,000 florins.

STEM (AS. *stemn*, OHG. *stam*, Ger. *Stamm*, stem; connected with OIr. *tamon*, stem, and ultimately with Eng. *stand*). In general, stems of plants are axes distinguished from roots by bearing leaves or leaf-like organs. Although there are stem-like structures among the thallophytes and bryophytes, it is only among vascular plants (pteridophytes and spermatophytes) that real stems appear.

Stems may be variously classified. By duration, they are annual or perennial; by structure, herbaceous or woody; by direction, erect, decumbent, prostrate, climbing, etc. Perhaps one of the most important classifications is upon the basis of character of foliage organs produced, as follows: *Foliage-bearing stems*, which generally give style to the whole plant body, are the most conspicuous, since they display green leaves, and are necessarily aerial. As a consequence, they are inclined to branch, and the leaf-bearing joints are well separated. *Scale-bearing stems*, which bear the comparatively small and colorless (not green) leaf-like bodies (scales), may be subterranean or aerial, and the joints may be so near together that the scales overlap, as in the aerial scale bud of shrubs and trees, or the subterranean bud-like structures called bulbs, whose scales and stem become gorged with reserve food. Other prominent subterranean types are tubers (potato), comparatively short, thick stems, with much reduced and not overlapping scales, and the more slender rootstocks and rhizomes (Fig. 1). *Stems bearing flower parts* are very much modified, and constitute the so-called flowers of angiosperms (q.v.). The most essential classification of stems is on the basis of their anatomical structure (see below). The bracing of stems, especially those bearing foliage and flowers, is a conspicuous feature. (For structural details of stems, see ANATOMY OF PLANTS; HISTOLOGY.) Certain broad outlines must be presented here as a basis of the most fundamental classification. At the tip of the stem there is a single apical cell (some pteridophytes) or a group of apical cells, which by their power of continuous division increase the stem in length and give rise to all the tissues. Just behind this growing tip the three great regions begin to be defined (Fig. 2). On the outside is a layer of cells (dermatogen) that gives rise to the epidermis. In perennial stems that increase in diameter the epidermis is sloughed off on the older parts, and the region beneath develops a cork tissue of greater or less thickness, which constitutes the bulk of the bark (q.v.). Within the dermatogen is a zone consisting of several layers of cells (periblem) that gives rise to the cortex. Within the periblem is a central solid cylinder of cells (plerome) that gives rise to the stele, characterized by developing the vascular or woody bundles. The arrangement and character of the woody bundles developed in

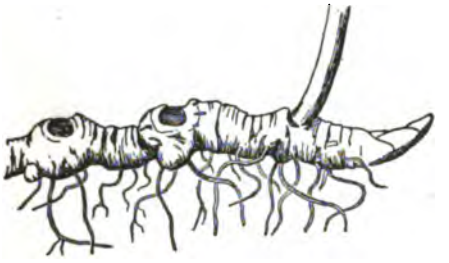


FIG. 1. UNDERGROUND STEM OF SOLOMON'S-SEAL.

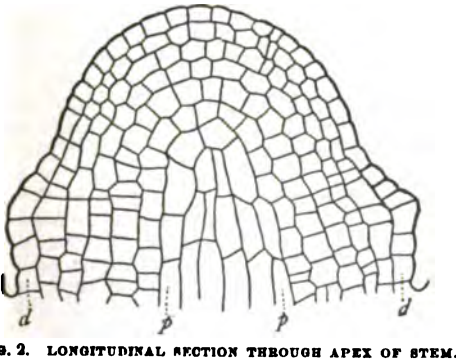

FIG. 2. LONGITUDINAL SECTION THROUGH APEX OF STEM. Showing dermatogen (*d*), plerome (*p*), and between them the periblem.

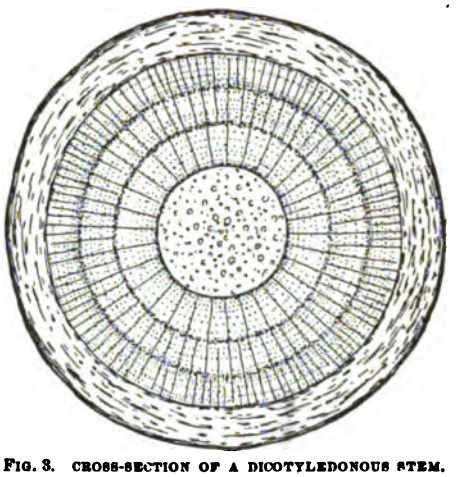

FIG. 3. CROSS-SECTION OF A DICOTYLEDONOUS STEM. Showing pith, three growth rings, and cortex.

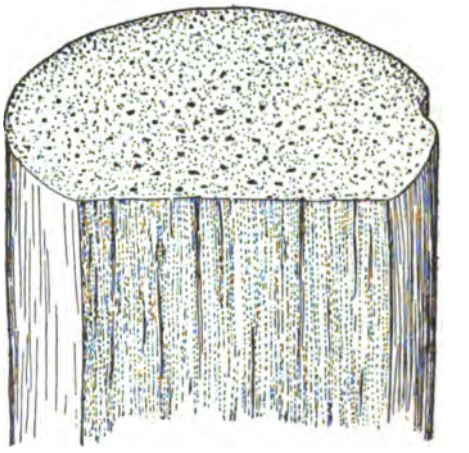

FIG. 4. CROSS AND LONGITUDINAL SECTION OF CORN STEM. Showing the monocotyledonous structure.

the stele determines the three general and most fundamental types of vascular stems. In the dicotyledon and conifer types (Fig. 3) the woody bundles are arranged in a hollow cylinder surrounding a central pith. Around the woody tissue of perennial stems there is developed a layer of actively dividing cells, the cambium, that adds a new outer zone of woody bundles each growing season, in cross-section giving the appearance of concentric annual rings. This power of increasing in diameter is one of the prominent features of these stems. In the monocotyledon type (Fig. 4) the woody bundles are scattered irregularly through the stele, as in the cornstalk and palm, so that there is no defined central pith region. Such stems show no annual increase in diameter. In the pteridophyte type usually a single large woody bundle of peculiar structure appears in the stele, in such a way that there can be no annual increase in diameter.

FIG. 5. BRANCH OF CACTUS (*Opuntia arborescens*), GROWN IN THE DARK.

The stem form above differs from the normal stem below in general shape, in the loss of protuberances and spines, and in the gain of leaves.

The primary function of the stem is to develop foliage leaves and display them to the air and sunlight, and also to act as a great conducting region between the root system and the leaves. (See CONDUCTION.) Subsidiary functions are vegetative propagation (as in horizontal ground stems); the storage of foods (as in bulbs and tubers); and the manufacture of foods, as in leafless stems, such as Equisetum and the cacti. Among the external factors which influence stem development, light and moisture are perhaps most important. In general, light is thought to retard stem development, as seen when stems grown in full light are compared with those grown in weak light and in the case of tubers. In some cases, however, as in the cacti, light has been found to favor stem development. Experiments seem to show that much of the so-called influence of light is due to a moisture influence (Fig. 6).

FIG. 6. BRANCHES OF GORSE (*Ulex Europæus*).

Showing the influence of moisture; the spiny branch at the right grew in dry air, the other branch in moist air.

STEM-GIRDLER. A horn-tail fly (*Phylloecus flaviventris*) which with its ovipositor girdles the twigs of currant bushes and deposits an egg below the cut. The resulting larva bores downward into the pith, which it devours, with the adjacent woody portion of the stem. In the autumn it spins its cocoon in the burrow, transforms to a pupa in the following spring, and shortly after emerges. An allied species (*Phylloecus integer*) works similarly in willows. See WILLOW INSECTS.

STENDAL, stĕn'dăl. A town in the Province of Saxony, Prussia, on the Uchte, 36 miles north-northeast of Magdeburg (Map: Prussia, D 2). It has a fifteenth-century late-Gothic cathedral restored in 1893. There are railway repair shops, and factories for iron furniture, cloth, gilt cornices, agricultural implements, and sugar. Stendal, founded in the twelfth century, was the capital of the Altmark of Brandenburg. Population, in 1900, 22,081.

STENDHAL, stän'dăl'. The name assumed by MARIE HENRI BEYLE (1783-1842). A French novelist remarkable for the keenness of his analysis of character. Though never popular, Stendhal has been much read and admired by

Flaubert and the naturalistic school, and by the later psychologic novelist Bourget. Stendhal was born at Grenoble. At seventeen he entered the service of Bonaparte, for whom he conceived great admiration. After Napoleon's downfall he resided in Italy. In 1821 he was expelled by the Austrians and returned to Paris. In 1831 he became French Consul-General at Civitavecchia. In the age of Chateaubriand Stendhal sympathized with Voltaire, in the day of the Romantic carnival he was practicing the restless dissection of character that marks the work of Taine and Bourget. Hardly one of his books could have paid the expense of printing, and of his now admired essay on love (*De l'amour*) it is said that seventeen copies were sold in eleven years. Nisard, the great literary historian of his time, does not name him. To-day he takes his place among the 'great French writers.' His works are collected in twenty-four volumes, of which five are posthumous. They begin with a book of Italian travel and an essay *De la peinture en Italie* (1817); *De l'amour* follows in 1822, with a striking essay on *Racine et Shakespeare*, participating much in the contention of the Romanticists. His first novel, *Armance* (1827), was followed by *Le rouge et le noir* (1831) and *La chartreuse de Parme* (1839). In all these he analyzes the various forms of restlessness into which the fall of Napoleon had thrown a generation trained to expect a life filled with violent emotion. All the novels are realistic studies of social types, but of types of energy and passion. The greatest of his creations is Julien Sorel, the criminal hero of *Le rouge et le noir*, whose career, founded on fact, is a veritable breviary of hypocrisy, though the Fabrice of *La chartreuse de Parme* is hardly inferior. But, though skillful in the dissection of motive, Stendhal's novels are careless in style, slovenly in construction, much inferior in this to his posthumously published *Vie de Napoléon* (1876). Consult: Sainte-Beuve, *Causeries du lundi*, vol. ix. (Paris, 1857-62); Zola, *Les romanciers naturalistes* (ib., 1881); Bourget, *Essais de psychologie contemporaine* (ib., 1883); Rod, *Stendhal*, in "Les grands écrivains français" (ib., 1892); Farges, *Stendhal diplomate* (ib., 1892); Brun, *Stendhal* (ib., 1900).

STEN'NIS, The Standing Stones of. A name applied to two circles of stone pillars on two headlands in the Loch of Stennis, Scotland.

STE'NO, Nicholas, or, in Danish form, **Niels Stensen** (1639-86). A distinguished anatomist and Roman Catholic bishop. He was born and educated as a Protestant at Copenhagen. In 1660-63 he lived at Amsterdam and Leyden and won renown for his discoveries in anatomy. In 1666 he became head of a hospital in Florence and body physician to the Grand Duke of Tuscany. In 1667 he accepted the Roman Catholic faith. From 1672 to 1674 he was professor of anatomy at the University of Copenhagen. In 1675 he became a priest and gave up his scientific studies. In 1677 he was made a titular bishop, and thenceforth he labored zealously among the northern missions as vicar apostolic. He wrote several religious works, including *Prüfung der Reformatoren* (1678). Consult his *Life* by Plenkers (Freiburg, 1884).

STENOGRAPHY. See Shorthand.

STEN'SEN, Niels. See Steno, Nicholas.

STENTOR (Lat., from Gk. *Στέντωρ*). In Homer's *Iliad*, a Grecian herald in the Trojan War. His voice was as loud as that of fifty men together. His name is preserved in the adjective stentorian.

STENZLER, stĕnts'lĕr, **Adolf Friedrich** (1807-87). A German Sanskrit scholar, born at Wolgast. He studied at Greifswald, Berlin, and Bonn, and in Paris and London. In 1833 he became professor of Oriental languages at Breslau. He edited, with Latin versions, the *Raghuvainça* (1832) and the *Kumâra Sambhava* (1838) of Kalidasa; with German translations, Yâknavalkya's *Book of Laws* (1849), and *Indische Hausregeln* (1864-78; containing the *Açvalâyana* and the *Pâraskara*); Kalidasa's *Meghadûta*, with commentary and glossary (1874); and *The Institutes of Gautama* (1876); as well as a very valuable *Elementarbuch der Sanskritsprache* (1868; 6th ed. 1892).

STEPHAN, stĕ'fän, **Heinrich von** (1831-97). A German administrator. He was born at Stolp, in Pomerania; entered the Prussian postal service in 1848 and was rapidly promoted until in 1875 he became Postmaster-General of the German Empire, having under his control the telegraph lines as well as the mails. In 1877 he assumed charge of the national printing offices. He introduced many internal reforms, invented the postal card, and brought about the formation of the Postal Union. He published *Geschichte der preussischen Post* (1859) and *Das heutige Aegypten* (1872).

STEPHANITE (named in honor of Archduke *Stephan*). A mineral silver sulphantimonite crystallized in the orthorhombic system. It has a metallic lustre and is iron-black in color. It occurs in veins with other silver ores, especially in Freiberg, Bohemia, in Hungary, Mexico, Peru, and in the United States at the Comstock lode in Nevada, and at various localities in Idaho.

STEPH'ANUS, or **ÉTIENNE,** â'tyĕn'. A famous French family of printers and scholars. Henricus (c.1460-1520), the founder of the establishment with which the family is identified, set up a press in Paris in 1501. His publications, about 120 in number, of which only one was in French, were mostly scientific.—His second son, Robertus (1503-59), had a good classical training and on his father's death carried on the business. In 1531 his *Thesaurus Linguæ Latinæ* began to appear, and in 1539 he was appointed royal printer to Francis I. In 1551, after the King's death, he was forced to leave Paris for Geneva, where in the same year he published the Greek New Testament, with his verse divisions, which are still in use. His various editions of the Bible, in Hebrew, Greek, Latin, and French, several works of the Genevan reformers, a *Dictionnaire français-latin* (1539-40 and 1549), French and Latin grammars, and a work on pedagogy, the first book from his press (1526), are the more important titles in a list of neary 400, all of which are marked by wonderful typographical clearness and accuracy.—His son Henricus, the younger (1528-98), after three years in his father's establishment in Geneva, in 1554 became independent. From his extensive travels he brought

back valuable collections of classical manuscripts. But his scholarly enthusiasm in launching the editions of Plato (1578), and the *Thesaurus Linguæ Græcæ* (1572), which were so long the source of all Greek lexicons, outran his business prudence. The great printing house was nearly ruined and his later works were printed by others. Thirty first editions of Greek authors constitute a claim to renown second only to that won by the *Thesaurus*.—His son PAULUS (1566-c.1627) succeeded him, edited Euripides (1602) and Sophocles (1603), and in 1602, implicated in the Escalade (see GENEVA), had to leave Geneva.—His eldest son, ANTONIUS (1592-1674), momentarily renewed the glories of the house of Paris, but eventually died in the Hôtel Dieu, old, blind, and poor. Consult: Renouard, *Annales de l'imprimerie des Etienne* (2d ed., Paris, 1843); Feugère, *Essai sur la vie et les œuvres de Henri Etienne* (ib., 1853). For Robert's work in connection with the Greek New Testament, Scrivener, *Introduction to the Textual Criticism of the New Testament* (3d ed., London, 1883).

STEPHEN, stē'vn. The first Christian martyr. He was chosen first among the seven deacons whose selection is related in Acts vi., and the account of his martyrdom is given in the following chapter. His execution does not seem to have had the sanction of the Roman authorities, and therefore was illegal. The authenticity of the speech in chapter vii. has been questioned, but, on the whole, there does not seem to be valid reason for doubting that the account is trustworthy. Saint Stephen's festival is celebrated in the Roman Catholic and Anglican churches on December 26th. His relics were believed to have been discovered at Jerusalem in 415 and a minor festival on August 3d commemorates this event. Consult the commentaries on Acts vi. and vii.; also McGiffert, *The Apostolic Age* (New York, 1897); and for the discovery of the relics, Lagrange, *Saint Etienne et son sanctuaire à Jérusalem* (Paris, 1894).

STEPHEN. The name of nine popes. STEPHEN I., Pope 254-257. The chief interest of his pontificate lies in the controversy over the validity of baptism by heretics, in which Stephen declared definitely that baptism, no matter by whom administered, was valid so long as the proper matter and form were employed. (See HERETIC BAPTISM.) He is called a martyr in the *Liber Pontificalis*, but the tradition cannot be traced further back than the sixth century.—STEPHEN II., Pope 752-757. During his pontificate occurred the epoch-making Donation of Pepin (q.v.), which was the real foundation of the Papal States in the modern sense. Consult Schnüren, *Die Entstehung des Kirchenstaates* (Cologne, 1894).—STEPHEN III., Pope 768-772, a Sicilian by birth. He held a synod at the Lateran in 769, supported by the sons of Pepin, at which an attempt was made to exclude secular influence in Papal elections, and a decree passed against the Eastern Iconoclasts. The relations between the Franks and Lombards troubled the latter years of his reign, and Desiderius, King of the Lombards, had the chief influence in Rome until after Stephen's death.—STEPHEN IV., Pope 816-817. He was closely allied with the Emperor Louis the Pious, whom he crowned at Rheims.—STEPHEN V., Pope 885-891.—STEPHEN VI., Pope 896-897. The most striking event of his pontificate is characteristic of the darkness of the times. Urged on by the faction to whom he owed his elevation, Stephen had the body of his predecessor Formosus disinterred, and after the formality of a trial and condemnation stripped of its sacerdotal robes and thrown into the Tiber. Stephen himself was soon imprisoned by a popular uprising, and died in prison.—STEPHEN VII., Pope 929-931, during the period when Theodora and Marozia held sway in Rome.—STEPHEN VIII., Pope 939-942, while Marozia's son Alberic II. held the temporal power and restricted the Pope to purely spiritual functions. He was able, however, by threats of excommunication to reduce to obedience the rebellious vassals of Louis IV. of France.—STEPHEN IX., Pope 1057-58, Frederick by baptism, brother of Gozelo, Duke of Lorraine. He was made a cardinal and chancellor of the Roman Church by Leo IX. On his return from an embassy to Constantinople he entered the Monastery of Monte Cassino, and became its abbot in 1057. As Pope he followed his German predecessors in their zeal for reform, but died in less than a year. Consult Will, *Die Anfänge der Restauration der Kirche im 11. Jahrhundert* (Marburg, 1864). Some lists of popes enumerate ten Stephens. The confusion arises from the fact that another of the name was elected immediately before Stephen II., but died four days after, before he had received episcopal consecration, and is therefore not properly called Pope.

STEPHEN (c.1097-1154). King of England from 1135 to 1154. He was the third son of Stephen, Count of Blois and Chartres, by Adela, daughter of William the Conqueror, and was thus the nephew of Henry I. of England. He was brought over to England at an early age and became a favorite with his uncle, who bestowed on him large estates and obtained for him in marriage the hand of Matilda, heiress of Count Eustace of Boulogne. Henry's only son having died in 1120, the King sought to secure the crown for his daughter Matilda, widow of Henry V. of the Holy Roman Empire, and Stephen was among the first of the great barons to take the oath of fealty to Matilda. Nevertheless, on the death of Henry I. in 1135, Stephen hastened from Normandy to England, seized the royal treasure, and was crowned King at Christmastide. Revolts in the south and west occurred in 1136, and though these were speedily suppressed, they broke out anew in the following year. In 1138 David I. of Scotland invaded England in support of the claims of his niece Matilda, but he was badly beaten in the battle of Northallerton (q.v.). Robert, Earl of Gloucester, half brother of Matilda, also rose in rebellion, but was for the time defeated. Stephen, however, foolishly entered into conflict with the Church, whose cause was espoused by his own brother, Henry of Winchester, the Papal legate. While the quarrel was in progress, Matilda and Robert of Gloucester landed in England, toward the end of 1139, and began a civil war which lasted for fourteen years and plunged England into utter misery. The nobles took advantage of the civil strife to make themselves virtually independent, and their castles, which Stephen had unwisely permitted them to build up, became mere robber strongholds and places of terror for the unhappy peasantry. The writer in the *Anglo-Saxon*

Chronicle says: "In this King's time all was dissension and evil and rapine. . . . Thou mightest go a whole day's journey and not find a man sitting in a town or an acre of land tilled. The poor died of hunger and those who had been men well-to-do begged for bread. . . . To till the ground was to plow the sands of the sea." "Men said openly that Christ and His saints slept." In 1141 Stephen was taken prisoner at the battle of Lincoln, and was deposed by a Church council, Matilda being chosen Queen. She soon alienated her supporters by her harsh government, and Stephen, who had been released in exchange for Robert of Gloucester, was declared the lawful King by a second Church council and was crowned on Christmas Day. In 1148 Matilda left England; Robert of Gloucester was now dead and the struggle was henceforth carried on by Henry, the son of Matilda and Geoffrey Plantagenet, Count of Anjou, who in 1151 succeeded his father and by his marriage to Eleanor of Aquitaine, the divorced wife of Louis VII. of France, became one of the richest princes in Europe. Stephen's son, Eustace, died in 1153, and in November of the same year Stephen and Henry concluded the Treaty of Wallingford, by which the former remained King, while the succession was vested in Henry. Stephen died October 25, 1154. Consult: Stubbs, *Constitutional History*, vol. i. (6th ed., Oxford, 1896); id., *The Early Plantagenets* (5th ed., London, 1886).

STEPHEN, Henry John (1787-1864). An English jurist. He was born at Saint Christopher's, West Indies, studied for a time at Saint John's College, Cambridge, and in 1815 was called to the bar. His legal treatises have given him a permanent place among English jurists. In 1824 appeared his *Treatise on the Principles of Pleading in Civil Actions*, which is a model of form and clearness, and was styled by Kent "the best book that was ever written in explanation of the science." His *New Commentaries on the Laws of England* (1841) enjoyed great contemporary popularity. He also published a *Summary of the Criminal Law at Its Present State* (1834). Consult L. Stephen, *Life of Sir James Fitzjames Stephen* (London, 1895).

STEPHEN, Sir James Fitzjames (1829-94). An eminent English jurist and writer on legal subjects, born in London. He was educated at Trinity College, Cambridge, and was admitted to the bar at the Inner Temple in 1854. He was recorder of Newark-on-Trent in 1859-69, and was legal member of the Legislative Council of the Governor-General of India in 1869-72, doing much to consolidate, abbreviate, and simplify the Indian law of crimes and of evidence, it being due to his efforts that the Indian Evidence Act was passed in 1872. He returned to England in 1872 and employed his time until 1875 in the work of codifying the law of evidence and criminal law of England. He was appointed professor of common law to the Inns of Court in 1875, and in 1879 was appointed a judge of the Queen's Bench Division of the High Court, which position he held until 1891, when he was disabled by nervous trouble resulting in insanity. His greatest work was his *History of the Criminal Law of England* (1883). It is the best work upon the subject for the period it covers, although marked by a certain bias due to his peculiar temperament; and his *Digest of the Law of Evidence* (1876) is widely used in England and the United States. He also published: *Essays of a Barrister* (1862); *Liberty, Equality, and Fraternity* (1873); *Digest of the Criminal Law* (1877); *A View of the Criminal Law in England* (1863). Consult Leslie Stephen, *Life of Sir James Fitzjames Stephen* (London, 1895).

STEPHEN, James Kenneth (1859-92). An English verse-writer, born in London. At King's College, Cambridge, from which he graduated in 1882, he was elected to the Whewell scholarship in international law, and to a fellowship (1885). In 1884 he was called to the bar at the Inner Temple, and in 1888 he was appointed clerk of assize for the South Wales Circuit. Two years later he resigned to return to Cambridge as tutor. In the meantime he had contributed to the *Saint James Gazette* and had conducted a weekly journal called *The Reflector*. The year before his death Stephen published two slender volumes of light verse, *Lapsus Calami* and *Quo, Musa, Tendis?* which met with instant success. In recent verse there is nothing cleverer than some of the parodies, as those on Browning, Wordsworth, Clough, Whitman, and especially Kipling. To the one on Browning there is a noble apology. Other poems show a keen critic of contemporary life.

STEPHEN, Sir Leslie (1832-1904). An English biographer and critic, son of Sir James Stephen. He was born in London and was educated at Eton and at King's College, London, and Trinity Hall, Cambridge, where he graduated in 1854 (M. A. 1857) and remained as fellow and tutor until 1864. In that year he went to London and engaged in literary work, writing much for leading periodicals. His first wife (died 1875) was a daughter of Thackeray. In 1865 he published *Sketches from Cambridge*, reprinted from the *Pall Mall Gazette*, and in 1871 became editor of the *Cornhill Magazine*, the reputation of which he maintained by securing such contributors as Stevenson, Hardy, and Henry James. He resigned this post in 1882 to undertake the editorship of the *Dictionary of National Biography*, which, though ill health forced him to hand the management over to Sidney Lee in 1891, will always be a monument to his scholarship and judgment. He wrote nearly four hundred of the articles himself, including Addison, Burns, Byron, Carlyle, Coleridge, Dickens, George Eliot, Fielding, Gibbon, Hume, Johnson, Milton, Pope, Scott, Swift, Thackeray, and Wordsworth. Practically all his work on the *Dictionary* was excellent, but his type of mind and literary method achieved the happier results, perhaps, with the eighteenth-century subjects. For a year (1883) he held the Clark lectureship in English literature at Cambridge. In addition to biography and literature Stephen showed a keen interest in philosophy and ethics. In this field he was utilitarian and fortified his position with an irony, a subtlety of thought, and a trenchantly critical method that won him high regard among literary men and scholars at the expense, perhaps, of popularity. His works include: *Hours in a Library* (three series, 1874-76-79), able and impartial criticisms about which there plays a delightful humor; *The History of English Thought in the Eighteenth Century* (1876, new ed. 1902); *Essays on Freethinking and Plain Speaking* (1879) *The Science of Ethics* (1882), widely used as a

text-book; *Life of Henry Fawcett* (1885); *An Agnostic's Apology* (1893); *Life of Sir James Fitzjames Stephen* (1895), his brother; *Social Rights and Duties* (1896); *Studies of a Biographer* (1898); *The English Utilitarians* (1900); and, in the "English Men of Letters" series, lives of Swift, Pope, Johnson, Hobbes, and George Eliot. Stephen was knighted in 1902.

STEPHEN BÁTHORY, bā'tō-rē. See BÁTHORY.

STEPHEN DUSHAN, dōō'shän (c.1308-55). Czar of Servia from 1331 to 1355. Profiting by the disorders in the Byzantine Empire, he obtained possession of a large part of Macedonia and of Northern Greece. He also extended his sway over most of Albania, while Bulgaria acknowledged his overlordship, and he defied the power of Louis the Great of Hungary. Stephen was great as a ruler, as a soldier, and as a lawgiver. In 1346 he had himself crowned Emperor (Czar) of the Servians and Greeks. In 1349 an independent patriarchate was instituted for Servia. Under Stephen there was, for a brief period a great Slavic realm in the southeast of Europe. His death was followed by its speedy disruption. Stephen Dushan is regarded as a national hero by the Servians.

STEPHENS, stē'vənz, ALEXANDER HAMILTON (1812-83). An American statesman, and the Vice-President of the Confederate States; born in Taliaferro County, Ga., February 11, 1812. His boyhood was one of poverty and toil, with occasional attendance at 'old-field' schools. A society for the education of young men for the Presbyterian ministry became interested in him and provided him with the means for education at Franklin College, now the State University, where he graduated at the head of his class in 1832. He did not enter the ministry, but he returned, with interest, the money advanced for him by the society, in accordance with the understanding upon which he had received it. He taught school for a time, and after three months' study of law without a tutor was admitted to the bar at Crawfordville, his county-town, at the age of twenty-two. At twenty-four he was elected to the State Legislature, and after five years' service there was sent to the United States House of Representatives, where he remained from 1843 until he voluntarily retired in 1859.

In 1861 he became Vice-President of the Confederate States and remained so while that government lasted, though not wholly in accord with its policy. He headed the Confederate Commission that met President Lincoln and Secretary Seward at Hampton Roads in February, 1865, to confer upon terms of peace. (See HAMPTON ROADS CONFERENCE.) There is no foundation in fact for the story that Lincoln told Stephens that he might write his own terms if restoration of the Union were agreed upon as the first condition of peace. After the fall of the Confederacy he was imprisoned in Fort Warren, Boston Harbor, from May until October, 1865. Elected to the United States Senate in 1866, he was not permitted to take his seat, and he did not reënter official public life until 1873, when he became a member of the National House of Representatives, from which he again voluntarily retired in 1882. In the fall of that year he was elected Governor of Georgia, and died in the executive mansion, Atlanta, March 4, 1883, leaving a creditable record as statesman, orator, and writer.

His career is one of the most remarkable in American annals. With moral as well as physical courage, he was independent of party. Hence, until 1855, though he had never been in thorough accord with the Whig Party, he generally acted with it simply because he preferred its policy, on the whole, to that of the Democrats. When the Whig Party became disorganized by affiliations of its Northern members with the Free-Soilers, he acted with the Democrats, opposed the Know-Nothing Party, and supported Douglas for the Presidency in 1860. But as, in 1852, he would not act with the Whig Party in support of Scott, so in 1872 he would not act with the Democratic Party in support of Greeley. While he rejected as fallacious and inconsistent the doctrine of nullification, he believed in the right of secession; but he was opposed to the policy of resorting to it in 1861 as a remedy for the political situation at that time. He was devoted to the Union, but believed his ultimate allegiance due to his State, and when she seceded he went with it; but in the conflict that ensued his efforts were directed to a peaceful adjustment based on the principles upon which the Union was formed, for he held the Union itself secondary in importance to those principles. Besides editing the Atlanta *Daily Sun* from 1871 to 1873, he published: *A Constitutional View of the War Between the States* (1868-70); *The Reviewers Reviewed* (a reply to his critics); and *A School History of the United States* (1872). Consult: Cleveland, *Alexander H. Stephens in Public and Private, with Letters and Speeches* (Philadelphia, 1866); Johnston and Browne, *Life of Alexander H. Stephens* (ib., 1878; new ed. 1883).

STEPHENS, GEORGE (1813-95). An English archæologist, born in Liverpool. He was educated at University College, London. In 1834 he settled in Stockholm, Sweden, as a teacher of English. He translated Tegner's *Frithiof* into English verse (1841); was one of the founders of the Society for the Publication of Ancient Swedish Texts (1843), for which he edited several works; and published a *Catalogue of English and French Manuscripts in the Royal Library at Stockholm* (1847). In 1851 he moved to Copenhagen, and was appointed professor of English and Anglo-Saxon in the university there (1855). While holding this position he prepared his best known work, *The Old Northern Runic Monuments of Scandinavia and England, Now First Collected and Deciphered* (vol. i., 1866; vol. ii., 1868; vol. iii., 1884), which was abridged under the title *A Handbook to the Old Northern Runic Monuments*. As a collection of inscriptions, this work has great value; but the interpretations were proved worthless by Wimmer and other scholars.

STEPHENS, HENRY MORSE (1857—). A British-American historian, born in Edinburgh. He graduated at Balliol College, Oxford, in 1880, became a staff lecturer on history to the Oxford Extension Delegacy in 1891, and in 1892 was chosen lecturer on Indian history at Cambridge University. He was professor of modern European history at Cornell University from 1839 to 1903, when he became professor of history and

director of university extension at the University of California. His published works include: *History of the French Revolution* (1886); *Portugal* (1891), in the "Story of the Nations Series;" *Albuquerque and the Early Portuguese Settlements in India* (1891); *History of Europe, 1789-1815* (1899), in the "Periods of European History Series;" *Modern European History, 1600-1890* (1899). He also edited *Principal Speeches of the Statesmen and Orators of the French Revolution* (1891), and, in collaboration with G. B. Adams, *Select Documents of English Constitutional History* (1901).

STEPHENS, JAMES (1824-1901). An Irish agitator and Fenian leader, born in Kilkenny. After participating in the Young Ireland rising of 1848, he fled to Paris. In 1853 he instituted the foundation of the Irish Republican Brotherhood, commonly known as the Fenian Society (q.v.). His system depended on complete preparation of the people. A favorable opportunity was to be awaited when England should be embroiled in foreign troubles. By 1863, both in point of view of numbers enrolled and revenue raised, the organization had assumed formidable proportions, but from that time dates its decline. The *Irish People*, a newspaper which he founded in Dublin in 1863 as a Fenian organ, he conducted on a private basis. The rising in the autumn of 1865 was an ill-timed affair that had hung fire from the preceding spring, and the leaders were arrested. Stephens's facile escape from Dublin Castle was a cause of reproach on the ground that he sacrificed his lieutenants to his own chances instead of taking them with him. He proceeded to the United States and devoted his energies to pacifying and uniting the branch of the society there, but in 1867 he was formally deposed. He fled for his life to Paris, and in 1891 returned unnoticed to Ireland.

STEPHENS, JOHN LLOYD (1805-52). An American traveler and author, born at Shrewsbury, N. J. He graduated at Columbia College in 1822; from 1825 until 1834 practiced law in New York City, and then traveled for two years in Southern and Eastern Europe and in Palestine and Egypt, writing letters for the *American Monthly Magazine* that attracted widespread attention. Later he published *Incidents of Travel in Egypt, Arabia Petræa, and the Holy Land* (1837) and *Incidents of Travel in Greece, Turkey, Russia, and Poland* (1838). In 1839 he was sent by President Van Buren on an unsuccessful mission to Central America. On his return he published *Incidents of Travel in Central America, Chiapas, and Yucatan* (1841). He again went to Central America in 1841 and made further explorations, the results of which appeared in *Incidents of Travel in Yucatan* (1843). Both works were widely read at the time and attracted attention to the archæological remains in Yucatan. In 1849 Stephens became interested in the plan for building a railroad across the Isthmus of Panama, and was made vice-president and afterwards president of the company that was formed for that purpose. A monument was erected in his honor on the highest point traversed by the railroad.

STEPHENS, WILLIAM (1671-1753). An English colonial Governor, born at Bowcombe, Isle of Wight. He graduated at King's College, Cambridge, in 1684, and was admitted to the Middle Temple. About 1736 he went to South Carolina to survey a barony and met General Oglethorpe. He removed to Georgia in 1737 and became secretary of the trustees. In 1741 he became president of Savannah, one of the two counties into which the colony was divided, and in 1743 was made president of the colony. He was requested to resign on account of his age in 1750, and gave up his office in April, 1751. He published *Journal of the Proceedings in Georgia, Beginning October 20, 1733* (1742). One volume was printed separately as *State of the Province* (1742). His life was written by his son, Thomas, under the title *The Castle-Builders* (2d ed., 1759).

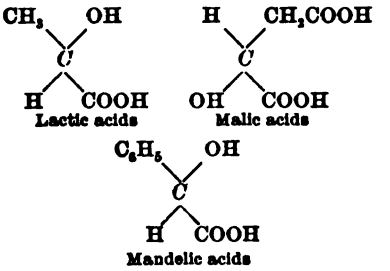
STEPHENSON, stē'ven-son, GEORGE (1781-1848). An English engineer and inventor and the 'founder of railways.' He was born at Wylam, near Newcastle, where his father was fireman at a colliery. After a boyhood spent in farm work he became assistant to his father and was steadily advanced. He got some education while working as fireman and brakeman, and in addition to his regular duties undertook the cleaning and repairing of clocks. He became acquainted with William Fairbairn at this time and the two were in frequent conference. After serving as engineer at various collieries and other establishments he was made engine-wright of the Killingworth High Pit, having by this time gained a thorough practical knowledge of the operation and construction of engines and pumping machinery. Devoting his leisure to scientific pursuits, he invented a miner's safety lamp (q.v.) known as the 'Geordie' (1815), and there resulted a controversy over the priority of the invention, as a similar idea had been successfully worked out by Sir Humphry Davy (q.v.). His attention was meanwhile turned to the experiments of Blackett and Hedley with locomotives, then in progress at Wylam, and he induced the owners of the Killingworth Colliery to undertake the construction of a locomotive. (See LOCOMOTIVE.) In 1821 he became chief engineer of the Stockton and Darlington Railway (see RAILWAYS), and in 1824 he was appointed engineer of the Liverpool and Manchester Railway. In 1825 the Stockton and Darlington road was opened, and was the first regularly operated in the world where locomotives were employed to haul freight and passengers. In 1829 his *Rocket* won in the celebrated competitive trial of locomotives on the Liverpool and Manchester Railway, and in 1830 the line was formally opened. Subsequent improvements were made in the locomotive and Stephenson became chief or consulting engineer to nearly all of the railway projects that were soon set on foot. His success in this field made it possible for him to become interested also in the development of coal mines. Stephenson visited the Continent in 1846, where he was received with unusual honors. He was the first president of the Institution of Mechanical Engineers, which he founded in 1847, but was never a candidate for political honors. In the latter part of his life he devoted himself to farming at his country place at Tapton House, where he died. By his successful development of the locomotive and of the railway Stephenson ranks as one of the foremost mechanical engineers of the nineteenth century. Not only was

his influence felt in the purely mechanical and engineering difficulties to be overcome, but also in the conservative organization and prosecution of the railway enterprises of his time. Consult Smiles, *Lives of the Engineers*, vol. iii. (London, rev. ed., 1874). Read in this connection articles on LOCOMOTIVE and RAILWAYS.

STEPHENSON, ROBERT (1803-59). A British civil engineer. He was the son of George Stephenson (q.v.) and was born at Wallington Quay, near Newcastle. He was educated at Newcastle and received practical engineering experience at the Killingworth Colliery and with his father in railway surveying and the construction of locomotives, being, in the meanwhile, a student for six months at Edinburgh University. After managing his father's locomotive factory in Newcastle for a few months he went to South America on account of ill health (1824) and engaged in mining. Coming back to England in 1827, he returned to the locomotive works and supervised the construction of the *Rocket* (see LOCOMOTIVE), incorporating in its mechanism many original and serviceable ideas, and assisted his father in other work. In 1833 he became the engineer of the London and Birmingham Railway, one of the first in which great engineering difficulties were encountered in the construction, but which was completed in 1838. The firm of Robert Stephenson & Co. by this time had become the leading engine builders of the world and a standard type of locomotive was evolved which was subsequently enlarged and improved. Robert Stephenson was interested in every department of railway construction, and particularly in the design of bridges, where he achieved the highest reputation. Among the bridges he designed were the high-level bridge over the Tyne at Newcastle, the Victoria Bridge at Berwick, the famous Britannia Tubular Bridge across Menai Strait, the Conway Bridge, and the Victoria Bridge over the Saint Lawrence. (See BRIDGE.) In 1847 Stephenson was elected to Parliament from Whitby as a Conservative, and in 1856 became president of the Institution of Civil Engineers. See Smiles, *Lives of the Engineers* (London, rev. ed., 1874); Jeafferson and Pole, *The Life of Robert Stephenson* (ib., 1864). See LOCOMOTIVE; RAILWAYS; STEAM ENGINE; BRIDGE.

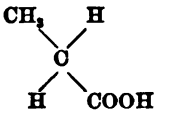
STEP'NIAK' (pseudonym of KRAVTCHINSKI), SERGEI MIKHAILOVITCH (1852-95). A Russian revolutionary exile and writer, born in Southern Russia. He graduated at the Saint Petersburg School of Artillery, and entered the Forestry Institute at Saint Petersburg. In 1872 he joined a Nihilist circle and engaged in spreading revolutionary ideas among the factory workmen in the capital. He was arrested in 1874 in the Government of Tver, but escaped, and henceforth led the life of an outlaw. He engaged in conspiracies in Italy, took an active part at Geneva in the publication of *The Commune*, and smuggled into Russia a press and type for illegal publications in 1878. When the revolutionists resolved upon the death of General Mezentseff, chief of the gendarmes, Stepniak, chosen by lot for the purpose, stabbed him on August 16, 1878, and somewhat later published *Life for Life* in justification of the act. During the years 1879-83 he lived in Switzerland and Italy, where appeared his famous *Underground Russia* (1882). In 1884 Stepniak settled in London. In 1885 appeared his *Russia Under the Tsars*, followed by *The Russian Storm Cloud* (1886), *Russian Peasantry, Career of a Nihilist* (1889), *The Little Cottage on the Volga*, and *King Stork and King Log* (1895). He edited *Free Russia* (founded in 1890), the monthly organ of the English Society of Friends of Russian Freedom. He died in London.

STEPPE (Russ. *stepi*, waste, heath, steppe). The name given to the undulating plains of Southeastern Europe and Northern Asia which correspond in general to the prairies and pampas of America, but are marked by some peculiarities due to their elevation and dry climate. The steppes are covered with grass in the rainy season or early summer and afford pasturage to great herds of cattle, sheep, and horses, and are largely occupied, where not brought under cultivation, by nomadic tribes of Tatars. See GRASSLANDS; PRAIRIE.



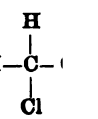
STERE (Fr. *stère*, from Gk. *στερεός*, *stereos*, solid). Another name for a cubic meter. The measure is much used for wood, especially firewood. See METRIC SYSTEM.

STEREO-CHEMISTRY. A branch of chemistry dealing with those cases of isomerism that cannot be explained by the doctrine of the linking of atoms, and explaining those cases on the assumption that the combining forces of an atom act in certain definite directions in space. Isomerism (i.e. the existence of compounds having the same qualitative and quantitative composition and the same molecular weight, yet differing more or less in their properties) and the doctrine of the linking of atoms (the structural theory) have been discussed in the article CARBON COMPOUNDS, which should be read in connection with the present sketch.



OPTICAL ISOMERISM. Most of the cases not explained by the doctrine of the linking of atoms are presented by compounds identical in all their chemical and physical properties except the power of rotating the plane of polarized light. It is well known that this power is possessed by a number of crystalline substances in the solid state, and that every such substance can be obtained in two 'enantiomorphous' crystalline forms, rotating the plane of polarized light through equal angles but in opposite directions. But when melted or dissolved such substances usually lose that power completely—which shows that their optical property is peculiar, not to their nature, but to the particular crystalline form which they assume in the solid state. These are not the substances that stereo-chemistry has to deal with: such substances, inasmuch as they lose their difference of optical rotatory power with their crystalline form and are therefore identical in the liquid, gaseous, or dissolved state, cannot be considered as different chemical individuals, and hence cannot form the subject of a theory of chemical compounds. Cases of optical isomerism proper are presented by substances retaining or acquiring their difference of optical rotatory power in the liquid, gaseous, or dissolved state.

In 1874 Le Bel and Van 't Hoff discovered, independently and almost simultaneously, that *all optically active compounds, and only optically active compounds, contain one or more 'asym-*



metric' carbon atoms, i.e. carbon atoms directly linked to four atoms or groups of atoms different from one another. The following formulas, containing asymmetric carbon atoms (denoted by an italic *C*), represent optically active compounds:

On the contrary, formulas like that of propionic acid,

which contains no asymmetric carbon atom (i.e. no atom combined with four *different* atoms or groups), have in no case been found to represent optically active compounds. The relation between the optic rotatory power and the asymmetric carbon atom must therefore form the cornerstone of any explanation of optical isomerism that might be advanced. Altogether three different explanations suggest themselves as possible: (1) the assumption that the four valencies of the carbon atom are unequal and that cases of isomerism may result from different distributions of the four atoms or groups combined with the carbon atom, among its different valencies; (2) the assumption that the atoms or groups combined with the carbon atom are in constant motion around it and that the molecules of optically different compounds may be made up of the same atoms or groups in different motions around the carbon atom; and (3) the assumption that the molecules of different compounds may be made up of the same atoms or groups, similarly linked to the carbon atom, but differently arranged in space around it. The first of these assumptions compels us to recognize the possible existence of isomers that are positively known to be impossible. For instance, if the assumption were correct, two different nitro-methanes would be possible; yet a systematic experimental investigation carried out by Henry showed that nitro-methane can exist in one form only. The second of the above assumptions is altogether incapable of either purely theoretical development or systematic correlation with facts, and must therefore be abandoned. The third assumption, viz. that the difference between optical isomers is due to differences in the configuration of the atoms in their molecules, presents itself, therefore, as the only possible explanation. Furthermore, even this explanation must first of all discard the hypothesis of the arrangement of atoms in a plane. Indeed, were the plane graphical formulas, as we ordinarily write them, true to reality, then, for instance, two methylene chlorides would be possible, the configurations of whose atoms would be represented by the following formulas:

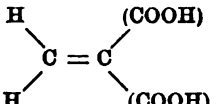
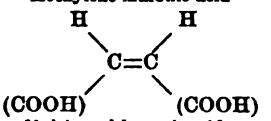
models, why only one acetic acid, $CH_3(COOH)$, is possible; why only one mono-chlor-acetic acid, $CH_2(Cl)(COOH)$, is possible; why only one di-chlor-acetic acid, $CHCl_2(COOH)$, is possible; why only one tri-chlor-acetic acid, $CCl_3(COOH)$, is possible; why two optically isomeric chloro-bromo-acetic acids, $C(H)(Cl)(Br)(COOH)$, are possible; and why two optically isomeric chloro-bromo-fluor-acetic acids, $C(Cl)(Br)(F)(COOH)$, are possible.



As already pointed out above, optical isomers are invariably found to possess precisely the same chemical and physical properties and to differ only with regard to the direction in which they rotate the plane of polarized light. The question now suggests itself, How can such isomers be separated from each other when mixed? This problem is so much the more important because all reactions by which compounds with asymmetric carbon atoms may be produced from compounds containing no such atoms cause the simultaneous production of both optical isomers in precisely equal quantities; so that a separation is required whenever optically active compounds are to be prepared artificially (in nature either one or the other of a pair of optical isomers is often found isolated). Three methods have thus far been found for effecting the separation. First, it is possible, in many cases, and under certain conditions of temperature, to separate the isomers mechanically—in those cases, namely, in which the two crystallize from their solutions separately. In all such cases the two isomers are found to form enantiomorphous crystals. Below, or sometimes above, the point or interval of temperature at which this takes place, the two isomers usually crystallize together, forming a double compound, the so-called 'racemic' modification of the given compound. The racemic modification is optically inactive because its two components tend to rotate the plane of polarized light to the same extent in opposite directions. The second method of separating optical isomers is applicable only to acids and bases. If a mixture of two optically isomeric acids is treated with an optically active base, two salts result differing more or less considerably in solubility, and therefore capable of being separated by fractional crystallization. The result is similar when a mixture of two optically active isomeric bases is treated with an optically active acid. Finally, the third method is based on the fact that certain processes of fermentation often destroy one of the optical isomers and leave the other intact. Thus, *levo*-glucose may be prepared by subjecting to fermentation its mixture with *dextro*-glucose, the latter alone being affected by the fermentation. The reason of such facts is not yet understood. It has been assumed by some that the living organisms (e.g. Penicillium glaucum) causing fermentation are capable of discriminating, by a sort of instinct, between the isomers, and, while feeding on one, reject the other. But the lifeless enzymes (q.v.) obtained from ferments have been shown to exercise the same action as the ferments themselves; and hence the peculiar action of the latter may be assumed to be due to the purely chemical properties of their enzymes.

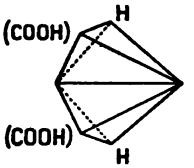
Passing now to the consideration of compounds whose molecules contain more than one asymmetric carbon atom, the most important case to be mentioned is that of tartaric acid, $(COOH)C(H)(OH)\cdot C(H)(OH)(COOH)$, with two asymmetric carbons in its molecule. By the use of models like those mentioned above, it is easy to convince one's self that three different arrangements are possible: (1) a right-handed arrangement of the groups around either of the asymmetric carbons; (2) a left-handed arrangement of the groups around either of the asymmetric carbons; (3) a right-handed arrangement around one, and a left-handed arrangement around the other asymmetric carbon. Corresponding to these are the well-known *dextro*-rotatory, *levo*-rotatory, and inactive modifications of the acid, the last named being inactive because one-half of its molecule rotates the plane of polarized light to the same extent in one direction as the other half does in the opposite direction. Besides these there is the racemic modification ('racemic acid'), which is a double compound of the dextro-rotatory and levo-rotatory tartaric acids (q.v.). The compounds containing more than two asymmetric carbon atoms include the sugars (q.v.)—an important class of compounds whose theory could not have been developed, and many of which could hardly have been discovered without the concepts of stereo-chemistry.

Geometrical Isomerism. It may be seen from the preceding paragraphs that the fundamental hypothesis of stereo-chemistry, viz. that the valencies of a carbon atom act symmetrically around it in space, while indispensable for correlating optical isomers, also throws additional light on the phenomena of chemical isomerism proper. Take, for example, again the case of methylene chloride, CH_2Cl_2. Were optical isomerism unknown and the stereo-chemical hypothesis non-existent, the question as to why only one modification of this compound is possible would be answered by pointing out that the four carbon valencies are identical and that, hydrogen and chlorine atoms being univalent, only one mode of linking the atoms is possible. If it were further asked, "But how do we know that two methylene chlorides might not exist, in whose molecules the atoms are *linked* similarly, but *arranged* differently?"—chemists would answer: "Of course, such a state of things is not inconceivable; only in all the innumerable cases thus far discovered, the doctrine of the linking of atoms is sufficient, the number of known isomeric compounds never exceeding the number of possible modes of linking; and so we deem it unnecessary to enter into speculations as to the arrangement of atoms in space." From the standpoint of stereo-chemistry the answer is thorough: only one methylene chloride is possible, (1) because the four valencies of carbon are identical; (2) because only one mode of linking the atoms is possible; (3) because only one arrangement of the atoms in space is possible, as may be readily demonstrated by the use of tetrahedron models.



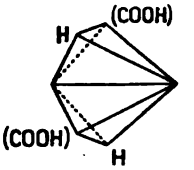
It is, therefore, clear that stereo-chemistry not only explains, and hence permits of foreseeing, all possible cases of optical isomerism, but also explains thoroughly why more cases of chemical isomerism than are explained and foretold by the doctrine of the linking of atoms are not possible. But stereo-chemistry has still another important application. Its fundamental hypothesis applied to the so-called 'unsaturated' compounds

(see CARBON COMPOUNDS) leads to a clear explanation of cases of isomerism which, again, cannot be explained by the doctrine of atomic linking alone. In the simplest class of unsaturated compounds one carbon atom is united by *two* valencies to another carbon atom. In stereo-chemistry this means that two carbon tetrahedra have an edge in common, the four atomic groups held by the two carbons being situated at the four free corners of the tetrahedra. Take, for example, the case of two carbon atoms united by a double bond and holding two hydrogen atoms and two carboxyl (COOH) groups. In this case the doctrine of the linking of atoms recognizes the possibility of two isomeric modifications, viz.:



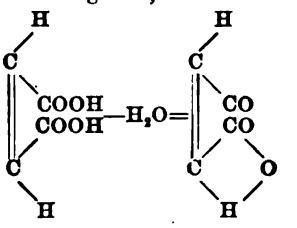
Methylene-malonic acid

and



Maleic and fumaric acids

Stereo-chemical doctrine recognizes that with the second of these modes of linking two different arrangements in space are possible, as may be seen from the accompanying diagram, and



Maleic acid

Fumaric acid

better still by the use of models. As a matter of fact, three unsaturated acids $C_2(H_2)(COOH)_2$ are known, viz. methylene-malonic acid characterized by the first of the above modes of linking, and two acids—maleic and fumaric—both characterized by the second mode of atomic linking, and differentiated from each other by the different *configuration* of their atoms. Optical activity is of course out of question, because none of the molecules under consideration contains an asymmetric carbon atom. But corresponding to the difference in configuration are certain differences in the chemical behavior of maleic and fumaric acids, although the close relationship between the two is indicated by the great readiness with which they are transformed into each other. The most important difference between the two consists in the fact that maleic acid readily forms an anhydride, its two carboxyl groups losing the elements of water and becoming joined together, thus:

Maleic acid — Maleic anhydride

The two carboxyl groups must be nearer together than in fumaric acid, and therefore the first of the above two stereo-chemical formulas is assigned to maleic, the second to fumaric acid. See FUMARIC AND MALEIC ACIDS.

As to compounds with triple bonds in their molecules (see CARBON COMPOUNDS), the verdict of stereo-chemistry is that no more isomers are possible than can be foreseen by the doctrine of atomic linking. This, too, may be best demonstrated by means of models.

HISTORY. In conclusion it may be mentioned that the optical rotary power of a substance in the non-crystalline state (sugar in solution) was first observed by Biot in 1815. The optically isomeric tartaric acids were thoroughly investigated by Pasteur, who in 1860 discovered the three known methods of separating such isomers (see above). Ten years later Wislicenus studied the isomeric lactic acids, and in a memoir published in 1871 expressed the view that the doctrine of atomic linking was no longer sufficient for the purposes of organic chemistry. Wislicenus's remark attracted the attention of Van 't Hoff, who advanced the stereo-chemical theory of optical isomerism in 1874. Meanwhile Le Bel, in Paris, had undertaken to continue the work of Pasteur, and soon independently arrived at the same conclusions as Van 't Hoff. Remarkably enough, Le Bel's and Van 't Hoff's memoirs appeared within one month. The theory of geometrical isomerism was worked out by Van 't Hoff about 1878. At present stereo-chemistry forms quite an extensive science, and its theories, to which no exception has yet been found in the case of carbon compounds, are being gradually extended also to the compounds of nitrogen.

Consult: Wislicenus, *Ueber die räumliche Anordnung der Atome*, etc. (Leipzig, 1887); Hantzsch, *Grundriss der Stereochemie* (Breslau, 1893; French trans., Paris, 1896); Van 't Hoff, *Die Lagerung der Atome im Raume* (Brunswick, 1894); Bischoff, *Handbuch der Stereochemie* (Frankfort-am-Main, 1893). Consult also the works on theoretical and organic chemistry recommended in the article CHEMISTRY. See CHEMISTRY; CARBON COMPOUNDS; LACTIC ACID; TARTARIC ACID; FUMARIC AND MALEIC ACIDS; VALENCY.

STEREOCHROMY, stĕr'ê-ŏk'rō-mĭ (from Gk. *στερεός, stereos*, solid + *χρῶμα, chrōma*, color). A process of wall-painting, invented in 1896 by Prof. J. N. von Fuchs, of Munich, and first practiced by the painter Joseph Schlotthauer. Upon a thin coating of mortar forming a part of the wall, mineral water colors mixed with soluble glass are applied, thus admitting of any part of the picture being retouched, as in the case of oil paintings. A coating of liquid glass is then added to protect it from the effects of the atmosphere. Experience has shown, however, that the surface of the painting cracks, and the process is no longer practiced.

STEREORNITHES, stĕr'ê-ôr'nĭ-thêz (Neo-Lat. nom. pl., from Gk. *στερεός, stereos*, solid + *ὄρνις, ornis*, bird). A group of extinct ratite birds of gigantic size whose remains are found in the Miocene strata of Patagonia. The propriety of this name as indicative of a distinct group has been criticised, and it is believed that,

on the contrary, many of the species are not ratite at all, but carinate, one, at least, having been determined to be a vulture. The most conspicuous genus is Phororhacos. See BIRD, FOSSIL. Consult Newton, *Dictionary of Birds* (New York, 1893-96).

STEREOSCOPE (from Gk. *στερεός, stereos*, solid + *σκοπεῖν, skopein*, to view). An optical instrument that enables one to see the pictures of objects not merely as plane representations, but with an appearance of solidity or relief. When a person looks at a solid body with both eyes the pictures formed on the retina of the two eyes are not alike, as the right eye is able to see more of the right side of the object and vice versa. When these two impressions are blended the object is seen with an appearance of depth or relief. It was not until 1838 that an attempt was made to produce this effect. This was accomplished in the first stereoscope, which was devised by Wheatstone (q.v.) and consisted of two plane mirrors at an angle of 90° and two similar clamps or supports for holding the picture. The face of the observer was placed close to the meeting point of the two mirrors and the light from each picture was reflected into the eye by the adjacent mirror. The pictures for use in this instrument were drawn as they would appear to each eye separately, and consequently were reflected to the eyes as they would actually be seen. The apparatus was successful so long as the pictures were confined to representations of geometrical objects of three dimensions, which could be constructed readily, but the reproduction of more complex objects, such as natural scenery, was beyond the skill of the artists, and it did not occur to the inventor to use photography, which was then being developed. The stereoscope was brought to its present state by Sir David Brewster, who in 1849 constructed a lenticular stereoscope in which lenses were substituted for the reflectors used by Wheatstone. In this way he was able to obtain a magnified image as well as one characterized by the stereoscopic effect. Instead of employing whole lenses he divided a double convex lens transversely into halves, which were placed in front of the two pictures with their thin edges adjacent. This was done so that the rays would be deviated by such an amount that they would apparently originate in a common point between the two pictures, the lens acting as a prism which always bends the rays around its base. In this way the two pictures, which are placed directly in front of the two lenses at a distance equivalent to the principal focus, are united into one image. The growth of photography and the ease with which pictures for the stereoscope could be produced soon made the instrument extremely popular, and the open form used in the United States was devised by Dr. Oliver Wendell Holmes, the poet. Brewster also invented a form of photographic camera with two lenses to take stereoscopic pictures. Instead of two lenses, which in modern stereoscopic cameras are generally of the rapid rectilinear type, the position of the camera can be shifted, but the results are not as good as those obtained with two similar lenses mounted on a camera with a vertical partition which enables two pictures to be taken on the same plate. The lenses, generally speaking, should be about 2½ inches apart, though a slight increase does not make any great difference, the relief becoming more prominent. Too great a difference, however, makes an exaggerated and unnatural picture. In printing, the negative reverses conditions, and the prints must be interchanged, as the pictures taken on the right-hand side must always be seen with the right eye.

The opera glass furnishes a familiar instance of the application of the binocular principle, and in the more modern double-tube telescopes and field glasses, particularly for military operations, great success has been attained in securing the stereoscopic effect with considerable magnifying power. Consult: Brewster, *The Stereoscope* (Leipzig, 1856); Helmholtz, *Physiologische Optik* (ib., 1856-66); Le Conte, *Sight* (New York, 1881); Müller-Pouillet, *Lehrbuch der Physik* (9th ed., Brunswick, 1897).

STEREOTYPING. See PRINTING.

STERILITY (Lat. *sterilitas*, barrenness, from *sterilis*, barren; connected with Gk. *στερεός, stereos*, solid, stiff, barren, *στέριφος, steriphos*, hard, barren). Barrenness, infecundity. In a woman, sterility consists of an incapacity for conception; in a man, of the inability to procreate the species. T. G. Thomas, of New York, has analyzed exhaustively the cause of sterility in a woman as follows: (1) Causes preventing the entrance of semen into the uterus, including absence of the uterus or vagina, obturator hymen, vaginismus, atresia vaginæ, occlusion of cervical canal, conical shape of cervix, cervical endometritis, polypi or fibroids, displacements, very small os internum or externum. (2) Causes preventing the production of a healthy ovule, including chronic ovaritis, cystic disease of both ovaries, cellulitis or peritonitis, absence of ovaries. (3) Causes preventing passage of ovule into uterus, including stricture or obliteration of Fallopian tubes, absence of Fallopian tubes, detachments and displacements of Fallopian tubes. (4) Causes destroying the vitality of semen or preventing fixation of impregnated ovum, including corporeal or cervical endometritis, membranous dysmenorrhœa, menorrhagia or metrorrhagia, abnormal growths, areolar hyperplasia.

Sterility in man is *organic* when there is anatomical derangement of the apparatus; *atonic* when erections are wanting or feeble; *anæsthetic* when there is a diminution of sensitiveness in the nerves supplying the male organ; or *psychic* when mental conditions (as of fright, repulsion, etc.) inhibit the genital centre in the spinal cord. The determination of which partner in marriage is sterile is of great importance. In many countries obloquy and derision attach to the wife who fails to bear children, and her legal status is impaired. The woman is much less often to blame than has been supposed.

STERILIZED FOOD. Food that has been subjected to an agent (usually heat) capable of destroying the germs of fermentation or disease which may be present. The articles of diet which are not usually prepared by heat before ingestion, and which are capable of conveying disease, are fresh fruits and certain vegetables, water, and milk. The two latter are particularly likely to act as carriers of pathogenic microörganisms. Water may be rendered sterile by boiling or by distillation. It is then best kept for use in sterile bot-

tles, sealed, and maintained at a low temperature. Ice may be the means of carrying disease, since many bacteria, although retarded in their growth, are not killed by freezing.

Milk is the food around which the question of sterilization centres, because it is the sole nourishment of infants and swarms with bacteria, particularly during the summer months. Although it comes sterile from the breast of the suckling mother or the udder of the healthy cow, milk is almost a perfect culture medium for many varieties of bacteria, pathogenic and non-pathogenic, which multiply with astonishing rapidity. It may become contaminated during the interval between milking and ingestion in various ways. Unclean materials may be introduced into the milk from the udders of the cow or the milker's hands. Impure water used either as an adulterant or for cleansing containers may be a means of contamination. Typhoid fever has been proved to have been conveyed in this manner. Exposure to the air alone is sufficient to introduce, through dust, many different forms of bacterial life.

The diseases most likely to be propagated through milk are typhoid fever, tuberculosis, scarlet fever, cholera, suppuration, and especially the summer diarrhœa of children. Besides producing their specific diseases bacteria produce poisonous elements in milk which are capable of giving rise to ptomaine poisoning (q.v.) in individuals who drink it. It has been proposed at various times to prevent the development of germs in milk by the addition of non-poisonous antiseptic substances. But it has been found that even with such drugs as salicylic acid and boric acid quantities too large to be wholesome must be employed. Formalin has been extensively used of late years to keep milk sweet and aseptic. Cold is a very imperfect means of sterilization. A low temperature retards development of bacteria for a time, but does not destroy them nor their spores.

Milk is usually sterilized by boiling or by exposure to superheated steam. Germs existing in this fluid can be absolutely destroyed only by heating to 212° F. or higher on two or three successive occasions. The ordinary method of sterilizing milk is to place it in sealed jars or bottles containing sufficient for one feeding, which are then subjected to the action of steam. It is then cooled rapidly, kept sealed from the air, and placed on ice until needed. Exposure to such high temperatures alters the character of milk very materially, both as to its digestibility and nutritive qualities, and it is therefore rendered unfit for use except as a makeshift in very hot weather and in cases of infantile summer diarrhœa. Prolonged use of sterilized milk for children dependent solely upon it for nutriment has resulted in symptoms of scurvy. To obviate this difficulty milk is often subjected to a process known as pasteurization. This consists in heating it to a temperature of 167° F. and maintaining it at this point for a period of twenty minutes. Pasteurization has been shown to be sufficient to kill the microörganisms most commonly found in milk, and in particular those giving rise to diarrhœal diseases, which are very vulnerable to heat. Spores, however, are not destroyed. The tubercle bacillus is more resistant, but, as has been said before, tuberculosis is not often conveyed by milk. Pasteurized milk will keep two or three days at ordinary temperatures or several days on ice, and its taste, digestibility, and nutritive value are believed to be unchanged. See ADULTERATION; MILK.

STERLING. An epithet generally applied to the coinage of Great Britain. Charlemagne superseded earlier systems by a coinage in which a pound of 12 ounces became the money weight. The older *silfer* or scruple of 24 wheat-corns being superseded by the penny of 32 wheat-corns, the term sterling seems to have been applied to the latter, in consequence of its being in use among the Ripuarian or Austrasian Franks, sometimes called the *Esterlings*. In England the word 'sterling' came in the course of time to indicate the fineness of the silver. The superiority of the English standard silver was generally acknowledged over Europe; and hence the adjective 'sterling' has become a synonym for 'pure' or 'genuine.'

STERLING, stĕr'lĭng. A city in Whiteside County, Ill., 109 miles west of Chicago, on Rock River, and on the Chicago and Northwestern and the Chicago, Burlington and Quincy railroads (Map: Illinois, C 2). It is of considerable industrial importance, having good water power. The principal manufactures are agricultural implements, caskets, watches, canned goods, flour, paper, and foundry and machine-shop products. There is a public library with more than 9000 volumes. Population, in 1890, 5824; in 1900, 6309.

STERLING, JOHN (1806-44). An English author, born on the island of Bute. He was educated at Glasgow and at Cambridge. He went to London and began writing for the *Athenæum*. Owing to ill health, he passed two years in the West Indies (1830-32). Returning to England, he took orders and served eight months as a curate. In 1838 he formed the Anonymous (afterwards the Sterling) Club, which included Lord Houghton, Carlyle, and Tennyson. Among his writings are *Arthur Coningsby* (1833), *Poems* (1839), *The Election*, a poem (1841), and *Strafford*, a drama (1843). Sterling, a man of many friends, cut down with consumption in the prime of life, has been immortalized by Carlyle in a *Life* (Boston, 1851). Consult *Essays and Tales* with a memoir by J. C. Hare (London, 1848).

STERN, stĕrn, ADOLF (1835—). A German literary historian, born in Leipzig. He studied at the Universities of Leipzig and Jena, and in 1868 was appointed professor of the history of literature in the Polytechnikum of Dresden. His publications include the compilation *Fünfzig Jahre deutscher Dichtung* (1871); two collections of essays, *Aus dem achtzehnten Jahrhundert* (1874) and *Zur Litteratur der Gegenwart* (1880), and his most important work, *Geschichte der neuern Litteratur* (7 vols., 1882-85).

STERN, DANIEL. See AGOULT, Comtesse d'.

STERNBERG, stĕrn'bĕrk. A town in Moravia, Austria, 12 miles north-northeast of Olmütz (Map: Austria, E 2). It is the chief seat of the Moravian cotton and linen industry, and there is a large tobacco factory. Population, in 1900, 15,195.

STERNBERG, CONSTANTIN (1852—). A Russian-American pianist and composer, born at Saint Petersburg. In 1871 he became conductor

of the Court Opera at Strelitz; in 1875 director of the music school, and Court pianist at Schwerin. He settled in the United States in 1885, becoming director of the College of Music at Atlanta, Ga. In 1890 he became the head of the Sternberg School of Music in Philadelphia. His compositions include some admirable pianoforte music.

STERNBERG, GEORGE MILLER (1838—). An American bacteriologist and army surgeon, born in Otsego County, N. Y. He was graduated from the College of Physicians and Surgeons, New York City, in 1860, and was appointed assistant surgeon in the United States Army in 1861; he served through the war. After the close of the Civil War he was assigned to several posts until 1875, when he was promoted to the rank of surgeon and major. In 1879 he was sent to Havana, Cuba, by the National Board of Health as a member of the yellow fever commission. In 1885 the American Public Health Association awarded to him the Lomb prize of $500 for his essay on "Disinfection and Individual Prophylaxis Against Infectious Diseases." In 1893 Sternberg was made surgeon-general of the United States Army, with the rank of brigadier-general, and in this capacity he directed the medical affairs of the United States Army during the Cuban War. Among his published works are *Photomicrographs and How to Make Them* (1883) and *Malaria and Malarial Diseases* (1884).

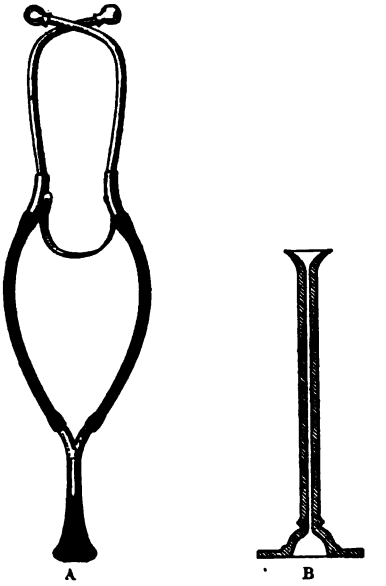
STERNE, LAURENCE (1713-68). An English author. He was born at Clonmel, in Ireland. Carried about in the regiment in which his father was an officer, he saw many phases of life in Ireland and England. From ten to eighteen he was at school at Halifax, in Yorkshire. Later he went to Jesus College, Cambridge, where he took his degree in 1736. He was ordained two years later, probably with a view to taking the family living of Sutton, near York, which was immediately given him, to be followed in 1741 by the prebend in York Minster. In 1743 the living of Stillington, which carried with it another prebendal stall in the cathedral, was given to him. He passed twenty years in his Yorkshire home, preaching curious sermons, associating with boisterous squires and reading Cervantes, Rabelais, and the old romances. He found himself suddenly famous when the first two volumes of his *Tristram Shandy* apeared at York at the end of 1759. He went up to London, became the lion of the moment, and published a collection of sermons. In 1760 he was presented to the living of Coxwold. There he went on with *Tristram*, publishing the ninth and last volume in 1767. During these years he spent much time in London and traveled on the Continent. The outcome of his tour in the autumn of 1765 was *A Sentimental Journey Through France and Italy* (1768). Less than a month after its publication Sterne died in a London lodging. In 1775 appeared *Letters to His Intimate Friends*, with the fragment of an autobiography, edited by his daughter, and *Letters from Yorick to Eliza* (i.e. Mrs. Elizabeth Draper).

Sterne's work reached a wide popularity at once, and had a following in England, France, and Germany for years. His sentimentality, the deliberate self-conscious indulgence in feelings of pathos, became the fashion of the day. His work is curiously subjective, dependent upon the moods and whims of the moment; and its formless, easy-going style, such a contrast to the ordered regularity which had marked English prose from Dryden to Addison, thus admirably represents his thought. His characters are remarkable for their genuine human quality, remote as they live from the interests of the ordinary people of the time, and belong to the small class of positive creations in literature. Consult the biographies by Fitzgerald (London, 1864; 2d ed. 1896) and Traill (ib., 1882); Stapfer, *Laurence Sterne, sa personne et ses ouvrages* (Paris, 1870); Texte, *Rousseau et le cosmopolitisme littéraire au XVIIIème siècle* (ib., 1895); Thackeray, *English Humourists* (London, 1853). His works, collected in 1780, were reprinted with newly discovered letters under the editorship of J. P. Browne (London, 1873). A convenient but less complete edition was edited by G. Saintsbury (London, 1894).

STERNHOLD, THOMAS (c.1500-49). One of the authors of the metrical English version of the Psalms. He was probably born in Gloucestershire, England. According to Wood he studied at Christ Church, Oxford, but did not take a degree. He held the office of groom of the robes to Henry VIII. and Edward VI. The first edition (undated, but about 1547) contains nineteen psalms. A second edition (1549) with additions by John Hopkins (d. 1570) contains 37, and in the complete psalter (1562) 40 bear the name of Sternhold. The rest were by Hopkins and several others. The rendering is very literal, but somewhat coarse and homely in phrasing. It was used in England long after the new version by Tate and Brady (1696). "My Shepherd is the Living God" (Psalm xxiii.) is still current. Consult Julian, *Dictionary of Hymnology* (London and New York, 1892).

STERNUM (Neo-Lat., from Gk. *στέρνον*, breast-bone), or BREAST-BONE. A narrow flat bone in the median line of the chest in front, giving attachment to the first seven ribs through their costal cartilages and thus closing anteriorly the thoracic cavity. In the adult it consists of three parts, the upper or manubrium, the middle or gladiolus, and the inferior or ensiform. A sternum is not present in fishes, batrachians, or serpents, but it does occur in all warm-blooded vertebrates and reaches its highest development in the flying birds, where a heavy ridge or keel furnishes a joint of attachment for the powerful muscles of the wings. In the tortoise it is represented by the lower shell or plastron.

STERRETT, JOHN ROBERT SITHINGTON (1851—). An American classical scholar, born at Rockbridge Baths, Va. He was educated at the University of Virginia and in Europe. Later he engaged in important archæological expeditions in Asia Minor, the results of which were published in the papers of the American School at Athens under the titles *Wolf Expedition to Asia Minor* (1885), *Epigraphical Journey in Asia Minor* (1888), and also in *Leaflets from the Notebook of a Traveling Archæologist* (Texas, 1889). After holding professorships of Greek at Miami University and the University of Texas, he was called in 1892 to a similar position at Amherst College; he remained there until 1901, when he became head of the department of Greek in Cornell University. In 1896-97 he was



professor in the American School of Classical Studies at Athens. Other publications by him are *Qua in re Hymni Homerici quinque maiores inter se differunt* (1881); *Inscriptions of Assos; Inscriptions of Tralles* (1885).

STERRY, JOSEPH ASHBY-. An English critic.. See ASHBY-STERRY, JOSEPH.

STESICHORUS, stē-sĭk'ō-rŭs (Lat., from Gk. Στησίχορος) (c.640-555 B.C.). A famous Greek lyric poet, born in the Locrian Mataurus, but considered as a Himeræan, since he spent the greater part of his life in the city of Himera, of which his father seems to have been one of the early settlers. It is reported that he was at first the friend of Phalaris, the tyrant of Agrigentum, but that later, recognizing the cruel character of that tyrant, he warned his fellow-citizens against his schemes by telling them the fable of the horse that gave himself up to man in order to revenge himself on the stag. The Himeræans did not listen to his advice and he was compelled to flee to Catana, where he died. The Himeræans, however, in later times honored him with a statue which was seen by Cicero; his figure was also stamped on their coins. A famous story connected with Stesichorus relates that he was struck with blindness because of his attack on Helen, but recovered his sight after he had published a recantation in which he declared it was only the shade of Helen, not Helen herself, that went to Troy.

In his hands the religious hymn, which had been cultivated by previous lyricists, was somewhat secularized. The content also was epic, although the form continued to be that which had been established for melic verse. He treated in his *Destruction of Troy* the story of Æneas's wanderings, which thereafter was established in literary tradition. He also employed folk-tales and was the forerunner of the Greek romance in that he established in Greek literature the impersonal love poem, and he was the first to give literary treatment to the Sicilian story of Daphnis, which was later handled by Theocritus and other bucolic poets. His dialect was a combination of epic with Doric. He also contributed to the development of the strophic and epodic structure of lyric poetry. His poems were written in strophe, antistrophe, and epode, and this arrangement became the norm for lyric poetry, which was thereafter changed only in minor details. The fragments are published by Bergk, *Poetæ Lyrici Græci* (Leipzig, 1882). Consult, also: Welcker, *Stesichorus' Kleine Schriften* (Bonn, 1884); Rizzo, *Questioni Stesichoree* (Messina, 1895).

STETHOSCOPE (from Gk. στῆθος, *stēthos*, breast + σκοπεῖν, *skopein*, to view). An instrument for examining the heart and lungs through their sounds. In its simplest form, invented by Laennec (q.v.), the stethoscope consists of a tube of wood, from 10 to 12 inches long, with a flanging end to be placed on the chest to receive the sound, an open canal to conduct it, and a broad flat ear piece at the other end for apposition to the ear and excluding extraneous sounds. (See Fig. B.) An improvement upon this is the binaural stethoscope, introduced by Dr. Camman of New York, in the form of a binaural or double instrument having an ear piece for each of the ears and flexible rubber tubes connecting them with the chest piece. (See Fig. A.) A still finer instrument is the phonendoscope, which conveys with greater minuteness and intensity. The chest piece of the phonendoscope consists of a shallow metal cup covered by a disk of ebonite, with a perforation in the cup for attaching the rubber tubes for the ears. From the centre of

STETHOSCOPE.
A, stethoscope with ear tubes; B, older form.

the disk of ebonite springs a small rod ending in a button, which is placed upon the spot to be auscultated. This instrument is useful in the finer phases of diagnosis, particularly to distinguish between pericardial and endocardial sounds and to detect the fœtal heart. See AUSCULTATION; RESPIRATORY SOUNDS.

STETTIN, stĕt-tēn'. The capital of the Province of Pomerania, Prussia. The city is situated on both banks of the Oder, 17 miles south of the Stettiner Haff, an inlet of the Baltic, and 83 miles by rail northeast of Berlin (Map: Prussia, F 2). The district on the right bank of the river comprises the former suburbs of Lastadie and Silberwiese. The site of the town is hilly, and consequently the streets are uneven, but the houses are well built. The extensive fortifications were demolished in 1874. The castle, dating from 1577, formerly occupied by the Dukes of Pomerania, is now a Government building. The Königs-Thor and the Berliner Thor are interesting sandstone gates built by Frederick William I. Saint James is an imposing thirteenth-century church in the centre of the town, restored in 1897; Saint Peter and Saint Paul is the oldest church in Pomerania, restored 1816-17; and the fine new Roman Catholic church (1890) is also worthy of note.

Stettin is the most important manufacturing town in Pomerania. Its principal industrial establishment is the Vulcan ship-building yard, employing over 6000 men, and covering 65 acres. There is also a large iron foundry, where all the anchors for German ships are forged. The clothing industry ranks second in importance only to ship-building, and employs over 10,000 men,

women, and children. There are numerous large factories for the manufacture of chemicals and cement, bicycles and sewing machines, soap and candles, sugar, paper, glass, etc. A new harbor on the east bank of the Oder was opened in 1900. This, together with the deepening of the Oder to the Stettiner Haff, enabling large vessels, which formerly stopped at Swinemünde, to reach the city, has made Stettin the third port of Germany. It has direct steamship communication with New York, London, and other foreign cities. The port was cleared in 1900 by 4594 vessels, of 1,552,543 tons burden. The chief exports are corn, spirits, lumber, sugar, and cement; the imports, iron, petroleum, wine, groceries, and coal. Population, in 1890, 116,228; in 1900 (Greater Stettin), 210,680.

Stettin is of Slavic origin. It first came into notice in the twelfth century. As a member of the Hanseatic League it became a flourishing commercial town. It belonged to Sweden from 1648 until 1720, when it passed to Prussia. It was held by France from 1806 to 1813. Consult W. H. Meyer, *Stettin in alter und neuer Zeit* (Stettin, 1887).

STEUBEN, stū'ben, *Ger. pron.* stoi'ben, FRIEDRICH WILHELM VON, Baron (1730-94). A German-American soldier, born at Magdeburg, Prussia. He was educated at the Jesuit colleges of Neisse and Breslau, and at the age of fourteen served as a volunteer under his father at the siege of Prague. In 1747 he was appointed cadet of infantry, and in 1758, after several promotions, became an adjutant-general with the rank of captain. He fought with distinction in the Seven Years' War, at the close of which he was appointed grand marshal of the Prince of Hohenzollern-Hechingen, in which position he remained until about 1774. While in Paris in 1777 he was induced by Saint Germain to go to America and arrived at Portsmouth, N. H., on December 1st. He immediately offered his services as a volunteer to Congress, and was directed to join the army at Valley Forge. This he did February 23, 1778, and in May, 1778, he was appointed instructor-general of the Continental army with the rank of major-general. He devoted himself to the task of reorganizing the army on the European model, drilling the awkward and untrained soldiers and introducing order and system. He increased enormously the general efficiency of the army and thus contributed in no small degree to the success of ensuing campaigns. At Monmouth he rendered valuable service, and in 1780 he was sent with a separate command to coöperate with General Greene in Virginia, where he opposed the marauding expedition of Benedict Arnold, and finally took an active part in the siege of Yorktown. In 1780 he prepared a manual for the army entitled *Regulations for the Order and Discipline of the Troops of the United States*, which came into general use. After the war he received grants of land from several States, and finally Congress voted him a tardy pension of $2400. For several years he lived in New York City and then removed to the tract of land (Steuben Township) granted to him by New York, where he lived in a rude log cabin (near the site of the present Utica) until his death, November 28, 1794. Friedrich Kapp has written the most trustworthy biography (New York, 1859).

STEUBENVILLE, stū'ben-vil. The county-seat of Jefferson County, Ohio, 43 miles west by south of Pittsburg, Pa., on the Ohio River and on the Pennsylvania, the Wheeling and Lake Erie, and other railroads (Map: Ohio, J 5). It is favorably situated for commerce and industry. Noteworthy features are the Carnegie Public Library, city hall, court house, Gill Hospital, Stanton Park, and Altamont Park and Casino. The surrounding section has coal deposits, natural gas, and petroleum wells. There are manufactures of glassware, chimneys and electric light bulbs, paper, foundry and machine shop products. Several plants are connected with the iron and steel industry. The water-works are owned and operated by the municipality. Population, in 1890, 13,394; in 1900, 14,349. A fort named in honor of Baron Steuben was erected here in 1787 and the town was laid out in 1798. The city was chartered in 1851 and its limits were extended in 1891. Consult Howe, *Historical Collections of Ohio* (Columbus, 1890-91).

STE'VENS, ABEL (1815-97). A Methodist Episcopal clerical writer. He was born at Philadelphia and entered the New England Conference (1834). He was editor of *Zion's Herald* (Boston, 1848-60), of the *National Magazine* (New York, 1852), of the *Christian Advocate* (ib., 1856-60), corresponding editor of the *Methodist* (ib., 1860-74). He was the author of *Memorials of the Introduction of Methodism Into the Eastern States* (1852), *Memorials of the Early Progress of Methodism in the Eastern States* (2d series, 1854), *The History of the Religious Movement of the Eighteenth Century Called Methodism* (1858-61), *History of the Methodist Episcopal Church in the United States of America* (1864-67), *Supplementary History* (1899), *Madame De Staël, A Study of Her Life and Times* (1880).

STEVENS, ALFRED (1828—). A Belgian genre painter. He was born at Brussels, and studied principally with Roqueplan and under Ingres in the Ecole des Beaux-Arts, Paris. He first exhibited in Brussels, but in 1849 settled at Paris where he has since resided. Among his works are the "Discouragement of the Artist" and "Love of Gold" (1853); "Masquerade on Ash Wednesday" (1853, Marseilles Museum); "Consolation" (1857, Ravené Gallery, Berlin); "The Lady in Pink," "La bête a Bon Dieu" (Brussels Museum); "The Japanese Robe" (Metropolitan Museum, New York). He painted in fresco "Allegories of the Four Seasons" (in the Royal Palace, Brussels). His most characteristic subjects depict the interiors of modern houses as background and accessories for the figures of piquant women and children of fashionable life. He revels in the arrangements of furniture and rich stuffs, by means of which he secures remarkable effects of texture and quality. His management of tone and light is scientific, at the same time pure and admirable. His type of women possess the quality of charm with a reserve of expression and a refinement not shown by the ultra-moderns in his genre.

STEVENS, ALFRED GEORGE (1818-75). An English sculptor. He was born in Dorset County, England, and received his artistic training in Italy (1833-42). In 1841 he studied for a year under Thorwaldsen, after which he returned to England, where, in 1845, he was made professor in the Art School at Sheffield. His great-

est achievement in sculpture is the Duke of Wellington monument, Saint Paul's Cathedral, including the powerful groups of "Truth Tearing Out the Tongue of Falsehood" and "Valor Triumphing Over Cowardice," which decorate the canopy above the edifice. He is also celebrated for his designs for metal articles of daily use, executed in exquisite classical taste, as well as for more ambitious efforts like the vases decorating the railing in front of the British Museum, and the lions on the posts, since placed in the Museum; the mantelpiece in the dining-room of Dorchester House, Park Lane; and the mosaics designed to fill the spandrels under the dome of Saint Paul's. He was almost unrecognized by the British public. His Italian training, exempt from English influence, accounts for his excellence at a time when English sculpture was in the decline. Consult Stannus, *Alfred Stevens and His Work* (London, 1891).

STEVENS, Benjamin Franklin (1833-1902). An eminent American bibliographer, born in Barnet, Vt. He joined his brother, Henry, in London in 1860; for many years had charge of the Chiswick Press, acted as purchasing agent for American libraries, and became United States dispatch agent. For more than thirty years he and his agents searched the archives of England, France, Holland, and Spain for papers relating to America. His publications include: *American Manuscripts in European Archives* (1887); *Campaign in Virginia in 1781* (1888); *Facsimiles of Manuscripts in European Archives Relating to America, 1773-83* (25 vols., 1889-98); *Gen. Sir William Howe's Orderly Book at Charlestown, Boston, and Halifax* (1890); *Columbus, His Own Book of Privileges, 1502* (1893); *Introduction to Calendar of American Papers in the Earl of Dartmouth's Collection* (1895).

STEVENS, Ebenezer (1751-1823). An American soldier, born in Boston, Mass. He enlisted as a lieutenant in a Rhode Island artillery regiment in May, 1775, and by successive promotions rose to the rank of lieutenant-colonel in April, 1778, serving in the expedition against Quebec (1775), and commanding the artillery at Ticonderoga, at Freeman's Farm, and, for a time, at Yorktown. He was one of the founders of the Society of the Cincinnati, became prominent as a merchant in New York, and was made a major-general of militia.

STEVENS, Edward (1745-1820). An American soldier. He was born in Culpeper County, Va., became colonel of Virginia militia early in 1775, was in command at the skirmish at Great Bridge (December 9, 1775), saved part of Washington's army from capture at Brandywine (September 11, 1777), served with gallantry and marked ability at Germantown, Camden, and Guilford Court House, and became a brigadier-general of militia in 1779.

STEVENS, Edwin Augustus (1795-1868). An American capitalist, railroad organizer, and ship-builder, born at Hoboken, N. J. With his brother Robert L. Stevens (q.v.) he succeeded to the large shipping and railroad interests of their father, John Stevens (q.v.), and became one of the most prominent railroad organizers in the United States. After his brother's death he tried to dispose of the famous Stevens Floating Battery, and on his own death bequeathed it to his native State, together with $1,000,000 to insure its completion. This sum proved inadequate, however, and the State disposed of the vessel to the United States Government, which finally sold it for old iron. Another vessel of his, the *Naugatuck*, was accepted by the Federal Government and was used during the Civil War. He founded the Stevens Institute of Technology (q.v.).

STEVENS, George Alexander (1710-84). An English wit, the son of a London tradesman. He joined a company of strolling players, and for many years followed the stage as an actor in minor parts. He became famous for his *Lecture on Heads*, first delivered at the Haymarket in 1764 and repeated for many years throughout Great Britain and in America. The lecture is a humorous and extravagant series of hits on contemporary follies as represented by various heads. Stevens also wrote many popular songs, as "Cease, rude Boreas, blustering railer." Consult the *Lecture* with heads executed by Charlton Nesbit from designs by Thurston (London, 1799), and *Songs, Comic and Satirical*, with cuts by Berwick (Oxford, 1772; and numerous reprints).

STEVENS, George Barker (1854—). An American theologian, born in Spencer, N. Y., and educated at the University of Rochester (class of 1877) and at Yale Divinity School, where he graduated in 1880. He was pastor of the First Congregational Church of Buffalo (1880-83) and of the First Presbyterian Church of Watertown, N. Y. (1883-85), and then, after a year's study in the University of Jena, became professor of New Testament criticism and interpretation at Yale, a chair which he left in 1895 for that of systematic theology in the same university. He wrote *The Pauline Theology* (1892); *The Johannine Theology* (1894); *A Short Commentary on Galatians* (1894); *The Epistles of Paul in Modern English* (1898); *The Messages of the Apostles* (1900); and *The Teaching of Jesus* (1901).

STEVENS, Henry (1819-86). An American bibliographer, born at Barnet, Vt. He graduated at Yale in 1843 and studied law at Harvard. Attracted to colonial history, he visited England in search of Americana in 1845, and remained there till his death, acting as purchasing agent for the British Museum and for many libraries, public and private, noteworthy among which was the Lenox Library of New York, whose collection of Americana he formed. He published many bibliographical catalogues and pamphlets, highly prized for their minute accuracy, and made a collection of Franklin documents which was purchased by the United States Government. Of his very numerous publications the more noteworthy are: *Catalogue Raisonné of English Bibles* (1854); *Catalogue of American Books in the Library of the British Museum* (1857); *Bibliotheca Americana* (1861); *Bibliotheca Historica* (1870); *Historical Collections* (1881-86); *Who Spoils Our New English Books* (1885); and *Recollections of James Lenox* (1886).

STEVENS, Isaac Ingalls (1818-62). An American soldier and administrator, born at North Andover, Mass. He graduated at West Point in 1839. He joined General Scott's army in Mexico as adjutant of engineers in 1847, and

participated in all of its important engagements. In 1849 he became the assistant in charge of the United States Coast Survey office at Washington, but resigned from the army in 1852 to accept the Governorship of Washington Territory. In 1855 the Washington Indians revolted. Stevens at once sternly suppressed the insurrection, and arrested Chief Justice Edward Lander, who had issued writs of habeas corpus for Indian prisoners. On the outbreak of the Civil War he was commissioned colonel of the Seventy-ninth New York Volunteers, and a few months later was promoted to the rank of brigadier-general. He participated in the actions on Stone River and at Secessionville. On July 4, 1862, he was promoted to the rank of major-general, and during August he took part in the campaign in northern Virginia, participating in the second battle of Bull Run and the battle of Chantilly. While leading his men in a charge during the latter, he was killed, September 1, 1862. He published *Campaigns of the Rio Grande and Mexico, with Notices of the Recent Work of Major Ripley* (1851); and a *Report of Explorations for a Route for the Pacific Railroad near the 47th and 49th Parallels of North Latitude, from Saint Paul, Minn., to Puget Sound*, printed by order of Congress (1855-60).

STEVENS, JOHN (1749-1838). An American inventor, engineer, and steamboat builder. He was born in New York City, and in 1768 graduated at King's (now Columbia) College. He then studied law, and in 1771 was admitted to the bar. In 1790 he petitioned Congress for legislation for the protection of American inventors, and through his efforts a bill was passed which laid the foundations for the present patent system of the country. As early as 1788 he had begun experiments in the application of steam as a motive power, and in 1792 took out two patents for marine engines under the new law. Subsequently, in association with Nicholas Roosevelt and Robert R. Livingston, he built a steamboat, and attempted to obtain from the New York State Legislature the exclusive right of navigation of the Hudson River, but the boat, when completed in 1801, failed to fulfill the speed conditions imposed, and Livingston subsequently became associated with Fulton in his more successful attempt. In 1804 he built a steamship propelled by twin screws, and in 1807, with his brother Robert, built the paddle-wheeled steamboat *Phœnix*, which was put in successful operation only a few days after Fulton's *Clermont*. The *Phœnix* was shut out of the waters by the monopoly of Fulton and Livingston, but was operated for six years on the Delaware River, to reach which the *Phœnix* sailed around from New York City, and was thus the first steamship to navigate the ocean successfully. In October, 1811, between Hoboken and New York City he established the first steam ferry in the world. He invented and designed many improvements in steamboat and steam-engine construction, and designed in 1812 a circular iron-clad floating battery for harbor defense. In 1826 he constructed a locomotive model after his own designs, which he exhibited in operation in Hoboken, and which was said to have been the first locomotive ever to run on a track in America.

STEVENS, JOHN AUSTIN (1795-1874). An American banker and financier, born in New York City. He graduated at Yale in 1813, and in 1818 became a partner in the extensive mercantile business of his father, Ebenezer Stevens, in New York City. During the Civil War he was one of the principal financial advisers of the Government, and his greatest public service was rendered as chairman of the famous 'treasury note committee' of New York, Boston, and Philadelphia bankers, which played a prominent part in placing the first 7-30 and later war loans.

STEVENS, JOHN AUSTIN (1827—). An American author, born in New York City. He graduated at Harvard in 1846; was secretary to the New York Chamber of Commerce from 1862 to 1868; and later was for some years librarian of the New York Historical Society. He founded the Society of the Sons of the Revolution and the Loyal League. In 1877 he established the *Magazine of American History*, of which he was the editor until 1883. His publications include: *The Valley of the Rio Grande* (1864); *Colonial Records of the New York Chamber of Commerce* (1867); *The Expedition of Lafayette Against Arnold* (1878); and *Life of Albert Gallatin* (1884), in the "American Statesmen Series."

STEVENS, JOHN LEAVITT (1820-95). An American journalist and diplomat, born at Mount Vernon, Me. In 1855 he became associate editor of the Kennebec (Me.) *Journal*, and in 1857 chief editor of the paper. He was an advocate of the Republican Party, in whose organization in Maine he assisted. He was Minister Resident to Uruguay and Paraguay from 1870 until 1873. In 1877-83 he was Minister Resident to Sweden and Norway, and in 1889 became Minister Resident to the Hawaiian Islands. His title was made Envoy Extraordinary and Minister Plenipotentiary in 1890. Upon the outbreak of a revolution against the royal Government in 1893, and the establishment of a provisional government (see HAWAIIAN ISLANDS, *History*), he established a protectorate over the islands. This action was disavowed by the Secretary of State of the United States, and subsequently Stevens was recalled, and was exonerated by the Senate. His publications include a scholarly and valuable *History of Gustavus Adolphus* (1884).

STEVENS, PHINEAS (1707-56). A colonial soldier in America, born at Sudbury, Mass. About 1711 he removed with his father to Rutland, N. H. (now in Vermont), and in 1723 was a captive for a time among the Saint Francis Indians. He was one of the pioneer settlers of "Township No. 4" (now Charlestown, N. H.), and in April, 1747, during King George's War, as commandant of the fort there, repelled the attack of 400 French and Indians under Niverville. He was twice (1749 and 1752) sent to Canada to negotiate an exchange of prisoners. A journal kept by him during his first trip to Canada is printed in the *New Hampshire Historical Collections*, vol. v.

STEVENS, ROBERT LIVINGSTON (1787-1856). An American inventor and marine engineer, son of John Stevens (q.v.), born in Hoboken, N. J. He applied the wave line to shipbuilding, invented a percussion shell (the rights to which were bought by the Government), was one of the first to use anthracite coal in steam navigation, and introduced many improvements in the con-

struction of steamships and marine engines. In 1842 he was commissioned by the Government to build the first iron-clad warship ever constructed, generally known as the Stevens Floating Battery; but, owing to improvements in ordnance and the consequent changes in specifications, he died without completing it. See STEVENS, EDWIN AUGUSTUS.

STEVENS, THADDEUS (1792-1868). An American statesman and Congressional leader, born at Danville, Vt., April 4, 1792. He graduated at Dartmouth College in 1814; taught school in York, Pa., and studied law; began to practice in Gettysburg, and removed to Lancaster, Pa., in 1842. In 1833 he became a member of the State Legislature, in which he sat for a number of years, serving with credit. In 1836 he was a delegate to the State Constitutional Convention, winning notoriety by his advocacy of negro suffrage. Stevens affiliated with the Anti-Masonic Party (see ANTI-MASONS), and was an active member of its Baltimore convention in 1831; but from the time of his election to the Legislature he acted with the Whigs. His career in the Legislature was varied, but indicative of his energy and ability, and although his business interests suffered severely, he conquered the 'machine' in his own party, and in December, 1849, took his seat in Congress. During two terms that he filled there he opposed not only the Fugitive Slave Law, but also every form of concession to the South. After an interval of six years devoted to the practice of law he returned to Congress in 1859, and from then until his death was the recognized leader of the House of Representatives, being chairman of the Committee on Ways and Means throughout the war, and later chairman of what was then the equally important Committee on Reconstruction. He was regarded as the most radical anti-slavery advocate in Congress. He was one of the authors of the so-called Wade-Davis Reconstruction Bill of 1865 and reported the Reconstruction Act of 1867 from the committee of which he was chairman. (See RECONSTRUCTION.) He was chairman of the House committee in charge of the impeachment of President Johnson (q.v.). He died at Washington, August 11, 1868. Biographies have been written by E. B. Callender (Boston, 1882), and by S. W. McCall (Boston, 1899), the latter being one of the "American Statesmen Series."

STEVENS, WALTER LE CONTE (1847—). An American physicist. He was born in Gordon County, Georgia, and graduated from the University of South Carolina in 1868. He was professor at Oglethorpe College, Atlanta, Ga.; Chatham Academy, Savannah, Ga.; Packer Collegiate Institute, Brooklyn, N. Y.; Rensselaer Polytechnic Institute, Troy, N. Y.; and in 1903 occupied the chair of physics at Washington and Lee University, Lexington, Va.

STEVENS INSTITUTE OF TECHNOLOGY. A school of mechanical engineering, in Hoboken, N. J., established in 1870, and named for its founder, Edwin A. Stevens, who bequeathed to it a block of land and $650,000. The school was opened in 1871 with Henry Morton as its first president. The curriculum embraces thorough training in applied mathematics, in the theory of machine construction with a study of existing systems, mechanical drawing and designing, shop practice and experimental mechanics, physics, chemistry, and applied electricity, with English branches and the modern languages. Admission is by examination solely; the only degree conferred is that of mechanical engineer. The institute has been the recipient of many benefactions, the most notable being those of Henry Morton, who, during his presidency of thirty years, gave to the institute about $150,000, and those of Andrew Carnegie, whose gifts amounted to $290,000 in 1903, in which year the endowment was $820,000, with an income of $91,000. The grounds and buildings were valued at $390,000, with a total estimated value of $1,250,000 for the property under its control. The Institute had in that year an attendance of 296, with 22 instructors, and the academic department an enrollment of 254, with 15 instructors. The library contained about 8000 volumes. In 1901 Alexander C. Humphreys became president of the Institute.

STEVENSON, ADLAI EWING (1835—). An American politician, Vice-President of the United States in 1893-97. He was born in Christian County, Ky., and was educated at Centre College, Danville, Ky., but removed with his parents to Bloomington, Ill., before graduating. At Bloomington he studied law and in 1857 was admitted to the bar. He was a master in chancery from 1860 to 1864, became prominent in Democratic local politics, and was a member of the 44th Congress (1875-77), and of the 46th Congress (1879-81). As First Assistant Postmaster-General during President Cleveland's first administration he antagonized civil-service reformers by his sweeping removal of Republican postmasters. In 1892 he was chairman of the Illinois delegation to the Democratic National Convention, by which he was nominated for Vice-President on the Cleveland ticket, which was elected. In 1897 he was appointed by President McKinley a member of the commission sent to Europe to inquire into the feelings of European Powers in regard to the possible establishment of international bimetallism. In 1900 he was again the candidate of the Democratic party for Vice-President.

STEVENSON, GEORGE JOHN (1818-88). An English hymnologist, educated at Saint John's College, Battersea, London. In 1846 he became head master of the Philanthropic Institute, a reformatory at Southwark; and in 1848, head master of the parochial school at Lambeth Green. Resigning his position in 1855, he started as a London bookseller and publisher, and continued this business until a short time before his death. In 1831 he became a Methodist, and thereafter gave much time to the history and the literature of his sect. From 1861 to 1867 he edited the *Wesleyan Times*. His *Methodist Hymn Book and Its Associations* (1869; enlarged with slightly changed title, 1883) is a valuable work. Among other publications are books on Spurgeon (1857 and 1867), *Memorials of the Wesley Family* (1876), and *Methodist Worthies* (1884). Consult Julian's *Dictionary of Hymnology* (London, 1892).

STEVENSON, JOHN JAMES (1841—). An American geologist, born in New York City. He graduated at New York University in 1863. He became professor of chemistry at West

Virginia University in 1869 and in 1871 was appointed professor of geology in New York University. He served as geologist on the United States Geological Survey west of the 100th meridian in 1873-74 and 1878-80. He was also on the Pennsylvania Geological Survey in 1875-78 and in 1881-82. In this work he made out the classification of the upper coal measures of Ohio and Pennsylvania, and also described the coal area of New Mexico and southeastern Colorado. He became corresponding member of the more important scientific societies and academies of foreign countries. He was president of the New York Academy of Sciences from 1896 to 1898, and president of the Geological Society of America in 1898. His publications include: *The Geology of a Portion of Colorado Explored and Surveyed in 1873* (1875); *Report of Progress in the Greene and Washington District of the Bituminous Coal Fields of Western Pennsylvania* (1876); *Report upon Geological Examinations in Southern Colorado and Northern New Mexico During 1878 and 1879* (1881); *Origin of the Pennsylvania Anthracite* (1893); *Lower Carboniferous of the Appalachian Basin* (1903); and more than a hundred other memoirs, many of the greatest importance, on geological topics.

STEVENSON, Joseph (1806-95). A Scottish antiquary, born at Berwick-upon-Tweed. In 1831 he was appointed to a post in the manuscript department of the British Museum, and in 1834 became a sub-commissioner of the public records. He was ordained a priest in the Church of England (1839), but his studies in the Reformation period of English history led him to the Roman Catholic Church (1863). In 1877 he entered the Society of Jesus. For his services he was granted a Government pension, and was honored by Saint Andrews with the degree of LL.D. At the suggestion of Stevenson, the English Government began in 1857 the valuable *Chronicles and Memorials of Great Britain and Ireland*, otherwise known as the *Rolls Series*. The Government also sent him to Rome to make an exhaustive examination of the Vatican archives. The thirteen volumes of his manuscript were deposited in the Public Record Office, but were not published. Stevenson edited nearly fifty works for the leading learned societies.

STEVENSON, Robert (1772-1850). A Scotch engineer, born at Glasgow. His progress in the study of engineering was so rapid that in 1791 he was entrusted with the erection of a lighthouse on Little Cumbrae. During forty-seven years' service as engineer and inspector of lighthouses, he planned and constructed twenty-three lighthouses round the Scottish coasts, employing the catoptric system of illumination, and his valuable invention of intermittent and flashing lights. The most remarkable of these structures was that on the Bell Rock (q.v.). The enterprise was unprecedented in lighthouse engineering, for the Bell Rock was never uncovered except at the lowest ebb tides. Stevenson was the author of four volumes of professional printed reports, a large work on *The Bell Rock Lighthouse* (Edinburgh, 1824), and articles in the *Encyclopædia Britannica* and in the *Edinburgh Encyclopædia*.—His son Alan (1807-65) was also an engineer of prominence, and was the author of a *Treatise on Lighthouse Illumination*. See Lighthouse. Consult Stevenson, *Life of Robert Stevenson* (Edinburgh, 1878).

STEVENSON, Robert Alan Mowbray (1847-1900). An English art critic, a cousin of Robert Louis Stevenson. He was born in Edinburgh, was educated at Sussex College, Cambridge, and studied art in the Edinburgh School of Art, and in Paris and Antwerp, but never attained much success as a painter. In 1882 he began to teach art at Cambridge and in 1889 became professor of fine arts at University College, Liverpool. He was one of the most gifted and just of English critics. His sympathies were with the impressionist school, but his judgment was impartial, and he possessed a keen analytical mind and an effective style. His works include: *Engraving* (1886), from the French of Delaborde; *Peter Paul Rubens* (1898); *The Art of Velazquez* (1895; revised ed. in Williamson's series of *Great Masters*, 1899); and an *Essay on Raeburn* (1900).

STEVENSON, Robert Louis (properly Robert Lewis Balfour) (1850-94). A Scottish romancer, essayist, and poet, born in Edinburgh, November 13, 1850, the only son of Thomas Stevenson, a distinguished lighthouse engineer. After beginning his education at various schools and under private tutors, he entered Edinburgh University in 1867, with the intention of becoming an engineer. On this profession he turned his back in 1871, and prepared for the bar, to which he was called in 1875. He had already written several essays and tales and some verse, but chiefly with a view of, in his own forcible phrase, "playing the sedulous ape" to the great masters. His strong bent to a literary career was now encouraged by the friendship of such men as Edmund Gosse, Andrew Lang, and Sidney Colvin, whom he met in London. A canoeing trip in Belgium and France and a walking tour in the Cévennes furnished material for *An Inland Voyage* (1878) and *Travels with a Donkey* (1879), sketches in which he gave full proof of his exquisite literary art. Without attracting much attention, he was contributing to the *Cornhill Magazine* and *Temple Bar* short stories, and some of his best essays, those which were afterwards collected under the titles of *Virginibus Puerisque* (1881) and *Familiar Studies of Men and Books* (1882). To this period also belong the fascinating, fantastic *New Arabian Nights* (1882), first published between 1876 and 1878. In 1876 he had met, in an artistic colony near Paris, Mrs. Osbourne, an American lady, who was afterwards to be his wife. In 1879, hearing from California that she was seriously ill, he made up his mind to go there. His resources were so limited that he made the long journey in an emigrant ship and train, noting his curious experiences and publishing them afterwards in *The Amateur Emigrant* (1894) and *Across the Plains* (1892). He spent two years in California, often in very delicate health, and in 1880 married Mrs. Osbourne. The next few years were spent in various health resorts—Davos, the Riviera, Bournemouth, and the Adirondacks. Often under the most discouraging conditions, but with that brave cheerfulness which was the distinguishing note of his character, he worked incessantly. Success first came to him with the publication in 1883 of *Treasure*

Island, a tale of pure adventure. *Dr. Jekyll and Mr. Hyde* (1886), a striking ethical parable under the guise of fiction, attracted the more thoughtful and was recommended from many a pulpit. In the same year appeared *Kidnapped*, which, with its sequel *David Balfour* (1893) and the *Master of Ballantrae* (1889), offered vivid pictures of the Scottish life of the past. In 1888, still in quest of health, he left San Francisco with his family on a voyage to the South Seas. Pleased with the scenery and the people of Samoa, he made a permanent home for himself there in 1890 and acquired a position of commanding influence among the natives. After an heroic struggle against consumption, he died, through the rupture of a blood-vessel in the brain, December 3, 1894, and was buried on the peak of Mount Vaea, above Vailima, his Samoan home. Active to the last, he left several manuscripts, among which were two romances, *Weir of Hermiston* (1896) and *St. Ives* (completed by Quiller-Couch, 1897). The former, which no writer was bold enough to touch, is generally considered, even in its unfinished state, Stevenson's masterpiece. Others of his works which deserve special mention are: *The Silverado Squatters* (1883); *Prince Otto* (1885), a dainty romantic tale; three books written in collaboration with his stepson, Lloyd Osbourne, *The Wrong Box* (1888), *The Wrecker* (1892), and *The Ebb Tide* (1894); a volume of exquisite verse, *Underwoods* (1887); *A Child's Garden of Verses* (1885); *The Merry Men and Other Tales* (1886), a volume of short stories in which his mastery over the grim and terrible best shows itself; *Memoir of Fleeming Jenkin* (1887); and *Father Damien, an Open Letter* (pamphlet, 1890), unique among Stevenson's writings, and one of the most powerful *apologia* in English.

In both fiction and essays Stevenson displays the possession of an exquisite and finished style; his work is that of a true artist in words, and his example stimulated many of the younger artists of the day to more or less conscious imitation. His influence was also great in regard to the subject-matter of fiction. At a time when the novel had forgotten to tell a story and was running into minute philosophical analysis, Stevenson came forward with adventure as purely romantic as Scott's, though in structure, in method of description and narrative, and in brilliancy of style he marks the great technical advance which had been made since the days of the *Waverley Novels*. But it was not only the many delightful qualities of his written work which made Stevenson the best loved writer of his time; even more, perhaps, he was endeared to countless readers by the frank revelation of a most engaging personality, which shines through all his works—of a serene undaunted cheerfulness, gained not by shutting his eyes to the pathos and the difficulty of human conditions, but by a brave rising to the height of their demands and an unwavering sense of the compensations which such an attitude offers.

The most nearly completed collection of his works is the sumptuous Edinburgh edition, edited by Sidney Colvin (1894-98); two volumes of charming letters arranged by the same editor, with much biographical matter, appeared in 1899, and the *Vailima Letters*, written from Samoa in 1895. Consult also the biographies by his cousin Graham Balfour (London, 1901), Baildon (ib., 1901), Black (Edinburgh, 1898), and Cornford (ib., 1899); also Simpson, *Stevenson's Edinburgh Days* (London, 1898); Fraser, *In Stevenson's Samoa* (ib., 1895); Osbourne and Strong, *Memories of Vailima* (ib., 1903); and critical studies by Raleigh (London, 1895); James, in *Partial Portraits* (ib., 1888); Chapman, in *Emerson and Other Essays* (New York, 1896). See also ENGLISH LITERATURE; NOVEL; ROMANTICISM.

STEVENSON, SARA (YORKE) (1847—). An American archæologist, born in Paris, France. She was educated in Paris at the Cours Rémy and the Institut Descauriet, resided in Mexico in 1862-67, and later became known as an archæologist. In 1889 she was an organizer of the department of archæology of the University of Pennsylvania, in 1890 became curator of its Egyptian and Mediterranean sections, and in 1894 its secretary. She also received the secretaryship of the American Exploration Society in 1897 and the presidency of the Pennsylvania branch of the Archæological Institute of America in 1899; in 1898 visited Egypt for the Exploration Society and the city of Philadelphia; and in 1893 was vice-president of the jury on ethnology at the World's Columbian Exposition. Among her writings are various papers and articles on archæology, and the volume *Maximilian in Mexico* (1898).

STE'VENS POINT. The county-seat of Portage County, Wis., 150 miles northwest of Milwaukee, on the Wisconsin River, and on the Wisconsin Central Railroad (Map: Wisconsin, D 4). It is the seat of a State normal school, and has a Polish normal academy and a public library. The region is one of the richest lumbering sections in the State. It also has some mineral wealth and there is excellent water power. There are saw mills, paper mills, knitting mills, a foundry, and manufactories of sashes and doors, furniture (including tables and desks), engines, boxes, wall paper, etc. The manufacture of artificial flies for fishing is an important industry. The government is vested in a mayor, elected biennially, and a unicameral council. Stevens Point was settled in 1836, and received its present charter in 1897. Population, in 1890, 7896; in 1900, 9524.

STEVIN, SIMON (1548-1620). A Dutch mathematician, physicist, and engineer, born in Bruges. After being a merchant and traveling extensively through Europe, he enjoyed the favor of Prince Maurice of Orange, holding under his appointment civil and military offices, his scientific qualifications making him particularly valuable in military engineering, where he enjoyed a high reputation. He is best known for his mathematical work which led to the introduction of decimal fractions, and he stated that the universal use of a decimal system of coinage, measures, and weights was bound to come. He also made valuable contributions to mechanics and physics, demonstrating the resolution of forces, the equilibrium of forces on an inclined plane, showing the difference between stable and unstable equilibrium, and the fact that the pressure of a liquid is independent of the shape of the containing vessel and depends merely upon the height and area of the base. He wrote on double-entry bookkeeping and adapted it to the material needs of Prince Maurice. Stevin's mathematical

works, a part of which were published in Dutch in 1568 were collected and translated into French, being published in 1634. For his work in mathematics consult: Cantor, *Vorlesungen über Geschichte der Mathematik* (Leipzig, 1892); for his work in physics, Gerland and Traumüller, *Geschichte der Physikalischen Experimentier Kunst* (Leipzig, 1899).

STEWARD (AS. *stigweard, stiweard,* from *stig,* pen for cattle, sty + *weard,* guard), LORD HIGH. The first of the great offices of State in England. Although of ancient origin, it owes its eminence to John of Gaunt (1340-99). It was hereditary in various lines until the accession of Henry IV. (1399), when it was merged with the Crown, and has since been in abeyance except when temporarily revived from time to time under the great seal *pro hac vice.* It is now revived only on the occasion of a coronation, when the Steward is of great ceremonial importance, or the trial of a peer by the House of Lords for treason or felony, when the Steward presides. The last session of this character occurred in 1901, before which the Lord High Steward's Court had not met for sixty years. When the proceedings are at an end, the Lord Steward terminates his commission by breaking his wand of office.

STEWART, stū'ĕrt. A Scotch and English royal family. See STUART.

STEWART, ALEXANDER TURNEY (1803-76). An Irish-American merchant, born at Lisburn, near Belfast, Ireland, of Scotch parentage. He entered Trinity College, Dublin, with the intention of studying for the ministry, but left before graduating and in 1823 emigrated to America. Settling in New York City, he taught school for two years, and in 1825, having fallen heir to a small legacy from some Irish relatives, he established himself in the dry-goods business. In 1848 he built the store at Broadway and Chambers Street, which at the time was the largest dry-goods store in the world. In 1862 he removed his retail business to a new store, which he erected at a cost of $2,750,000, at Broadway and Ninth and Tenth Streets, retaining his old store for wholesale trade. At the time of his death the business of A. T. Stewart and Company comprised branches and agencies in the principal cities of Europe, and several mills and factories in the United States.

STEWART, ALVAN (1790-1849). An American abolitionist, born at South Granville, Washington County, N. Y. After teaching in the Royal School of the seigniory of Saint Armand, Canada, in 1811-12, and practicing law at Utica, N. Y., he devoted himself chiefly to advocating temperance and the abolition of slavery. In 1835 he called together in Utica an anti-slavery convention that was dispersed by mob violence. According to William Godell, Stewart was the first to insist "on the necessity of forming a distinct political party to promote the abolition of slavery." When such a party was formed, he was its candidate for Governor, but was, of course, defeated. Years before Lincoln made his famous 'house divided against itself' speech or Seward his 'irrepressible conflict speech,' Stewart declared that "these States must necessarily be in eternal conflict until liberty conquers slavery, or slavery overturns the liberty of all." A collection of his speeches, with a slight memoir, was published by his son-in-law, Luther R. Marsh (New York, 1860).

STEWART, BALFOUR (1828-87). A British physicist and meteorologist. He was born at Edinburgh, and was educated at Saint Andrews University and Edinburgh University. After a brief career in business in 1856 he became connected with Kew Observatory, later (1859) being appointed its director. He was appointed professor of natural philosophy in Owens College, Manchester, in 1870, where he served until his death.

Professor Stewart's researches in radiant heat procured for him the Rumford medal of the Royal Society. He also devoted himself to the study of terrestrial magnetism and meteorological problems, particularly those connected with solar radiation. He was also a devout churchman and was a member of a committee appointed to promote the interchange of views of scientific men of orthodox religious opinions. In *The Unseen Universe,* a popular work written by Stewart in conjunction with Professor Tait, an attempt was made to combine theological doctrines with the scientific ideas then current to demonstrate the existence of the soul and of a transcendental universe. He published an *Elementary Treatise on Heat* (1866, 5th ed. 1888); *Lessons in Elementary Physics* (1871); *Physics* (1872); *The Conservation of Energy* (1875); and *Lessons in Practical Physics,* with W. H. Gee (vol. i., 1885; vol. ii., 1887).

STEWART, CHARLES (1778-1869). An American naval officer, born in Philadelphia, Pa. At the age of thirteen he shipped on board a merchant vessel as cabin boy, and in a few years rose to be captain of an Indiaman. In 1798 he entered the United States Navy as fourth lieutenant of the frigate *United States,* on which he served until 1800, after which he was given command first of the schooner *Enterprise* and then of the *Experiment.* Soon afterwards he captured the French schooner *Deux Amis,* and a few days later the schooner *Diane.* While on this cruise he captured the British privateer *Louisa Bridger* by a night action, but on discovering her nationality made suitable reparation. In 1804, in command of the *Siren,* he joined the Mediterranean Squadron. He then returned to the United States in command of the *Constellation,* and in 1806 was promoted to be captain. During the following years he was for a time in the merchant service, but he reëntered the navy, and at the outbreak of the War of 1812 aided Commodore Bainbridge in persuading the Administration to send the United States warships to sea instead of keeping them in New York Harbor. In 1813 he was transferred to the *Constitution,* which on February 20, 1815, captured two British war-vessels, the *Cyane,* 34 guns, and the *Levant,* 18 guns. Soon afterwards, however, he was surprised by a British squadron and the *Levant* was recaptured. He commanded the Mediterranean Squadron from 1817 to 1820, after which he was sent to the Pacific Station. On his return in 1823 he was tried by court-martial on a number of charges, but was acquitted. He commanded the Home Squadron in 1842-43, and for several years was commandant of the Philadelphia Navy Yard. In 1862 he was promoted to the rank of rear-admiral. During

the last seventeen years of his service he was senior officer of the navy.

STEWART, DAVID, Duke of Rothesay and Earl of Carrick. See ROTHESAY.

STEWART, Sir DONALD MARTIN (1824-1900). A British field-marshal. He was born near Forres, Elginshire; completed his education at Aberdeen University, and in 1840 joined the Bengal Army. He saw active service on the frontier; served with distinction during the Indian Mutiny at the sieges of Delhi and Lucknow; commanded the Bengal troops in the Abyssinian War in 1867-68; and from 1869 to 1874 was chief commissioner of the Andaman and Nicobar Islands. During the Afghan War in 1878 he was in command of the Kandahar field force, and in 1880 on his celebrated march from Kandahar to Kabul won the battles of Ahmed Khel and Urzu. As military and civil commander in Northern Afghanistan, he sent Sir Frederick Roberts on his famous march from Kabul to Kandahar, while he withdrew with the remainder of the army through the Khyber Pass.

STEWART, DUGALD (1753-1828). A Scottish philosopher, born in Edinburgh. He studied at the University of Edinburgh from 1765 to 1769. In 1771 he went to Glasgow, partly with a view to one of the Snell scholarships at Balliol College, Oxford, and partly to attend the lectures of Dr. Reid. It was there that he wrote an essay on dreaming, which was his first effort in mental philosophy and contained the germs of many of his subsequent speculations. He lived in the same house with Archibald Alison, the author of the *Essay on Taste*, and the two became intimate friends through life. He was at Glasgow only one session. In 1772, in his nineteenth year, he was called upon by his father, whose health was failing, to teach the mathematical classes in the University of Edinburgh; in 1775 he was elected joint professor, and acted in that capacity till 1785. In 1778 Adam Ferguson was absent from his post on a political mission to America, and Stewart taught the moral philosophy class in addition to his mathematical classes. On the resignation of Ferguson in 1785, he was appointed professor of moral philosophy, and continued in the active duties of the chair for twenty-five years. In 1792 appeared his first volume of the *Elements of the Philosophy of the Human Mind.* In 1793 he published his *Outlines of Moral Philosophy.* In 1806, on the accession of the Whig Party to power, he received a sinecure office worth £300 a year. In 1810 Stewart gave up his active teaching work and retired to Kinneil House, Linlithgowshire, which the Duke of Hamilton placed at his service. In the same year he published his *Philosophical Essays;* in 1814 the second, and in 1827 the third volume of the *Elements;* and in 1828 *Philosophy of the Active and Moral Powers.* He died in Edinburgh, June 11, 1828.

The philosophy of Stewart was the following up of the reaction against the skeptical results that Berkeley and Hume drew from the principles of Locke. Both Reid and Stewart professed the Baconian method of observation and induction, but considered that these processes of investigation could establish certain ultimate truths of a higher certainty than themselves. His collected works were edited by Sir W. Hamilton, in 11 vols. (Edinburgh, 1854-59), to which Professor Veitch contributed a biography.

STEWART, MATTHEW, Earl of Lennox (1516-71). A Regent of Scotland. He was born in Dumbarton Castle and was the son of John, third Earl of Lennox. After negotiations with Henry VIII. of England which resulted in treason to his own country, he married Henry's niece, Lady Margaret Douglas, and engaged in several fruitless expeditions in the attempt to bring Scotland under the control of England. When Mary Stuart came to the throne of Scotland, Lennox returned to his native country, was reinstated in his forfeited estates, and arranged the marriage between Mary and his eldest son, Henry, Lord Darnley (q.v.). After his son's murder he took an active part in the seizure and imprisonment of Mary in Lochleven Castle, and was provisionally appointed Regent on behalf of his infant grandson, afterwards James VI. He was appointed lieutenant-general of the kingdom and confirmed in the Regency after the assassination of Murray, in 1570; he led his forces against and gallantly defeated the Queen's supporters, capturing the castles of Doune and Dumbarton; and convened a parliament at Leith which was adjourned to be held later at Stirling. While on his journey to the latter town he was mortally wounded during a skirmish with some of the Queen's partisans.

STEWART, ROBERT, second Marquis of Londonderry, best known as VISCOUNT CASTLEREAGH (1769-1822). An eminent English statesman. He was the eldest surviving son of Robert, first Marquis of Londonderry, and was educated at Saint John's College, Cambridge. He entered the Irish Parliament in 1790 at the age of twenty-one. In 1796 he became Viscount Castlereagh; and in 1798 he was made Chief Secretary for Ireland. In suppressing the rebellion of that year he was resolute and energetic. In helping to bring about the Parliamentary union with England he made free use of English money in corrupting opponents of the plan. He entered the Imperial Parliament, and in 1805-06 was Secretary of State for the War and Colonial departments. Resigning on Pitt's death in 1806, he resumed the office of War Minister next year, and organized the disastrous Walcheren expedition (1809). Canning (q.v.), then Foreign Secretary, attacked Castlereagh on this account with much bitterness. The result was that both resigned, and a duel took place between them, September 21, 1809, in which Canning was wounded. After the assassination of Perceval in 1812, Castlereagh became Foreign Secretary, a post which he held during the period famous for the achievements of the Duke of Wellington. By this time the general direction of British policy was unalterably fixed by circumstances, and it was the merit of Castlereagh that he pursued this course with steadiness and even obstinacy. His personal influence and his untiring exertions kept together the coalition against Napoleon. He represented England at the Congress of Vienna in 1814-15, at the Treaty of Paris in 1815, and at the Congress of Aix-la-Chapelle in 1818. His foreign policy was favorable to the principles of the 'Holy Alliance' abroad and he constantly recommended despotic measures at home. As the leader of the Liverpool Government in the Lower

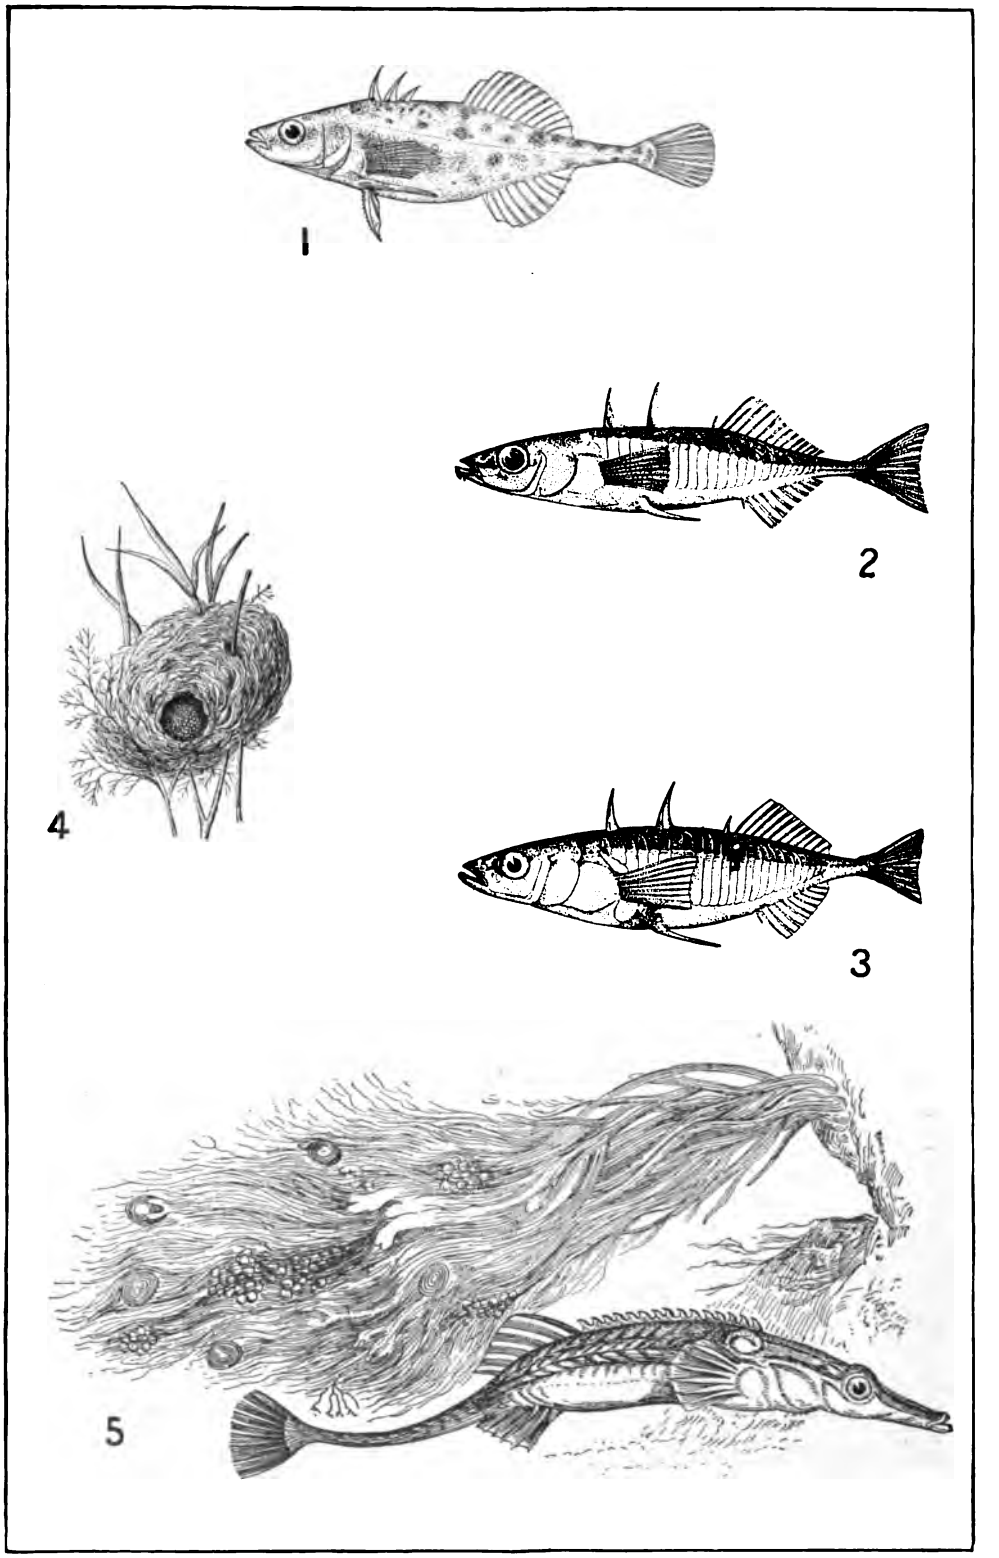
House, he carried the suspension of the Habeas Corpus Act in 1817. The 'Six Acts' of 1819 made him extremely unpopular. The retirement of Canning from the Ministry (1820) threw the whole weight of business on Castlereagh. By the death of his father in 1821 he became Marquis of Londonderry. The great toil and responsibility of his office deranged his mind, and he died by his own hand at his seat at North Cray Place, Kent, August 12, 1822. Consult his *Memoirs and Correspondence* (12 vols., London, 1848-53).

STEWART ISLAND. See NEW ZEALAND.

STEYN, stīn, MARTINUS THEUNIS (1857—). A South African statesman, the last President of the Orange Free State. He was born at Winbury, Orange Free State, and was educated at Grey College, Bloemfontein, and in Holland, after which he studied law at the Inner Temple, London, and was called to the bar in 1882. Returning to South Africa, he resided at Bloemfontein, where he at once gained distinction as a lawyer and in 1889 became State Attorney. In the same year he was elevated to the bench as second puisne judge, and in 1893 was appointed first puisne judge. In 1896 he was chosen by universal suffrage President of the Republic. His policy was at once manifested in an attempt to draw the two Boer States closer together, and the defensive alliance agreed upon by the Orange Free State and the Transvaal in 1897 had his hearty support. In the summer of 1899 he represented his State in the conference at Bloemfontein with Sir Alfred Milner (q.v.) and President Kruger (q.v.) in an attempt to adjust the difficulties existing between the British and the Boers. Upon the failure of negotiations and the breaking out of hostilities he at once called out the Free State troops to act in coöperation with those of the Transvaal. During the course of the war he continued actively assisting and advising the generals in the field, moving his capital from place to place. In May, 1900, after the British had annexed the Orange Free State by proclamation, he issued a counter-proclamation reasserting the State's independence, and calling on the burghers to continue their defense. After Kruger's departure for Europe he became the virtual head of the Boer forces in the field. He took part in the peace conference that led to a cessation of hostilities in 1902 and subsequently took up his residence in London.

STEYNE, LORD. A clever and wicked old nobleman in Thackeray's *Vanity Fair*, who is involved in a scandal with Becky Sharp.

STEYR, stīr, or **STEIER.** A town of Upper Austria, at the confluence of the Steyr and the Enns, 90 miles west by south of Vienna (Map: Austria, D 2). Its principal structures are the Gothic church (1443) and the palace of Count Lamberg (tenth century). It is an important centre of the Austrian iron and steel industry. There is here a large Government rifle factory; the manufactures are cutlery, leather, paper, woolens, hosiery, etc. Population, in 1890, 21,499; in 1900, 17,592.



STIBNITE (from Neo-Lat. *stibium*, from Gk. *στίβι, stibi, στίμμι, stimmi*, sulphuret of antimony, probably from Egypt. *stm*, stibium). A mineral tri-sulphide of antimony crystallized in the orthorhombic system. It has a metallic lustre, and is red to steel-gray in color. It occurs with quartz, in beds or veins, in granite or gneiss, often with other antimony minerals and metallic sulphides. It is found in the Harz, Freiberg, Cornwall (England), Algeria, Borneo, Japan, and in the United States in Maine, New Hampshire, Maryland, Arkansas, and at various localities in California and Utah. It was used by the ancients for coloring the hair, eyebrows, etc. Stibnite is an important ore of antimony.

STICKLEBACK (so called from the sharp spines on its back). A general name for the small active fresh-water hemibranch spiny-rayed fishes of the family Gastrosteidæ, interesting because of their nest-building. They are natives of Northern America, Europe, and Asia. There are a dozen or so species, none exceeding six inches long. The body is slender and more or less compressed, without scales, but usually mailed with plates. The anterior dorsal fin is replaced by several strong, widely separated spines. The ventral fin consists of a strong spine and one or two rudimentary rays. The typical form is the common European stickleback or 'burnstickle' (*Gasterosteus aculeatus*), represented in Eastern North America by the very similar or identical *Gasterosteus bispinosus*. It is four inches long, is olivaceous and dotted on the back, and has three dorsal spines. In the spring the male of this species builds upon the bottom of the stream a nest composed of bits of straw, sticks, leaves of plants, and sand, glued together by a secretion produced by a special gland. This secretion is drawn out into a silk-like thread by which the materials are entangled or woven together as the fish in moving about trails it after him. The completed shape is like that of a hand-muff, smooth inside, and with its openings in the direction of the current. When the house is completed the male induces a female to enter and deposit her eggs, a process lasting only a few minutes. The female then leaves by one of the openings and the male enters by the other to deposit milt over the eggs. In turn other females are invited in, until the nest contains layer after layer of eggs and milt. These the male guards with care against many enemies, until the young are hatched and able to shift for themselves. Sticklebacks are remarkably voracious and extremely destructive to the young fry of fishes. Consult authorities cited under AQUARIUM; and FISH. See the accompanying Plate of STICKLEBACKS.

STIELER, stē'lĕr, ADOLF (1775-1836). A German cartographer, born at Gotha, and educated at Jena and Göttingen. He was employed in the Government service at Gotha. His principal cartographic work, establishing a remarkable standard of accuracy and completeness, is *Der Handatlas* (1817), and his other publications include: *Schulatlas* (1821); *Kleiner Atlas der deutschen Staaten* (1876); *Taschenatlas* (revised by Habenicht, 1885); and *Deutschland, Niederlande, Belgien, Schweiz und angrenzende Länder* (1829).

STIELER, JOSEPH (1781-1858). A prominent German portrait painter, born at Mainz. Self-taught, he practiced miniature painting early in life, then studied at Würzburg under Christoph Fesel (1737-1805) and at the Vienna Academy under Füger. After painting portraits in Hungary and Poland, he spent two years (1807-9) in

4. NEST OF EUROPEAN STICKLEBACK (Gasterosteus aculeatus).
5. SEA-ADDER (Spinachia spinachia) and its eggs hidden among the seaweed.

Paris, a pupil of Gérard, then worked at Frankfort and Milan, and in 1811 went to Rome, where he executed the large altar-piece "Liberation of Saint Leonhard" (Saint Leonhard's, Frankfort). Called to Munich in 1812, he portrayed all the members of the royal family, then in Vienna, where he remained from 1816 to 1820, the Emperor Francis and his consort, besides many notables, among them Beethoven (1819). After his return to Munich Stieler became the most fashionable portraitist of his day, among whose numerous paintings of royalties, statesmen, scholars, artists, and other celebrities may be noted the familiar portrait of Goethe (1828, New Pinakothek, Munich), reproduced in an earlier volume (see GOETHE), and the famous "Gallery of Beauties" (1827-47, Royal Palace, Munich).

STIELER, KARL (1842-85). A Bavarian dialect poet and author, born in Munich, son of the preceding. After studying law in his native city he undertook extensive travels, which he described in letters to the *Allgemeine Zeitung.* Afterwards he became State archivist in Munich. His poems, written in the dialect of Upper Bavaria and overflowing with fresh, delicious humor, appeared in the following collections: *Bergbleameln* (1865), *Weil's mi freut* (1876, 11th ed. 1896), *Habt's a Schneid'?* (1877), and others, all of which met with great favor, as did also his High German poems *Hochlandslieder* (1879, 8th ed. 1896), *Neue Hochlandslieder* (1883, 4th ed. 1892), and *Wanderzeit* (1882, 3d ed. 1893). Posthumously were published *Ein Winteridyll* (21st ed. 1897), *Kulturbilder aus Bayern* (2d ed. 1895), *Natur- und Lebensbilder aus den Alpen* (1890), *Aus Fremde und Heimat* (1886), and *Durch Krieg zum Frieden* (1895). For his biography, consult Heigel (Bamberg, 1891).

STIFF-NECK. See WRYNECK.

STIFTER, stĕf'tĕr, ADALBERT (1805-68). An Austrian poet, novelist, and painter, born at Oberplan, Bohemia. He studied law at the University of Vienna, but gave the preference to history, philosophy, and natural science, embraced the profession of teaching, and in 1850 was appointed superintendent of public schools in Upper Austria. His idyls and novelettes, collected under the title *Studien* (1844-51, 13th ed. 1895-96), rank with the best prose writings of his time, and from their first appearance evoked unstinted admiration. Their purely idyllic character, utterly alien to all worldly problems and tendencies, the masterly details in the author's original conceptions and descriptions of nature, constituted so grateful a contrast to the current belletristic productions as to atone for the merely accessory rôle assigned to the human element. The *Studien* were followed by *Bunte Steine* (1852; 9th ed. 1892); and the novels *Der Nachsommer* (1857) and *Witiko* (1865-67). His letters, with biography, were published by Aprent (1869). An edition of his complete works appeared in Prague (1901 et seq.). Consult: Kuh, *Zwei Dichter Oesterreichs* (Pressburg, 1872); and the biographies by Markus (Vienna, 1877), Pröll (Prague, 1891), and Stoessl (Berlin, 1902).

STIG

mark). The generic name given to fossilized plant remains with pitted surfaces, found in the coal measures. They were first thought to represent a distinct species of plant, but they are now known to be the roots of Sigillaria and other trees that lived in Carboniferous times.

STIGMATIZATION (from ML. *stigmatizare*, from Gk. *στιγματίζειν*, *stigmatizein*, to mark, brand, from *στίγμα*, *stigma*, mark, brand, puncture, from *στίζειν*, *stizein*, to mark, puncture). The name applied to the impression on certain individuals of the 'stigmata' or marks similar to the wounds made in the body of Christ during His torture. These stigmata comprise not only the wounds of the hands and feet and of the side received in the crucifixion, but also those impressed by the crown of thorns and by the scourging. In some cases the stigmata have been only subjectively felt and could not be seen by others. In a few cases, wherein it has been claimed that the impression was made upon the heart alone, special marks have been found on that organ after death. The impression of the stigmata, being held in certain cases to be miraculous, was regarded as a mark of signal favor. The first and most remarkable example of stigmatization is that of Saint Francis of Assisi (q.v.). In his case these mysterious markings are said to have persisted for three years, until his death, and to have been seen by Saint Bonaventure and by several popes, and closely observed by multitudes after his death.

Since Saint Francis's time there have been many such cases. Dr. Imbert Gourbeyre in 1894 was able to collect 321 examples, in every century since the thirteenth, in every European country and in every station in life. While the great majority were religious, mostly Dominicans or Franciscans, many were not and some twenty were in the married state. Nearly 100 were reported during the nineteenth century. The most noteworthy of these are Anna Katherine Emmerich (died 1824) and Louise Lateau (1850-83) of Bois d'Haine, Belgium. This last case attracted great attention and provoked public discussion, in which the Salpêtrière school of neurology took the position that stigmatization is only a neurotic phenomenon in hysterical individuals. Dr. Lefebvre, an eminent physician, professor of medicine at the University of Louvain, who had been for many years in attendance at two insane asylums, after a prolonged investigation of Louise Lateau's case, pronounced it miraculous. On the other hand, Theodor Schwann, the distinguished biologist, also a professor at Louvain and himself a Catholic, refused after careful examination to admit the preternatural character of the phenomena. There seems no doubt that phenomena of a nearly similar kind have been produced by suggestion in susceptible individuals. In the *Comptes Rendus* of the Society of Biology of Paris for July 11, 1885, there is a report of a case in which bleeding through the unbroken skin was produced by hypnotic suggestion. Consult: Gourbeyre, *Les stigmatisés* (Paris, 1873); id., *La stigmatisation, l'extase divine et les miracles de Lourdes* (ib., 1894); Bourneville, *Le science et le miracle* (ib., 1878); Lefebvre, *Louise Lateau* (Louvain, 1870); Bourneville, *Louise Lateau* (Paris, 1875); Richer, *Etudes cliniques sur l'hystéro-épilepsie ou grande hystérie* (ib., 1881).

STILES, stīlz, EZRA (1725-95). An American clergyman and college president, born at North Haven, Conn. He graduated at Yale in 1746, was tutor there from 1749 to 1755, was ordained by the Congregational Church in 1749, and preached for a time to the Stockbridge Indians. Transient religious doubts induced him to abandon the ministry and study law (1752); and he was admitted to the bar in 1752, and practiced in New Haven in 1753-55. Returning to the ministry in 1756, he was pastor of the Second Church in Newport, R. I., in 1756-77, and during this period spent a large part of his time in literary and scientific studies, learning several European and Oriental languages and carrying on an extensive correspondence with learned men in many parts of the world. In 1777-78 he was pastor of the North Church, Portsmouth, N. H., and in 1778 became the president of Yale, which position he held until his death. In addition to his presidential duties, he occupied the chair of ecclesiastical history from 1780 to 1795, and lectured on mathematics, astronomy, natural philosophy, and mental and moral philosophy. Both during and preceding the Revolution he was an ardent patriot. Besides several orations and sermons, he published *An Account of the Settlement of Bristol, R. I.* (1785), and a rambling, diffuse *History of Three of the Judges of King Charles I.* (1794); while his *Literary Diary* and bound manuscripts preserved at Yale fill over 45 volumes. The diary edited by Dexter was published in 1901. Consult *Life*, by his son-in-law, Abiel Holmes (1798), and by J. L. Kingsley in *Sparks's American Biography*.

STILES, HENRY REED (1832—). An American physician and author, born in New York City. He was educated at the College of the City of New York, and at Williams, subsequently studied medicine, and practiced for a short time. In 1857 he began the publication of *The American Journal of Education*. In 1859 he resumed his medical practice, and in 1863 became librarian of the Long Island Historical Society. In 1873 he became superintendent of the New York Homœopathic Insane Asylum at Middletown, N. Y., and from 1877 to 1881 was director of the Homœopathic Dispensary at Dundee, Scotland. From 1882 to 1885 he was professor of mental and nervous diseases in the New York Woman's Medical College. His publications include: *The History and Genealogies of Ancient Windsor, Connecticut* (1859); *Monograph on Bundling in America* (1861); *The Wallabout Prison-Ship Series* (1865); and *The History of the City of Brooklyn, New York* (1867-70). He edited *Illustrated History of the County of Kings and City of Brooklyn* (1884).

STILETTO-FLY. A small, slender predatory fly of the family Therevidæ, frequently of varied color and closely resembling one of the robber-flies (Asiliidæ). It does not catch its prey on the wing as do the robber-flies, but lies in wait upon leaves and bushes and even upon the ground, springing on weaker insects as they approach. The larvæ are very long and slender, and live in rotten wood and in rich earth, and seem to feed upon both decaying animal and vegetable matter.

STILICHO, stĭl'ĭ-kō, FLAVIUS (?-A.D. 408). A Roman general, one of the most notable figures in the history of the sinking power of Rome and

the German invaders. He was the son of a Vandal who served as an officer in the Roman Army under Valens, Emperor of the East (364-378), and himself followed a military career, earning the special recognition of the Emperor Theodosius (379-395), who, in 383, sent him at the head of an embassy to the Court of the Persian King Sapor III. Here, though still a young man, he proved such a successful diplomatist that a very advantageous peace was at once arranged; and on his return to Constantinople, at the end of 384, he married Serena, the Emperor's niece, and received the titles of *comes stabuli sacri* and *comes domesticorum*. During the next decade he was engaged in military operations in various parts of the Empire, attaining the grade of commander-in-chief (*magister militum*) of the army in Thrace in 385, and directing the campaign in Britain against the Picts, Scots, and Saxons in the same year. In 386 he was battling with his Emperor against the barbarians on the banks of the Hebrus. In 392 he was most successful in campaigns against the Bastarnæ, Goths, Alani, and Huns, but was prevented from gaining greater glory by the jealousy of the Consul Rufinus, who exercised a great influence over the Emperor. In 394, however, he received a greater honor; for Theodosius made his own son Honorius *augustus*, giving him the sovereignty of Italy, Spain, Gaul, and Africa, and appointing Stilicho and Serena his guardians. Thus Stilicho found himself on a footing with his hated rival Rufinus, for he became the real ruler of the West, with headquarters at Rome, as the young Honorius was wholly indifferent to the cares of State. While Theodosius lived, Stilicho and Rufinus were forced to maintain a semblance of peace, but no sooner was he dead, in 395, than their rivalry broke out openly. Stilicho had the advantage of a stronger personality and a close connection with the Imperial family, for his daughter Maria was betrothed to his ward, the Emperor Honorius. After successful campaigns on the Rhine, he marched to the East, nominally to drive back the Goths and Huns, whom Rufinus had persuaded to invade the Empire, but really with the design of overthrowing Rufinus, and by connivance with these same Goths Stilicho procured his assassination at the close of 395. He was now the virtual master of the Empire, for Honorius and Arcadius, the joint Emperors, were mere puppets in his hands; but Stilicho never aspired to the throne for himself, remaining as yet loyal to the worthless son of his old patron. His attention, indeed, was now wholly occupied with the formidable invasion of the Goth Alaric, who had forced his way into the Peloponnesus with a great army, and was abetted by Arcadius from jealousy of Stilicho. Alaric was almost caught in a trap, but managed to escape northward, where he held his own for six years, often making predatory incursions even into Italy. At the end of 402 the final contest was fought out. Alaric had invaded Northern Italy, and the cowardly Honorius fled from Mediolanum (Milan) to Ravenna. Stilicho gathered all the available troops from the western provinces and made a brave stand. He was blockaded in Milan, but early in 403 he broke the blockade and won a victory over Alaric at Pollentia, near Turin, and another at Verona. Alaric withdrew from Italy, but retained his power at the Court of Arcadius. In 406 a new invasion threatened Italy. A countless horde of Germans and Celts was led down from the north by their chief, Radagaisus, who occupied the heights of Fæsulæ, above Florence, where Stilicho, by a brilliant movement, that was regarded as miraculous, hemmed him in and forced him to surrender. Radagaisus was treacherously put to death and all his followers were sold into slavery. This was the last great achievement of Stilicho. His ultimate downfall was due to his ambition to see his own son Eucherius on the throne of Rome; and in this he might have succeeded, had it not been for the wily Olympius, who gained influence over Honorius and warned him of Stilicho's designs. Honorius now for the first time showed signs of energy. He aroused the soldiers by a clever speech and won over many partisans of Stilicho, who, deserted by his friends, met death by assassination at Ravenna in 408.

STILL, JOHN (c.1543-1608). An English prelate, born at Grantham, Lincolnshire. He was educated at Christ's College, Cambridge. He became successively Margaret professor of divinity at Cambridge (1570), prebendary of Westminster (1573), master of Saint John's College, Cambridge (1574), Archdeacon of Sudbury (1576), master of Trinity College, Cambridge (1577), and Bishop of Bath and Wells (1593). To him has been ascribed on insufficient evidence *A Ryght Pythy, Pleasaunt, and Merie Comedie, intytuld Gammer Gurton's Nedle*, the second English comedy extant. It contains the spirited drinking song beginning "Backe and side go bare, go bare." On the authorship of the comedy, consult *Modern Language Notes* for June, 1892 (Baltimore).

STILLBIRTH. See ABORTION.

STIL'LINGFLEET, EDWARD (1635-99). An Anglican prelate, born at Cranborne, in Dorsetshire. He received his education at Cambridge. In 1659 he published the *Origines Sacræ, or Rational Account of the Christian Faith, as to the Truth and Divine Authority of the Scriptures*, a work which made his reputation, and is still esteemed as one of the most masterly treatises extant on the subject of which it treats. In 1664 appeared his *Rational Account of the Grounds of the Protestant Religion*, a defense of the Church of England from the charge of schism in its separation from Rome, which was received with great favor, and led to his appointment as preacher at the Rolls Chapel. In 1670 he became canon of Saint Paul's Cathedral, and in 1678 was made dean. After the Revolution of 1688 he received the appointment to the Bishopric of Worcester. Stillingfleet's chief works, besides those mentioned, were the *Origines Britannicæ, or Antiquities of the British Churches* and *The Doctrines and Practices of the Church of Rome Truly Represented* (1686; 3d ed. 1851), a standard work. His complete works were published in six volumes (London, 1710, with life by Richard Bentley, supplementary vol., 1735).

STILLINGIA, stĭl-lin'jĭ-ȧ (Neo-Lat., named in honor of Benjamin *Stillingfleet*, an English botanist of the eighteenth century). A genus of plants belonging to the natural order Euphorbiaceæ. The species are mostly trees or shrubs of tropical Asia and America, and of the islands of Bourbon and Mauritius. The leaves are alternate, petiolate. One species, *Stillingia sylvatica*,

queen's delight or yaw shrub, a perennial herb two to three feet high, is found from Virginia to Kansas and south to the Gulf. The root of this plant has been variously used in medicine. *Stillingia sebiferum* or *sapium*, the tallow tree of China, from the fruit of which the Chinese obtain tallow, and which was introduced into the East and the West Indies, has a trunk and branches like the cherry and foliage resembling that of the black poplar.

STILL LIFE. The name applied to that branch of art which concerns itself with the representation of lifeless objects such as game, fruits, flowers, vases, and house furniture. See PAINTING.

STILL'MAN, SAMUEL (1738-1807). An American clergyman. He was born in Philadelphia, Pa., removed to Charleston, S. C., in 1748, was ordained as a Baptist minister in 1759, and preached first at James Island (S. C.), then at Bordentown (N. J.), and finally at Boston. He was one of the incorporators of Brown University (1764). He was an exceedingly effective preacher, and just before and during the Revolutionary War exerted a powerful influence on the side of the Patriot Party. Among his published sermons are *A Sermon on the Repeal of the Stamp Act* (1766), *Election Sermon* (1779), *Masonic Discourse* (1785), and a *Sermon Occasioned by the Death of George Washington* (1799).

STILLMAN, WILLIAM JAMES (1828-1901). An American journalist, landscape painter, and author. He was born in Schenectady, N. Y., and after graduating at Union College took up landscape painting under Frederick Church. In 1849 he studied in England, where he was influenced by the Pre-Raphaelites, becoming acquainted with Turner, whose work he admired, and with Ruskin, whose influence upon his painting was a baneful one. In 1852 he was commissioned by Louis Kossuth to go to Hungary to carry away the Crown jewels which Kossuth had hidden during the Revolution. From there he went to Paris, where he studied under Yvon, and continued to practice painting until 1855, when he adopted journalism as his profession, devoting himself to political and artistic subjects. Stillman was United States Consul at Rome (1861-65), and at Crete (1865-69). From 1883 to 1885 he was art critic of the *Evening Post*, and from 1875 to 1885 correspondent on political affairs for the London *Times*. He lived in Italy from 1878 to 1898, after which he retired to Surrey, England, where he died in 1901. His published works include the *Cretan Insurrection of 1866-68* (1874), *On the Track of Ulysses* (1888), *Billy and Hans* (1897), *Francesco Crispi* (1899), a biographical study, and the *Autobiography of a Journalist*, with many interesting reminiscences. His most noted painting is the "Procession of the Pines" (1858). Stillman was also an expert photographer, and published series of views of Athens, the Acropolis, and the temples of Sicily.

STILL'WATER. The county-seat of Washington County, Minn., 18 miles northeast of Saint Paul, on the Saint Croix River and Lake, and on the Chicago, Milwaukee and Saint Paul, the Chicago, Saint Paul, Minneapolis and Omaha, and the Northern Pacific railroads (Map: Minnesota, F 5). It has a situation of great natural beauty at the foot of the celebrated 'dalles' of Saint Croix, cliffs which extend for 30 miles above the city. Stillwater has the Minnesota State Prison, a public library, a United States Government building, a fine city hall, Stillwater City Hospital, and Saint Joseph's and Saint Mary's convents. The city is known for its extensive lumber interests. There are breweries, foundries and machine shops, grain elevators, a brick yard, and manufactories of flour, wagons, boats, farm implements, boots and shoes, boxes, etc. The government, under the revised charter of 1891, is vested in a mayor, chosen every two years, and a common council. Stillwater was settled in 1843, was incorporated as a village in 1848, and was chartered as a city in 1854. Population, in 1890, 11,260; in 1900, 12,318.

STILLWATER, BATTLES OF. See SARATOGA, BATTLES OF.

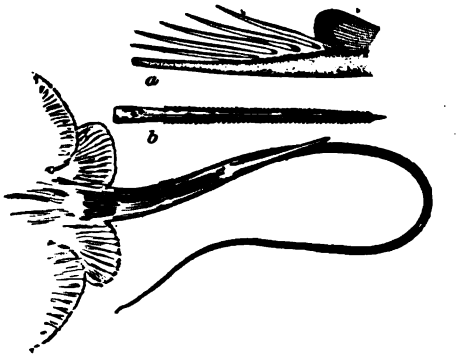
STI'LO, LUCIUS ÆLIUS PRÆCONINUS (called also Philologus). A celebrated Roman grammarian. He was learned in both Greek and Latin and was an instructor of Cicero in rhetoric and of Varro in grammar. His sympathy with the aristocratic party led him to accompany Quintus Metellus Numidicus into exile at Rhodes in B.C. 100. His works include commentaries on the *Axamenta*, or Songs of the Salii, and the *Twelve Tables*, and a volume entitled *De Proloquiis*. The treatise *Ad Herennium*, generally found in editions of Cicero, has been conjecturally assigned to him.

STILT (Swed. *stylta*, OHG. *stelza*, Ger. *Stelze*, stilt, crutch). A large, handsome, long-shanked shore-bird of the genus Himantopus, related to the avocets. The common Old World species (*Himantopus himantopus*) is widely distributed. The American species (*Himantopus Mexicanus*) is common to both continents; and others are known in other parts of the world along seacoasts. They frequent muddy flats in small flocks, and walk with long, measured steps, seeking for food among the reeds, and catching small fishes in the pools and shallows. See Plate of BEACH BIRDS.

STILT-BUG. A plant-bug of the family Berytidæ, which includes very slender species with long, thin legs in which the thighs are thickened at the tip. Only six species are known to occur in the United States.

STIM'SON, FREDERIC JESUP (1855—). An American lawyer and author, born in Dedham, Mass. He graduated at Harvard in 1876 and at the Harvard Law School in 1878, and began practice in Boston. In 1884-85 he was Assistant Attorney-General of Massachusetts, and in 1899-1901 general counsel to the United States Industrial Commission. He is best known as the author of law books, including *American Statute Law* (2 vols., 1886), the standard work on the subject; *Stimson's Law Glossary* (1890); *Government by Injunction; Labor in Its Relation to Law* (1894); *Handbook to the Labor Law of the United States* (1895); and *Uniform State Legislation* (1896). Under the pen-name of "J. S. of Dale" he also wrote several novels and short stories.

STIMULANTS (from Lat. *stimulare*, to urge, prick, from *stimulus*, goad, incitement; connected



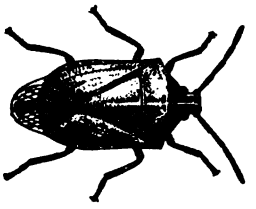
with Gk. *στίζειν*, *stizein*, to pierce, Skt. *tij*, to be sharp, OHG. *stehhan*, Ger. *stechen*, Eng. *stick*). Agents which increase temporarily the functional activity of the organism as a whole or of the various organs of the body. These may be cardiac, respiratory, nervous, hepatic, renal, gastric, etc., depending on the organ or system affected. Stimulants embrace a wide range of therapeutic agents, but popularly the term is applied to those acting especially on the circulatory, respiratory, and nervous systems. Alcohol is the most generally employed, in the form of whisky, brandy, or wines. The various preparations of ammonia, inhaled or given as the aromatic spirits of ammonia, are very serviceable diffusable stimulants. Ether may be taken as an inhalation, a hypodermic injection, or in solution by the mouth, and acts rapidly. Among the other general stimulants may be mentioned camphor, strychnine, lavender, ginger, peppermint oil, and the other essential oils. This class of remedies is useful in fainting, hysteria, shock, and similar conditions.

STIMULUS (from Lat. *stimulus*, goad, incitement). A mechanical, molecular, chemical, or ethereal change in the conditions external to a plant cell or to the plant body, which produces a change (reaction) in the cell, a particular organ, or the whole plant. Mechanical stimuli, due to the mass movement of the external agents, are contact, pressure, traction, friction, torsion, etc. (See MOVEMENT; THIGMOTROPISM; TENDRIL.) In the absence of knowledge as to its nature, gravity may be included in this group, since it depends upon the mass of the body acting (the earth), although it is not in itself mechanical. (See GEOTROPISM.) Molecular stimuli depend upon molecular movements. Osmotic pressure has been proved capable of acting as a stimulus. The reactions of organisms to solutions of varying concentration are interpreted as due not to the chemical nature but to the number or impact of the solute molecules, since they are alike with all substances of the same osmotic pressure. (See OSMOSIS.) Chemical stimuli depend not upon the mass, but upon the chemical composition of the body acting. They are, therefore, almost as various as chemical compounds, although many substances are nearly or quite inert. The most common acting upon plants are water, organic acids, mineral salts and other solutes in the water. (See CHEMOTROPISM.) Ethereal stimuli are propagated in the ether, light and heat. (See HELIOTROPISM; THERMOTROPISM.) Here also may be included electricity, whose action in nature is little understood. (See IRRITABILITY.)

STINDE, stĭn'de, JULIUS (1841—). A German humorist. He studied and practiced chemistry, became editor of a Hamburg trade journal, contributed to periodicals, and was gradually drawn wholly to literature, wherein he won popularity by *Buchholzens in Italien* (1883), *Die Familie Buchholz* (1884, translated), a second part of this (1886), *Frau Buchholz im Orient* (1888), *Frau Wilhelmine Buchholz' Memoiren* (1895), and *Hotel Buchholz, Ausstellungserlebnisse* (1896). His other writing, dramatic and otherwise, is of slight worth, but in the *Buchholz* series the lower middle class of Berlin is depicted with a fresh, genial, healthy humor.

STING (from AS. *stingan*, Goth. *us-stiggan*, to push out; connected with OHG. *stanga*, Ger. *Stange*, obsolete Eng. *stang*, sting). An organ possessed by various kinds of animals, by means of which they not only inflict a mechanical wound in their prey, but also insert into it an irritant or poisonous chemical. Stinging or nettling cells (see NEMATOCYST) occur in all the Cœlenterata except ctenophores, in some tubularian worms, and on the cerata of the nudibranch Eolis. The sting of scorpions (q.v.) is in the tail. The poison, secreted by a gland, exudes through small openings into the wound, and is powerful enough to cause death in the small natural prey. Among insects, several forms are provided with a sting. This organ, which is of especial use as a means of defense to the so-called aculeate Hymenoptera, a group which includes the bees, wasps, and many ants, and to the Mutillidæ or 'cow-ants' or 'velvet ants,' is simply a modified ovipositor connected with a poison gland. The sting of a bee consists of three distinct pieces: two barbed needles and one gouge-like piece, the 'director;' the needles move up and down on the director, controlled by muscles attached to their bases. In the anterior part of the director there is a slight projection on the needle which catches a bit of the poison in the chamber and carries it to the wound. The director itself is composed of a united pair of stylets, and without the director is a third pair of stylets which are thick and hairy. (See INSECTS, section on *Poisonous Insects*.) The poison is secreted by poison glands which pour their poison into the chamber. The poison of the bee is said to be secreted by two glands, one producing an acid and the other an alkaline fluid. Only acid poison glands are said by some investigators to be present in those wasps which only stupefy the prey that they store up for the nourishment of their young.

STING-RAY, or **STINGAREE**. A ray (q.v.) of the family Dasyatidæ, characterized by the usual possession of a long whip-like tail, bearing near its base one or more long, strong, sharp spines retroversely serrated. When broken off the spine is replaced by the coming forward of one of a succession growing behind it. The family includes about fifty species, inhabitants of the warmer seas, some species occurring in the fresh waters of



TAIL OF A STING-RAY.

a, enlarged view of the base of the tail of a sting-ray, having several spines; *b*, a single spine, barbed on both sides.

Northern South America, some of which are ten or twelve feet in length. They are generally much dreaded because of the ugly wound they are capable of inflicting with the spine or 'sting.' The sting is not poisonous, as is frequently supposed, although the mucous secretions of the skin may be responsible for the serious inflammations frequent in the wounds. See RAY and accompanying Plate; DEVILFISH.

STINK-BUG. Any one of the heteropterous insects of the family Pentatomidæ, very many of which are protected from their natural enemies by a nauseous, penetrating, and persistent odor, which remains with berries over which these bugs may have walked. The family is a large one and 4000 species have been described, of which 300 are found in the United States. They are broad, flat insects with five-jointed antennæ, and are usually green, gray, or brown, although some have a brilliant combination of black and red or yellow and black. They vary strangely in habit, some species being exclusively carnivorous and others exclusively plant-feeders, while others seem to feed indifferently upon the juices of plants or upon other insects. See SOLDIER-BUG.

A STINK-BUG.

STINT (from AS. *styntan*, to make blunt, short, from *stunt*, dull, stupid). One of the small sandpipers (q.v.) of the genus Tringa. The American stint (*Tringa minutilla*) is the smallest of the sandpipers, less than 6 inches long, breeds only in the Arctic regions, and is common throughout North America during the migrations. The plumage in summer is variegated bright bay, blackish, ashy and whitish above, whitish beneath; in winter the color is simply ashy above, whitish beneath.

STIPA. See FEATHER-GRASS.

STIPENDS, CLERICAL (Lat. *stipendium*, tax, tribute, salary, from *stips*, gift, donation + *pendere*, to weigh out). A general designation of the means of support provided for the clergy. There have developed in Western civilization five general methods of providing clerical support, together with all sorts of combinations of those methods. Those methods may be defined as those of (1) voluntary offerings, (2) tithes, (3) endowments, (4) State aid, and (5) contracts. No country shows any one method prevailing to the exclusion of the others. Without doubt the earliest method of supporting a priesthood was by means of voluntary contributions. Tithes (q.v.) were commanded of Hebrews by revelation, and the system continued in Christian times. State aid may be considered as of two kinds, the direct and the indirect, the latter to be considered first, as of the greater antiquity. When the political power under the Emperor Constantine came openly to the support of the Christian religion one of the first results of the friendly coöperation of the State was the legal capacity given to the churches in a corporate character to receive gifts *inter vivos* and by bequest, and to hold the same in perpetuity. This was an indirect method of State aid. Direct State support of the clergy is a comparatively modern institution, which has developed since the Reformation era. It is now in operation in those European States of Roman Catholic allegiance which have entered into a treaty, technically known as a concordat, with the See of Rome for the support of the clergy. Such treaties came about as a return for the sequestration of the older ecclesiastical endowments in land. France, Spain, Portugal, and Austria give such direct support to the Roman Catholic clergy. The Protestant German and Scandinavian States furnish a like support to the Protestant ministry. Russia supports the hierarchy of the orthodox Church. A similar system of direct State support prevails in the Central and South American States for the Roman Catholic clergy, and under Spanish rule prevailed also in Cuba, Porto Rico, and the Philippines. The fifth method, that of contracts, is essentially American. It consists first of a contract between a local church (in the Protestant denominations) and its minister for the payment of a definite sum for his support, and then a series of contracts between the church as a corporation and the attendants at public worship for the rental of pews and sittings. As a reaction from this method has developed what is known as the 'free church' movement, which seeks to abolish pew rentals and to substitute systems of voluntary contributions.

STIPPLE (from Dutch *stippeln*, to speckle, from *stippen*, to dot, prick, from *stip*, point, dot), or STIPPLING. In engraving, a process of producing light and shade, and sometimes color, by means of points, dots, or small, short marks, hardly to be considered lines. In water-color work the dots of color inevitably run together, so that the process is somewhat like cross-hatching in ordinary drawing. This is a process used by artists who are in search of very minute detail. See LINE ENGRAVING and ETCHING.

STIPULATION (Lat. *stipulatio*, bargain, *stipulare*, to bargain, covenant). In law, a material clause or provision in a contract. The term is also sometimes applied to a written agreement between attorneys as to some matter of practice. In admiralty practice it is a bond or undertaking filed with the court by one of the parties to an action or proceeding. A libellant must file a stipulation for costs. When a vessel is attached under a libel, the owner must file a 'stipulation for value' to obtain her release. See BOND.

STIRLING, stĕr'lĭng. A river-port and capital of Stirlingshire, Scotland, on the Forth, 35 miles northwest of Edinburgh (Map: Scotland, D 3). The rich agricultural, mining, and manufacturing districts around it are the main basis of its prosperity. Situated at the head of navigation of the Forth, Stirling, strongly fortified by nature, was the key to the Highlands. It owes its origin to the strong natural fortress of Castle Hill, crowned by the venerable castle, which commands an extensive view of great beauty. From this hill, covering the declivity which slopes north and eastward to the plain, extends the oldest part of the town. Stirling Bridge, which existed in 1571, was until recent years the only one by which wheeled carriages could cross the Forth. Noteworthy are the East

and West Churches—the former erected by James IV. about 1494—and 'Mar's Work,' an incomplete and richly ornamented structure, built in 1572. Ropes, malt, leather, soap, and mineral oils are manufactured. Vessels of one hundred and fifty tons can reach the port of Stirling, but its river trade has decreased since the advent of railroads.

Stirling (formerly *Stryvelyne*, or *Estrivelin*) is one of the most ancient and historically important towns of Scotland. Alexander I. died in the castle in 1124. Near by, the battle of Stirling was fought in 1297. (See WALLACE, WILLIAM.) The town was taken by Edward I. after a siege of three months, in 1304. In the vicinity, at Bannockburn (q.v.), the famous battle of that name was fought in 1314. The castle was the birthplace of James II. and of James V. James III. built the Parliament House in the castle, and otherwise improved and embellished the fortress. James V. built the palace, the walls of which are profusely covered with grotesque ornamentation. In the older part of the castle is the 'Douglas Room,' in which William, Earl of Douglas, was assassinated by James II. In 1651, after the battle of Dunbar, the castle was taken by Monk; and it withstood a siege by the Highlanders in 1745. Population, in 1891, 16,800; in 1901, 18,403. Consult: *History of the Chapel Royal of Stirling* (Grampian Club, 1882); *Charters of Stirling* (1884).

STIRLING, EARL OF (1726-83). See ALEXANDER, WILLIAM.

STIRLING, JAMES (1692-1770). A mathematician, born at Garden, Stirlingshire, Scotland. He was educated at Glasgow University and Balliol College, Oxford. He was expelled from Oxford (1715) on account of his relations with the Jacobites, and went to Venice, where he took up the study of mathematics. It was during his residence in Venice that he wrote his work *Lineæ Tertii Ordinis Newtonianæ* (1717), and his paper *Methodus Differentialis Newtoniana Illustrata*, which was communicated to the Royal Society through Newton (*Philosophical Transactions*, 30: 1050). Stirling returned to London in 1725 and devoted himself to the teaching of mathematics, enjoying the friendship of Newton and corresponding with many of the noted mathematicians of the day. His greatest contribution to mathematics was his *Methodus Differentialis, sive Tractatus de Summatione et Interpolatione Serierum Infinitarum* (1730; 2d ed. 1764; English trans. 1749).

STIRLING, JAMES HUTCHINSON (1820—). A Scottish philosopher, born at Glasgow, January 22, 1820; studied arts and medicine at the Glasgow University. He practiced medicine for some years, but soon gave up medicine to study philosophy. He published *The Secret of Hegel* (1897); a translation of Schwegler's *History of Philosophy* (1867); *As Regards Protoplasm* (1869); *Lectures on the Philosophy of Law* (1873); *Text-Book to Kant* (1881); *Philosophy and Theology* (1890); *Workmen and Work* (1894); etc.

STIRLING-MAXWELL, Sir WILLIAM (1818-78). A Scotch author, born near Glasgow. He bore the name of Stirling until 1866, when by the death of Sir John Maxwell, his maternal uncle, he succeeded to a baronetcy and

form was the *stoa diple*, in which a row of columns replaced the dividing wall. The forms of the stoa multiplied; two inner rows of columns were often used and additional stories were added. The stoa originated among the Ionian Greeks in Asia Minor, whence they were introduced into Greece. Celebrated examples were the simple Stoa Poikile (many-colored) upon the marketplace of Athens, the walls of which were decorated with scenes from the battles of Marathon and Œnoë by Polygnotus; the *stoa diple* of Thoricos; the three-aisled "Basilica" of Pæstum; and the two-storied stoa of King Attalus II. at Athens. Stoas were frequently adorned with statuary and painting.

STOAT. The British name for a weasel (q.v.).

STOBÆ'US, JOANNES (Lat., from Gk. Ἰωάννης ὁ Στοβαῖος, *Iōannēs ho Stobaios*). A Greek writer, apparently a native of Stobi, in Macedonia. The date at which he lived is not certain, but was probably about A.D. 500. To him we owe the preservation of a large number of our fragments of over five hundred early Greek poets and prose writers. This excerpt work in four books bore the name *Florilegium* (Ἀνθολόγιον), but in the course of the Middle Ages was divided into two parts, one of which is known as the *Eclogæ*, the other as the *Florilegium*. The best critical edition is by Wachsmuth and Hense (Berlin, 1884-94).

STOCK (AS. *stocc*, OHG. *stoc*. Ger. *Stock*, post, trunk; probably connected with Skt. *tuj*, to thrust). In corporation law, the rights or interest which the organizers of a corporation, or persons who contribute to its capital, have in its assets, franchises, management, and profits. The amount fixed by the charter of a corporation as the sum which is to be paid into its treasury for use in its business operations is called the *capital stock*. The latter term is sometimes inaccurately applied to the actual property owned by a corporation, as the capital stock of a corporation may not represent its actual assets, even at the time of its organization. The total capital stock of a corporation is divided into shares, which are represented by certificates, and the latter are distributed to subscribers according to the amounts of their respective subscriptions. Shares of stock may be made of any value, the par value being fixed by dividing the number of shares issued into the total amount of capital stock. The usual par value is $100, but shares representing other sums, even so small as $1 each, are sometimes issued, especially in industrial enterprises. Many States require stock to be issued at its par value.

Treasury stock is that which is not allotted to subscribers, but retained by the corporation for the purpose of selling it from time to time to raise funds.

Stock may be divided into *preferred* and *common* shares. The amount in dividends which the former can receive in each year is usually fixed and certain, and if more is paid as dividend it must be paid on the common stock. Preferred stock may be *cumulative* or *non-cumulative*. If the former, any deficiencies in dividends in one year must be made up later, before a dividend can be declared on the common. For example, if 7 per cent. cumulative preferred stock is issued, and the earnings are only sufficient to pay 5 per cent. on it in a given year, the deficiency of 2 per cent. must be made up later. If such stock were non-cumulative, the preferred stock would only receive 5 per cent. for that year, even though the earnings the next year were sufficient to pay 15 per cent. on the amount of the capital stock, and an 8 per cent. dividend were declared on the common stock.

The name of each person to whom a share of stock is issued is entered upon the books of the corporation.

Shares of stock are transferable by assignment, and the transferee obtains a right to have his name entered upon the books of the company as a stockholder in the place of his transferrer. However, shares of stock are not negotiable instruments in the strict sense of that term, but they are commonly indorsed in blank and transferred from one person to another as if such transfer were protected by the same rules of law. For this reason the courts in the United States generally protect an innocent purchaser for value, on the ground of estoppel. The English courts do not go so far in this respect, and the only safe course there is for a purchaser of stock to have the transfer entered on the books of the corporation immediately. Dividends are paid to the record owner of stock irrespective of who holds the certificates. A record owner of stock is called a stockholder. See Cook, *Stock and Stockholders* (New York, 1887); Dos Passos, *The Law of Stock Brokers and Stock Exchanges* (New York, 1882); also CORPORATIONS and authorities there cited.

STOCK (so called from its woody stem), GILLIFLOWER, or GILLYFLOWER (*Matthiola*). A genus of about thirty species of herbs or half shrubs of the natural order Cruciferæ, natives of the Mediterranean regions. Most of the species are thickly clothed with white or grayish stellate

STOCK (*Matthiola incana*).

hairs; the fragrant, generally beautiful flowers are in racemes; the pods are cylindrical or compressed. *Matthiola incana*, indigenous in Southern Europe, is probably the parent of the greater number of the cultivated hoary-leaved kinds known as Brompton stock, etc., while those

with smooth leaves, called ten-week stock, German stock, etc., are referred to *Matthiola fenestralis*, which, perhaps, is a mere variety of the one species *Matthiola incana*. The sandy shores of Wales and of Cornwall produce a species (*Matthiola sinuata*) the large purple flowers of which are fragrant only at night, a characteristic also of several other species. Stocks are generally raised by gardeners from seed. The hoary-leaved stocks are usually treated as biennials, although they may almost be reckoned perennial. The smooth-leaved stocks are treated as annuals.

STOCKADE. A means of defence consisting of stakes, logs, timbers, tree trunks, etc., firmly set in the ground and adjoining each other, and provided with loopholes through which the fire of the defenders may be delivered. Stockades are one of the oldest forms of fortifications, having done duty since the time of arrows and javelins, and are still useful as a protection against musketry fire under certain circumstances, though of course valueless when subject to attack by artillery. As the logs, etc., are usually considerably higher than a man's head and are sharpened on the top, stockades are also valuable as obstacles and can be defended readily. It is essential that the logs or timber should be firmly planted and bound together and reinforced by horizontal timbers or logs, earth, rails, or other material at the engineer's command, while the loopholes must be advantageously placed. Stockades may be useful where timber is plentiful, but their construction involves considerable labor and skillful working of timber. For details of construction of stockades and other field defences, consult Beach, *Manual of Military Field Engineering* (3d ed., Kansas City, 1897). See FORTIFICATION.

STOCK'BRIDGE. A North American Indian tribe. See MAHICAN.

STOCKBRIDGE. A town, including two villages, in Berkshire County, Mass., 17 miles south of Pittsfield, on the Berkshire Division of the New York, New Haven and Hartford Railroad (Map: Massachusetts, A 3). It is picturesquely situated in the Berkshire Hills. Noteworthy features are the Bell Tower, commemorating the early Indian Mission; a fine park, the gift of Cyrus W. Field; the Edwards Monument, the Indian Burial Ground, Williams Academy, and the Jackson Library and Reading Room. In the vicinity are Ice Glen, a narrow gorge, with caves whose sides are coated with ice all the year; Prospect Hill, commanding an extended view; and Lake Mahkeenac, near which are the remains of the house where Hawthorne wrote the *House of the Seven Gables* and other works. Population, in 1890, 2132; in 1900, 2081.

An Indian mission was established here in 1736, and three years later the place was incorporated as a town under its present name (from Stockbridge, England). Jonathan Edwards was a missionary here from 1750 to 1758, and here he wrote his most famous works. In 1785 the Indians moved to New Stockbridge, N. Y. Consult: Jones, *Stockbridge Past and Present* (Springfield, 1854), and *History of Berkshire County* (New York, 1885).

STOCKBRIDGE, HENRY (1822-95). An American political leader, born at North Hadley, Mass. He graduated at Amherst College in 1845 and was admitted to the bar in Maryland in 1848. He remained loyal to the Union during the Civil War, and in 1864 became a member of the State Legislature. He was a member of the Constitutional Convention which met to decide the question of the abolition of slavery in the State, was active in securing the adoption of the Constitution framed by its members, and defended it before the courts. It was largely by his exertions that the indentures of apprenticeship, which threatened to take the place of slavery, were omitted from the statutes, and enfranchisement secured, without possibility of evasion, to the negroes of Maryland.

STOCKDOVE (so called either because formerly regarded as the parent stock of the domestic pigeons, or because it breeds in the trunks of trees). A wild pigeon (*Columba œnas*) of Europe, gray, with a burnished metallic purple breast, scarlet eyes, orange-colored bill, and red legs. It is about fourteen inches in length.

STÖCKER, stĕ'kĕr, ADOLF (1835—). A German theologian and politician, born in Halberstadt. He studied theology and philosophy in Halle and Berlin, entered the ministry, and in 1874 became cathedral preacher and Court pastor in Berlin. In 1879 he was elected to the Prussian Chamber of Deputies, and from 1881 till 1893 he was a member of the Reichstag. During this period he was a leader of the agitation against the Jews. In 1890, because of his activity as a Socialist agitator, he was removed by the Emperor from his position as pastor of the Court. Six years afterwards, with a considerable number of followers, he seceded from the Conservative Party, to which he had hitherto belonged, and organized the Christian Socialists. In 1892 Dr. Stöcker became the editor of the *Deutsche evangelische Kirchenzeitung*. Among his published works are: *Christlich-Social* (1884 and 1890); *Wach' auf evangelisches Volk!* (1893); and *Dreizehn Jahre Hofprediger und Politiker* (1895).

STOCK EXCHANGE. An institution where sales and purchases may be made of securities of corporations and municipalities, and in some cases of certificates representing commodities of trade, such as silver bullion, petroleum, etc. In their origin stock exchanges appear to have been free to the use of any one who wished to buy or sell, and it was probably with this function in view that some of the older exchanges, notably the Paris Bourse, were located in buildings erected at the public expense. It was very quickly discovered, however, that in order to enforce bargains some formal organization was necessary. Membership in stock exchanges therefore came to be limited on the general basis used by clubs or other associations. As the profits of the use of the exchange became large possession of a membership became a valuable privilege.

The London Stock Exchange has for many generations occupied the most conspicuous place in the history of finance, for the reason that transactions on its floor were conducted by the great aggregation of capital, home and international, which made its abiding place in that city. Originally confining its dealings to British Government stock, the London Exchange became active, at the opening of the nineteenth century, in securities of other nations which applied to

London capitalists for the placing of their public loans. To this class of securities were later added railway shares. After 1888 stocks of incorporated industrial enterprises, and more recently of mining and exploration companies, grew into high favor, the Stock Exchange merely acting as the medium for the transfer of such shares from the hands of the capitalists behind the enterprise to those of the general public.

The New York Stock Exchange devoted itself during most of its history almost exclusively to securities of railway enterprises, even the dealing in United States Government bonds and in other American public securities being chiefly conducted outside of the Exchange. In recent years, however, along with the development of the London movement of industrial incorporation, the New York Stock Exchange has been largely utilized for the exploiting of shares of American companies of this nature. This movement, which flagged during the hard times of the early nineties, was renewed in enormous volume during the great 'boom' in trade which followed 1897. In the course of this time listing of industrial securities on the New York Exchange attracted an immense business to that branch of its activities. The New York Stock Exchange has never dealt to any noteworthy extent in foreign securities, thereby reflecting the general tendency of American investors. Even the large purchases of British consols by American bankers during the Exchequer's loan issues of 1900, 1901, and 1902 were disposed of privately, and were never allowed a place in the formal trading of the Stock Exchange.

There has been some rather notable diversity in the business of the New York Exchange and other American exchanges. For example, the Philadelphia Stock Exchange has long been noted as the market for various street-railway securities. This was because Philadelphia capitalists had interested themselves particularly in that form of investment. For similar reasons the Boston Stock Exchange, though not an organization which commanded the resources and capital of New York, monopolized for many years, and largely controls now, the trading in shares of copper-mining companies.

Stock exchanges of Continental Europe have in general devoted themselves to transportation enterprises of their own countries, to their own Government's securities, and to securities of other European governments which came to those markets to raise capital. More recently the stock exchanges of Paris, Berlin, and Vienna have followed London's example in taking up on a large scale shares of incorporated industrial enterprises. This has been particularly true of Berlin, where the iron industry has been extensively exploited in this form.

HISTORY. Stock exchanges as an institution had their origin at the time of the creation of public debts on the modern plan, at the close of the seventeenth century. The incorporation of the East India Company in London further developed the possibilities of the raising of public capital for corporate uses through the medium of stock-exchange trading. In 1720 the enormous public speculation in the shares of the South Sea Company in London and of the Mississippi Company in Paris brought stock-trading to a height never before conceived of. No city at that time, however, possessed a stock exchange in the sense now attached to the term. In London transactions in stocks were conducted through stock brokers, whose headquarters were at Jonathan's and Garraway's Coffee Houses in 'Change Alley. There does not appear to have been any formal organization among these brokers. Addison in the *Spectator* speaks humorously of having been taken for one of their number by the stock-jobbers at Jonathan's. The London Stock Exchange Building was not erected until 1801; the Paris Bourse not until 1826. The New York Stock Exchange membership, even after it had become a formal organization, conducted its business in hired rooms until December, 1865, when the building was erected on Broad and Wall Streets, which has been replaced by the new structure on the same site, dedicated in April, 1903. The history of stock exchanges is very largely a mirror of the financial history of the community in which they are situated. The New York Stock Exchange rose to a position of real prominence only after the Civil War. Even at that time the fact that it did not deal in gold as a commodity threw a great part of the community's highly speculative business over to the Gold Exchange, which was formed for that purpose exclusively. The dramatic incident of this period was the gold panic on Black Friday in September, 1869, when a combination of several unscrupulous speculators, among them James Fisk, Jr., and Jay Gould, attempted to corner and put to extravagant figures the gold supply of the market. Operations on the Stock Exchange proper at that time were largely made up of the personal struggles of rival capitalists, notably in connection with the Erie and New York Central railroads.

The completion of the Pacific Railway (1869) caused extensive speculation in shares of the two transcontinental railways, and as capital increased and the railway mileage of the country extended the transactions of the Exchange became of a national rather than provincial character. The leading operators of that time were Gould, Fisk, Daniel Drew, Cornelius Vanderbilt, and their associates. None of the capitalists named was accustomed to trade personally on the Stock Exchange; indeed, such a practice has always been the rare exception among active financiers.

The crisis of 1873 was felt in its full force on the New York Stock Exchange, which was obliged to close for two days at the height of the panic in order to stem the tide of liquidation in securities. With the great trade revival which followed the resumption of specie payments and the profitable grain harvests of 1879 the New York Stock Exchange entered upon a period of renewed activity. During the year 1880, which marked the climax of the 'boom' of that period, trading on the Exchange reached an enormous volume, and the value of seats in the Stock Exchange rose to an unprecedented figure. In 1881, when a reaction in the tide of prosperity began, the New York Stock Exchange reflected the change by a contraction in the volume of business done and by an extensive fall in prices. Speculation by the general public was again rife in 1882, but was checked with great violence by the sudden fall in railway and industrial profits at the close of the year. The severe reaction of 1883 was followed by the panic of May, 1884,

in which half a dozen Stock Exchange houses failed and two important banks were compelled to close their doors.

The period from 1886 to 1888 inclusive was chiefly marked by the large issues of securities to provide funds for the very extensive railway building then in progress. There were several excited markets on the Stock Exchange, though the tendency at the close of the period was toward depression of values, largely because of the enormous creation of new securities. The year 1890 was again marked by great activity and rising prices on the Stock Exchange. This 'boom' was checked by the Baring panic of November, 1890, in London, which was reflected by a prompt recall of English capital from the United States, and by a New York Stock Exchange panic, in the course of which two or three broker houses failed. From then until the outbreak of the more serious panic of 1893, a shrinkage in business was the chief characteristic of the New York Stock Exchange's history.

The panic of 1893 was in many respects one of the most dramatic episodes in the Stock Exchange history. There was at one time, during July of that year, talk of repeating the expedient of 1873 and closing the Exchange. This turned out to be unnecessary, as foreign capital came to the market's relief in the moment of emergency. The following year, 1894, was a period of great depression, when the volume of Stock Exchange business fell to the lowest point since 1878. Recovery followed in 1895, when foreign capital was again commanded in connection with the international syndicate to float the United States Government's bond issue and protect the Treasury gold reserve. A panic of smaller proportions swept over the Stock Exchange at the close of this year, in connection with the collapse of the protective operations and the international clash between America and Great Britain over Venezuela. The two ensuing years were chiefly characterized by the reorganization of the great number of important railways which had failed during 1893 and 1894, and whose new securities, largely increased in quantity, were placed through the medium of the Stock Exchange in 1896 and 1897.

The financial revival which began at the close of the last-named year introduced a new epoch in the history of the New York Stock Exchange —an epoch in all respects the most remarkable of its history. Supply of American capital available for investment purposes seemed suddenly to have become unlimited—largely because of the country's immensely profitable harvests at a time of European famine, but also on account of a wholly unprecedented increase in our general export trade, in manufactures as well as in agricultural products, which gave to our markets a command over foreign capital which they had never before possessed. This increase in capital was made use of by promoters of all kinds of enterprises, and their shares found active reception on the Stock Exchange. A highly excited movement for the rise at the opening of 1899 converged chiefly on shares of industrial companies organized to buy up independent plants. Checked by the excess of the speculators and by an industrial reaction during the Presidential contest of 1900, this movement was renewed with immense force at the opening of 1901. At that time all precedents of every kind in Stock Exchange history were broken. Where, a few years before, transactions of 200,000 shares a day had been regarded as constituting a large market and half a million shares as a day of extreme activity, scarcely a day now elapsed in which the volume of business did not run from one to two million shares, culminating on April 30, 1901, in transactions of 3,200,000 shares. Prices in the meantime were advancing at a rate which brought the entire financial public into the field as a speculator. The real force underlying the movement was the purchase of stock companies by other companies which pledged their credit to raise the funds requisite to provide for the purchase. This movement culminated in the famous Northern Pacific corner of May 9, 1901, when the efforts of two rival groups of capitalists to get hold of that railroad property forced its shares to the price of $1000, the stock having never touched $100 until three weeks before. Apprehension that operators who were unable to deliver stock which they had pledged would be dealt with summarily, caused one of the most violent collapses of values in the Stock Exchange's history. Recovery was prompt, and both 1901 and 1902 were characterized by numerous sensational movements for the advance, the second of those years scoring as a rule the higher values. In general, however, it was recognized that high-water mark in Stock Exchange activity had been reached. In the autumn of 1901 and in the fall of 1902 and the early part of 1903 severe reaction in values supervened.

The noteworthy characteristic of the period was the employment of enormously wealthy syndicates to sustain prices for the newly issued shares on the Stock Exchange until the public could be induced to buy. Such syndicates were remunerated at first by large allotments of stock and later by heavy cash payments, the syndicate formed in March, 1901, to 'underwrite' the billion-dollar stock issued by the United States Steel Corporation to take up the shares of other steel and iron combinations, pledging itself, in case of necessity, to advance $200,000,000 capital for the purpose. The stock issue worked out so successfully, however, that only a small fraction of the guarantee was called for, and two years later the original capital subscribed was returned to subscribers, with an additional cash allotment sufficient to raise profits to 200 per cent. A second syndicate, formed in 1902 to underwrite a $50,000,000 bond issue by the same corporation and the conversion of $200,000,000 of its stock into bonds, fared less fortunately, being obliged to perform the whole of its guarantee at a time of falling prices. In the spring of 1903 it was generally recognized that the extensive employment of the syndicate underwriting plan had 'tied up' immense amounts of capital which were usually available in the general market. The investing public having bought very sparingly and the syndicate banking interests being unable to support prices, a very severe and general decline on the Stock Exchange ensued.

VOLUME OF BUSINESS. Stock exchanges keep no official record of transactions on their floor. In New York such records are carefully kept by unofficial chroniclers; but as this is not done in London or on the Continent, comparison is impossible. It is safe to say, however, that in recent years the volume of business done

on the New York Stock Exchange has far exceeded that transacted in any other institution of the world. Following is the unofficial record of sales in that institution during a series of years:

	Stocks	Corporation Bonds	Government Bonds	State Bonds
1902	$188,503,000	$879,749,000	$1,378,000	$3,675,000
1901	265,944,000	994,235,000	1,892,000	2,502,000
1900	138,380,000	569,159,000	7,012,000	2,082,000
1899	176,421,000	826,711,000	10,582,000	2,013,000
1898	112,699,000	888,747,000	24,581,000	3,642,000
1897	77,324,000	529,843,000	10,394,000	2,004,000
1896	54,654,000	363,158,000	26,494,000	2,284,000
1895	66,583,000	499,758,000	7,480,000	5,583,000
1894	49,075,000	339,950,000	4,345,000	10,929,000
1893	80,977,000	351,854,450	2,143,000	3,792,000

METHOD OF BUSINESS. Stock exchanges as at present constituted are limited in membership and governed by strict rules which cover both methods of business, rates of commission to be charged, and conduct on the floor. The rules governing methods of business in New York prescribe a minimum commission of one-eighth of one per cent. on the face value of securities purchased for outside customers, one thirty-second of one per cent. for purchases made on account of fellow members, and one-fiftieth of one per cent. for purchases made on the order of another member on the floor.

In London commissions vary from 1s. per hundred to 2s. 6d. per hundred, according to the nature of the security. The Paris *agents de change* charge one-fourth of one per cent. In New York the Stock Exchange member may both transact business on the floor of the Stock Exchange and solicit business from outside customers. In London these functions are divided between the two functionaries known as 'jobber' and 'broker,' which correspond roughly to the divisions in other English professions, as, for instance, the barrister and solicitor in law. Members of the London Stock Exchange are forbidden to advertise; New York Stock Exchange houses advertise freely. *Agents de change* in Paris are forbidden to solicit outside business.

Acceptance of a bid or offer of stock makes the transaction official on a stock exchange and binds each participant to the fulfillment of his bargain. Stocks thus sold must be delivered to the buyer by 2:15 P.M. of the ensuing day. The New York Stock Exchange practices daily settlement of such accounts. In London settlements are made fortnightly, the bargain being carried for the account, that is to say, on credit, during the intervening period.

No security may be dealt in on the Stock Exchange which has not been formally 'listed' by the committee. In New York a statement of the company's condition, with a balance-sheet, is required before listing; also proof that proper facilities for transfer and registry of shares have been provided, and that with bonds the mortgage has been properly drawn and recorded. Corporations unwilling to make public statements have, however, been allowed since 1885 to obtain a place in what was called the 'unlisted department.' Since stocks in this department enjoy all the facilities of 'listed stocks,' the discrimination has been entirely futile. Listings on the New York Stock Exchange in recent years have been as shown in the preceding table, 60 to 70 per cent. being securities issued to replace others formerly listed.

	Stocks	Bonds
1902	$533,519,300	$784,032,595
1901	923,010,100	1,642,013,715
1900	443,713,000	620,935,000
1899	525,384,240	704,172,605
1898	700,064,680	528,153,996
1895	257,275,450	143,373,900

MEMBERSHIP PRICES AND RULES. With the limitation of stock exchange membership title to a seat in the exchange becomes valuable property. In New York the price of Stock Exchange seats has fluctuated with great irregularity. In 1879 their price was $9000; they rose to $20,000 in 1881, and to $37,000 in 1883, but by 1893 had declined to $15,250. From that price they gradually recovered, and in the recent great activity of business reached unprecedented figures. During the 'boom' of May, 1901, they sold for $66,000, and subsequently, in 1902, went as high as $84,000. The price at the opening of 1903 was $80,000. Ownership of a New York Stock Exchange seat does not necessarily imply the privilege of the floor; for that the owner must apply in due form to the committee on admissions. In the London Stock Exchange applicants for admission must be recommended by three members of at least four years' standing, who pledge themselves to the extent of £500 apiece to reimburse his creditors in case of his default within four years. If he is of foreign birth he must have been two years naturalized. In Paris, where the number of *agents de change* is limited to sixty, an applicant must be proposed by his predecessor or that predecessor's heirs, and must be approved by the governing committee and the Minister of Finance.

STOCK EXCHANGE SEAT AS PROPERTY. Owing to the peculiar personal nature of a member's rights and privileges, the exact legal status of a seat as a property right is not settled in all jurisdictions. By the general weight of authority, however, a seat may be considered as a species of incorporeal property held subject to such rules and regulations as may be adopted by the exchange. This gives a seat an anomalous position in the law of property because of the qualified and restricted character of an owner's rights. As it cannot be transferred except with the consent of the exchange, and to a person acceptable to the latter, it is held that it cannot be seized and sold upon an execution, but it seems settled in most jurisdictions where the question has arisen that a receiver appointed in proceedings supplementary to execution may apply to the court for an order requiring the judgment debtor to arrange for a transfer of his seat to a person acceptable to the exchange, and apply the proceeds to the satisfaction of the judgment. This may also be done by a judgment

creditor's bill in some jurisdictions. Thus, it will be seen that the courts do not assume to proceed against the seat itself, but attain the desired end through their power over the debtor. The United States Supreme Court has held that the rights of a member to his seat in an exchange pass to his assignee in bankruptcy, and the latter may take such steps as may be necessary to compel the bankrupt to procure a transfer of his seat subject to the rules of the exchange. By the rules of probably all exchanges the claims of members must be first satisfied upon the sale of a seat. A seat cannot be bequeathed or devised by will, nor is it strictly descendible, as the person to whom it might be thus given or descend might not be acceptable to the exchange; but the rules generally provide for the sale of a seat on the death of a member, an application of the proceeds to any claims the other members may have against the deceased, and a distribution of the proceeds to his personal representatives. The courts are loth to interfere with any reasonable rules and regulations of a stock exchange and with any action it may take to maintain discipline or enforce its rules, and their aid could probably only be invoked in cases of gross fraud or imposition upon a member.

DISCIPLINE. Strict discipline over the conduct of members is maintained by all the larger exchanges. The penalty is suspension from the privileges of the exchange for a given period or expulsion in the case of serious offense. On the New York Stock Exchange these penalties may be imposed for fictitious sales, for trifling bids, for acceptance of smaller commissions than those prescribed by the Exchange, and for 'obvious fraud.' More recently discipline has been exercised for dealing with a rival exchange contrary to the regulations of the member's own exchange, and for questionable business conduct outside of the exchange. In London the same penalties are made applicable on the general ground of failure to comply with the committee's decision or of dishonorable and disgraceful conduct. The rules of the Paris Bourse prescribe penalties in case the member "does not confine himself strictly to his duties" or "introduces injurious innovations."

CURB TRADING. An institution which has grown to considerable proportions in recent years has been the so-called 'curb trading,' so named because the transactions are usually conducted on the street outside the entrance to the stock exchange. In London, Paris, and New York this trading has at times reached very large proportions, though the system which it represents is radically different in the three cities. In London curb trading is utilized for the sake of dealing in foreign shares whose home market is open after the official closing of the London Exchange. For example, trading in American securities is conducted in Shorter's Court, behind the London Stock Exchange, frequently until 6 P.M. or later, the New York Stock Exchange, on account of the five hours' difference in time, being actively at work at that hour. In Paris the curb market, under its French title of the 'Coulisse,' has had a longer history. It has represented virtually a rival exchange, not subject to the numerous and rather vexatious limitations of the older Bourse. The Coulisse has frequently been suppressed by law, but has invariably revived, and has probably conducted a larger total business than the Bourse itself, except, perhaps, in Government securities. At present the Coulisse conducts its operations on the portico of the Bourse and is a recognized institution. In New York curb trading devotes itself exclusively to securities which have not been admitted to the list of the Stock Exchange. In this category are comprised many very important enterprises, including shares of the Standard Oil Company and of the various banks. The curb also provides a market for newly organized enterprises which have not reached a stage where they can apply for a place on the Stock Exchange list, and it gives an opportunity for fixing values of a forthcoming security before the share or bond certificates are formally issued. In the conversions of the United States Steel Corporation stock, for instance, the shares and bonds were bought and sold 'when, as, and if issued' on the curb, and on these terms their values fluctuated in some cases 14 or 15 points before the security itself ever legally existed. There is no restriction of the right to deal in the 'curb' market, but in practice its privileges are limited to regular and responsible parties, whose position or credit is known to the other party to a bargain.

STOCK EXCHANGE CLEARING HOUSE. In recent years the system of 'clearing' stock exchange transactions, on the plan of the bank clearing house, has been generally adopted by stock exchanges. As introduced on the New York Exchange in 1892, the system provides for the offsetting of securities which a broker has contracted to deliver by an equivalent amount of the same securities which he may have contracted to receive. Thus, if broker A has sold 1000 New York Central shares to B and bought 1000 of the same shares from C, the two transactions are settled by the delivery of 1000 shares by C to B. The price may be different in the two transactions, but such differences are adjusted by the clearing house, to which the broker is 'debtor' or 'creditor' on his daily sheet. The same principle is followed even where the amounts bought and sold do not agree. Thus A, in the above case, may have sold only 500 shares to B and bought 1000 from C. In that case C delivers 500 shares to A and 500 to B, and payment is made accordingly. The economy consists in the lessening of the number of individual checks which must be drawn for settlement, and against which bank balances must be maintained. Supposing the price of New York Central, in the transactions last described, to have been 100, the old plan of individual deliveries would have necessitated drawing of checks, for settlement, in the total amount of $150.000. The clearing-house plan requires only $100,000. The aggregate saving in checks drawn, during an ordinary year, has exceeded $500,000,000.

The plan was adopted by the Frankfort Stock Exchange in 1867, at Berlin in 1869, at Hamburg in 1870, at Vienna in 1873, at London in 1876, and by various American stock exchanges between 1880 and 1887.

STOCK EXCHANGE TERMS. The stock exchange has a dialect or slang of its own, many of the terms in which had their origin at the time of the South Sea speculation in 1720. A 'bull' is a buyer of stocks which he hopes to sell at higher prices. He may buy altogether with his own capital; but if he is merely a stock exchange

speculator, he borrows most of the requisite funds, depositing the purchased stock as security. He can usually borrow 80 per cent. of the cost value of his shares the difference, 20 per cent., being his 'margin.' If the price falls, the lender calls on him to 'make good his margin.' If he fails to do so, and the margin continues 'impaired,' he is 'closed out' by the sale of his collateral. A 'boom' is a successful upward movement of prices; this term is of American origin. The opposite of a 'boom,' in stock exchange phraseology, is a 'slump.' The 'bear' is a seller of stocks which he hopes to obtain, later on, at lower prices. He may be selling his own holdings and delivering them to the purchaser. But if a speculator, he may borrow stocks as the 'bull' borrows money. Generally he obtains the stocks by lending their equivalent in money to the owner. He is said to be 'short' of stocks, where the bull is 'long.' The bull 'realizes' when he sells to take his profits; similarly, the bear 'covers' when he buys on the market the stock in which he has been speculating, and returns the shares which he has borrowed. Stocks are said to be 'carried' when they are accepted as security from a bull speculator. A 'manipulated' market is one in which speculators have caused an artificial appearance of real buying or selling. A 'rigged' market is much the same thing, though in a more intensified form. 'Puts' are contracts sold at a fixed percentage by capitalists to bull speculators, whereby the capitalist undertakes to pay a set price for a given number of shares within a stipulated time. This insures the speculator against more than a certain amount of loss if he buys stocks. 'Calls' are contracts similarly sold by capitalists, who agree within a given time, and at a set price, to deliver the shares agreed upon to the speculator. This is a guarantee against losses on a falling market. Both sorts of contracts are classified as 'privileges.' 'Wash sales' are transactions in which buyer and seller are employed by the same person, with a view to creating a semblance of activity. They are prohibited under severe penalties by the stock exchanges, but are rarely detected and are very frequently utilized.

STOCKHOLDER. In the strict sense of the term, a person who owns one or more shares of stock in a corporation, and who has been recognized by the latter as having the rights commonly incidental to such ownership. Entry of a person's name on the books of a corporation as the owner of stock is the best evidence of his standing as a stockholder, and as long as his name remains there he may generally exercise all a stockholder's privileges. However, a person to whom shares of stock have been transferred, but whose name has not yet been entered on the books, is sometimes treated as if he were a stockholder and spoken of as such. A corporation is protected in paying dividends to a person whose name remains on its books as a stockholder, even if he has transferred his shares of stock, provided the purchaser has not given notice of that fact. A stockholder of record has the right to vote in certain meetings, the most important of which, perhaps, is one for the election of officers. Each stockholder may vote the number of shares he owns, and thus one person owning the majority of the stock of a corporation may control its elections and policy against the wishes of a great number of holders of a small number of shares aggregating less than the majority. Among the rights of a stockholder are: the right to protest and invoke the aid of the courts against a misuse of the funds of the corporation, or against fraud by the majority stockholders or the officers; to object to a change in the kind of business which the charter authorizes it to carry on; the right to inspect all or any of the books of the corporation at reasonable times and places; and to receive dividends out of the earnings, when a surplus has accumulated, which is not needed for running the business, or for improvements. In many States a stockholder is only liable for the debts of the corporation to the amount of his stock, that is, he only loses what he has paid in, assuming he has paid in the par value of his stock, in case of insolvency of the corporation. If a subscriber to the stock of a corporation has not paid in the full par value of the amount of stock subscribed for by him, creditors of the corporation may hold him for the balance remaining unpaid. A stockholder is not strictly a creditor of the corporation to the amount of his stock, as he is deferred to corporate creditors on a final distribution of assets; but he may become a creditor by a loan of money or sale of goods, and thus stand on an equal footing with the others as to such claims, in most jurisdictions. See CORPORATION; STOCK; and consult authorities there referred to.

STOCKHOLM, stŏk'hōlm. The capital of Sweden, situated at the outlet of the Mälar Lake into the Baltic Sea, in latitude 59° 20′ N., longitude 18° 3′ E. (Map: Sweden, H 7). The situation is extremely picturesque, the city being built partly on a number of islands, partly on peninsulas cut off from the mainland by deep fiords, while the waterways both toward the Mälar and toward the sea lead through labyrinths of fiords and islands. Stockholm has been called the 'Venice of the North,' but its aspect is entirely different from that of Venice. Both the islands and the mainland are rocky and hilly, with granite knolls exposed on all sides, while a primæval forest penetrates almost to the heart of the city. The old nucleus, known as Staden (The City), is built on an island lying across the mouth of the Mälar channel, and connected by bridges with the northern and southern shores and with the little Riddarholm (knight's island) on the west. It has narrow streets falling steeply on all sides from the central Stortorget. Skeppholmen, to the east of Staden, is almost wholly occupied by military and naval depots. The remaining parts of the city, Södermalm on the south shore, Norrmalm and Oestermalm on the north shore, and Kungsholmen in the northwest, are for the most part regularly laid out with broad and straight streets. Here are also a number of handsome squares, parks, and promenades, such as the Gustaf Adolfs Torg, with an equestrian statue of Gustavus Adolphus, the Kungsträdsgård on the water front with a handsome fountain, and the Humlegård, a large and beautiful pleasure garden, containing a colossal bronze statue of Linnæus. From Oestermalm a bridge leads to the easternmost part of the city—an island about two miles long and three-fourths of a mile wide, known as Djurgården from its having formerly been a deer park. It is now laid out as a city park.

The principal churches are the Storkyrka (great church), founded in the thirteenth cen-

tury, rebuilt in the eighteenth and restored in 1892; the Riddarholms Kyrka, a Gothic structure with a perforated iron spire 290 feet high, and the burial place of Swedish kings; the Tyska Kyrka (German Church), a German Renaissance building of the seventeenth century; and the conspicuous Katarina Kyrka crowning the heights of Södermalm. The royal palace, on the northeastern corner of the Stadsholm, was begun in 1697 in the Italian Renaissance style, and is a large and beautiful rectangular building with four wings inclosing a quadrangle. At the western end of the island stands the Riddarhus (knight's house), containing portraits and armorial bearings of Swedish nobles. Noteworthy also are the new opera house, finished in 1898; the handsome Renaissance building of the National Museum, built in 1850-66, opposite the royal palace on the Blasieholm; and the large and imposing new building of the Northern Museum, begun in 1898, in the Djurgård.

Although Stockholm has no university, it has numerous establishments for higher technical and popular education and an excellent elementary school system. The Royal Library had in 1899 381,900 volumes and 11,000 manuscripts. There are the National Museum, containing fine art collections and a collection of Swedish antiquities; the Northern Museum (Nordiska Museet) for Scandinavian ethnology and archæology; a museum of natural history; a biological museum showing groups of Scandinavian mammals in their natural surroundings; an astronomical observatory; and numerous scientific and literary associations, the principal of which are the Swedish Academy, the Academy of Sciences, and the Academy of Fine Arts, History, and Archæology.

Stockholm is the largest industrial centre of Sweden next to Göteborg. There are iron foundries and machine shops, breweries, sugar and cotton mills, and tobacco factories, and manufactures of furniture, soap, food products, and miscellaneous articles, while shipbuilding is also carried on. The city ranks first among Swedish ports in the value of imports, and third in exports; the imports in 1897 amounted to $3,307,520, and the exports to $866,680. The chief exports are iron and timber. In 1900 the shipping at the port amounted to 2255 entries and clearings with a total of 964,367 tons, but in the number and tonnage of its home vessels the city is exceeded by Göteborg. The approaches to the harbor are intricate and rendered somewhat dangerous by rocky reefs, but the harbor itself is good and provided with dry docks and extensive wharfage accessible for large ships. Up to 1895 the harbor was closed by ice about twenty-five days in the year, but recently a new ice-breaker has been put into service to keep it open. The city is, in general, very progressive in the matter of public works. The population increased slowly during the first half of the nineteenth century, having been 75,000 in 1780 and 93,000 in 1850. In 1890 it was 246,454, and in 1901 303,356.

Stockholm was founded in 1255 by Birger Jarl, and was for centuries confined to the Stadsholm and Riddarholm, which were fortified. It was several times besieged and taken by Danish armies, and its wooden buildings were often destroyed by fire until they were supplanted by stone structures. In 1520 the city was the scene of the 'Stockholm Blood Bath,' when the Danish King Christian II., in order to strengthen his position in Sweden, had a large number of Swedish nobles decapitated on the Stortorg. Consult Wattenbach, *Stockholm, ein Blick auf Schwedens Hauptstadt* (Berlin, 1875).

STOCKING FRAME. See KNITTING.

STOCKINGS. See HOSIERY.

STOCK'PORT. A manufacturing town in Cheshire, England, on the Mersey, at the junction of its main feeders, 6½ miles southeast of Manchester (Map: England, D 3). Its prosperity is of modern date. The streets lie on the slopes of a narrow gorge, and are irregular and occasionally precipitous; to the south they rise in terraces above the river. The principal buildings are the court-house, market hall, mechanics' institute, infirmary, and the institution for the blind, deaf, and dumb. The free grammar school was founded and endowed in 1487. The town possesses seven fine parks, the chief of which is Vernon Park, which contains a museum. Stockport owns an electric lighting plant, street railways, sewage works, gas, water supply, and markets. It has extensive manufactures of cottons, woolens, silks, machinery, brass and iron goods, shuttles, and brushes. Population, in 1881, 59,544; in 1891, 70,263; in 1901, 78,871.

STOCKS. An apparatus of wood, much used in former times for the punishment of petty offenders. The culprit was placed on a bench, with his ankles fastened in holes under a movable board, and allowed to remain there for an hour or two. The period of the first introduction of the stocks in England is uncertain, but in the second statute of laborers, 25 Edward III. (1350), provision is made for applying the stocks to unruly artificers. Combined with the stocks was often a whipping-post for the flagellation of vagrants. The use of stocks was general in the English colonies of North America and was employed frequently for the punishment of common scolds.

STOCK'TON. The county-seat of San Joaquin County, Cal., 78 miles east by north of San Francisco; on an arm of the San Joaquin River, at the head of navigation, and on the Atchison, Topeka and Santa Fe and the Southern Pacific railroads (Map: California, C 3). It is in a region noted for its great natural beauty and equable climate and is very attractive. The State Hospital for the Insane is here, and there are also a public library with over 36,500 volumes, the San Joaquin County Law Library, Saint Mary's College, and Saint Agnes Academy. The county court-house, constructed at a cost of $300,000, the high school ($150,000), the post-office, county jail, opera house, Masonic Temple, Saint Joseph's Home, and the County and the Pacific hospitals, are also noteworthy features. In addition to possessing large grain, live stock, and fruit interests, Stockton has considerable industrial importance. Agricultural machinery and implements, flour, foundry products, window glass, lumber, leather, beer, fuel briquettes, canned goods, and woolens constitute the leading manufactures. The government, under the charter of 1889, is vested in a mayor, chosen biennially, and a unicameral council. Stockton was founded in 1849 by Charles M. Weber, the owner of a large Mexican grant, and was named in honor of Robert

Field Stockton, of the United States Navy, who took possession of California for the United States. In its early days it was the starting and outfitting point for miners bound for Calaveras, Tuolumne, and Mariposa counties. Population, in 1890, 14,424; in 1900, 17,506.

STOCKTON, Francis Richard (1834-1902). A popular American writer of humorous tales, born in Philadelphia. In early life he was a wood-engraver and designer; in which capacity he contributed pictures to periodicals. Meanwhile he busied himself also with literary and journalistic work. He was first employed on the Philadelphia *Morning Post*, and in 1872 gave up designing definitively to join the New York *Hearth and Home*. Soon he joined the staff of the *Century Magazine* (then *Scribner's Monthly*) and in 1873 was made assistant editor of the newly founded magazine for children, the *Saint Nicholas*, remaining here till about 1880. He was a prolific writer. His books for children include: *Ting-a-Ling Stories* (1870); *Roundabout Rambles* (1872); *What Might Have Been Expected* (1874); *Tales Out of School* (1875); *A Jolly Fellowship* (1880); *The Floating Prince* (1881); *The Story of Viteau* (1884); and *Personally Conducted* (1889). Even more numerous are his longer works; they are well known for the agreeable impossibility of the situations they narrate. The chief are: *Rudder Grange* (1879), which brought him into prominence; *The Lady or the Tiger?* (1884), perhaps his most popular story; *The Late Mrs. Null* (1886); *The Christmas Wreck* (1886); *The Casting Away of Mrs. Lecks and Mrs. Aleshine* (1886); *The Bee-Man of Orn* (1887); *The Hundredth Man* (1887); *The Dusantes* (1888); *Amos Kilbright* (1888); *The Great War Syndicate* (1889); *The Stories of Three Burglars* (1889); *The Merry Chanter* (1890); *Ardis Claverden* (1890); *The House of Martha* (1891); *The Squirrel Inn* (1891); *The Clocks of Rondaine* (1892); *The Watchmaker's Wife* (1893); *The Adventures of Captain Horn* (1895); *The Great Stone of Sardis* (1897); *The Girl at Cobhurst* (1898); *Afloat and Ashore* (1900); and *The Captain's Toll-Gate*, with memoir by his wife (1903). In the character of his humor Stockton stands alone. His situations are whimsical and his characters grotesque; usually, however, the eccentricity is not merely superficial, and the story, quietly rather than boisterously amusing, and told with apparent sincerity, produces an illusion that pleasingly conceals its absurd premises and its logical though equally absurd conclusions.

STOCKTON, Richard (1730-81). An American lawyer, and a signer of the Declaration of Independence. He was born near Princeton, N. J., graduated at the College of New Jersey (Princeton) in 1748, was admitted to the bar in 1754, visited England in 1766-67, where he made the acquaintance of many distinguished men, and in 1774 became a judge of New Jersey's Supreme Court. He at first advocated a reconciliation between the colonies and England, and in December, 1774, wrote to Lord Dartmouth, proposing a scheme of colonial self-government; but he soon began to take an active part in the opposition to the British Ministry and as a member of Congress in 1776 voted for and signed the Declaration of Independence. In September, 1776, he was sent by Congress, with George Clymer of Pennsylvania, to inspect the northern army.

STOCKTON, Robert Field (1795-1866). An American naval officer, grandson of Richard Stockton (q.v.). He was born at Princeton, N. J., studied for a time at Princeton, and in 1811 became a midshipman in the United States Navy. He joined Commodore Rodgers on the frigate *President* in 1812, was for a time an aide to the Secretary of the Navy, took part in the defense of Baltimore, and was promoted to be lieutenant in September, 1814. In 1815 he distinguished himself in the Algerine War on board the *Spitfire*. He returned to the United States in command of the *Erie* in 1821, and in the fall of the same year sailed in the *Alligator* for the African coast, where he negotiated successfully for the land upon which the American Colonization Society founded Liberia (q.v.). During the early part of the Mexican War he commanded the Pacific Squadron. To his energy, and that of General Frémont, with whom he cooperated, was largely due the success of the American operations on the coast. He captured Los Angeles and San Diego, fought several battles, organized a civil government for California, and installed Frémont as Governor, relinquishing the command to Shubrick in 1847. He resigned from the navy in 1850, and was a United States Senator from New Jersey in 1851-53. Having resigned in 1853, he was for some time president of the Delaware and Raritan Canal Company. Consult *Life and Speeches of Robert Field Stockton* (1856).

STOCKTON-ON-TEES. A seaport in the County of Durham, England, 11 miles east-northeast of Darlington, on the left bank of the Tees (Map: England, E 2). The broad and handsome High Street is nearly a mile in length. A new town known as South Stockton has sprung up on the right bank of the river, the two being connected by an iron bridge of three arches, built in 1887. Shipbuilding, chiefly in iron, is carried on; and blast furnaces, foundries, engine works, extensive potteries, and iron works are in operation. Sailcloth, ropes, and linen are manufactured; and there are corn mills and spinning mills. At Stockton the Tees is navigable for vessels of large tonnage. The moated Norman castle, long an episcopal residence, was taken for the Parliament in 1644, and totally destroyed by the Roundheads in 1652. At the Restoration it had become so poor a place that it contained only 120 houses. Its growth and prosperity date from the development of the iron and steel industry. The Stockton and Darlington Railway, the first to commence the conveyance of passengers and goods, was opened September 27, 1825. Population, in 1891, 49,700; in 1901, 51,500.

STODDARD, Charles Augustus (1833—). An American Presbyterian clergyman, born in Boston, Mass. He was educated at Williams College, at the University of Edinburgh, at the Seminary of the True Church of Scotland, and at the Union Theological Seminary, where he graduated in 1859. He was pastor of the Washington Heights Presbyterian Church, New York City, until 1893. In 1869 he became connected with the New York *Observer*, and in 1885 succeeded Samuel I. Prime as editor. His publications include: *Across Russia from the Baltic to the Danube* (1891); *Spanish Cities, with*

Glimpses of Gibraltar and Tangier (1892); and other books of travel.

STODDARD, CHARLES WARREN (1843—). An American traveler and author, born at Rochester, N. Y. As a youth he was in business in San Francisco, Cal., and in 1864 visited the Hawaiian Islands, where he subsequently lived for long periods. He traveled much about the world from 1873 to 1878 as correspondent of the San Francisco *Chronicle*. In 1885 and 1886 he was professor of English at Notre Dame College, Ind., then spent some time in travel, and became lecturer on English literature in the Catholic University at Washington, D. C. His books were chiefly poetry and sketches of travel, and include: *Poems* (1867); *South Sea Idyls* (1873); *Summer Cruising in the South Sea* (1874); *Mashallah! A Flight into Egypt* (1880); *The Lepers of Molokai* (1885); *A Troubled Heart, and How It Was Comforted at Last* (1885); *Hawaiian Life; or, Lazy Letters from Low Latitudes* (1894); *The Wonder Worker of Padua* (1896); *A Cruise Under the Crescent* (1898); *Over the Rocky Mountains to Alaska* (1899); *In the Footprints of the Padres* (1902); *Exits and Entrances* (1903).

STODDARD, RICHARD HENRY (1825-1903). An American poet, critic, and journalist, born at Hingham, Mass. He was educated in the public schools of New York City, worked in an iron foundry, gained attention in 1849 by a privately printed volume of verse, *Footprints*, obtained a place in the Custom House (1853-70), and was confidential clerk to George B. McClellan (1870-73), pursuing meantime literature as an avocation as literary reviewer, especially for the *World*, the *Mail*, and the *Mail and Express*. Noteworthy among his numerous publications are: the juvenile *Adventures in Fairyland* (1853); verses collected in *Songs of Summer* (1857); *The King's Bell*, a poem (1862); *The Story of Little Red Riding Hood*, verse (1864); *The Children in the Wood*, verse (1865); *Abraham Lincoln*, a commemoration ode (1865); *Putnam the Brave* (1869); *The Book of the East*, verse (1867); *The Lion's Cub and Other Poems* (1890); and *Under the Evening Lamp* (1892). A collected edition of his verses was issued in 1880. Stoddard also edited several noteworthy anthologies, among them *Melodies and Madrigals* (1865); *Poets and Poetry of America* (1872); *Female Poets of America* (1874). For many years he was an important figure in the literary life of New York.—His wife, ELIZABETH (BARSTOW) (1823-1902), collaborated with him in editorial work and wrote three novels, *The Morgesons* (1862), *Two Men* (1865), and *Temple House* (1867). Her *Poems* were collected in 1895. Consult Stoddard's *Recollections Personal and Literary*, ed. by R. Hitchcock (New York, 1903).

STODDARD, WILLIAM OSBORN (1835—). An American author and journalist, born at Homer, N. Y., and educated at the University of Rochester, where he graduated in 1857. After three years of farming and newspaper work in Illinois, where he edited the Chicago *Daily Ledger* and the *Central Illinois Gazette*, and three months' service as a volunteer at the outbreak of the Civil War, he acted from 1861 to 1864 as private secretary to President Lincoln and then engaged in literary work. His publications include: *The Heart of It* (1880); *Life of Abraham Lincoln* (1884); *Lives of the Presidents* (10 vols., 1888-89); *Table Talk of Lincoln* (1892); *Quirt Ten Eyck* (1893); *The Swordmaker's Inn* (1896); *With the Black Prince* (1898); *Lincoln at Work* (1899); and *Jack Morgan* (1901).

STOD'DART, JAMES HENRY (1827—). An American actor, born in Yorkshire, England. He was the son of an actor and during his youth in Glasgow he often took juvenile parts with his father. At seventeen he began an independent career, winning at length in Liverpool considerable success as a comedian. He came to the United States in 1854 and became a member of Wallack's company. Afterwards for a time he played with Laura Keene; then with Dion Boucicault; and subsequently for twenty years was under the management of A. M. Palmer. Even in comparative youth, Stoddart was best known in 'old man' parts. Among his most popular characters were Mr. Moneypenny in *The Long Strike*, Colonel Preston in *Alabama*, the curate in *Saints and Sinners*, and, later, Lachlan Campbell in *The Bonnie Brier Bush* (1901). Consult: Stoddart's own *Recollections of a Player* (New York, 1902); McKay and Wingate, *Famous American Actors of To-day* (New York, 1896).

STOD'DERT, BENJAMIN (1751-1813). An American soldier and Cabinet officer. He was born in Charles County, Md., joined the Continental Army in 1776, became a captain in January, 1777, and was severely wounded at Brandywine in September, resigning his command in April, 1779. He then served as secretary of the Board of War until 1781, and from 1798 to 1801 was Secretary of the Navy, being the first to discharge the duties of this office, though George Cabot (q.v.), who resigned within a few weeks, was the first to be appointed. His services in connection with the organization of the department were very valuable.

STOHMANN, stō'mân, FRIEDRICH KARL ADOLF (1832—). A German agricultural chemist, born in Bremen, and educated at Göttingen and London. He was Graham's assistant at University College from 1853 to 1855, and afterwards assisted Henneberg at Celle. In 1862 he started the station for agricultural experiments at Brunswick. He was called to Halle in 1865 and to Leipzig in 1871, where he was director of the agricultural physiological institute of the university. His principal investigations had to do with the nourishment of animals. He wrote: *Beiträge zur Begründung einer rationellen Fütterung der Wiederkäuer* (1860); *Biologische Studien* (1873); *Handbuch der technischen Chemie* (1872 and 1874); *Handbuch der Zuckerfabrikation* (1878); and *Die Stärkefabrikation* (1878).

STOICS (Lat. *stoicus*, from Gk. *στωϊκός, stōïkos, στοϊκός, stoikos*, relating to a colonnade, stoic, from *στόα, stoa*, colonnade). The name of the school of ancient moralists opposed to the Epicureans in their views of human life. The stoical system dates from the end of the fourth century B.C.; it was derived from the system of the Cynics, whose founder, Antisthenes, was a disciple of Socrates. Indeed, the doctrines, but still more the manner of life, and most of all the death of Socrates, were the chief foundations of the stoical philosophy.

The founder of the system was Zeno (q.v.),

from Citium in Cyprus, who opened his school in a portico called the Stoa Pœcile ('painted porch') at Athens, whence the origin of the name of the sect. Zeno had for his disciple Cleanthes, from Assus, in the Troad (died c. 220 B.C.), whose Hymn to Zeus is the only fragment of any length that has come down to us from the early Stoics, and is a remarkable production, setting forth the unity of God, His omnipotence, and His moral government. Chrysippus, from Soli in Cilicia (c. 280-207 B.C.), followed Cleanthes, and, in his voluminous writings, both defended and modified the Stoical creed. He was regarded as a second founder of the school, and it was a saying in antiquity that without Chrysippus there had been no Stoa. Chrysippus was succeeded by Zeno of Tarsus and Diogenes of Babylon; then followed Antipater of Tarsus, who taught Panætius of Rhodes (died B.C. 112). Panætius introduced Stoicism to Rome, and also made such modification in the system that it is customary to regard Stoicism as entering with him upon a second period, characterized by a "nearer approach to the Peripatetic and Platonic teaching" (Windelband). Among the most prominent Stoics of this period are to be mentioned Boëthius of Sidon and Posidonius of Apamea in Syria. The third period of Stoicism is the Roman period, represented by L. Annæus Cornutus, L. Annæus Seneca, Epictetus, and the Emperor Marcus Aurelius Antoninus.

Stoicism was mainly an ethical theory, but it had a logic and a physics as well. Under logic it included both dialectic and rhetoric. Dialectic was predominantly a theory of knowledge. The main question here was: How can we test truth? In answer to this question the Stoics worked out a sensationalistic epistemology. The soul is originally like a blank wax tablet. Things cause alterations or impressions on the soul, and those alterations or ideas which refer to particular things compel assent. These impressions are kept in memory, and, partly without and partly with conscious intention, concepts arise. These are entirely subjective; thus in ancient times we find the germ of nominalism (q.v.). The highest value is attached to the involuntarily formed concepts, for these compel assent from all men (*consensus gentium*). Physics included, for the Stoics, cosmology, psychology, and theology. All reality is corporeal, but falls into two classes, the active and the passive, which, however, are inseparable. The active principle is sometimes represented as fire, sometimes as spirit. The spirit-fire is God, and is self-conscious. Out of it is developed air, water, earth, the whole universe of separate beings, and all nature is rational. Every individual soul is a part of the universal world-soul for a time individualized, but ultimately to be absorbed into the world-soul again, at the time when all the differentiation of the universe is consumed in all-devouring fire. This process takes place by Fate, i.e. in accordance with irreversible laws, but is also purposeful, i.e. mechanism is conceived of as compatible with teleology. When one cycle of differentiation and absorption is complete, another begins.

The Stoic ethics was the ethics of apathy. The soul or the divine principle in man should not allow itself to be carried away by the passions aroused in it by external things. A man must be self-controlled. The passions are due to false judgments and mental disturbances, hence they can be overcome by wisdom and by a refusal to assent to their dictation. A man is not, indeed, master of his fate, but he can keep his self-control and proud self-complacency through all the vicissitudes of life. The Stoic formula was a life in accordance with nature. As we have seen that for Stocism nature is all rational, to live in accordance with nature was to live in accordance with reason. Such a life is happy. Pleasure is an accessory, not an end, of a reasonable life. The Stoics took a very rigorous view of virtue, which they claimed admitted of no degree. One may be virtuous, but if he is not thoroughly so he is not so at all. There may be approximation to virtue, short of virtue, but such approximation is not virtue. Only very few men are virtuous; the vast majority are fools. The four cardinal virtues of the Stoic system are insight, courage, temperance, and justice, a classification which in essence does not depart from the Platonic. One very distinctive feature of Stoicism was its cosmopolitanism. Because all men are manifestations of the one universal Spirit, they should live in brotherly love and readiness to help each other. Differences of rank and wealth are external, and should not interfere with social relations. Thus, long before Christianity taught that there is neither Greek nor Jew, nor male nor female, nor bond nor free, Stoicism had recognized and lived up to the brotherhood of man.

Consult: Capes, *Stoicism* (London, 1880); Zeller, *Die Philosophie der Griechen* (3d ed., Leipzig, 1880; Eng. trans. by Reichel, London, 1880).

STOKES, stōks, George Thomas (1843-98). An Irish divine and author, born in Athlone, Westmeath, Ireland. He was educated at Queen's College, Galway, and Trinity College, Dublin, and, after acting as curate in Killaloe and Newry, he became, in 1869, vicar of All Saints, Blackrock, which position he retained until his death. In 1883 he was called to the chair of ecclesiastical history in Dublin University, and in 1893 he became canon of Saint Patrick's in Dublin. Among his publications are: *Ireland and the Celtic Church* (1886); *Sketch of Mediæval History* (1887); *Ireland and the Anglo-Norman Church* (1889); *Bishop Pocock's Tour Around Ireland in 1752* (1891); *The Acts of the Apostles* (1891); and *Greek in Gaul and Western Europe Down to A.D. 700* (1892).

STOKES, Sir George Gabriel (1819-1903). An English mathematician and physicist, born in Skreen, County Sligo, Ireland. He was educated at Cambridge, and became fellow of Pembroke College in 1841, and was elected in 1849 to fill the Lucasian chair of mathematics in Cambridge. In 1885 he was appointed president of the Royal Society. Stokes was the first to explain in his lectures the scientific principles on which spectrum analysis depends, while to him is due also the first thorough study and explanation of the phenomena of fluorescence, in his paper *On the Change of the Refrangibility of Light* (*Philosophical Transactions* for 1852-53), for which he received the Rumford Medal. He greatly extended and improved the application of mathematics to physico-mathematical treatment of questions connected with the distortion of elastic solids, the motion of waves in water, the undulatory theory of light, the summation

of series, the internal friction of fluids, and other subjects in hydrodynamics, etc. He also discussed the variation of gravity over the surface of the earth and wrote an important paper on the nature of Röntgen rays. For his work in optics Stokes stood preëminent among the scientists of the nineteenth century, and he did much to mold current thought and theory in this field. He published the *Burnet Lectures on Light* (1892); *Mathematical and Physical Papers* (3 vols., 1880-1902); and *Gifford Lectures on Natural Theology* (1891-93). He was made a baronet in 1889.

STOKES, HENRY NEWLIN (1859—). An American chemist. He was born in Moorestown, N. J., and was educated at Haverford College and Johns Hopkins University, after which he studied chemistry in Munich and in Zurich. In 1889 he became an assistant chemist in the United States Geological Survey, which office he relinquished in 1892 to accept the place of assistant professor in the University of Chicago, where he remained until 1893, when he returned to the service of the Geological Survey. He accepted an appointment with the Bureau of Standards in 1903. His researches include studies in organic chemistry, especially on phosphimic and metaphosphimic acids.

STOKES, WHITLEY (1830—). A distinguished Celtic scholar and authority on Anglo-Indian law, born in Dublin, Ireland. He was educated at Trinity College, and became a barrister of the Inner Temple in 1855. In 1862 he went to India, where he occupied various legal positions under the Government. He drafted the present *Code of Civil Procedure* and did other important legal work, but became best known, and is likely to be longest remembered, for his contributions to Celtic scholarship, a branch of research which he took up before he went to India, and continued during his governmental service there. The greater part of his work deals with early Irish, but his studies included the other Celtic languages, investigations of Cornish and British monuments, and contributions to Celtic grammar. It has been said that his researches have done more than those of any other scholar to make accessible the literary and historical monuments of the ancient Irish language. His writings are intended mainly for scholars, but his texts usually are accompanied by translations, and some of these possess high literary worth. Conspicuously good are his renderings of the "Death of the Sons of Usnach" (*Irish Texte*, vol. ii.), and of the "Briden Da Derga" (*Revue celtique*, vol. xxii.). His principal publications are: *Irish Glosses* (1860); *Three Irish Glossaries* (1862); *The Play of the Sacrament* (1862); *The Passion, a Middle-Cornish Poem* (1862); *The Creation of the World: A Cornish Mystery* (1863); *Three Middle-Irish Homilies* (1871); *Goidelica* (2d ed. 1872); *Beunans Meriasek* (1872); *Middle-Breton Hours* (1876); *The Calendar of Œngus* (1880); *The Tripartite Life of Saint Patrick* (1887); *The Old Irish Glosses at Würzburg and Carlsruhe* (1887); *Lives of Saints from the Book of Sismore* (1889); *Urkeltischer Sprachschatz* (1894); *The Martyrology of Gorman* (1895).

STOKE-UPON-TRENT. A manufacturing town in Staffordshire, England, 15 miles north of Stafford (Map: England, D 4). The principal public buildings are the town hall, New Market hall, and Minton Memorial building. There are statues to Wedgewood, Minton, and Colin Minton Campbell. The town is the centre of the 'Potteries' district, and owes its importance to porcelain and earthenware manufactures, carried on in about 200 factories. It has manufactures of iron, engines, machinery, and bricks, and in the vicinity are numerous coal mines. The town, incorporated in 1874, is of modern growth. Population, in 1891, 24,000; in 1901, 30,450. Consult Ward, *Stoke-upon-Trent* (London, 1843).

STOLBERG, stōl'bĕrk, CHRISTIAN, Count (1748-1821). A German poet, born at Hamburg, of an ancient family, originally from Thuringia. Christian studied at Göttingen (1769-74), where he and his brother joined the literary Hainbund, was twenty-three years in the public service, and lived from 1800 till death near Eckernförde, Schleswig. He translated Sophocles (1787), and wrote several volumes of poems (*Gedichte*, 1779, 1782, 1787, 1810) noteworthy for their pictures of family life.

STOLBERG, FRIEDRICH LEOPOLD, Count (1750-1819). A German poet and translator, brother of Christian. He was born at Bramstedt, Schleswig, studied at Halle and Göttingen, and from 1777 to 1780 was Ambassador of the Prince-Bishop of Lübeck at Copenhagen. He became Ambassador of the Danish Court at Berlin in 1789, and filled other official positions until in 1800, with his whole family, he became a convert to Roman Catholicism, an event which caused much excitement throughout Protestant Germany. During his later years he lived in comparative retirement, devoted mainly to literary work of the most varied kind, ranging from verse of great facility and boldness of imagery, through translations of Greek authors, prose romance, and travels, to a fifteen-volume history of Christianity from his later standpoint (1807-18). He died at Sondermühlen, near Osnabrück. Consult biographical studies by Menge (Gotha, 1862), Hennes (Frankfort, 1876; Mainz, 1875), and Janssen (Freiburg, 1900).

STOLE (Lat. *stola*, from Gk. *στολή*, *stolē*, long robe, from *στέλλειν*, *stellein*, to array, despatch). A narrow band of silk worn over the shoulders by the clergy of the Roman Catholic and Anglican communions, corresponding to a vestment known as *orarion* in the Eastern churches. See COSTUME, ECCLESIASTICAL.

STOLEN GOODS. In law, chattels which have been the subject of larceny and have not been restored to the possession of their owner. Inasmuch as the larceny does not divest the owner of his property in the stolen goods, a buyer cannot acquire title to them even if the purchase be made in good faith. In England, however, this rule does not apply if stolen goods were bought in market overt (q.v.), and the owner had not prosecuted the thief, in which case the *bona fide* purchaser acquires valid title. In the United States there are no markets overt, and any person buying stolen goods acquires no better title to them than the thief has. That is, the owner has a right to take them wherever he may find them. This rule is subject to the qualification that current money and negotiable papers payable to bearer or indorsed in blank may pass to and become the absolute property of

a *bona fide* purchaser even if they have been stolen from their lawful owner. See NEGOTIABLE PAPER.

To constitute the crime of receiving stolen goods, the goods must have been stolen and not acquired by embezzlement or false pretenses. The receiver must either know that they have been stolen or have reasonable grounds for believing that they have been unlawfully taken from their owner. The crime becomes complete when the receiver takes them into his possession or they are taken for him with his knowledge by a servant or agents. If the goods after being stolen come back into the possession of the owner or are delivered to the receiver by the owner's authority, they cease to be stolen goods, and the crime of receiving cannot be committed with reference to them.

In England it early became the law that if goods were stolen in one county and carried into another by the thief, he was deemed to have committed larceny in both counties, and could be indicted and placed on trial in either. As the offense, wherever committed, was an offense against the same sovereignty, this rule as to larceny amounted simply to a convenient method of determining the place of trial. The English courts refused to apply the rule where goods were stolen in a foreign country and brought to England. Courts in many of the United States have somewhat illogically applied this rule to the several States, holding that if goods are stolen in a sister State and then brought within the State larceny is committed in both States, notwithstanding the fact that the original offense was committed against an independent sovereignty so far as the administration of the criminal law is concerned, and that the having in possession of stolen goods is a very different offense from the larceny of the goods. A few States, as Ohio, have refused to follow this rule, and one, Vermont, has applied the rule to goods stolen in other States and brought within the State, but has declined to follow it in case of goods stolen in foreign countries. (See LARCENY.) The crime of receiving stolen goods is now generally defined by statute and the punishment imposed varies in the different States. In most States the offense is deemed a felony. See CRIME; JURISDICTION.

STOLP, stölp. A town in the Province of Pomerania, Prussia, on the Stolpe, 12 miles from the Baltic Sea, and 65 miles west by north of Danzig (Map: Prussia, G 1). The fourteenth-century Marienkirche, with its lofty tower, is worthy of note. The town has an old castle. Its most important industries are amber turning and carving, and linen weaving. Machinery, furniture, leather, and cigars are also manufactured. Stolp was a member of the Hanseatic League, and belonged to the Dukes of Pomerania until 1637, when it passed to Brandenburg. Population, in 1900, 27,272. At the mouth of the Stolpe lies Stolpmünde, the port of Stolp, with a population of about 2000.

STOLTENBERG-LERCHE, stōl'ten-bĕrk-lĕrk'e, VINCENT. See LERCHE, VINCENT STOLTENBERG.

STOLZ, stôlts, FRIEDRICH (1850—). An Austrian classical philologist, born at Hall, in Tyrol, and educated at Innsbruck and Leipzig. He established himself as docent at the University of Innsbruck in 1879, and was appointed professor in 1887. Besides his great work, the first volume of the *Historische Grammatik der lateinischen Sprache* (1894-95), he wrote *Zusammengesetzte Nomina in den homerischen und hesiodischen Gedichten* (1874); *Die lateinische Nominalkomposition* (1877); *Studien zur lateinischen Verbalflexion* (1882); *Lateinische Laut- und Formenlehre* (in Müller's *Handbuch*, 3d ed. 1899); *Homeri Odysseæ Epitome* (1893); *Entwickelung der indogermanischen Sprachwissenschaft* (1899); and an ethnographical study, *Die Urbevölkerung von Tirol* (2d ed. 1892).

STOMACH (Lat. *stomachus*, from Gk. *στόμαχος*, throat, gullet, stomach, from *στόμα*, *stoma*, mouth). The principal organ of digestion, receiving the food through the œsophagus, and, after certain digestive changes have taken place, emptying it into the intestines, where the process is completed. The stomach is irregularly conical, curving somewhat upon itself so that the lower curvature is much greater than the upper curvature. The size varies according to the amount of food received, but when empty the walls are in apposition. It lies in the left hypochondriac and epigastric regions, behind and partly protected by the ribs and in close relation with the left lobe of the liver and the diaphragm. The stomach has an external peritoneal coat, a muscular coat consisting of longitudinal, circular, and oblique fibres, a submucous or areolar layer, and a lining mucous membrane. In this mucous membrane are the so-called pyloric and peptic glands, which secrete the gastric juice necessary for the digestive processes carried on here. The main blood supply is through the gastric artery, and the nerve supply is derived from the pneumogastric nerves and the sympathetic system. See ALIMENTARY SYSTEM; DIGESTION; FOOD; GASTRITIS; RUMINANT.

STOMACH, DISEASES OF THE. The organic diseases of the stomach with constant lesions include gastritis (q.v.), ulcer, erosions, and cancer. The 'functional' diseases, with variable lesions, include hyperchlorhydria, gastrosuccorrhœa, achylia gastrica, and isochymia.

Ulcer of the stomach is usually characterized by a deep circumscribed loss of substance of the mucous membrane lining the stomach, refusing to heal, and occasioning pain, vomiting, and hemorrhage. The cause cannot always be assigned, although the affection is of so frequent occurrence as to be found, either active or cicatrized, in about 5 per cent. of all persons who go to autopsy for all diseases (Brinton). It is twice as frequent in females as in males, and occurs most generally during middle life. Its mortality is most frequent between the ages of forty and sixty. While anæmia seems to play some part in the causation of ulcer, it is deemed more probable that hyperacidity of the gastric juice is more often accountable. Ulcers generally occupy the posterior surface, the lesser curvature, and the pyloric sac. When they heal they leave behind depressed scars with contractile tendency, producing, when at the pylorus, a stricture. When they do not heal, corrosion of neighboring blood-vessels may ensue, with hemorrhages, possibly fatal; or there may arise adhesions to neighboring organs, or perforations. The symptoms named increase in severity till death occurs from

perforation, hemorrhage, or starvation; or, they gradually disappear and the patient recovers. The prognosis is only fair. About half of the cases recover, about 13 per cent. die of perforations and peritonitis, about 20 per cent. die of tuberculosis, about 5 per cent. die of starvation, and about 5 per cent. die of hemorrhage. The treatment of ulcer includes rest, diet by mouth and by rectal enemata, correction of acidity by proper alkalies, the administration of nitrate of silver or bismuth, and the proper management of the accidents: hemorrhage, peritonitis, and collapse.

Erosions of the stomach consist really of small, superficial ulcers of the mucous lining. They occur commonly in chronic gastritis; often their cause is unassignable. The symptoms include pain, a feeling of weakness, and emaciation. The emaciation is progressive to a certain point, during the earlier part of the attack, but after reaching a certain level the patient grows no thinner, and does not present a cachexia.

The patient may suffer from erosions for many years. The treatment consists of the use of nitrate of silver, intra-gastric galvanization, diet, general hygiene and out-of-door exercise, condurango, nux vomica, and iron.

Cancer of the stomach is more frequent than cancer of any other organ. It is apparently on the increase. Gastric cancer occurs more frequently at the age of fifty; it is rare before thirty. It is probably equally divided between the sexes. The tendency to cancer is possibly hereditary. It follows trauma and ulcers, and it is probably also due to primary infection with the suspected bacillus which bacteriologists hope to discover as the cause of cancer. The new growth may be an epithelioma, a medullary carcinoma, a scirrhus, or a colloid carcinoma. See TUMOR.

The general symptoms of cancer of the stomach are pain, loss of appetite, vomiting, hemorrhage, tumor, fever, constipation, and a decided cachexia. Examination of the blood reveals a leucocytosis in some cases during fasting, and an absence of the normal leucocytosis of digestion. Little can be argued from the urine, although in some cases the chlorides are diminished and indican is increased, and rarely peptonuria is present. Examination of the stomach contents after a test meal reveals decrease of the free hydrochloric acid as well as of the total acidity, and the presence of lactic acid. The prognosis is hopeless for cure. If the disease be of slow progress, the patient may gain relief enough from surgical interference to live along several years. When the neoplasm invades the pylorus, resection of this part of the stomach may be made; or excision, if in other parts of the organ. Among palliative operations are gastrotomy and gastro-enterostomy. The former is suitable in cases of cancer of the œsophagus or of the cardiac orifice, the latter in cases of pyloric stenosis. The medical treatment consists of diet, the iodides, condurango, methyl blue, chloral, and such analgesics as may be expedient.

Of the 'functional' diseases, *hyperchlorhydria* is a condition in which the gastric juice possesses more acidity and ferments than it should. A test of the stomach contents decides the diagnosis, and the condition is met by hygiene, diet, alkalies, bromides, and in some cases opiates and electricity.

Gastrosuccorrhœa is a periodical and continuous production of the normal gastric juice, causing vomiting and intense pain, restlessness, nausea, and a feeling of pressure in the epigastrium. Analysis of the contents of the stomach is the best diagnostic test. The treatment of this rare affection is largely by the use of atropine, nitrate of silver, galvanization, and lavage.

Achylia gastrica is a condition in which there is a constant absence of gastric juice, accompanied by atrophy of the stomach, and following severe catarrhal disease of that organ. The gastric contents decide the diagnosis. Lavage, faradization of the stomach, and attention to diet constitute the treatment.

Isochymia is a distressing condition in which food is always found in the stomach, even when fasting. The stomach is dilated and the mechanical insufficiency of the organ is so great as to fail of emptying the chyme into the intestines. Paresis of the gastric muscular coat or contraction of the pylorus is the cause of this condition. Indifferent appetite, thirst, dryness of the throat, oppression, pain, and eructation of gas, together with vomiting of chyme, are among the notable symptoms. Constipation is present and emaciation becomes pronounced. Ulcer may be the cause of the pyloric stenosis. The course of the condition varies with the etiology. Lavage, diet, nitrate of silver, rectal alimentation, massage, and the administration of alkalies may all be of advantage, as also the galvanic current. See CARDIALGIA; INDIGESTION; SARCINA. Consult Einhorn's *Diseases of the Stomach* (New York, 1903).

STOMACH-PUMP. An instrument used to remove poisons from the stomach, to feed persons who cannot swallow, or who attempt to starve themselves, or to wash out the stomach during disease. It is a syringe with a flexible tube, inserted into the stomach through the œsophagus, by which fluid is injected and removed.

STOMATA (Neo-Lat. nom. pl., from Gk. *στόμα, stoma*, Av. *staman*, mouth). The so-called breathing pores especially numerous in foliage leaves and developed in any epidermis overlying green tissue. Each stoma consists of two crescentic guard cells whose concave surfaces face one another, leaving a slit which is opened or closed as required by the plant, hence the name 'automatic gateway.' See LEAF.

STOMATITIS. See MOUTH, DISEASES OF THE.

STOM'ATOP'ODA. See CRUSTACEA; MANTIS-SHRIMP.

STONE. See BUILDING STONE.

STONE. See WEIGHTS AND MEASURES.

STONE. See CALCULUS.

STONE, ARTIFICIAL. The name given to various artificial compositions of which the basis is hydraulic cement, which are plastic when first made and assume with age a stone-like hardness and consistency. Some of these compositions possess undeniable merit for certain kinds of work and are considerably used. The chief stones of this character are Béton-Coignet, Portland stone, McMurtrie stone, Ransome stone, and Sorel stone. *Béton-Coignet* was invented by Coignet, a Frenchman, and as made by him was composed of Portland cement, siliceous hydraulic cement, and clean sand very thoroughly mixed with a

small amount of cold water. This plastic mixture is then placed in molds to harden for use. *Portland stone* is a mixture of Portland cement and sand or sand and gravel wet to make a plastic mixture and rammed into molds to harden. Under various trade names Portland stone has quite an extensive use in the United States. It is molded into blocks of numerous forms and sizes, with or without ornament, for buildings and other structures. *Sand bricks* are an artificial stone made by mixing sand and lime into a moist paste, molding this paste into bricks or blocks, and setting the molded blocks to harden in heated chambers. *McMurtrie stone* is formed by adding alum and potash soap to the mixture for Portland stone. These ingredients form compounds of alumina in the pores of the stone, which reduce the capacity of the stone to absorb water and add somewhat to its strength. *Ransome stone* is made by mixing sand and silicate of soda, molding the mixture into blocks or slabs, and setting them to harden under pressure in a hot solution of chloride of calcium. This material is used mostly in England, where it is applied to a variety of purposes. *Sorel stone* is a French product, and is made by adding to oxide of magnesium a solution of chloride of magnesium. It is used mainly in making emery wheels. Consult Baker, *Treatise on Masonry Construction* (New York). Excellent articles on the manufacture of sand brick are contained in the *Transactions of the American Ceramic Society*, vols. iv. and v. See CONCRETE; PAVEMENT.

STONE, AMASA. (1818-83). An American railroad builder and philanthropist. He was born at Charlton, Mass., and early engaged in the building of railroads and bridges, being made superintendent of the New Haven, Hartford and Springfield Railroad in 1845. He was one of the contractors for building the Cleveland, Columbus and Cincinnati and the Cleveland and Erie railroads, and during the Civil War he was often an adviser of the Government in matters of transportation of men and material. Stone gave $600,000 to Adelbert College of the Western Reserve University at Hudson, on condition of its removal to Cleveland, and also made many charitable benefactions in the city of Cleveland.

STONE, CHARLES POMEROY (1825-87). An American soldier, born at Greenfield, Mass. He graduated at West Point in 1845, entered the ordnance department, and served under General Scott during the war with Mexico. On the outbreak of the Civil War he organized the District of Columbia Volunteers, and in May, 1861, was made brigadier-general. He participated in several actions during June and July, 1861, took part in General Patterson's operations in the Shenandoah Valley, and commanded at the disastrous affair at Ball's Bluff (q.v.). Though charges were never preferred against him, he was arrested and confined for six months in military prisons. In August, 1862, he was released, and in May, 1863, he was assigned to the Department of the Gulf. He participated in the siege of Port Hudson in 1863, and then for nearly a year served as chief of staff to Major-General Banks. On August 21, 1864, he was given command of a brigade before Petersburg, and on September 13, 1864, resigned his commission. In 1870 he entered the service of the Khedive of Egypt as chief of staff and with the rank of brigadier-general. He was later appointed general aide-de-camp to the Khedive. In 1883 he returned to the United States.

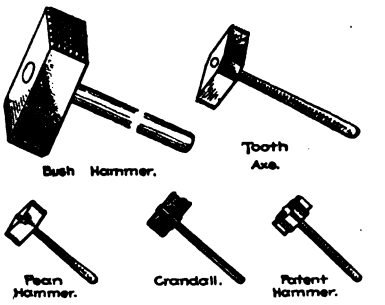
STONE, EDWARD JAMES (1831-97). An English astronomer, born in London. He received his education at Queen's College, Cambridge, and in 1859 was elected fellow of his college. In 1860 he became chief assistant at the Royal Observatory at Greenwich. From 1866 to 1870 he was secretary of the Royal Astronomical Society, and its president (1882-84). In 1870 he was appointed her Majesty's astronomer at the Cape of Good Hope, and in 1879 Radcliffe observer at Oxford, which position he retained till his death. From observations made in 1862 Stone deduced a value of the solar parallax, which fixed the solar distance as slightly over 91,000,000 miles. The reversal of the Fraunhofer spectrum, a confirmation of Young's spectroscopic discovery of the reversing layer of the sun, was observed by him during the solar eclipse at Klipfontein in 1874.

While at the Cape Observatory he prepared a catalogue of 12,441 stars (1880), containing all stars down to the seventh magnitude between the South pole and 25° S. declination, for which he was awarded the Lalande prize of the French Academy in 1881. This survey of the southern heavens was completed in the *Radcliffe Catalogue* for 1890, in which he gives the places of 6424 stars to the seventh magnitude between the equator and 25° S. declination. Consult Royal Society's *Catalogue of Scientific Papers.*

STONE, SAMUEL JOHN (1839-1900). An English hymn-writer, born at Whitmore, in Staffordshire. He was educated at the Charterhouse and at Pembroke College, Oxford. He became curate of Windsor (1862-70) and of Saint Paul's, Haggerston (1870-74), vicar of Saint Paul's, Haggerston (1874-90), and rector of All Hallow's on the Wall, London (1890). He is widely known for his many hymns, as "Round the Sacred City Gather," "The Church's One Foundation," and "Lord of Our Soul's Salvation." Consult his *Hymns* (1886), also his *Lyra Fidelium* (1866), *The Knight of Intercession and Other Poems* (1872), *Sonnets of the Sacred Year* (1875), and *Lays of Iona* (1897). For bibliography of hymns, consult Julian's *Dictionary of Hymnology* (London, 1892).

STONE, THOMAS (1743-87). A signer of the Declaration of Independence. He was born in Charles County, Md., studied law at Annapolis, began practice at Frederickton in 1764, and was a delegate to the Continental Congress in 1775-77, and again in 1783-84, being president *pro tem.* in 1784. He was a member of the Committee on Confederation in 1776-77, and, returning to Maryland in 1777, urged the State Convention to ratify the Articles of Confederation. Consult Sanderson, *Signers of the Declaration of Independence*, vol. ix. (Philadelphia, 1823-27).

STONE, WILLIAM LEETE (1792-1844). An American journalist and historical writer, born at Newpaltz, N. Y. After editing several provincial journals he became editor of the New York *Commercial Advertiser* in 1821. He earnestly furthered a plan for collecting the colonial documents of New York, and was defendant in a famous suit brought by the novelist Cooper for criticisms that had appeared in his journal on that novelist's *Home as Found* and the *History*

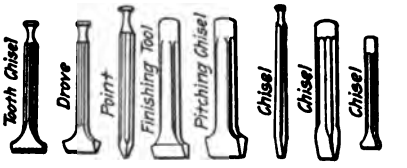


of the Navy. (See COOPER, J. F.) He was active in furthering benevolent institutions for the deaf and dumb and for juvenile delinquents. Among his many publications the revolutionary *Tales and Sketches* (2 vols., 1834), *Maria Monk and the Nunnery of the Hôtel Dieu* (1836), and a social satire *Ups and Downs in the Life of a Distressed Gentleman* (1836) are still of interest. Better known probably are his *Life of Joseph Brant* (1838); *Life of Red Jacket* (1840); and *Uncas and Miantonomeh* (1842). An account of his other works is given in *Life and Writings of Col. William L. Stone* (1866), by his son, WILLIAM LEETE STONE, JR. (b. 1835), himself the author of many works of antiquarian research connected with the Revolutionary epoch, among which the more noteworthy are: *The Life and Times of Sir William Johnson, Bart.; Revolutionary Letters; Burgoyne's Campaign; History of New York City; Reminiscences of Saratoga and Ballston.* He edited also *Ballads of the Burgoyne Campaign and Other Revolutionary Memorials.*

STONE AGE. A term commonly used to denote the earliest recognized stage in the development of human culture as defined by the materials used by man for weapons, utensils, etc. The phrase is somewhat misleading, however, since it is quite probable that primitive man made use of wood and other perishable materials to a far greater extent than of stone, and as a consequence the stage is defined by the prevailing material of the relics rather than by that of the actual implements in common use.

The term Stone Age represents in no sense a chronological division of human progress, but is a loose equivalent for a stage of cultural development varying widely in duration in different parts of the world. There are, for example, tribes still in the Stone Age, while, on the other hand, some groups had progressed beyond it before the dawn of history. It is also worth noting that some tribes commonly classed as belonging to the Stone Age produced objects of a superior artistic and industrial merit to those of peoples who had advanced to the use of metals. The evidence for the existence of such an age in most parts of the world is conclusive, but it is from the prevalence and character of the relics in certain parts of Europe rather than in America that the idea and the term have come into general use.

A very common and well-recognized subdivision of the Stone Age is into the *paleolithic* and *neolithic* periods. In the paleolithic period man's best tools were extremely crude, and he is considered to have understood how to chip stone into shape, but not how to grind or polish it. In the neolithic period both these advances had been made. The terms *protolithic* and *technolithic* have also been proposed to indicate the earlier and later periods of the Stone Age, but have not come into general use. Relics of the Stone Age abound in practically all parts of the world, and are found in great numbers in all archæological museums. The most characteristic types are knives, scrapers, arrow-points, spear-heads, celts, axes, mortars, and pestles. See ARCHÆOLOGY, AMERICAN.



STONE CUTTING AND DRESSING. Processes employed in preparing quarried stone for structural and ornamental purposes. These processes range in character from the rough shaping of the stone into squared blocks, which is generally performed at the quarry, to the cutting and polishing of carefully modeled and ornamental pieces such as columns, cornices moldings, and balustrades, and they may be carried out either by means of hand tools or by

STONE-WORKING HAMMERS.

stone-working machines. The hand tools used in stone cutting and dressing are various shaped hammers and chisels and simple forms of measuring instruments, templates, and gauges.

After a block is broken from its quarry bed by one of the methods described in QUARRYING, it is trimmed to the desired size and shape by a variety of means according to the hardness of the stone and the kind of finish desired. By means of the pitching chisel the rough block is trimmed down to a line, then the irregular surface is worked down by the point, after which it is finally dressed. If the stone is to be polished it is first scoured with wet sand. Small blocks are now usually ground with wet sand on a re-

STONEWORKING CHISELS.

volving iron bed, while large blocks are ground by dragging a slab of stone back and forth across them with wet sand as the abrading material. For securing a finer polish, emery, hones, pumice stone, and polishing putty (oxide of tin) are used. A high grade of polish can be secured by skilled workmen only, and each man usually has his own peculiar methods for securing the result desired.

In most large establishments *grinding and polishing* machines are much employed. For flat surfaces a circular horizontally revolving iron plate or grating, attached to the lower end of a vertical shaft, with an elbow joint, is used, the workman guiding the plate to various parts of the surface, and using sand or emery as the abrading material. By attaching felt to the plate the same machine is used for polishing. Blocks of such small size as can be handled by the workmen are usually ground upon horizontally revolving iron beds some eight or ten feet in diameter. Pendulum machines are used for polishing simple moldings. The molding being first cut as smoothly as possible with the chisel, a plate of cast iron, fitted as accurately as pos

sible, is made, by means of a long arm, to travel back and forth along the molding, with sand, emery, putty powder, or other abrasive.

For turning posts and pillars *lathes* are now generally used. For the softer stones a simple pointed cutting tool similar to that used in turning metals and held and operated by a similarly constructed machine is employed. In turning hard stones like granite the cutting tool is in the form of a thin steel disk some 6 inches or 8 inches in diameter, so arranged as to revolve with the stone when pressed against it at a sharp angle. Lathes of this type are used, which are capable of turning a block 25 feet long and 5 feet in diameter to a perfect column. *Planers* for rough work, such as flagstone, resemble the same machine for planing metals. See METAL-WORKING MACHINES.

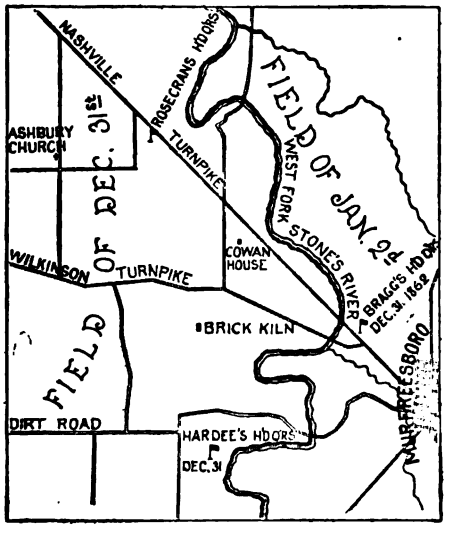
Stone-sawing machines are made in various forms. The most familiar form consists of a smooth flat blade of soft iron which is given a reciprocating motion by machinery and fed with sharp sand and water. Such saws are commonly worked in gangs of ten or a dozen blades set parallel the desired distances apart and operated by a single saw frame. This method of sawing is not applicable to cutting granite, on account of its hardness. Frequently, in place of sand, use is made of small globules of chilled iron or of crushed steel as an abrasive. Circular saws set with diamonds have proved very efficient tools, but their use is generally prohibited by their expense. Slate is sawed by circular saws such as are used for sawing lumber. In Europe considerable use has been made of twisted cords of steel made to run around pulleys like a band saw. Among other machines for stone cutting and dressing mention may be made of pneumatic hammers and the sand blast.

BIBLIOGRAPHY. The literature relating to stone cutting and dressing is somewhat scattered. Two books which may be consulted with advantage, however, are: Merrill, *Stones for Building and Decoration* (New York, 1891), and Baker, *Treatise on Masonry Construction* (New York, 1900).

STONE-FLY. One of the aquatic insects of the family Perlidæ and order Plecoptera—flat-bodied insects with two pairs of wings. The hind wings are very broad and when folded lie flat on the back of the insect. The larvæ live in water, clinging to the under sides of stones, and in general appearance are much like the adult insects, except in the lack of wings and ocelli; they are carnivorous, living largely upon the nymphs of May flies (q.v.). The well-aërated water in which the nymphs live is correlated with a peculiar rudimentary tracheal system for breathing. The eggs are produced in enormous numbers and a single female may deposit more than 5000; they are small, and are probably dropped during flight upon the surface of the water as with the May flies.

STONEHAM, stōn'am. A town in Middlesex County, Mass., 8 miles north of Boston, on the Boston and Maine Railroad (Map: Massachusetts, E 3). It has a public library with 10.000 volumes, and a high-school building which cost $50,000; also a public park, included in the system of the Metropolitan Park District. Boots and shoes, boxes, and automobiles are the principal manufactures. The government is administered by town meetings. Population, in 1890, 6155; in 1900, 6197. Settled about 1670, Stoneham was under the jurisdiction of Charlestown and was called Charlestown End until 1725, when it was incorporated under its present name. Consult Stevens, *History of Stoneham* (Stoneham, 1890).

STONEHENGE (AS. *Stanhengist*, hanging stones). A celebrated stone circle, or cromlech, the ruins of which stand on Salisbury Plain, 1½ miles from Amesbury, in Wiltshire, Southern England. When entire it consisted of two concentric circles of monoliths, the outer 100 feet in diameter, inclosing two smaller rows in form of a horseshoe, the opening to the northeast. Within there is a block of blue marble 15 feet long which is called the 'Altar Stone.' On a northeast line from the altar is a flat stone on the edge of the trench surrounding the whole ruin, and the line prolonged cuts another large stone some distance away called the 'Friar's Heel.' This arrangement, also observed in numerous other stone circles, points to a means of determining the time of the summer solstice, and it is thought for this reason that Stonehenge was connected with sun-worship. In any case the monument, whether it was a temple, a court of justice, or a battle ring, has been designed with reference to the northeast. Modern research clearly proves that the structure dates from at least as early as the Bronze Age. The tumuli in the vicinity of the cromlech yield Bronze Age remains. Consult Flinders Petrie, *Stonehenge: Plans, Descriptions, Theories* (London, 1881).



STONE'HOUSE, EAST. See EAST STONEHOUSE.

STONE'MAN, GEORGE (1822-94). An American soldier and Governor of California. He was born at Busti, Chautauqua County, N. Y., and graduated at West Point in 1846. Just before the outbreak of the Civil War he was in command of Fort Brown in Texas, and was ordered by his superior officer, General Twiggs, to surrender to the Confederates, but refused to do so, and escaped with his troops on a steamer to New York. After some service in West Virginia he was appointed chief of cavalry in the Army of the Potomac. By overtaking the Confederate troops after the evacuation of Yorktown in May, 1862, he brought on the battle of Williamsburg. On November 15, 1862, he was made commander of the Third Army Corps, which he commanded at Fredericksburg on December 13th. During Hooker's Chancellorsville campaign he led a cavalry raid toward Richmond. In April, 1864, he was put in command of a cavalry corps in the Army of the Ohio, and in the Atlanta campaign undertook a raid against Macon and Andersonville. He was captured with a part of his force at Clinton, Ga., and was kept a prisoner for three months. In December, 1864, he led a raid from East Tennessee into southwestern Virginia, and destroyed the salt works at Saltville. In the following March he again entered southwestern Virginia, destroyed a part of the Virginia and Tennessee Railroad, and did much other damage. In the following month he moved into North Carolina, took Charlotte and other towns, and at Salisbury captured about 1400 prisoners. In 1871 he retired from the army and settled in California.

There he served for six years as a railroad commissioner, and in 1883 was elected Governor by the Democrats.

STONE MARTEN. See MARTEN.

STONE RIVER, BATTLE OF, or MURFREESBORO, BATTLE OF. An indecisive battle fought near Stone River, in the vicinity of Murfreesboro, Tenn., on December 31, 1862, and January 2, 1863, between the Federal Army of the Cumberland, numbering about 41,000 effective men, under General Rosecrans, and the Confederate Army of Tennessee, numbering about 35,000 effective men, under General Bragg. Soon after replacing General Buell on October 30, 1862, in command of the Army of the Cumberland, General Rosecrans occupied Nashville, while General Bragg, after having been manœuvred out of Kentucky by General Buell, took up a position in and near Murfreesboro, Tenn. On December 26th Rosecrans advanced from Nashville against Bragg, and on the 30th, after having encountered considerable resistance along the way, arrived in the immediate vicinity of Murfreesboro. Both generals arranged to attack on the following morning, and by a singular coincidence both adopted the same general plan of battle, each issuing orders for an attack by his left, heavily reënforced, upon his opponent's right. As the two armies faced one another, Crittenden, commanding the Federal left, was opposed to Breckenridge, commanding the Confederate right; Thomas, commanding the Federal centre, was opposed to Polk, commanding the Confederate centre; and McCook, commanding the Federal right, was opposed to Hardee, commanding the Confederate left. At 6 A.M. on the 31st,

STONE RIVER.

while Crittenden was preparing to cross the river and advance against Breckenridge, Hardee vigorously and with vastly superior numbers attacked McCook, who seems to have made an unwise arrangement of his line, and who, though he had assured Rosecrans of his ability to hold his position for three hours, soon gave way, his three divisions under Johnson, Davis, and Sheridan, after having offered a stubborn resistance, being gradually forced back to the Nashville Pike, in the rear of the Federal left and left centre. The Federal centre, however, under Thomas, successfully beat back the attacks of the Confederate centre and parts of the Confederate left, and, though a realignment of the troops in this part of the field had to be made, the Federals held their position. Meanwhile the Federal left, which, in pursuance of Rosecrans's plan of battle, had begun at 8 A.M. to advance against the Confederate right, had been recalled when the defeat of the Federal right became known, and was instrumental in beating back the final Confederate attacks. The fighting virtually ceased at dark. At the close of the day the advantage was decidedly with the Confederates, who, besides capturing 28 guns and a large number of prisoners, had driven part of the Federal army from its position and had forced Rosecrans to act on the defensive instead of carrying out his own plan of battle. On January 1st the two armies retained their positions, and there was little fighting, except along the skirmish lines. Van Cleve's division of Crittenden's Federal corps was, however, sent across the river to occupy a position on high ground opposite one of the fords of the river. On the following day, the 2d, at 4 P.M. Breckenridge's Confederate division made a furious assault upon this position, the capture of which was necessary to prevent the enfilading of the Confederate line; but, after being at first successful, it was finally driven back with great loss. On the night of the 3d Bragg evacuated Murfreesboro and retreated toward Tullahoma, 36 miles distant. For some months thereafter the Army of the Cumberland remained at Murfreesboro. Throughout the North the battle was claimed as a Federal victory, as it was strategically, though tactically it may be considered to have been drawn. The Federal loss in killed, wounded, and missing was about 12,900; that of the Confederates, about 11,700. Consult: Johnson and Buel (eds.), *Battles and Leaders of the Civil War*, vol. iii. (New York, 1887); Ropes, *Story of the Civil War*, vol. ii. (ib., 1894-98); Cist, *The Army of the Cumberland* (ib., 1882), in the "Campaigns of the Civil War Series;" Nicolay and Hay, *Abraham Lincoln: A History* (ib., 1890); Van Horne, *History of the Army of the Cumberland* (Cincinnati, 1875); and the *Official Records*, vol. xx., parts i. and ii.

STONE-ROLLER, or STONE-LUGGER. One of two fresh-water fishes of the Mississippi Valley: (1) A small and worthless sucker (*Catostomus nigricans*), which inhabits clear streams throughout the West. It usually rests quietly on the bottom, but darts swiftly away when alarmed, scattering the pebbles. It is olive green with brassy sides, and has a flattened, concave head and thick lips. (2) A small brown cyprinoid (*Compostoma anomalum*), remarkable for the fact that in the nuptial season the males become covered about the head and often over the whole body with large rounded tubercles. They frequent the deep pools of small streams.

STONES OF VENICE, THE. A treatise on the art and architecture of Venice by John Ruskin (1851-53), undertaken to record the vanishing glories of the city. It had great influence on the appreciation of Venetian art and on the Gothic revival of that day, and especially on

William Morris, though it was sharply criticised from an art standpoint.

STONEWARE. A kind of pottery distinguished by an advanced vitrification of the whole mass. It is for this reason that stoneware has been employed for jugs and flagons and vessels of all shapes and size intended to hold valuable liquids. The decoration of these vessels was often very elaborate. The color of this ware, when finished, was a nearly uniform soft gray, to which was added on many occasions a certain amount of blue. The ware is also very strong. The French word *grès* is commonly applied in the trade and by collectors to such pieces of stoneware as are of decorative character.

STONEWORK. Structural and decorative work in stone, whether for buildings of an architectural or of all engineering character; including, therefore, all kinds of masonry (q.v.) for foundations, piers, walls, vaults, etc., and all kinds of stone-cutting, both constructive and decorative. As other varieties are treated under the appropriate titles, it remains only to treat in this article, very briefly, of the artistic applications of stonework. These applications, as distinguished from sculpture and carving, are found chiefly in decorative details of works of architecture, including such engineering works in stone as are treated with decorative intent, like moldings, columns, bases and caps, pilasters, pedestals, pediments, finials, rustications, balustrades, parapets, and the like. On the technical side, the treatment of these details varies with the material and the design. All such stonework is first 'roughed out,' either at the quarry or at the stone-cutting yard, into blocks rudely approximating the intended form. If the stone is soft and friable, and the decorative detail complex or delicate, it is usually built into the structure in this rough form, and finished afterwards. The harder kinds of stone, blue-stone, granite and hard marble, and all moldings and blocks of simple form, are cut at the yard, carefully crated or packed and delivered finished at the building. The carved detail of the softer stones is executed 'in place' with the chisel by carvers specially trained for this. On the artistic side stonework is treated with greater or less fineness of finish according to the grain of stone, and the decorative effect sought. The harder granites and marbles are often highly polished, when used as shafts or panels. In heavy work, as on bridges, embankments and the basements of buildings, a rough fractured surface, called 'rock-face' or 'quarry-face' is often left on each block.

STONINGTON, stŏn'ĭng-tŏn. A town, including the borough of Stonington, in New London County, Conn., 50 miles southwest of Providence, R. I., on Long Island Sound, and on the New York, New Haven and Hartford Railroad (Map: Connecticut, H 4). It is attractively situated and has some reputation as a summer resort. A good harbor makes it also of considerable commercial importance. There are the shops of the New York, New Haven and Hartford Railroad, machine shops, printing press works, thread mills, and manufactories of silk machinery, cotton, woolen, and silk goods, velvets, and fertilizers. The government is administered by town meetings, convening annually. Population, in 1890, 7184; in 1900, 8540.

In 1649 William Cheesebrough of Plymouth Colony made the first permanent settlement at Stonington and called it Poquatuck. At first within the bounds of Massachusetts, whose General Court chartered it as Southertown in 1658, it passed to Connecticut in 1662, was named Mystic in 1665, and Stonington in 1666. In 1775 it was attacked by a British fleet under Commodore Wallace, and in 1814 it was bombarded for four days by Admiral Hardy, Nelson's favorite officer. For many years Stonington was prominent for its participation in the seal-catching and whale-fishing industries. It was the early home of Roger Sherman. Consult Wheeler, *History of the Town of Stonington from 1649-1900* (New London, 1900).

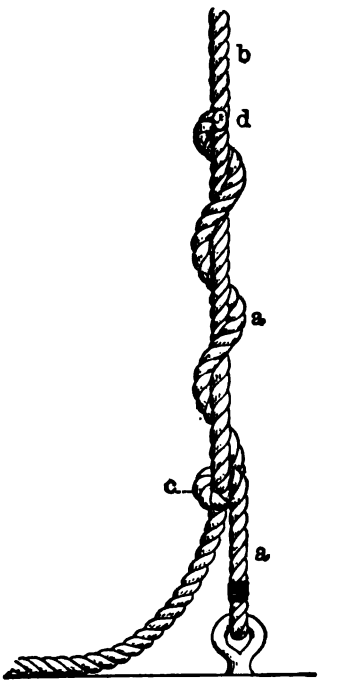
STONO FERRY, BATTLE OF. An engagement near a ferry over the Stono River, a short distance from Charleston, S. C., on June 20, 1779, during the Revolutionary War, between a small force of British, strongly intrenched, under Lieutenant-Colonel Maitland, and a superior American force under General Lincoln. General Prevost, on withdrawing from his invasion of South Carolina, left temporarily a small force of about 800 men at Stono Ferry and another small force on John's Island. In the early morning of June 20th General Lincoln attacked the British at Stono Ferry, but, owing to the failure of General Moultrie properly to coöperate with Lincoln, the garrison was reinforced from John's Island, and the American attack was repulsed. Lincoln then withdrew, beating off the attacks of the British, who followed for a short distance. The loss of the British in killed, wounded, and missing was about 130; that of the Americans was about 200.

STONYHURST COLLEGE. A leading Catholic college, situated at Stonyhurst Lane, England. It had its inception in the English college at Saint Omer, in the Province of Artois, France, founded by Robert Person, S.J., in 1592, under the protection and patronage of Philip II. of Spain, to which country that province then belonged. The school, in spite of many difficulties, prospered, and when Artois was ceded to France in 1659 a special article in the capitulation insured the safety of the institution. In 1760 it obtained from Louis XV. the much-desired title of 'Collège Royal.' At the expulsion of the Jesuits from France the college with all its movable belongings was removed to the city of Brûges in the Austrian Netherlands. When the Society of Jesus was suppressed by Pope Clement XIV. in 1773 an attempt was made by the Austrian Government to conduct the school with the aid of English Dominicans, but such was the attachment of the pupils to their old teachers that the college had to be closed owing to their rebellious attitude. Some of the masters and pupils then took refuge in Liège, where the authorities were more kindly disposed toward the Jesuits. In 1794, when the Revolutionary armies were marching upon Liège, the college was offered a final resting place by Thomas Weld, who gave it his estate at Stonyhurst, England. In 1808 the attendance outgrew the accommodation, and the construction of the first of a series of five buildings was begun. In 1832-36 a church was erected and in 1837 the college library was presented with the famous Arundell collection. The well-known observatory was erected in 1838.

In 1840 it became affiliated with the University of London. Henceforth the sciences were introduced and the curriculum which was based on the Ratio Studiorium (q.v.) was generally enlarged. The regular course of study covers a period of seven years.

STONY POINT. A town in Rockland County, N. Y., 35 miles north of New York City, on the Hudson River, and on the West Shore Railroad (Map: New York, F 4). Population, in 1890, 4614; in 1900, 4161. Stony Point was fortified by the Americans early in the Revolutionary War and was captured on May 31, 1779, by Sir Henry Clinton. On July 16th it was recaptured by General Anthony Wayne, who, with 1200 men, stormed the works and took 543 prisoners, the American loss being 15 killed and 83 wounded, and the British 63 killed besides the prisoners, among whom the wounded were included. Two days later the fortifications were dismantled and the place abandoned, the British reoccupying it soon afterwards. The site of the Revolutionary fort and battlefield has been converted into an historical reservation which was formally opened in 1902. Consult Johnston, *The Storming of Stony Point* (New York, 1900).

STOPPAGE IN TRANSITU. The stoppage by an unpaid seller of goods while on their way from him to the buyer, after title has passed to the latter. The right so to stop goods is not founded on any contract between the parties, nor upon any principle of equity, but upon mercantile usage. Its first recognition in the judicial reports of England appears in an equity case decided in 1690. Prior to this it was a well-established rule of the law merchant (q.v.). From courts of equity it was adopted by the courts of common law, and for three centuries has been a recognized rule of English jurisprudence. The term 'unpaid seller' is here employed in a broad sense. It includes not only the ordinary seller, but the factor of the buyer, who has paid for goods placed to his credit for the price—any one, indeed, whose position can be shown to be analogous to that of an ordinary seller, who is unpaid either wholly or in part.



The second requisite is that the buyer shall have become insolvent, and that the knowledge of this insolvency shall have come to the seller after dispatching the goods. Insolvency, in this connection, is used in its popular sense, meaning the financial condition of one who cannot pay his debts as they fall due in the ordinary course of business; and if he lets his commercial papers go to protest, or by other conduct affords the ordinary opponent evidence of insolvency, the unpaid seller is safe in treating him as insolvent.

The third requisite is that the goods shall have left the possession of the seller, but shall not have reached the possession of the buyer—that they shall be in transit. The transit begins as soon as they have left the seller's possession for transportation to the buyer. It continues as long as they are in the possession of a carrier, or other middleman, on their way to the buyer. "Such middleman may be the buyer's agent for certain purposes; and yet if, by the agreement of the parties or by the usage of trade, he is not a mere servant of the buyer, but is a person interposed between the seller and the buyer, having a possession of his own and liable, in his capacity as bailee, to an action by the buyer, in case the goods are carelessly lost or misdelivered, the goods are still in transit." Such transit may be intercepted by a new and distinct agreement between the carrier and the buyer, under which the carrier is thereafter to hold the goods subject to new orders from the buyer. It is not intercepted, however, by the levy of an execution or an attachment on the goods on behalf of a creditor of the buyer. Such a levy gives the creditor only the right of the buyer; and that right is subject to the unpaid vendor's right to stop the goods. If a bill of lading (q.v.) has been given to the buyer by the seller, its transfer to a *bona fide* purchaser cuts off the seller's right. This comes from the *quasi* negotiable character of the bill of lading under the law merchant.

Although no particular form of notice is required, a valid stoppage *in transitu* cannot be made without a notice of some kind to the carrier. If the goods are in the hands of an agent of the carrier, notice that the seller stops the goods may be given to either the agent or the principal. If given to the latter it must be given at such time and under such circumstances that the principal, by the exercise of reasonable diligence, may communicate it to the agent in time to prevent a delivery to the buyer.

The exercise of this right restores to the seller the possession of the goods, but does not revest title in him. The buyer or his transferee is entitled to the goods upon paying cash for them, but not otherwise.

STOPPER. A short length of rope or chain or an iron contrivance used on board ship for

STOPPER FOR ROPE.

a, Rope stopper.
b, Rope held by the stopper.
c, Point where a gripe *b*.
d, Loose end of *a*. This is usually held in place by a man until the stopper *a* is removed from *b*.

checking the running of a rope or chain, or for holding it firmly. A stopper for ropes is a short

length of soft manila secured at one end to the structure of the ship; the other end is passed around the rope to be stoppered with a jamming hitch. It is used to keep the rope from slipping while it is being belayed or secured. A stopper for a chain cable is usually of wire rope and four to six feet long. At one end it is spliced into the eye of a hook, and at the other has an

STOPPER FOR CHAIN CABLE.

eye formed around a short bar of iron. The hook is placed in a ringbolt in the deck, and the body of the stopper lashed to the chain by two 'tails' of soft manila rope. When ships are at anchor the chain is held by such stoppers.

STORAGE (from *store*, OF. *estorer, estaurer*, from Lat. *instaurare*, to renew, make, provide, from *in*, in + **staurare*, to set up; connected with Gk. *σταυρός*, *stauros*, stake, Skt. *sthāvira*, firm, AS. *stēor*, rudder, and ultimately with Eng. *stand*). Since most plants absorb or produce food in excess of their immediate needs, they provide for temporary or long-continued storage. These foods are transformed for permanent storage and mobilized for subsequent translocation by specific activities of the cell, self-regulated through irritability (q.v.). The chief regions of storage are spores, seeds, fleshy fruits, roots, tubers, bulbs, leaves, and stems. As a rule the regions of the higher plants specially adapted for storage are thick, fleshy, and abundantly supplied with thin-walled parenchyma cells. (See HISTOLOGY.) Storage occurs only in living cells. Occasionally the cell walls in storage regions are thick and woody, and in some cases, e.g. in the endosperm of seeds, the walls themselves are made up mainly of the stored material, reserve cellulose. The chief forms in which reserve food is stored are as follows:

(1) CARBOHYDRATES. Reserve carbohydrates are either soluble, such as sugars (saccharose, glucose, fructose, mannose, and galactose) and inulin, or insoluble, as starch and cellulose (qq.v.). Starch is organized into granules by the leucoplasts (q.v.). Reserve cellulose is deposited upon the cell walls as a complex carbohydrate, whose composition is unknown, though it seems to have somewhat the same relations to ordinary cellulose as the most complex of the dextrins, amylodextrin, holds to starch. It is found especially in the endosperm, or in various parts of the embryo, in bud scales, etc.

(2) FATS. Fats occur in the form of minute droplets (oil) in the protoplasm, not infrequently accumulated by special organs of the cell, the leucoplasts. They are found in the endosperm or embryos of seeds (probably in the seeds of nine-tenths of all seed plants), in spores, tubers, and the wood of trees.

(3) PROTEIDS. Proteids are found either as amorphous grains, the so-called aleurone, or as crystals, which are not infrequently associated with or imbedded in aleurone grains. These are sometimes formed by leucoplasts, but at other times appear to be deposited in the sap cavity (vacuoles) of cells, where the proteid appears to accumulate in increasing concentration until it solidifies in the form of the vacuole, or in one or several crystals. (See ALEURONE.) Crystals of proteid are also found in chromatophores, nuclei, and even in the cytoplasm itself. They are often distinguished as crystalloids, because they have the capacity of swelling (see IMBIBITION), a rare quality among inorganic crystals.

(4) AMIDES. Amides are nitrogenous compounds intermediate in complexity between proteids and carbohydrates and readily crystallizable. Most nitrogenous materials are ordinarily translocated as amides. They are rare in seeds, but especially abundant in the sappy reservoirs, such as bulbs, tubers, rhizomes, etc., where they constitute 40 to 70 per cent. of the total food.

The different kinds of storage materials are more or less definitely associated. Thus the reserve food may consist of proteids and sugar (e.g. the pea and onion); proteids and starch (e.g. the potato, the embryo of beans, pea, etc.); proteids and oil (e.g. the endosperm of the castor bean and the cotyledons of the soja bean); or proteids, oil, and reserve cellulose (e.g. the endosperm of the date and coffee); or proteids, with oils in the cotyledons and mucilage in the endosperm walls (e.g. clover). The reason for the special association of reserve foods is not known. Insoluble reserve foods are only transportable after digestion (q.v.).

STORAGE BATTERY. An accumulation of energy which is able to produce directly an electric current. The term is a misnomer, as electricity itself cannot be stored. A so-called storage battery or accumulator when acted upon by a current undergoes certain chemical changes. The chemicals which are thus separated recombine again when the circuit of the battery is closed, and in uniting give off a current of electricity about equal to that by which they were decomposed. Lead is the metal most commonly used in accumulators, the positive plate having a coating of lead peroxide, PbO_2, and the negative plate a surface of spongy lead.

The idea of the storage cell may be traced back to 1801, at which time Gautherot showed that platinum wires used in the electrolysis of saline solutions developed secondary currents. Later, in 1803, Ritter constructed a secondary pile of copper disks separated by cloths moistened with a solution of sal ammoniac. By charging this a few moments with a powerful galvanic battery the pile gave a strong shock. Volta, Becquerel, and others discovered that platinum and other metals—gold, silver—gave secondary electric currents when subjected to electrolytic action in certain solutions. In 1842 Grove produced his celebrated gas battery, which gave a current by means of the difference in polarity of oxygen and hydrogen, the constituents of water. In Faraday's *Researches* he mentions the high conductivity of peroxide of lead at the negative pole. Gaston Planté was the first to apply this principle, and constructed in 1860 his cell with coiled plates, the first practical storage battery, which was afterwards developed and modified by Faure, Metzger, Brush, and others.

Storage batteries may be divided into two general classes: Those in which the active material (peroxide of lead) is formed on the surface of the plates by chemical or electro-chemical action, and those in which some easily reducible salt of

lead is applied mechanically. The former are known as the Planté type, and the latter as the 'pasted' or Faure type.

The Planté cell is the simplest form of storage battery. The earliest cells were formed of two lead plates immersed in dilute sulphuric acid in water. The solution should have a specific gravity of 1.17 before charging, and as the charge proceeds the specific gravity increases to 1.195 at full charge. At each successive charge the peroxide formed on the positive plate sinks deeper into the metal, and this action continues until the metal is covered to a sufficient thickness to protect the lead from electrolytic action. There is no difficulty in forming the positive plate in a Planté cell, but with the negative plate the action is very slow. The latter is the great difficulty with all Planté cells. The usual method of forming the spongy lead is to charge the cell, allow it to rest, then reverse the charge through the cell. At each reversal of current the peroxide is liberated at the surface, leaving metallic lead in a very finely divided state. The voltage of a lead-sulphuric acid cell is about two volts. The above description is applicable in a general way to all cells of the Planté type, of which there are a great many varieties. Most of the modifications introduced by the different manufacturers are mechanical changes with a view to exposing more surface of lead to the action of the electrolyte. The Planté accumulator is a very efficient cell when once formed, but the great amount of time it requires for forming is its chief drawback. To avoid the great loss of time consumed in forming the Planté cells, Faure in 1880 devised the method of pasting a layer of chemically prepared oxide of lead to the surface of the plates. This was done by spreading the plates with minium, or litharge, made into a thick paste by the addition of acidulated water. After drying these plates were placed in a bath of dilute sulphuric acid, and then subjected to an electric current. A piece of felt was placed between the plates to prevent the lead salts from disintegrating. After charging, the salt on the positive plate is reduced to peroxide of lead, while that on the negative plate is converted into porous lead. The chief fault of the early Faure cells was the disintegration of the active material, which would drop away from the plate. Many methods have been devised for holding the active material on the plates, the most common of which is to cast a grid, or plate with cells or perforations, into which the active material is pressed. All the modern cells are made with perforated plates of this description. Besides these two types of accumulators, which are the most important ones, there are a number of others, in which the elements are composed of lead, zinc, copper, etc., none of which are in very extensive use.

Storage batteries are employed in many central stations to aid the dynamos at the time of the maximum output and to act as equalizers or reservoirs of electrical energy. The efficiency varies from 80 to 85 per cent. in laboratory tests, but in commercial practice it is about 70 per cent. or less. The depreciation, however, may be very rapid if the batteries are not operated with care. It is very important not to discharge accumulators faster than the rate for which they are built, as it results in the speedy destruction of the plates. They are not well adapted to traction purposes, as the motion of the car jars out the active material from the plates, and in starting the car a high rate of discharge is required. The weight and bulk of accumulators is also against their use on cars. With light vehicles, as well as with delivery wagons and trucks, accumulators have been employed very successfully, while for telephone and telegraph work in large cities they are rapidly supplanting primary cells, the change being attended not only with economy, but also with increased cleanliness and available space. Consult: Benjamin, *Voltaic Cell* (New York, 1893); Treadwell, *The Storage Battery* (ib., 1898).

STORAX (Lat. *storax*, styrax, from Gk. *στύραξ*, sort of fragrant resin, from Heb. *ṣŏrī*, heart of the mastic or of the turpentine-tree). A fragrant resinous substance, the styrax of the ancients, obtained from the storax-tree (*Styrax officinale*) of the natural order Styracaceæ, native of the Mediterranean region. Storax, which exudes from wounds in the bark and hardens in the air, appears in the form of reddish-yellow, opaque, soft, adhesive tears about the size of a pea, or in dry, brittle masses, wrapped in the leaves of a kind of reed. It has a fragrant odor and an aromatic taste, and was formerly much used in medicine. Benzoin (q.v.) is the product of a species of Styrax. Liquid storax is doubtfully regarded either as produced by *Styrax officinale* or by a species of liquidambar (q.v.). It seems probable that there are two kinds.

STO'RER, DAVID HUMPHREYS (1804-91). An American physician and naturalist. He was born in Portland, Me., and graduated at Bowdoin in 1822. After studying medicine he settled in the practice of his profession in Boston and continued there until his death. In 1854 he was called to the chair of obstetrics and medical jurisprudence in the Harvard Medical School. Storer was for many years associated with Louis Agassiz in his studies of zoölogy and herpetology. He published: *Report on the Ichthyology and Herpetology of Massachusetts* (1839); *Synopsis of the Fishes of North America* (1846); and a *History of the Fishes of Massachusetts* (1853-67).

STO'REY, MOORFIELD (1845—). An American lawyer, born in Roxbury, Mass. He graduated at Harvard in 1866, studied at the Harvard Law School, and in 1869 was admitted to the bar. In 1867-69 he was private secretary to Senator Charles Sumner, and in the latter year began the practice of his profession in Boston. An Independent in politics, he was prominent in the 'Mugwump' movement of 1884, and after the Spanish War became an ardent Anti-Imperialist and was defeated for Congress in 1900. He published the *Life of Charles Sumner* (1900) in "American Statesmen Series."

STORK (AS. *storc*, OHG. *storah*, Ger. *Storch*, stork; connected with Gk. *τόργος*, *torgos*, vulture). The popular name for a family of birds, the Ciconiidæ, allied to the herons and ibises. They are large birds, with long legs, half-webbed toes; the bill longer than the head, straight, strong, pointed, and without any groove; the nostrils pierced longitudinally in the horny substance; the eyes surrounded by naked skin. The species are about twenty-five in number and are of very wide geographic distribution. The common

white stork (*Ciconia alba*), a migratory native of the greater part of the Old World, is about three and a half feet in length. The head, neck, and whole body are pure white; the wings partly black; the bill and legs red. The neck is long, and generally carried in an arched form; the feathers of the breast are long and pendulous, and the bird often has its bill half hidden among them. The stork frequents marshy places, feeding on eels and other fishes, batrachians, reptiles, young birds, and small mammals. It makes a rude nest of sticks, reeds, etc., on the tops of tall trees, or of ruins, spires, or disused chimneys. The stork has no voice. Its flight is powerful and very high in the air. The flesh is rank, and not fit for food. Another species, the black stork (*Ciconia nigra*), rather smaller, the plumage of the upper parts glossy black, the under parts white, is also common in many parts of Europe, Asia, and Africa. The South American stork (*Dissoura maquari*) is very similar to the common stork.

The only birds of this family occurring in North America are the wood ibises of the Southern States and the jabiru (q.v.). They are large birds, three and a half feet long, with the head and neck bare, wings and tail black, and rest of plumage white. They are found in large flocks and nest in colonies. See ADJUTANT; MARABOU; SHOEBILL; etc.; and Colored Plate of WADERS.

STORM (AS. *storm*, OHG. *sturm*, Ger. *Sturm*, storm; probably connected with Gk. ὁρμή, *hormē*, attack, Skt. *sar*, to flow, hasten). Any unusual, severe, or destructive atmospheric phenomenon, such as a windstorm, sandstorm, tornado, typhoon, or hurricane, in which the wind is the destructive agent; a rainstorm, hailstorm, or snowstorm, monsoon, cloudburst, or flood, in which the precipitation is the prominent feature; a thunderstorm in which the thunder is impressive and the lightning is destructive; a blizzard, in which the combined cold wind and snow is the prominent feature. All these storms attend the flow of air from areas of high to those of low barometric pressure, or so-called storm centres or 'lows.' In general the winds blow around and in toward these low areas, thereby producing still lower barometric pressures near the centre. The lower air, being forced to rise above the earth's surface, expands, cools, and precipitates its excess of moisture, thereby giving us rain, snow, or hail.

Storms are often classified as attending areas of low pressure (cyclonic storms); or as attending areas of high pressure (anti-cyclonic). In all cases the flow of the air is primarily due to differences of density; the denser air is impelled to the earth's surface and is also pushed toward the equator by gravity. But the centrifugal force due to the diurnal rotation of the earth also pushes the denser air toward the equator harder

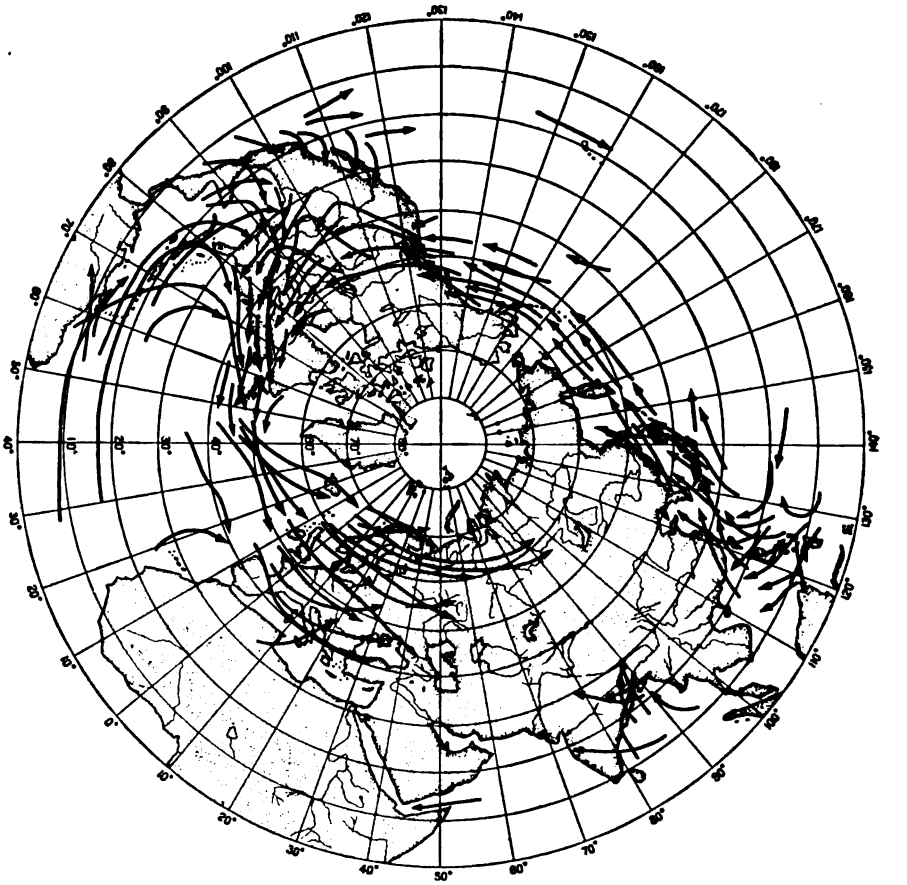


FIG. 1. CHART SHOWING STORM-PATHS.

than it does the lighter moist air. For both reasons, therefore, the lighter is raised up by the denser air, and overflows toward the pole. Now a body on the earth's surface and in motion relative to it, while at the same time rotating with it, will appear to an observer on the earth to be deflected toward the right hand as it moves forward in the Northern Hemisphere, but to the left hand in the Southern Hemisphere. By virtue of this deflection the winds that are blowing toward a region of low pressure acquire, each for itself, a deflection toward the right or the left respectively, so that instead of meeting at the centre they whirl around it in an inflowing spiral curve. By reason of this circulation an outward centrifugal pressure is produced, and the barometric pressure in the central region is much smaller than it would be if the winds flowed directly to the centre, without any spiral circulation. In extensive storm areas this general tendency of the lower winds to circulate around a centre may exist over a region a thousand miles or even more in diameter.

The mechanical and thermal problems connected with the generation and maintenance of storms are set forth without technical mathematics by Prof. William Ferrel in his *Popular Treatise on the Winds* (1st ed., New York, 1889). They are discussed most elaborately in a technical manner by Prof. F. H. Bigelow in his *Report on International Cloud Work* (published as vol. ii. of the *Report of the Chief of the Weather Bureau for 1898*). A full presentation of the work that has been done upon this subject by all students during the past century will be found in the *Lehrbuch der Meteorologie*, by Prof. Dr. Julius Hann (Leipzig, 1901), of which an English translation is promised in the near future.

As far as possible the paths pursued by storm centres during past years are platted upon charts, then they are classified according to their general characteristics and studied with reference to their relations to the topography of the continents and the general distribution of the barometric pressure, temperature, and moisture, and especially to the so-called general circulation of the atmosphere. The frequency of storms and the general types of storm paths are, of course, best known for the continental portions of the Northern Hemisphere, but there is also sufficient data for the oceanic regions to justify an attempt at presenting the accompanying sketch chart of the Northern Hemisphere showing the general character of the storm paths and the locations where they most frequently occur. (See Fig. 1.) This chart shows by its numerous lines and arrow heads the occurrence and the direction of motion of storm centres along the lines of greatest frequency, so far as now known. The Arctic region, Northern Africa, and Central Asia must be considered as blanks; we have no daily maps for these regions, and only know that general cyclonic storms are infrequent in Africa and Asia. The chart shows that storm centres move slowly westward when within the tropics and also slowly toward the pole, but move more rapidly eastward between the tropics and the Arctic Circle, as well as more rapidly northward. The zone of greatest storm frequency lies between latitudes 45° and 55°. In general the path of any observed storm may be predicted on the basis of a simple study of this chart of storm tracks. But individual temporary departures from average conditions are so great that in actual weather forecasts it is necessary to allow these general maps of types and averages to have only a very slight influence upon the work. It is, in fact, always necessary to consider what the special individual storm has been doing during the preceding few days, and to what extent it is normal, and to what extent it is abnormal, as to the direction and velocity of its motion, and

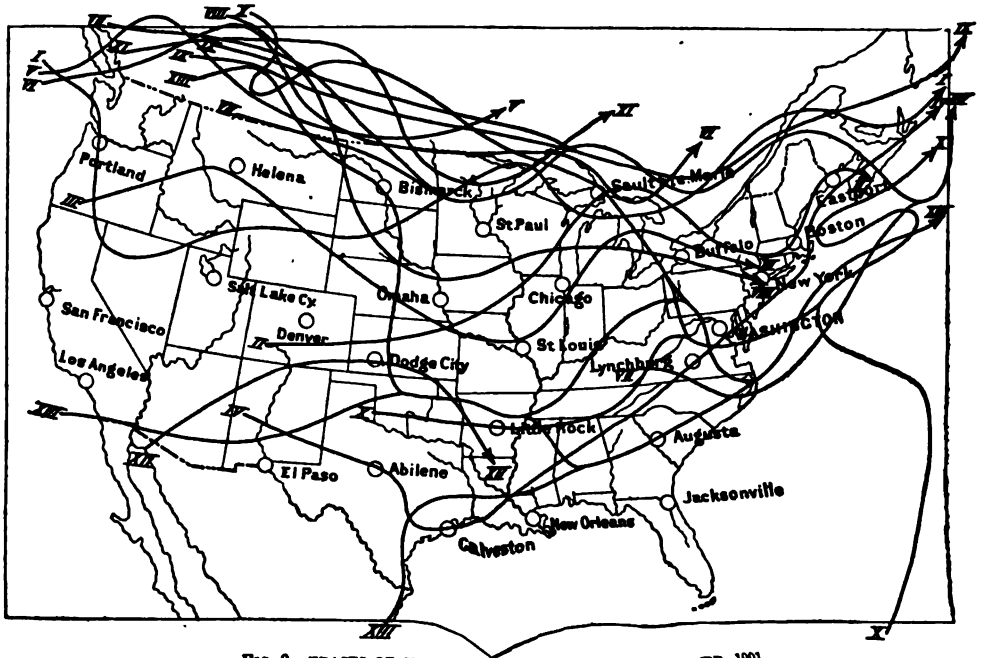

FIG. 2. TRACKS OF CENTRES OF LOW AREAS, JANUARY, 1901.

the rate of its increase or decrease in intensity. This can only be done by a careful comparison of several successive weather maps. As these maps are made up at least twice a day and sometimes more frequently, the forecaster is in a position to say how fast the storm is moving and whether it is growing more intense or rapidly dying away.

The great irregularities in individual storm paths may be appreciated by studying the accompanying chart (Fig. 2) showing the tracks of all the centres of low pressure which passed over the United States during January, 1901. The storms in that month were unusually severe over the North Atlantic Ocean. Of the thirteen tracks that are here charted four moved with a velocity of over one thousand miles daily; one of them at a velocity of less than five hundred miles daily; and one was stationary for one day. Further details in regard to these storms are given in the text of the *Monthly Weather Review* for the month in question. More than one-half of the cyclonic storms that pass over the United States have been developed somewhere in the Pacific Ocean. Perhaps one-quarter originated within the United States. The others are first perceived off the coasts of the West Indies or on the Gulf of Mexico. The most severe storms are the hurricanes that begin in the tropical portion of the Atlantic, move westward and northward into the South Atlantic or Gulf States, then turn toward the northeast and disappear while still moving toward Europe. The paths pursued by general cyclonic storms are apparently determined by the so-called general circulation of the atmosphere, but are modified considerably by the formation of cloud and rain or snow attending the storm.

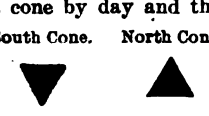
The most extensive condensed collection of data relative to American storms is found in the "Contributions to Meteorology," by Professor Loomis, as revised and published in the *Memoirs of the National Academy of Sciences*, vols. iii., iv., and v. (Washington, 1885, 1887, and 1889). The details of current storm phenomena are published regularly by the Weather Bureau in the *Monthly Weather Review*. The physical-mathematical theories founded by Espy and Ferrel have been further developed in numerous memoirs, some of which will be found in a collection of translations published by the Smithsonian Institution in 1891. The current literature is contained in the successive volumes of the *Meteorologische Zeitschrift* (Berlin). A general summary of our knowledge of the mechanics of storms is given by Prof. F. H. Bigelow in his *Report on International Cloud Work* (Washington, 1900).

STORM, stôrm, GUSTAV (1845-1903). A Norwegian historian, born at Lom. He studied at Christiania, where he became professor of history in 1887. His publications, which include a large number of articles in German and Scandinavian journals, deal chiefly with early Scandinavian history. They include *Sagnkredsene om Karl den Store og Didrik af Bern* (1874), *Kritiske bidrag til vikingetidens historie* (1878), and a translation of Snorre Sturlasson's *Kongesagaer* (1897), on which he had previously written his *Snorre Sturlassöns historieskrivning* (1873). He also edited the important *Monumenta historica norvegica* (1880). In 1900 the Norwegian Storthing appropriated twenty thousand kroner for a popular edition of Storm's Dano-Norwegian rendering of the *Heimskringla*, which had appeared in 1886-89.

STORM, THEODOR (1817-88). A German poet and novelist, one of the great masters of that peculiarly German creation, the short story of character and sentiment. He was born at Husum, Schleswig, on September 14, 1817, studied jurisprudence at Kiel and Berlin, and, returning to Kiel in 1839, became intimate with the brothers Theodor and Tycho Mommsen, poetry being the bond of union, especially their mutual admiration for the Swabian poet Mörike. The result was the publication of the *Liederbuch dreier Freunde* (1843), now a great rarity, which contained Storm's first essays in poetry. For ten years he practiced law in his native town and returned to it as Landvogt in 1864, having entered the Prussian civil service in 1853, and occupied judicial offices at Potsdam and Heiligenstadt, near Göttingen. In 1880 he retired and settled at Hademarschen, in Holstein, where he died on July 4, 1888.

Storm began his literary work at Husum by collecting the popular sagas and stories of Schleswig-Holstein, then assisted Biernatzki in editing his *Volksbuch*, in which, besides some exquisite lyrics, his first three important stories, *Martha und ihre Uhr* (1848), *Im Saale* (1849), and *Immensee* (1850), saw the light. The last-named novelette, the author's most popular and perhaps also his most characteristic work, was the crowning achievement of his first period; it is the best specimen of that retrospective type of story with which Storm's name is most intimately associated, and deservedly occupies a place in the front rank of the short stories of any land or age. Through various translations it has become familiar also to English readers. Of about a dozen stories written during the eleven years of absence from his native soil, *Im Sonnenschein* (1854) and *Angelica* (1855) are sketches of by-gone days, tinged with the elegiac melancholy which forms the key-note of most of the author's stories; *Im Schloss* (1861) and *Von jenseits des Meeres* (1864) boast of happy endings, and *Auf der Universität* (1862) is the most ambitious story of this period, in which scenes from Storm's own student life are charmingly interwoven. *Die Regentrude* (1864) is the best of several delicious fairy-tales. With Storm's return to Husum in 1864 his work enters an essentially new phase, in which the passive retrospective novel gives place to a more active and dramatic form of romance. On the one hand is here to be considered a series of chronicle-novels, written in an archaic style, comprising *Der Spiegel des Cyprianus* (1865), a romantic tale of the Thirty Years' War, *Aquis submersus* (1876), *Renata* (1878), *Zur Chronik von Grieshuus* (1884), and *Ein Fest auf Haderslevhuus* (1885); on the other hand some artist-novels, such as *Ein stiller Musikant* (1874), and *Psyche* (1875). On psychological lines are *Viola tricolor* (1873), *Carsten Curator* (1878), *John Riew* (1885), *Ein Bekenntnis* and *Der Schimmelreiter* (1888). Nor should the delightful children's story *Pole Poppenspäler* (1874) be forgotten. Consult Schütze, *Theodor Storm, sein Leben und seine Dichtung* (Berlin, 1887); Wehl, *Theodor Storm, ein Bild seines Lebens und Schaffens* (Altona, 1888); Schmidt, *Charakteristiken*, I. (Berlin, 1886); Stern, *Studien zur Litteratur der Gegen-*

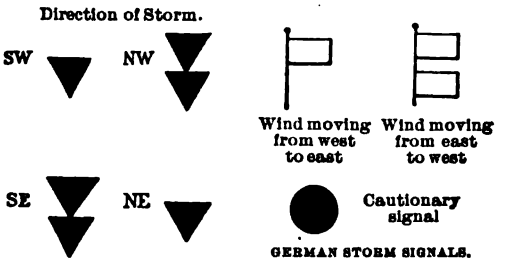
wart (Dresden, 1895); Robertson, in *The Gentleman's Magazine* (London, 1895); and Remer, *Theodor Storm als norddeutscher Dichter* (Berlin, 1897).



STORM AND STRESS (Ger. *Sturm und Drang*). The name of an emancipatory movement in German literature. It received the title from that of a typical drama by Klinger (1776), who wrote under the influence of Rousseau, with 'originality' and 'genius' as his watchwords. To this movement belong Goethe's *Götz von Berlichingen*, Schiller's *Die Räuber*, and countless works of similar striving but inferior worth. See GERMAN LITERATURE.

STORM AND WEATHER SIGNALS. Flags, semaphores, lanterns, steam whistles, and other devices exhibited or sounded to inform mariners and others of storms or weather conditions. The display of such warnings resulted from the personal studies in more or less coöperation about the middle of the nineteenth century. Storm and weather signals, properly so called, began to be displayed about 1863 in England by Captain Fitzroy; in France by Leverrier; and in Belgium by Buys-Ballot. The American system of observations began in 1870 and storm signals were first displayed in the autumn of 1871. At the present time every civilized nation and every port of any importance has some method of signaling or otherwise informing navigators of approaching storms. Among the systems that are now in use are the following:

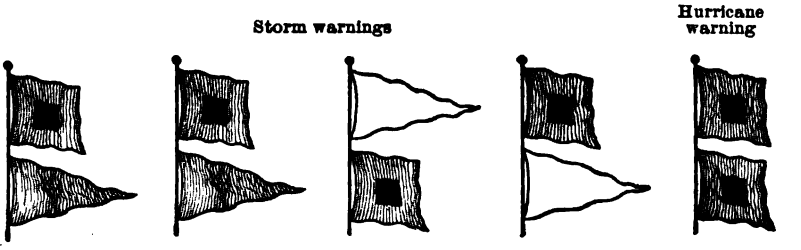
The *semaphore* is a simple vertical post having two or more arms attached that can be set at different angles with the vertical. The semaphore was introduced as a telegraphic apparatus about 1790, and numerous semaphore stations are still maintained in Europe and in various colonies. See SIGNALING AND TELEGRAPHING, MILITARY, for illustration.



The Dutch and Belgian *aëroclinoscope* (q.v.) is a modified semaphore, in which the position of the arm indicates the direction of the barometric gradient and consequently of the wind that is nearly perpendicular to that.

The British system of storm warnings utilizes a cone by day and three red lights, arranged as a triangle, by night. If the cone point downward it indicates a storm-wind from the southeast, veering through south to the northwest. If the cone point upward it indicates a northwest gale veering through the north to northeast.

BRITISH STORM SIGNALS.



The German system consists of cones and double cones by day, and a single red lantern by night. The accompanying diagram shows the arrangement of the cones. The change in direction of the wind is indicated by red flags. If the wind is expected to vary from west of north to east, a single flag is raised; if the movement is in the opposite direction, two flags.

GERMAN STORM SIGNALS.

The symbols and signals used at the ports of the Orient depend upon the nationality of the port.

The arrangement of flags used in the United States by the United States Weather Bureau for storm warnings differs from that for weather forecasts and is shown in the accompanying illustrations.

EXPLANATION OF UNITED STATES WEATHER BUREAU STORM AND HURRICANE WARNINGS.

Storm Warning. A red flag with a black centre indicates that a storm of marked violence is expected.

The pennants displayed with the flags indicate the direction of the wind; red, easterly (from northeast to south); white, westerly (from southwest to north). The pennant above the flag indicates that the wind is expected to blow from the northerly quadrants; below, from the southerly quadrants.

By night a red light indicates easterly winds, and a white light above a red light, westerly winds.

Hurricane Warning. Two red flags with black centres, displayed one above the other, indicate the expected approach of a tropical hurricane, or one of those extremely severe and dangerous storms which occasionally move across the lakes and northern Atlantic coast.

No night hurricane warnings are displayed.

Signals for the weather forecasts are as follows:

INTERPRETATION OF DISPLAYS.

No. 1, alone, indicates fair weather, stationary temperature.

No. 2, alone, indicates rain or snow, stationary temperature.

No. 3, alone, indicates local rain or snow, stationary temperature.

No. 1, with No. 4 above it, indicates fair weather, warmer.

No. 1, with No. 4 below it, indicates fair weather, colder.

No. 2, with No. 4 above it, indicates rain or snow, warmer.

No. 2, with No. 4 below it, indicates rain or snow, colder.

No. 3, with No. 4 above it, indicates local rain or snow, warmer.

No. 3, with No. 4 below it, indicates local rain or snow, colder.

When a steam-whistle is used for weather signals a warning blast of from 15 to 20 seconds'

duration is first sounded and then the longer blasts (4 to 6 seconds), which refer to weather, and the shorter blasts (1 to 3 seconds), which refer to temperature, the former being sounded first. The signals are as follows:

BLASTS	Indicate
One long	Fair weather
Two long	Rain or snow
Three long	Local rain or snow
One short	Lower temperature
Two short	Higher temperature
Three short	Cold wave

These signals may be repeated to avoid error.

STORM KING. A rocky peak of the Highlands of the Hudson, 1530 feet in height, 4 miles north of West Point. Its Dutch name was Boterberg, Butter Mountain. At its foot lies the town of Cornwall.

STORMS, CAPE OF. See CAPE OF STORMS.

STORM VAN 'SGRAVESANDE, vän sgrä'-ve-zän'de. A name sometimes applied to the Dutch mathematician Willem Gravesande (q.v.).

STOR'NOWAY. The chief town of Lewis with Harris (q.v.), an island of the Outer Hebrides, Scotland (Map: Scotland, B 1). Its chief feature is the palatial Stornoway Castle, completed in 1870. It is an important fishing station, exporting large quantities of fish to home and Baltic ports, and has a fine harbor, covering a square mile. Urban population, in 1901, 3711; of parish, in 1901, 12,983.

STORRS, CHARLES BACKUS (1794-1833). An American Congregational minister. He was born at Longmeadow, Massachusetts, and entered Princeton College, but, owing to ill health, did not graduate. He studied theology at Andover and was ordained in South Carolina in 1821. He was pastor in Ravenna, Ohio, 1822-28, was chosen professor of divinity in Western Reserve College in 1828, and president, in 1831.

STORRS, RICHARD SALTER (1821-1900). An American Congregational minister, born at Braintree, Mass. He graduated at Amherst College, 1839, and Andover Theological Seminary, 1845; was ordained pastor of the Harvard Congregational Church, Brookline, Mass., the same year; pastor of the Church of the Pilgrims, Brooklyn, N. Y., 1846, and so remained till his death. He was much sought after as an orator on special occasions and as lecturer, and his best-known works were composed in answer to such demands. But he united learning with oratorical power, and his works have permanent elements. Among them are: *The Wisdom, Power, and Goodness of God as Manifested in the Constitution of the Human Soul* (the Graham Lectures, 1857); *The Conditions of Success in Preaching Without Notes* (1875); *The Early American Spirit and the Genesis of It* (1875); *The Declaration of Independence and the Effects of It* (1876); *John Wycliffe and the First English Bible* (1880); *The Recognition of the Supernatural in Letters and Life* (1881); *Manliness in the Scholar* (1883); *The Divine Origin of Christianity Indicated by Its Historical Effects* (1884); *The Puritan Spirit* (1890); *Bernard of Clairvaux, the Times, the Man, and His Work* (1892).

STORRS, WILLIAM LUCIUS (1795-1861). An American jurist, born at Middletown, Conn. He graduated at Yale College, 1814; studied law at Whitestown, N. Y.; was admitted to the bar in 1817; resided and practiced law in Middletown; and was a member of Congress 1829-33 and 1839-40. He was a Whig in politics. In the latter year he was appointed associate judge of the State Supreme Court of Errors; Chief Justice, 1856; and was professor of law in Yale College, 1846-47. His decisions are printed in the Connecticut *Reports*.

STORTHING, stōr'ting. The legislative assembly of Norway (q.v.).

STO'RY, JOSEPH (1779-1845). An eminent American jurist and judge, born at Marblehead, Mass. He graduated from Harvard College in 1798, studied law, and was admitted to the bar in 1801. For a time he gave considerable attention to general literature and poetry. In 1804 he published *The Power of Solitude*, and other poems, which were not favorably received. He was discouraged by this failure, which he always felt keenly, and thereafter devoted himself to law and politics. He was elected to the State Legislature in 1805 and became a leader of the Republican, or, as it was afterwards called, the Democratic Party, and defended the measures of Jefferson. In 1808 he was elected to Congress, and although he was not in sympathy with the administration, President Madison, in 1811, appointed him associate justice of the Supreme Court of the United States. He was then only thirty-two years of age. In 1820, as a member of the Massachusetts Constitutional Convention, he advocated a property basis for the Senate. In 1829 he was appointed professor of law at Harvard, and taught law very successfully for sixteen years, at the same time serving on the Supreme Court bench. He was opposed to slavery, and was accordingly very unpopular in certain sections of the country. He presided as acting Chief Justice of the Supreme Court for some time after the death of Marshall, and probably only his attitude toward the administration prevented his selection as the permanent Chief Justice. During his long service on the bench he decided many admiralty and patent law cases which are authority at the present time, and he shared with Chancellor Kent the distinction of molding American equity jurisprudence. He wrote the opinion in the celebrated Dartmouth College case, which has been the subject of much criticism, although recognized as an able effort. He received the degree of LL.D. from Brown in 1815, from Harvard in 1821, and from Dartmouth in 1824. He continued his labors on the bench and in the law school until his death at Cambridge in 1845. His legal writings and decisions are still frequently quoted in the highest courts of the United States and England. He published the following legal works: *Commentaries on the Law of Bailments* (Boston, 1832); *Commentaries on the Constitution of the United States* (1833); *Conflict of Laws* (1834); *Commentaries on Equity Jurisprudence* (1835-36); and works on *Bills and Notes, Partnership, Agency, and Equity Pleadings*, at later dates. All of his works have gone through many editions, and are still used. See *Life and Letters of Joseph Story*, by W. W. Story (Boston, 1851).

STORY, WILLIAM WETMORE (1819-95). An American author and sculptor. He was born at Salem, Mass., the son of Justice Story of the United States Supreme Court. After studying

law at Harvard College, and under his father's direction, he was admitted to the bar, and practiced his profession in Boston. He published several legal books, among them: *Reports of Cases Argued and Determined in the Circuit Court of the United States* (1842-47); a *Treatise on the Law of Contracts* (1844); and a *Treatise on the Law of Sales of Personal Property* (1847). In 1848 he gave up law and went to Italy, where he made his home, residing principally at Rome, and died at Vallombrosa. The list of his works as a sculptor includes monuments, statues, ideal figures, and portrait busts. In the Metropolitan Museum, New York City, are the statues of Cleopatra (1864) and Semiramis (1874); other works by him include a statue of his father (Mount Auburn Cemetery); Edward Everett (Boston Public Gardens); a bronze statue of George Peabody, erected in London (replica, Baltimore, 1888); and the monument of Francis Scott Key in the Golden Gate Park, San Francisco. His last work was the "Angel of Grief," a monument erected to his wife, whom he survived but a year. His work is done in the classical style, showing, however, some slight tendency toward realism. Story was prolific in literature as well as in art. He published *The American Question* (1862); *Roba di Roma* (1862); *Proportions of the Human Figure* (1866); *Graffiti d'Italia* (1869); five volumes of his poems; and the *Life and Letters of Joseph Story* (1851). Story was United States commissioner on fine arts to the World's Fair at Paris (1879), and received decorations from France and Italy. An admirable *Life* of Story by Henry James appeared in 1903 (London and New York).—His son, JULIAN STORY, a portrait painter, was a student of Duveneck, Boulanger, and Lefebvre. He received a gold medal in Berlin in 1891, was elected a member of the Society of American Artists in 1892, and won a silver medal at the Paris Exposition of 1900. Among his sitters were King Edward VII. and Emma Eames, whom he married.

STOSCH, stôsh, ALBRECHT VON (1818-96). A German general and naval administrator, born at Coblenz. He received a military education and was commissioned lieutenant in 1835. He entered the general staff in 1855, and became chief of staff of the Fourth Army Corps in 1861 and major-general in 1866. In the Seven Weeks' War he was quartermaster-general of the Second Army. In the same year he was appointed director of the commissary department with the rank of lieutenant-general, and was chief of staff with the army left in France after the conclusion of peace. In 1872 he was appointed chief of the admiralty, and in 1876 received the title of admiral. While holding these offices he greatly increased the power and efficiency of the German navy. He retired in 1883 and died February 29th, 1896.

STOSS, stôs, VEIT (c.1440-1533). A celebrated German sculptor and engraver, the chief master of wood-carving in Germany. Beyond the fact that Nuremberg was his birthplace, nothing certain is known of his parentage, his youth and apprenticeship, but very probably he was reared in the school of Michel Wohlgemuth. The first definite mention of him dates from 1477, when he removed to Cracow, where he was held in great esteem and whence he returned in 1496, a well-to-do man, since in 1499 he bought a stately mansion at Nuremberg and made other investments besides. As to his subsequent life, we are informed that he caused much distress to the honorable council of Nuremberg, involved the city in litigation, and forged an obligatory bill, a crime which was then punishable by death. The council, however, by a special act of mercy, commuted the sentence to having him branded (1503), both his cheeks being pierced with a hot iron by the executioner. For breaking his oath not to leave the city, he subsequently had to suffer imprisonment, and in 1533 died, it is said, totally blind, at the age of ninety-three. This restless and graceless citizen, this forger and perjurer was nevertheless an artist of the most tender and feeling conception, whose works display the youthful purity of the Madonna and other saints as few of the masters of his time have done.

His earliest work on record is the "High Altar," in Saint Mary's at Cracow, executed in 1477-89, with the "Death of the Virgin" and the "Assumption" in the middle shrine, a work praised as a wonder of art by the master's contemporaries and to this day reckoned among the most perfect creations of its kind, exhibiting the artist's chief characteristics: vivid description, varied and animated figures, and rich drapery. Next followed, in 1492, the "Monument of King Casimir IV.," in the Cross Chapel of the Cathedral, a work of solemn splendor and withal of dignified simplicity. The earliest of his sculptures executed at Nuremberg are the three stone reliefs of the "Last Supper," "Christ on the Mount of Olives," and "Taking of Christ" (1499), in the ambulatory of Saint Sebaldus; over the high altar in the same church rises the "Crucifix and Figures of Mary and Saint John," designated as his last work (1526). Of the main altar in the Frauenkirche, only the heroic size statue of the "Madonna" (1504) is preserved, besides two reliefs. The taper-bearing angels in the choir of this church are also by Stoss. In the Germanic Museum may be seen the noble high-relief of the "Crowning of the Virgin by God and Christ," clear in composition and executed with masterly perfection; and the wooden paneling known as the "Rose Garland," in the centre reliefs of the Last Judgment and of the Heavenly Host grouped around a cross of Saint Anthony within a garland of roses, the whole framed by twenty-three minute reliefs of scenes from biblical history. Seven more reliefs, which formed part of this work, are now in the Berlin Museum. Noteworthy is the large "Pietà" in the Jacobskirche, which also contains several smaller but very able works of the master, but his best-known and chief work in carved wood is "The Angel's Salutation" (1518), in the Church of Saint Lawrence, the central group of heroic size surrounded by a chaplet of roses in which are set seven medallions with the Joys of the Virgin in bas-relief, a work unique in beauty and conception. He executed the superbly carved altar-pieces in the parish church at Schwabach (1506) and in the upper parish church at Bamberg (1523). His engravings, scenes from the Passion, severe in style and dating from his early period, are now very rare. Consult: Bergau, *Der Bildschnitzer Veit*

Stoss und seine Werke (Leipzig, 1877); Rée, in *Allgemeine deutsche Biographie*, xxxvi. (ib., 1893); Bode, *Geschichte der deutschen Plastik* (Berlin, 1887); and Lübke, *History of Sculpture*, trans. by Bunnett, ii. (London, 1872).

STOTHARD, stŏth'ĕrd, CHARLES ALFRED (1786-1821). An English antiquarian draughtsman, the second son of the painter Thomas Stothard. He was born in London, studied at the Royal Academy Schools, and exhibited his best painting, "The Death of Richard II.," in 1811. Afterwards he worked on the *Magna Britannia* (1815), and became historical draughtsman to the Society of Antiquaries. In that capacity he made drawings of the Bayeux tapestry, which were published in the society's *Vetusta Monumenta* (1821-23). His most important work was the *Monumental Effigies of Great Britain* (1811-21), which was completed by other artists, and republished in 1876. His drawings are all of remarkable accuracy.—His widow, ANN ELIZA KEMPE (1790-1883), who afterwards married Edward Atkyns Bray, was a well-known author. She wrote *Memoirs of C. A. Stothard* (1823). See BRAY, MRS. ANN ELIZA KEMPE (STOTHARD).

STOTHARD, THOMAS (1755-1834). An English illustrator and painter, born in London. In 1777 he entered the schools of the Royal Academy, and exhibited his first picture, the "Holy Family," in 1778. In 1779 he entered upon his career as an illustrator of books. More than 3000 of his designs were engraved, the greater number of which are to be found in the British Museum. Although lacking in temperament, his illustrations are characterized by grace and charm and by a sympathetic touch, especially when he depicted the loveliness of childhood. Stothard illustrated the novels of Fielding, Richardson, and Sterne; *Don Quixote*, *Gil Blas*, *Robinson Crusoe*, *Gulliver's Travels*, the *Arabian Nights*, *Clarissa Harlowe*, and *Tristram Shandy;* he also made designs to Miltou (1792-93), Pope's *Rape of the Lock* (1798), and Shakespeare's *Seven Ages of Man* (1790). As a painter he is less important. He designed decorations for the staircase at Burghley (1799), the cupola of the upper hall of the Signet Library (1822) at Edinburgh, and the decorations of the drawing-room, throne-room, and great staircase of Buckingham Palace. Of his easel pictures, the National Gallery possesses "Venus and Cupid Attended by the Graces" (1824), the "Woodland Dance," and the "Myth of Narcissus" (1793). Consult Mrs. Bray, *Life of Thomas Stothard* (London, 1851).

STOUGHTON, stō'ton. A town, including several villages, in Norfolk County, Mass., 18 miles south of Boston, on the New York, New Haven and Hartford Railroad (Map: Massachusetts, E 3). It has a public library with over 7000 volumes, and a handsome town hall. Boot and shoe making, and the manufacture of woolens, rubber goods, boxes, and wire are the chief industries. The government is administered by town meetings, convening annually. The waterworks are owned and operated by the town. Population, in 1890, 4852; in 1900, 5442. Stoughton, named in honor of Governor William Stoughton, was set off from Dorchester and incorporated in 1726. Consult Hurd, *History of Norfolk County* (Philadelphia, 1884).

STOUGHTON, ISRAEL (?-c.1645). An American colonist, born in England. He was one of the founders of Dorchester, Mass., and in 1633 he became a freeman of the colony. Though a member of the General Court in 1634 and 1635, he wrote a pamphlet denying the right of the assistants to act as magistrates. As a punishment, the Government debarred him from holding public office for three years, but upon his making a humble submission revoked the sentence. From 1637 to 1643 he himself was chosen an assistant, and in 1637 he was appointed commander of the colony's troops in the Pequot War. In 1639 he was a commissioner in the boundary controversy with Plymouth. Five years later he went to England, where he entered the Parliamentary forces with the rank of lieutenant-colonel and probably fought at the battle of Naseby. At his death he left 300 acres of land in Dorchester to Harvard University. Consult Quincy, *History of Harvard University* (Boston, 1860).

STOUGHTON, JOHN (1807-97). An English dissenting preacher and ecclesiastical historian. He was born in Norwich, and after receiving an elementary education entered a law office. He abandoned the law for the ministry, and after some preparation in Highbury College he was ordained in 1833. In 1872 he was elected professor of historical theology in New College, Saint John's Wood, though he still occasionally preached. In 1862 he published *Church and State, Two Hundred Years Ago . . . 1660-63*. His other important works are: *Ecclesiastical History of England from the Opening of the Long Parliament to the Death of Oliver Cromwell* (1867); *The Church of the Restoration* (1870); *The Church of the Revolution* (1874); *Religion in England Under Queen Anne and the Georges* (1878); *Religion in England from 1800 to 1850* (1884). Though somewhat diffuse, these histories are thorough and impartial: Consult his *Recollections of a Long Life* (London, 1894).

STOUGHTON, WILLIAM (c.1632-1701). A colonial Governor of Massachusetts. He was born in England, early emigrated to America, graduated at Harvard in 1650, and was a fellow at New College, Oxford, from 1652 until ejected at the time of the Restoration (1660). Returning to Massachusetts, he was a selectman from 1671 to 1674, an assistant from 1671 to 1686—though in 1684 he refused to serve—and a commissioner of the United Colonies from 1673 to 1677, and again from 1680 to 1686. In 1677 he went to England as the agent of his colony in a boundary dispute with New Hampshire. He was a member of Governor Andros's Council, but, nevertheless, served on the Council of Safety that deposed him, and from 1692 until his death was Lieutenant-Governor of Massachusetts, being acting Governor from the recall (1694) of Sir William Phipps until the arrival (1699) of Lord Bellomont. In 1692 he was chief justice of the special court of oyer and terminer by which the Salem 'witches' were tried, and, as such, treated the accused with relentless severity. He was a liberal benefactor of Harvard, and it was for him that Stoughton Hall was named. He published *New England's True Interest Not to Lie*, the election sermon preached by him in Boston in 1668, and a pamphlet en-

titled *A Narrative of the Proceedings of Andros* (1691).

STOUGHTON MUSICAL SOCIETY. See CHORAL SOCIETIES.

STOURBRIDGE, stĕr'brĭj. A town in Worcestershire, England, 20 miles north-northeast of Worcester, on the Stour (Map: England, D 4). It contains iron, glass, earthenware, and fire-brick factories. 'Stourbridge clay,' upon which the action of fire has less effect than upon most varieties of clay, is an article of export. Conservatory pots, crucibles, etc., are made of it. In the grammar school founded in 1552, and rebuilt in 1864, Samuel Johnson received part of his education. Population, in 1891, 14,891; in 1901, 16,302.

STOURM, stōōrm, RENÉ (1837—). A French economist, born and educated in Paris. He was employed in a department of the Ministry of Finance, became professor of finance in the Ecole Libre des Science Politiques, and in 1896 succeeded Léon Say as a member of the Academy of Political and Moral Sciences. On the history of finance, and more especially of taxation, he wrote *Les finances de l'ancien régime et de la révolution* (1885); *Le budget, son histoire et son mécanisme* (1889); *Systèmes généraux d'impôts* (1893); *Bibliographie historique des finances de la France du XVIIIème siècle* (1895); and *Les finances du consulat* (1902).

STOUT. See BEER.

STOUT, GEORGE FREDERICK (1859—). An English psychologist, born at South Shields, and educated at the Charlotte Terrace School in his native town and at Saint John's College, Cambridge. He was made a fellow at Saint John's College in 1884, and succeeded Croom Robertson as editor of *Mind* in 1891. After holding various academic positions in the field of philosophy and psychology, he was appointed in 1903 professor of logic and metaphysics in the University of Saint Andrews. His chief published works are: *Analytic Psychology* (1896); *Manual of Psychology* (1899); "Truth and Error," in *Personal Idealism* (1902); *Groundwork of Psychology* (1903). As a pupil of James Ward (q.v.), Stout infused into the traditional English psychology something of his teacher's critical spirit. His *Analytic Psychology* is planned, however, as a preliminary to a larger work on genetic psychology, in which especial attention is to be devoted to ethnographic evidence.

STOVE. See HEATING AND VENTILATION.

STOW, JOHN (1525-1605). One of the earliest and most diligent collectors of English antiquities. He was brought up to his father's trade of a tailor, but ultimately abandoned it for antiquarian pursuits. His principal works are his *Summary of English Chronicles*, first published in 1561, and subsequently reprinted every two or three years, with a continuation to the date of each new publication; *Annals of England*, 1580, and reprinted in 1592, to which year the annals are brought down; and *A Survey of London*, the most important of his writings, published in 1598. Besides these original works, Stow assisted in the continuation of Holinshed's *Chronicle*, Speght's edition of Chaucer, Leland's *Collectanea*, etc.

STOWE, stō, CALVIN ELLIS (1802-86). An American clergyman and author, born in Natick, Mass. He was educated at Bowdoin College and at Andover Theological Seminary. From 1830 to 1832 he was professor of Greek at Dartmouth College, and in the latter year became professor of sacred literature at Lane Theological Seminary, Cincinnati, where in 1836 he married Harriet, the daughter of Lyman Beecher, then president of the seminary. From 1850 to 1852 he was professor of divinity at Bowdoin College, and from 1852 until his retirement in 1864 was professor of sacred literature in Andover Theological Seminary. Among his published works are: *The Hebrew Commonwealth* (1829), from the German of Gahn; *Lectures on the Sacred Poetry of the Hebrews* (1829), from the Latin of Lowth; *Introduction to the Criticism and Interpretation of the Bible* (1835); *Elementary Education in Europe* (1837); *The Religious Element in Education* (1844); and *The Origin and History of the Books of the Bible* (1867).

STOWE, HARRIET ELIZABETH (BEECHER) (1811-96). A famous American novelist, born in Litchfield, Conn. She was the daughter of the Rev. Lyman Beecher, and sister of Henry Ward Beecher. She attended school at Litchfield Academy and later at Hartford. In 1832 her father was called to the presidency of Lane Theological Seminary at Cincinnati, Ohio. While living in that city she gained a personal acquaintance with the ways of slavery, especially in regard to the handling of fugitive slaves and the attitude of the South toward the abolitionists. The impression was strengthened by several journeys into some of the slave States with her husband, the Rev. Calvin E. Stowe, a strong anti-slavery man, whom she married in 1836. In 1843 Mrs. Stowe published her first book, entitled *The Mayflower, or Sketches of Scenes and Characters Among the Descendants of the Pilgrims.* In 1850 her husband was called to Bowdoin College, Brunswick, Maine, and in the interval before his transfer to the chair of sacred literature at Andover (Mass.) Theological Seminary, two years later, she wrote the book by which she is most widely known, *Uncle Tom's Cabin, or Life Among the Lowly.* The novel appeared in the *National Era* of Washington, D. C., between June, 1851, and April, 1852, in which latter year it was issued in book form in Boston. As a serial it attracted no unusual notice, but as a book its success, after a few weeks, was unprecedented. Five hundred thousand copies were sold in the United States in five years, and many more in England, and it has been translated into at least nineteen foreign languages. In the following year Mrs. Stowe, in reply to various inquiries, criticisms, and censures, published *A Key to Uncle Tom's Cabin.* She also wrote, in the same year, *A Peep into Uncle Tom's Cabin, for Children.*

The health of Mrs. Stowe was impaired by the excitement of her work, and in 1853 she went to Europe. On her return she published (1854) *Sunny Memories of Foreign Lands*, two volumes relating her travels. She then returned to the attack against slavery in *Dred: A Tale of the Great Dismal Swamp* (1856; at one time entitled *Nina Gordon*), but without the unction and success of her former work. Thenceforth her writing consisted chiefly of novels of quiet New England life, with which she was familiar, and except for her polemic book, *Lady Byron Vindi-*

cated: A History of the Byron Controversy (1869), and her article in *Macmillan's Magazine* which had occasioned that discussion, her works were comparatively free from the didactic spirit. The chief titles are: *The Minister's Wooing* (1859); *The Pearl of Orr's Island* (1862); *Agnes of Sorrento* (1862); *Religious Poems* (1867); *Oldtown Folks* (1869); *Pink and White Tyranny* (1871); *Sam Lawson's Fireside Stories* (1871); *My Wife and I* (1871); *Palmetto Leaves* (1873); *We and Our Neighbors* (1875); and *Poganuc People* (1878). Of these, the best are *The Minister's Wooing* and *Oldtown Folks*, which were greatly praised by such critics as Lowell. She removed from Andover to Hartford in 1864, and in 1868 became associated with D. G. Mitchell in the editorship of *Hearth and Home*.

Mrs. Stowe is remembered chiefly as the author of probably the most potent and widely read novel in modern literature. Though, like almost all her novels, loose and rambling in structure, *Uncle Tom's Cabin* has abundant vitality, and is the work of a genuine story-teller. It also has the unusual fortune of being at once a cause and an outcome of a heated national struggle; no novel was ever better timed for an occasion, and few have aroused so much admiration and dislike. Soon after its publication the book was dramatized, and probably no other play has been produced so many times or seen by so many people. Both in its original and in its numerous stage versions it still holds popular favor in spite of occasional protests. The character Uncle Tom was drawn from the life of Josiah Henson (q.v.).

Consult: the *Life* by Charles E. Stowe (Boston, 1889); and *Life and Letters*, by Mrs. Annie Fields (Boston, 1899).

STOWELL, stō'el, WILLIAM SCOTT, Baron (1745-1836). A British admiralty and ecclesiastical judge and jurist. He was the eldest brother of Lord Eldon (q.v.). He was born at Heworth, Durham, was educated at Newcastle, went to Oxford in 1761, and became a college tutor. In 1779 he removed to London, was called to the bar (1780), and admitted to the faculty of advocates at Doctors' Commons. In 1788 he was appointed judge in the Consistory Court, knighted, and nominated a privy councilor. In 1798 he became judge of the Court of Admiralty. Both as an ecclesiastical and admiralty judge he won high distinction. He practically created much of the admiralty law of England. He drew on the Roman law, and the maritime law of all nations, ancient and modern, and his opinions, therefore, were very scholarly. He wrote no systematic treatise or text-book, but his judgments were admirably reported, and supply the best evidence of his extensive legal learning, his sagacity, and his great literary ability. He is the highest English authority on the law of nations, and his judgments—those especially relating to the rights of belligerents and neutrals—have been described as the most valuable contribution made by an English judge to general jurisprudence since the time of Lord Mansfield. He represented Oxford in the House of Commons for twenty years, but he took no part in the business of Parliament, although he was a zealous supporter of the Conservative Party and the Established Church. At the coronation of George IV. he was raised to the peerage under the title of Baron Stowell of Stowell Park.

STRABISMUS (Neo-Lat., from Gk. *στραβισμός*, a squinting, from *στραβός*, *strabos*, crooked, from *στρέφειν*, *strephein*, to twist, turn about), or SQUINT. A well-known and common deformity which may be defined as a want of parallelism in the visual axes when the patient endeavors to direct both eyes to an object at the same time. The eye which is directed toward the object looked at is called the fixing eye, the other the squinting eye. The squint is said to be *convergent* when the eye or eyes are directed toward the nose, *divergent* when they are directed toward the temple, and *vertical* when directed upward or downward. The last is often associated with convergent squint. The divergent form is comparatively rare, and occurs most often with myopia.

Squint is of two kinds: (1) *paralytic*, and (2) *concomitant*. Paralytic squint is caused by paralysis of one or more of the ocular muscles. There is inability to move the affected eyeball away from the side toward which it is directed. When both eyes are turned toward the side to which the squinting eye is directed, the squint disappears. The head is held in a characteristic position in every variety of paralysis of the muscles of the eyeball, an attempt of nature to compensate for the squint by turning the head in such a direction that the squinting eye is directed toward objects in front of the body. There is diplopia, double vision, unless the squinting eye is the one fixed on the object. By the position of the double image, it is possible to determine which muscle is affected. The eye involved is often closed in order to avoid the second image, which is confusing in walking. For example, a person with paralysis of the superior oblique muscle while descending stairs sees two steps instead of one, and is often led to attempt to reach the false image, with disastrous results. The paralysis may be due to a lesion at any point between the cerebral cortex and the muscle. Syphilis is the most common cause; others are cold, rheumatism, and acute infectious disease. The treatment is that of the cause, exercise of the muscles, the use of prisms to relieve the diplopia, and operation as in concomitant squint if necessary. In *concomitant squint* there is the same deviation of the eyes in every position, and both eyes possess a normal range of movement. Squint may be *alternating*, in which the patient fixes with either eye; *fixed*; or *unilateral*, in which the squint is confined to one eye; in regard to permanency it may be *constant* or *periodic*. In concomitant squint there is rarely double vision, one image being disregarded. Uncorrected errors of refraction, congenital feebleness of vision, opacities of the cornea or media, or other disease of the eye, combined with weakness of a muscle, leads to concomitant squint, for, as the sight in one eye is imperfect, there is little inducement to make the muscular effort to keep the two parallel. The treatment includes correction of errors of refraction by glasses, exercise of the muscles by prisms, and operative methods. The last may be division of the short tendon or advancement of that of the opposing muscle, or a combination of these procedures.

STRABO (Lat., from Gk. *Στράβων*, *Strabōn*) (c. 64 B.C.-19 A.D.). A famous Greek geographer

and historian, born at Amasia, in Pontus. He received his education first at Nysa, on the Meander, from the grammarian Aristodemus and appears to have come to Rome with the Peripatetic Xenarchus and the grammarian Tyrannion, whose pupil he had also been. The date of his arrival seems to have been about B.C. 29. In B.C. 24 he left Rome in the train of Ælius Gallus, traveled in Arabia, and, returning to Rome in B.C. 20, made it his home until his death. Yet during this latter period he must have undertaken great journeys, for he informs us in his own work that he had traveled from Armenia in the east to Sardinia in the west, and from the Pontus Euxinus on the north to the borders of Ethiopia. While we lack certain information with regard to these journeys, Strabo's scanty knowledge of events in Rome in the latter half of Augustus's rule gives basis to the conjecture that he was absent during this period, very probably at the Court of Pythodoris, Queen of Pontus, of whom he makes frequent mention in his work. Strabo is most famous for his *Geography*, extant in 17 books, of which the first two deal with physical geography, books 3 to 10 with the geography of Europe, 11 to 16 with that of Asia, and book 17 with that of Africa. It is quite clear from internal evidence that the author did not complete his original plan. The sources of his knowledge were first of all his own observations made during his long journeys, and secondly the earlier geographers, of whom the most famous were Eratosthenes, Artemidorus, and Apollodorus of Athens. For Spain and Gaul his chief sources were Polybius and Posidonius.

His other work, of which we have but scanty fragments, was his *History*, which comprised 43 books. It was intended as a supplement to the work of Polybius and was divided into two parts. The first part sketched the history down to the period at which Polybius began; the latter treated in greater detail the history from Polybius to B.C. 27. The fragments of this work are published by Müller, *Fragmenta Historicorum Græcorum*, vol. iii. Consult also Otto, "Strabonis *ἱστορικῶν ὑπομνημάτων* Fragmenta," in *Leipziger Studien*, vol. xi. (1889). The *Geography* is edited by Kramer (Berlin, 1844-52); Meineke (Leipzig, 1866-77). English translation by Hamilton in Bohn's Classical Library (London, 1887); translation of selections, with introduction, maps, and plans, by Tozer (Oxford, 1893).

STRACHAN, străk'an, JOHN (1778-1867). A Canadian Anglican bishop. He was born in Aberdeen, Scotland, was educated at King's College in that city and at the University of Saint Andrews, and in 1799 emigrated to Canada. In 1812 he removed to York, now Toronto, and was appointed rector there. In 1839 he was made Bishop of Toronto. The chief cause of the violent opposition his policy aroused was his determined effort to establish the Church of England as a State Church. When the University of King's College was changed from its character as an Anglican institution, Bishop Strachan founded Trinity College in its stead. His personality and work as ecclesiastic and politician did much to bring about the Rebellion of 1837. Consult: Melville, *The Rise and Progress of Trinity College, Toronto, with a Sketch of the Life of the Lord Bishop of Toronto, as Connected with Church Education in Canada* (Toronto, 1852); and Bethune, *Memoir of Bishop Strachan* (1870).

STRACHEY, strā'chĭ, WILLIAM. A colonist and historian of early Virginia. He was a member of Gray's Inn, London. In May, 1609, he sailed for Virginia with Sir George Somers, and was wrecked on the Bermudas on July 28th. Strachey wrote one of the numerous accounts of the colonists' adventures which were widely circulated in manuscript before being printed in 1625, in Purchas's *Pilgrims*. In May, 1610, Strachey reached Virginia, where he became secretary and recorder of the colony. He edited the code of laws drawn up by Gates and Dale, and commonly known by the latter's name. Returning to England in 1612, he began writing his *Historie of Travaile into Virginia Britannia*. It was first printed in 1849, by the Hakluyt Society of London. It is the most reliable single narrative of events during the period of Virginia history with which he deals. Besides the 1849 edition of the *Historie*, consult Brown, *Genesis of the United States* (Boston, 1891).

STRACHWITZ, sträg'vĭts, MORITZ, Count (1822-47). A German poet, born in Peterwitz, Silesia, and educated for the law in Breslau and Berlin. His first volume, *Lieder eines Erwachenden* (1842), was mostly written while he was still in the gymnasium. More typical is the collection posthumously published, *Neue Gedichte* (1847), with its sharp attack on Heine and the other revolutionists, its protests against the 'Everlasting No,' and its famous and popular lyrics, "Der Himmel ist blau" and "Germania." A complete edition of his poems appeared in 1850, and in Reclam's *Bibliothek* in 1878.

STRACK, sträk, HERMANN LEBERECHT (1848—). A German theologian and Oriental scholar. He was born in Berlin and was educated there and at Leipzig. In 1877 he became professor in the theological faculty at Berlin. Among his more notable publications are: *Prophetarum Posteriorum Codex Babylonicus Petropolitanus* (1875); *Einleitung in das Alte Testament* (5th ed. 1898); *Lehrbuch der neuhebräischen Sprache und Litteratur* with Siegfried (1884); *Einleitung in den Talmud* (3d ed. 1900); *Das Blut im Glauben und Aberglauben der Menschen* (8th ed. 1900); *Grammatik des biblischen Aramäisch* (3d ed. 1901); *Das Buch Jesus Sirach im hebräischen Texte* (1903). He also published editions of several Mishma tracts; became editor of the *Porta Linguarum Orientalium* (Berlin), for which he wrote the Hebrew grammar (1883; 8th ed. 1902; Eng. trans., 1886); and, with O. Zöckler, editor of *Kurzgefasster Kommentar zu den Schriften Alten und Neuen Testaments* (Munich, 1886 et seq.). He prepared lexicons to the *Anabasis* (9th ed. 1902) and *Cyropædia* (2d ed. 1892) of Xenophon. In 1885 he began to edit *Nathanael*, a periodical devoted to Christian missionary work among the Jews.

STRADELLA, strȧ-dĕl'lȧ, ALESSANDRO (c.1645-c.1681). An Italian composer, born in Naples. Trustworthy information regarding his life and his works, the oratorios *San Giovanni Battista* (1676), *Susanna* (1681), and the operas Corispero (c.1665), *Orazio Cocle sul ponte* (c.1666), Trespolo *tutore* (1667), *La forza del amore paterno* (1678), may be obtained

from Richard, "Stradella et les Contarini," in *Le Ménestrel* (Paris, 1865 and 1866). The opera *Stradella*, by Flotow, is founded on Bonnet-Bourdelot's story of an incident in the life of Stradella, in his *Histoire de la musique et de ses effets* (1715). He is thought to have been murdered in Genoa, about 1681.

STRADIVARI, strä'dê-vä'rê, or **STRAD'IVA'RIUS**, ANTONIO (c.1644-1737). The most famous violin-maker of the Cremonese School. He was born in Cremona, and was probably apprenticed at a very early age to Nicola Amati, who at that time was regarded as the greatest of all the Cremonese masters. His first instruments were made between 1670 and 1685 and were largely of the Amati model, in consequence of which they are usually described as 'Amatese Strads.' They are distinguished by their lack of symmetry compared with his later works, their plain wood, and generally squatty design. About 1685 his originality began to assert itself, and by the following year he had evidently acquired his own peculiar style, which subsequent makers have largely used as a model. The period known as the 'long Strad' period was from 1690 to 1700, and incidentally it may be pointed out that the instruments made during that time were not any longer in design than those of the following years, from which they differed only in their treatment. For instance, the middle bouts, edges, and corners were longer and more graceful, and were possessed of a contour which has been described as a mingling of the feminine character of Nicola Amati's work and the masculine massive style of Stradivari from 1700 to 1737. In 1684 Nicola Amati died and bequeathed all his wood, models, and tools to Stradivari, thus providing the latter with a large and choice stock of tempered and seasoned wood, which was more than anything else responsible for the improved quality of his instruments dating from 1685. All the work of Stradivari was marked by minuteness of detail; the high quality of the wood and varnish; and the beauty of tone, which has a sympathetic quality altogether distinct from the best work of any other maker. His violins must have numbered fully two thousand, although comparatively few specimens are now in existence. He died at Cremona. —FRANCESCO STRADIVARI (1671-1743), the second son of Antonio, was born at Cremona. He carried on his father's business, adopting Antonio's model of the period of 1700-1712, and produced instruments of a commanding style and an invariably good tone. Like his father, he was exceedingly careful in the artistic finish of his work, using wood of the finest quality and a rich red-brown varnish.—OMOBONO STRADIVARI (1679-1742), the fourth child of Antonio, was chiefly remarkable for his skill in repairing valuable instruments.

Consult: Fétis, *Antoine Stradivari* (Brussels, 1856); Niederheitmann, *Cremona* (Leipzig, 1897).

STRAFFORD, THOMAS WENTWORTH, first Earl of (1593-1641). An English statesman. He was born April 13, 1593, in London, of an old Yorkshire family. He was educated at Saint John's College, Cambridge, and later (1607) became a student of the Inner Temple. He was married in 1611 and knighted in the same year, after which he traveled on the Continent. In 1614 his father died and he succeeded to the title of baronet and a large estate. He was a member of the last three Parliaments of James I. In the Parliaments of 1621 and 1624 he supported the Crown against those who were trying to force England into a war with Spain. In the first Parliament of Charles I. he opposed Buckingham, who had now adopted the same policy of war with Spain, yet he was not in sympathy with Eliot and the Puritans. In the Parliament of 1628 he became the real leader of the House of Commons, though no formal leadership was recognized in those days. He introduced a bill similar in tenor to the Petition of Rights (q.v.), but containing no declaration that the law had been violated in the past. Charles, however, refused to accept it, and Wentworth, unwilling to resist the King further, allowed the opposition to pass into other and more hostile hands. He supported the Petition of Right and was then apparently satisfied that the 'ancient government' of the kingdom had been restored. In June, 1628, he was made baron, on December 10th viscount, and on December 25th president of the Council of the North. On November 10, 1629, he was made member of the Privy Council. As president of the Council of the North he was the royal executive in that region and he exercised his authority vigorously and a little roughly in checking insubordination. His anti-Puritan sympathies had already drawn him into intimate relations with Laud, which ripened into a lifelong friendship. On January 12, 1632, Wentworth was made Lord Deputy of Ireland and he went to Dublin in July, 1633. His administration lasted six years before events in England drew his attention away. His task was a difficult one and his actions were arbitrary and often harsh, but on the whole extremely beneficial. Trade and industry were encouraged, disorders and numerous abuses were suppressed, and Ireland enjoyed unprecedented material prosperity. In 1639 Wentworth visited England. On January 12, 1640, he was created Earl of Strafford, and thenceforth he was the King's most influential adviser. Already the Scottish troubles had reached an acute stage. On account of his long absence, Strafford failed to appreciate the changed temper of the English people, and habits of arbitrary rule had grown upon him. He advocated the strongest measures and hurried back to Ireland to raise money and troops for Charles. This was made the basis of his impeachment on the meeting of the Long Parliament. Charles promised him that if he would come to London to meet the charges, he "should not suffer in his person, honor, or fortune." Inasmuch as the charges against him, even if proved, did not constitute treason as defined by the statute of Edward III., Parliament changed the impeachment into a bill of attainder, though Strafford was still heard in his own defense. His doom was sealed when Parliament discovered that Charles was plotting to rescue him by force. On May 8, 1641, the attainder bill was passed and on the 10th Charles, daring to resist no longer, signed it with Strafford's consent. Strafford was beheaded two days later.

Our estimate of Strafford's character will always rest principally upon his own recorded words. They will be found in *The Earl of Strafford's Letters and Despatches, with an Essay Towards His Life*, ed. by Radcliffe (2 vols., Lon-

don, 1739). Consult also Gardiner, *History of England 1603-42* (10 vols., London and New York, 1883-84).

STRAIGHT UNIVERSITY. A coeducational institution for negroes exclusively, at New Orleans, La., founded by Seymour Straight and incorporated in 1869. The institution has an endowment of $17,000, and is sustained by voluntary contributions, through the American Missionary Association. Its buildings and grounds are valued at about $100,000. Its library contains about 2500 volumes. In 1903 the faculty numbered 28, and the students about 750 in all departments.

STRAIN, Isaac G. (1821-57). An American naval officer and explorer, born in Roxbury, Pa. He entered the navy as a midshipman in 1837, in 1845 was in command of an exploring expedition that penetrated into the interior of Brazil, and in 1848 explored Lower California. In 1849 he made the overland journey from Valparaiso to Buenos Ayres, publishing an account of the trip entitled *The Cordillera and Pampa: Sketches of a Journey in Chile and the Argentine Provinces in 1849* (1853). He became a lieutenant in 1850, served with the commission to locate the boundary line between Mexico and the United States, and in 1854 was placed in charge of a party sent to survey and explore the Isthmus of Panama and report upon the best route for the construction of an interoceanic canal. In 1856 in the *Arctic* he made soundings in the North Atlantic Ocean to ascertain the feasibility of a submarine cable. Returning to Panama, he died there from exposure in the following year. Consult Headley, *The Darien Exploring Expedition Under command of Lieutenant Strain* (New York, 1885), in the "Franklin Square Library."

STRAITS SETTLEMENTS. A crown colony of Great Britain, comprising some of the British possessions on the Malay Peninsula and a few of the adjacent islands, viz. Singapore (q.v.), Malacca (q.v.), Dindings (q.v.), Penang (q.v.), or Prince of Wales Island, the Province of Wellesley, the Keeling Islands (q.v.), and Christmas Island (q.v.). The total area, excluding Christmas Island and the Keeling group, is 1542 square miles. The colony has little natural wealth. It is important for its extensive transit trade, which passes almost entirely through Singapore and Penang. The total trade amounted in 1901 to nearly $288,000,000, of which the imports represented over $127,000,000. The trade of Singapore alone amounted to about $233,000,000. The principal imports are rice, cotton goods, and opium; the exports consist chiefly of tin (which is brought from the Federated Malay States), gums, and spices. All the ports are free. The total shipping during 1901 was 16,000,000 tons. The Governor is assisted by an executive council, and a legislative council composed of nine official and seven unofficial members, five of the latter being nominated by the Crown and two by the chambers of commerce at Singapore and Penang, and confirmed by the Crown. The Governor is also High Commissioner for the Federated Malay States and Borneo. The population (exclusive of Christmas Island and the Keeling group) was 512,342 in 1891, and 572,249 in 1901. In the latter year the population was composed of 281,933 Chinese, 215,058 Malays, and 5058 Europeans and Americans. There is an extensive immigration from China and India, chiefly coolies, the immigrants from the two countries in 1901 numbering 178,778 and 25,357 respectively. The crown colony was organized April 1, 1867. The capital is Singapore.

Bibliography. Swettenham, *Malay Sketches* (London, 1895); id., *The Real Malay* (ib., 1899); Rathbone, *Camping and Tramping in Malaya* (ib., 1898); Belfield, *Handbook of the Federated Malay States* (ib., 1902); Skeat, *Tribes of the Malay Archipelago* (ib., 1902).

STRAKOSCH, strä'kôsh, Moritz (1825-87). An Austrian composer and pianist, born in Lemberg, Galicia. He was the brother-in-law and teacher of Adelina Patti, and was educated in music at Vienna, coming to America in 1845, where he won considerable success as a teacher and concert pianist. In 1856 he became an impresario and introduced many great musicians to the American public. He was the composer of several salon pieces for the pianoforte and one opera, *Giovanna di Napoli*, which had its first presentation in New York. He died in Paris.—Max Strakosch, brother of the preceding, succeeded him in the management of the various concerts and opera undertakings. He died in New York in 1892.

STRALSUND, străl'zŭnt. A seaport in the Province of Pomerania, Prussia, situated on the Strelasund, which separates the mainland from the island of Rügen, 149 miles by rail north-northeast of Berlin (Map: Prussia, E 1). It is entirely surrounded by water. The natural strength of the place was greatly increased by formidable fortifications, which, however, were converted into promenades in 1873. Stralsund has narrow but regular streets, and many of the houses are finely gabled, giving the town a quaint and ancient appearance. There are three splendid Gothic churches erected in the fourteenth and fifteenth centuries. The handsome town hall contains a picture gallery, a collection of antiquities, and a public library of 60,000 volumes. There is a school of navigation. Stralsund is noted for its manufactures of playing cards. Oil, machinery, arc lights, furniture, and bricks are also produced. There is considerable shipping and a large export trade, chiefly in grain, sugar, fish, and malt. Stralsund, founded in 1209, was in the fourteenth century an important member of the Hanseatic League. The most notable event in its history was its eleven weeks' siege by Wallenstein during the Thirty Years' War (May-August, 1628). It was a possession of Sweden from the Peace of Westphalia (1648) to 1815, when it passed to Prussia. Population, in 1890, 27,814; in 1900, 31,083.

STRAMONIUM (Neo-Lat., of uncertain etymology), Stinkweed, Jamestownweed, Jimsonweed, Thorn-Apple (*Datura Stramonium*). A common weed of the natural order Solanaceæ. De Candolle refers it to countries bordering on the Caspian Sea; others regard it as coming from Northern India. It is a coarse, strong, vigorous, branching weed, from two to six feet high, with ovate toothed or angled leaves, large funnel-shaped flowers followed by prickly globular two-celled pods containing numerous angular black seeds which are reputed narcotic but are

little used. All parts of the plant have a disagreeable smell.

STRANAHAN, străn'â-an, James Samuel Thomas (1808-98). An American contractor and philanthropist, born in Peterboro, N. Y. He was successively school teacher, surveyor, and trader, and then became a railroad contractor in Newark, N. J., gradually acquiring large interests in the companies by accepting stock as payment for construction. He removed to Brooklyn in 1844 and until his death was closely identified with the city's commercial expansion and public improvement. From 1860 until 1882 he served as president of the Brooklyn Park Commission. His greatest achievement was the planning and building at an enormous cost of Prospect Park, one of the largest and most beautiful civic parks in the United States. In 1891 Brooklyn erected a statue of him at the main entrance to Prospect Park.

STRAND. See Rope; Knotting and Splicing.

STRAND, The. An important business thoroughfare of London, so named because it led through the marshy land bordering the former banks of the Thames. It extends from Charing Cross to Temple Bar, and in the sixteenth century was bordered by the mansions of the nobility, some of which survive in the names of various streets and buildings. It contains a number of theatres and newspaper offices, and is at all times busy and animated.

STRANDBERG, strănd'bâr-y', Karl Wilhelm August (1818-77). A Swedish poet, born in Södermanland, and educated at Upsala and Lund. The greater part of his earlier writing was of a patriotic nature. His works show great purity of form and depth of patriotism. Under the pseudonym Talio Qualis he published *Sånger i pansar* (1845); *Vilda Rosor* (1854); and his *Samlade vitterhetsar 'beten* (1877). He translated Byron's *Don Juan* and selections from Molière.

STRANGE, Sir Robert (1721-92). A Scottish engraver. He was born in Kirkwall, on one of the Orkney Islands. He made an attempt at law, but drawing claimed his chief attention, and he became an apprentice to Richard Cooper, at Edinburgh, for six years. To gain the hand of Isabella Luminsden, he joined the rebel army at the time of the Jacobite uprising, and after its defeat he was rescued by his lady-love, who hid him under her hooped skirt from the officers in search of him, and continued singing over her needlework. After their marriage, in 1747, he went to Paris and studied dry point under Le Bas. He made an improvement upon this process that gave a more beautiful finish to the engravings. He moved to London in 1751, devoting himself to historical engravings, but a refusal to engrave the portraits of the Prince of Wales and Lord Bute in 1759, supposedly for political reasons, was the cause of his departure for Italy. There his welcome was most cordial and he was made a member of the Academies of Rome, Florence, and Bologna, and professor of the Royal Academy at Parma. During a subsequent stay in Paris he was made a member of the Royal Academy of Painting. After his return to London in 1780 he made his peace with the reigning family by his engraving of West's "Apotheosis of the Princes Octavius and Alfred," and was awarded the honor of knighthood in 1787. Strange's engravings are chiefly after the great Italian masters, including Guido Reni, Salvator Rosa, Raphael, and Correggio, and after Van Dyck. Though often defective in draughtsmanship, his work is characterized by grace of line and the excellency of his rendition of the flesh. Consult: Dennistoun, *Memoirs of Sir Robert Strange* (London, 1855); introduction to Marshal Keith's *Memoir* (ib., 1843); and the *Life* by Woodward prefixed to *Twenty Masterpieces of Strange* (ib., 1847).

STRANGE, Robert (1796-1854). An American lawyer. He was born in Virginia; was educated at Hampden-Sidney College; studied law, and after his admission to practice, settled at Fayetteville, N. C. He served as a member of the North Carolina House of Delegates in 1822-23 and 1826, was judge of the Superior Court 1826-36, United States Senator 1836-40, and some time later Solicitor of the Fifth Judicial District. The Indian legends of the region about Fayetteville were attractively related in his novel, entitled *Eoneguski; or, the Cherokee Chief.*

STRANGE CASE OF DOCTOR JEKYLL AND MR. HYDE, The. A story by R. L. Stevenson (1886). It illustrates the struggle between good and evil in a human soul. Dr. Jekyll is a physician of excellent standing, but with concealed propensities which by secret indulgence have developed his lower nature into an almost distinct individual known as Mr. Hyde. By a powerful drug he has learned to transform himself at will into this terrible, debased creature, who commits hideous crimes. At last the power of the evil side of his nature gains the ascendency. Dr. Jeykll, without the intervention of the powder, becomes transformed into Mr. Hyde, and, unable to regain his better self, kills himself in despair.

STRANGLES (from *strangle*, OF. *estrangler*, Fr. *étrangler*, from Lat. *strangulare*, from Gk. στραγγαλᾶν, *strangalan*, στραγγαλίζειν, *strangalizein*, to strangle, from στραγγάλη, *strangalē*, halter; connected with στραγγός, *strangos*, twisted, Lat. *stringere*, to draw tight), Distemper, or Colt-Ill. An infectious disease of the horse, ass, and mule, most frequently observed in young animals, especially pure-bred. The animal seems dejected, has a capricious appetite, dry, staring coat, reddish eyes, and accelerated pulse and breathing. After about two days a cough and a nasal discharge are noted. A large puffy abscess is developed under the lower jaw, which opens later to the outside. Abscesses sometimes develop in other parts of the body. Light cases require little treatment except proper care and dieting, the opening of the abscesses, and the alleviating of fever when excessive.

STRANGULATION. The mechanical constriction of the neck so as to prevent the passage of air and to suspend respiration, and consequently life. Strangulation may be produced by throttling or hanging. Death is sudden when the obstruction to respiration is complete, but otherwise it is gradual in its onset. In hanging, especially in judicial executions where a long drop is used, death is probably due to fracture of the cervical vertebræ, with compression of the medulla oblongata, the seat of the nerve centre controlling respiration. When breathing has been interrupted for only a short time, and there

STRASSBURG
THE CATHEDRAL

is no mechanical obstacle to respiration, nor injury to the medulla, life may sometimes be restored by proper measures, such as artificial respiration, stimulant applications, and a plentiful supply of fresh air. To relieve cerebral congestion it is advantageous to abstract blood, and if this is replaced with normal saline solution by transfusion (q.v.) into the veins, the additional advantage will be gained of diluting the carbon dioxide in the blood.

When death has taken place by hanging, proofs of this, concerning which medico-legal questions may arise, depend upon the position of the body when found, the presence of marks upon the neck, and of the signs of asphyxia in the internal organs, and the absence of any other possible cause of death. The mark on the neck is gencally a hard, dry, yellowish, horny furrow running obliquely. The face is turgid, with blood-stained froth about the nostrils and lips; the tongue is swollen and protruding. The right side of the heart and the right lung are engorged with venous blood, while the left side is empty. See ASPHYXIA.

STRANGURY (Lat. *stranguria*, from Gk. *στραγγουρία*, *strangouria*, retention of urine, from *στράγξ*, *stranx*, drop squeezed out; connected with *στραγγαλίζειν*, *strangalizein*, to strangle + *οὐρεῖν*, *ourein*, to urinate, from *οὖρον*, *ouron*, urine). A variety of retention of urine, in which, while urine is present in the bladder and a desire to micturate is present, spasm or painful contraction permits of the passage of but a few drops. The spasm is usually of the urethra, but the rectum may share in the condition. It occurs after the use of cantharides or turpentine internally (both of which are eliminated by the kidneys) or by the use of a large Spanish-fly blister from which a considerable amount of the drug has been absorbed into the lymphatics, or sometimes during gonorrhœa. Hot applications to the genital region, a hot sitz-bath, hot enemata, and the ingestion of bland fluids which render the urine less irritating, will give relief. Opium is a valuable drug in the treatment of this condition.

STRAPAROLA, strä'pä-rō'lä, GIOVANNI FRANCESCO (?-c.1557). An Italian author, who was born at Caravaggio, near the end of the fifteenth century. Nothing is known of his life, and his name is only a sobriquet signifying loquacity. He published *Sonetti, strambotti, epistole e capitole* in 1508. He is remembered, however, by his *Tredici piacevoli notti*, "Facetious Nights," which is one of the most amusing imitations of the *Decameron*, and was published in two parts, in 1550 and 1554, at Venice. An English translation of the *Nights* by W. G. Waters appeared in 1894. Consult Dunlop, *History of Fiction* (London, 1851).

STRASBURGER, strüs'bo͝orK-ĕr, EDUARD (1844—). A German botanist, born at Warsaw, and educated at Bonn and at Jena, where he became professor in 1869 and director of the botanical garden in 1873. With Haeckel he visited the East, and in 1881 he accepted a call to the University of Bonn. In his special field of histology of plants he wrote: *Die Befruchtung bei den Koniferen* (1869); *Ueber Zellbildung und Zellteilung* (3d ed. 1880); *Ueber den Bau und das Wachstum der Zellhäute* (1882); besides *Das kleine botanische Praktikum* (4th ed. 1902); *Histologische Beiträge* (1888-93); and, with Noll, Schenck, and Schimper, *Lehrbuch der Botanik für Hochschulen* (5th ed. 1902). Conjointly with Pfeffer he edits the *Jahrbücher für wissenschaftliche Botanik* (Berlin, 1894 et seq.).

STRASCHIRIPKA, strä'shê-rĭp'kä, JOHANN. The correct name of the Austrian painter more commonly known as Johann Canon (q.v.).

STRASSBURG, strä's'bo͝orK. A city of Germany, the capital of Alsace-Lorraine. It is situated at the junction of the Breusch and the Ill, two miles west of the Rhine, 28 miles east of the French frontier, and 88 miles by rail north of Basel (Map: Germany, B 4). The Ill divides into five arms in the city. Strassburg is a fortress of the first class, and possesses a garrison of 15,000 men. A circle of fourteen forts and an inner rampart defend the city. The centre of the city forms an oval, and is surrounded by two arms of the Ill. Here the streets are narrow and crooked, and the picturesque ancient houses and frequent specimens of pure mediæval architecture, reflect a period when the city was both art-loving and wealthy. In this section, on the south-east, rises the structure for which Strassburg is best known—the cathedral, or Minster. It is said to have been founded about 600. The present edifice dates from 1176. The fore part of the cathedral is Romanesque, and the rest (the nave, 435 feet long) Gothic. The remarkable façade, the work of Erwin of Steinbach, with its galleries and rose window, especially commands admiration. Noteworthy also is the late Romanesque south portal, which is embellished with images. The tower is 465 feet high. A scarcely less celebrated feature of the Minster is its astronomical clock, the mechanism of which was constructed in 1839-42 to replace that of the famous clock of the sixteenth century. (See CLOCK.) Southwest of the cathedral is the Protestant Saint Thomas Church, a composite edifice embracing the Gothic and Romanesque, begun about 1200. It contains a marble monument to Marshal Saxe, executed by Pigalle. Near the cathedral is the ancient episcopal palace, identified with the Rohans, and now containing the unimportant municipal art museum. In the Grosse Metzig—the market hall—dating from 1588 is the valuable Museum of Industrial Art.

North of the Ill extend the handsome new quarters of the city, where, in the Kaiserplatz, may be seen the splendid Imperial Palace, in Florentine Renaissance. It was completed in 1888, and has a cupola 115 feet high. The modern Hall of the Provincial Diet and the provincial and university library are near by. The library has some 700,000 volumes. Farther on in a northeasterly direction is the Contades Park. Some little distance east of the city, and reached by the fine Ruprechtsauer Allée, lie the beautiful municipal grounds of the Orangerie—a pleasure-garden with Oriental features and lovely promenades. South of the town formerly stood the important citadel, built by Vauban, and destroyed during the siege of 1870. Between it and the city is the extensive arsenal. Strassburg has a statue of General Kléber, who was born there, and of Gutenberg; also a bust of Goethe, which marks the house where the poet lived as a student.

The university (see STRASSBURG, UNIVERSITY

OF) is situated across the Ill to the southeast of the city. There are, in addition, the important Protestant Gymnasium, the academy with its collections, a lyceum, a Roman Catholic seminary, a very fine municipal conservatorium of music, a mechanics' school of art, and an industrial art school. The municipal theatre is an admirable institution. The Frauenhaus contains an architectural and sculptural collection. The city archives are very valuable. The numerous excellent hospitals are mostly situated in the southern part of the city.

The city government is administered by the burgomaster, with six associates, and a council of 36 members. The city is divided into four cantons. Strassburg is commercially important, having of late greatly increased its trade, a considerable part of the traffic between France, Germany, and Switzerland passing through the city. The Ill is canalized; the Rhine-Marne and other canals traverse the city; and Strassburg is a railway centre. The new port covers upward of 300 acres, with wharves and quays on the Rhine. Latterly manufactories have grown up to some extent and include foundries, locomotive works, tobacco factories, tanneries, piano factories, chemical works, etc. Much jewelry is manufactured. The population in 1900 was 151,041, of whom one-half or more were Roman Catholics.

HISTORY. Strassburg is the Argentoratum of the Romans. A bishopric appears to have been established before the seventh century, when the name Stratisburgum began to be used. In 1262 its citizens threw off the yoke of the bishop in a battle at Oberhausbergen. The city, free and independent, had reached a high degree of prosperity at the Reformation. The citizens embraced Protestantism at an early date—1520. In 1681 Louis XIV. suddenly took possession of Strassburg, which was fortified by Vauban. It remained a French city until it became a part of the German Empire as a result of the Franco-Prussian War. It was an important military point under the French, and in 1870 held out against the Germans for six weeks under its gallant commander Uhrich, who finally capitulated on September 27th with over 17,000 men. Great damage was wrought during the siege by the bombardment.

Consult: Krieger, *Topographie der Stadt Strassburg* (Strassburg, 1894); Förster, *Strassburg, die Hauptstadt des Reichslandes* (ib., 1894); Euting, *Beschreibung der Stadt Strassburg* (12th ed., ib., 1901); *Beiträge zur Geschichte der Stadt Strassburg* (ib., 1896 et seq.); and Staehling, *Histoire contemporaine de Strasbourg* (Paris, 1884).

STRASSBURG, UNIVERSITY OF. A German university, the outgrowth of an earlier gymnasium, formally founded by privilege of Ferdinand II., in 1621. It flourished greatly in the seventeenth and eighteenth centuries, and, though Strassburg became French territory in 1681, the university retained much of its German character. Goethe and Herder studied here in 1770. It disappeared in the Revolution, rose again in 1802 as a Protestant academy, and in 1808 became a part of the University of France by the university reform of Napoleon I. After the war of 1870 the institution once more became German and was reorganized as a university in 1872. It has since been greatly encouraged by the Imperial Government as a centre of German influence and culture in reclaiming Alsace-Lorraine, and is in consequence in a very flourishing condition. Its budget is more than 1,000,000 marks, and it had in 1901 about 1200 students. Its library contains more than 700,000 volumes. There are various institutes connected with the university.

STRASSER, sträs'ẽr, ARTHUR (1854—). An Austrian sculptor, born at Adelsberg, Carniola. After having studied at the Vienna Academy, in 1871-75, he worked in the studios of Pilz and Kundmann, but soon branched off independently into a line of naturalistic production, first exemplified by statuettes of Japanese jugglers and actresses. The dark complexion and picturesque costumes of the Oriental races next attracted him to fashion terra-cotta figures, which, by skillful coloring, he succeeded in making impressively true to nature, as well in the racial peculiarities of his models as in all material accessories. These qualities are especially apparent in the "Egyptian Snake-Charmer," "The Secret of the Tomb," and the "Hindu at Prayer." His figures in bronze are equally lifelike, witness his "Goose-Girl" and the "Glimpse into Eternity." He also produced animal figures, especially lions, on a large scale, of which the "Triumphal Chariot of Marcus Antoninus," in Vienna, is a sterling example.

STRATEGY (OF. *strategie*, Fr. *stratégie*, from Gk. στρατηγία, *stratēgia*, generalship, from στρατηγός, *stratēgos*, general, from στρατός, *stratos*, army, encampment, from στορεννύναι, *storennynai*, Lat. *sternere*, Skt. *star*, to spread, extend, strew + ἄγειν, *agein*, to lead). Strategy is one of the two great subdivisions of the art of war, and comprises all those larger measures which relate to the grand field of operations, the object of which is to have the troops enter the contest of arms, the *battle*, under the most favorable conditions, involving the direction of the troops toward the battlefield, as well as the measures taken to reap the rewards of success. It has been defined as the use of battles in war, in contradistinction to *tactics* (the other great subdivision of the art of war), which is the use of troops in battle; or, again, as the art of leading armies, while *tactics* is the art of leading the smaller subdivisions of armies and is fully treated under its own head. See TACTICS.

The scope of strategy has been greatly extended with time. Formerly, it did not enter as a factor in war until the armies were actually in the field; but to-day *national policy* is also a determining factor, and one of vast importance, in view of the fact that modern wars are conducted on a grand scale and with great rapidity, therefore requiring definite plans to be prepared beforehand, in which questions of statesmanship and diplomacy are necessarily leading factors. Moreover, finance and commerce must also be considered.

Among the principles upon which strategy is based or according to which it is directed are:

(1) National policy and strategy must be kept in perfect agreement in war, and closely allied at every point, to accomplish the best results.

(2) When countries are at war each will probably finally concentrate its troops in a single army, so as to be able to strike decisive blows with its united power; hence the principal ob-

jective, against which all efforts should be directed at the outset, is the enemy's main army.

(3) Every effort must be made to bring together at the decisive moment all available forces.

These relate to the general objects of the war, the theatre of operations, and the entire field army as a whole. Separate actions may take place in various parts of the theatre, and they, too, will involve strategic principles, similar in character, but of minor importance.

(4) The offensive alone promises decisive results.

(5) The defensive can only avoid defeat; it cannot win victory.

(6) It is impossible to be too strong for a decisive battle.

(7) Concentration of the forces is a necessary condition for decisive action.

(8) No alteration in the plan of operations should be made after the campaign has definitely opened, unless enforced by the enemy or by the elements or unforeseen circumstances.

During the progress of military events certain of the latter will generally have a common object, and will be closely related in other respects. Every such group of events, composed in general of marches, positions, and battles, is designated an *operation*. A group of closely related operations constitutes a *campaign*. To-day the operations of a campaign are practically continuous, but, in order to be so, there must be a *base* of supplies, where ammunition, food, forage, and so on are accumulated for the support and maintenance of the army in its advance. Formerly this base was fixed, and could be fortified and stocked with supplies beforehand, but modern war demands a movable base, usually a network of railroads, but sometimes furnished by a fleet.

The lines along which the army advances from its base toward its objective are called *lines of operation*, and those by which the army obtains its subsistence and supplies, *lines of communication*. The base, the lines of operation, and the lines of communication, being of vital importance to the operating army, are naturally the objects of the enemy's attacks and manœuvres.

The strategic events of a campaign will usually take place in the following order:

Preparation, mobilization, strategic deployment, plan of operations, and the military operations themselves.

The operations may be strategically *offensive* or strategically *defensive*, or finally alternately offensive and defensive. The strategical offensive may be combined with the tactical offensive or the tactical defensive; and the strategical defensive may also be combined with either tactical form. All strategists and tacticians unite in giving the preference to the strategical and tactical offensive combined, but circumstances may force one of the other combinations on an army, at least for a time, or perhaps only in a particular part of the theatre. In that case, however, the offensive must be taken up at the earliest opportunity, if decisive results are desired.

The great principles of strategy apply to naval warfare as well as to wars on land, but certain modifications result from the fact that the lines of communication in the case of a fleet are less clearly marked, and bases and coaling and repair stations which are absolutely essential to success in naval warfare can be improvised and, if need be, changed. Again, combined naval and land operations, the transition from the purely naval contest to extended operations on land, involve some new principles not set forth here: the control of the sea by the attacker's fleet is one of the first conditions for the success of such combined operations.

STRAT'FORD. A town and suburb of London, in Essex, on the Lea, 4 miles east of Saint Paul's (Map: London, D 8). It has a fine town hall and is the seat of various extensive manufactures. There are flour mills, distilleries, and chemical works. The prosperity of the town has increased through its connection with the Eastern Counties Railway and the extensive works the company established here. Population, in 1891, 38,612; in 1901, 44,825.

STRATFORD. A port of entry and the capital of Perth County, Ontario, Canada, on the Avon River, and the Grand Trunk and the Georgian Bay and Lake Erie railroads, 88 miles west of Toronto (Map: Ontario, B 4). It has good water power, and there are flour, salt, and planing mills, and manufactures of iron castings, mill machinery, boots and shoes, and farming implements. The Grand Trunk Railroad shops are here. The county buildings are attractive. Population, in 1901, 9959.

STRATFORD DE RED'CLIFFE, STRATFORD CANNING, Viscount (1786-1880). An English diplomat, born in London. The influence of his famous cousin, George Canning, secured for Stratford in 1808 the secretaryship of the Embassy at Constantinople, under Adair, and on the latter's resignation in 1810 Canning was made Minister Plenipotentiary. In this position at a most critical moment in the great struggle against Napoleon, he negotiated the Treaty of Bucharest between Russia and Turkey, in 1812. In 1820 he was made Minister to the United States, where he was successful in the settlement of the difficult questions arising out of the War of 1812. After performing various diplomatic services and holding a seat in the House of Commons, he was sent in 1841 as Ambassador to Constantinople. The most dramatic and important event of his service at the Turkish capital was his diplomatic contest in 1853 with Prince Menshikoff, the Russian Ambassador Extraordinary. The result of the struggle—through which Canning obtained the name of 'Great Eltchi,' or *'the* great ambassador'—was a victory for Canning. He remained at Constantinople throughout the Crimean War and until

1858 and exerted great influence upon the Turkish Government with regard to its foreign relations and the inauguration of political reforms. He was raised to the peerage in 1852 under the title of Viscount Stratford de Redcliffe. He was the author of some creditable verse. In 1881 extracts from his papers and correspondence were published, with a preface by A. P. Stanley, under the title, *The Eastern Question*. Consult also: Lane-Poole, *Life of the Right Honourable Stratford Canning, Viscount Stratford de Redcliffe* (London, 1888).

STRATFORD-UPON-AVON, ā'von. A municipal borough and township in Warwickshire, England, 8 miles southwest of Warwick, on the Avon, famous as the birthplace of Shakespeare (Map: England, E 4). The town is neatly built, with wide, pleasant streets, containing numerous quaint, half-timbered houses. The house in which Shakespeare was born is still preserved, and there is a Shakespeare memorial building, including a theatre and a gallery of Shakespearean paintings, and a library of rare Shakespeareana. The poet is buried in the parish church of the Holy Trinity, a fine cruciform structure partly early English and Perpendicular, dating from the twelfth century and built on the site of a Saxon monastery which existed before 691. Other interesting remains of Shakespeare's time are the grammar-school endowed in 1482, in which he was educated, the guildhall, and the town hall. In the neighborhood at Wilmcote is the cottage of his mother, Mary Arden, and at Shottery, that of his wife, Anne Hathaway. Stratford is annually visited by 30,000 tourists, one-fourth of whom are from the United States. The town is an old free market borough with a governing charter since 1553. Population, in 1891, 11,400; in 1901, 10,600. Consult: Lee, *Stratford-on-Avon* (London, 1890); Savage, *The Registers of Stratford-on-Avon* (London, 1898).

STRATH'CLYDE'. A British kingdom which first appears prominently in the seventh century as one of the strongholds of the original Celtic inhabitants against the invading Anglo-Saxons. It lay in the western part of the island between the Clyde River and the Derwent in what is now Cumberland, though the name is sometimes applied to the entire territory between the Clyde and the Mersey. It was from an early time closely connected with the Scottish crown, to which it was united in 1124.

STRATH'CO'NA AND MOUNT ROYAL, Donald Alexander Smith, first Lord (1820—). He was born at Archieston, Morayshire, Scotland, and after receiving a common-school education entered the employ of the Hudson's Bay Company in 1838. After years of work on the coast of Labrador and in the Northwestern wilderness he was promoted to chief factor, and from that position to resident governor and chief commissioner of the company in Canada. In 1870 he was elected to the first session of the Manitoba Legislature, and to the Canadian House of Commons, and was appointed a member of the first executive council of the Northwest Territory. Four years afterwards he resigned from the Provincial Legislature, but, with the exception of the period from 1880 to 1887, he remained a member of the Dominion Parliament until 1896, when he was appointed High Commissioner to London and a member of the Queen's Privy Council of Canada. He became largely interested in railroads, and it was due to him more than to any other man that the Canadian Pacific Railway was completed. For this service Queen Victoria knighted him in 1886, and in 1897 raised him to the peerage as Baron Strathcona and Mount Royal.

STRATH'MORE'. In its most comprehensive sense, an extensive plain in Scotland (q.v.).

STRATH'NAIRN', Hugh Henry Rose, Baron (1803-85). A distinguished English general, born at Berlin, Germany. He served in 1840-41 under General Michell with the Turkish troops against Mehemet Ali; from 1842 till 1851 was British agent in Syria, and became chargé d'affaires at Constantinople in 1852. During the Crimean War he distinguished himself at Inkerman, and for his services was promoted to the rank of major-general. In the Indian Mutiny he commanded the Central India field force, and gained a great victory on April 1, 1858, over Tantia Topi, with 20,000 men, and captured Jhansi, the strongest fortress in Central India, April 5th; Kalpi, May 23d and Gwalior, June 19th. For these services he received the thanks of Parliament, was gazetted a G.C.B., and in 1860 was promoted to be lieutenant-general. He returned to England in 1865, and was soon after given command of the forces in Ireland, where he prevented the Fenian troubles from becoming formidable. In 1867 he was promoted to be general, and in 1877 became a field-marshal. Consult Low, *Soldiers of the Victorian Age* (London, 1880).

STRATHSPEY, străth'spā' (so called from *Strathspey* in Scotland). A rapid Scotch dance in $\frac{4}{4}$ time, somewhat resembling the reel (q.v.). Its music is composed of dotted eighths and sixteenths, and the dance itself is of a violent, jerky character. Its history dates from the latter part of the eighteenth century.

STRATIFICATION (from *stratify*, from Lat. *stratum*, pavement, coverlet, neu. sg. of *stratus*, p.p. of *sternere*, to spread, extend, strew + *facere*, to make, do). The term used in geology to define the arrangement of certain rocks into more or less parallel layers. Stratification is a very general characteristic of sedimentary deposits, sandstone, shale, limestone, etc., which for the most part have accumulated on the shores of the sea and the beds of lakes and rivers. The rock materials in each layer are of homogeneous character, due to the uniformity of conditions during the time of deposition, but the passage from one layer to another may be marked by a change in the nature and size of the materials, indicating a variation in the process of deposition. The layers are separated by divisional planes which mark periods of interruption in the desposition. When the layers are very thin, as in shale, for example, they are generally known as laminæ. A stratum is a group of one or more layers of the same mineral substance. See Geology.

STRAT'TON, Charles Sherwood (1838-83). An American dwarf, born in Bridgeport, Conn. Owing to his smallness of stature at the age of fourteen years, he was engaged by P. T. Barnum, and was exhibited throughout Europe and elsewhere, under the name of Gen. Tom Thumb; at the time of his engagement his weight was six-

teen pounds, and he was less than two feet high. In 1863 he was married to Lavinia Warren (q.v.), also a dwarf, and in company with Minnie Warren and 'Commodore' Nutt, they exhibited themselves far and wide.

STRATUM (Lat., pavement, coverlet, bed). The term applied in geology to the smallest subdivision of sedimentary rocks, practically synonymous with layer, seam, and bed. The distinctive characteristics of a stratum are homogeneity of composition and separation from adjacent beds or strata by well-marked divisional planes called bedding planes. A stratum represents a single uninterrupted period of accumulation, while the bedding planes are caused by longer or shorter pauses in the process. See GEOLOGY.

STRAUBING, strou'bĭng. A town of Bavaria, Germany, 23 miles southeast of Regensburg, on the right bank of the Danube (Map: Germany, E 4). The late Gothic Church of Saint James contains some notable paintings. The town has important manufactures of brick, lime, and cement. There are breweries and tanneries. Its population, in 1900, was 17,454, mostly Roman Catholic. Straubing stands on the site of the Roman colony *Sorbiodurum*. The present town dates from 1208, when Louis I. erected the Stadt-Thurm, which is still standing.

STRAUS, strous, OSCAR SOLOMON (1850—). An American diplomat, born at Otterberg, in Rhenish Bavaria. He came to the United States in 1854, and lived in Georgia until the close of the Civil War. He was educated at Columbia University. In 1887-89 he was Minister to Turkey, and so distinguished himself that in 1897 he was reappointed to the same position by President McKinley, remaining there till 1900. On January 14, 1902, he was named a member of the Permanent Court of Arbitration at The Hague to fill the place left vacant by the death of ex-President Harrison. His published works include: *The Origin of the Republican Form of Government in the United States* (1886); *Roger Williams, the Pioneer of Religious Liberty* (1894); *The Development of Religious Liberty in the United States* (1896); and *Reform in the Consular Service* (1897).

STRAUSS, DAVID FRIEDRICH (1808-74). A distinguished German theological and philosophical writer, born at Ludwigsburg, near Stuttgart. He was educated in the evangelical seminary of Blaubouren (where F. C. Baur was then teaching), whence he passed to the University of Tübingen. Here his religious convictions became disturbed. The theories of Schelling, of Jakob Böhme, and, finally, of Schleiermacher and Hegel successively claimed his allegiance. He left the university in 1830 to become assistant pastor of a small church and then taught in the seminary at Maulbronn. Here he remained but six months, and then went to Berlin in order to hear Schleiermacher and Hegel. The death of Hegel and Schleiermacher's apparent lack of sympathy determined him to quit Berlin after a very brief stay to take up the work of a 'repetent' at Tübingen (1832). Here his lectures on Hegelianism attracted attention. His skepticism was now quite pronounced, since his view of Hegelianism, which he accepted as the final philosophy, made a miraculous Christianity impossible. His theory of the origins of Christianity was formulated in the work that made him famous, *Das Leben Jesu, kritisch bearbeitet* (1835-36; Eng. trans. by George Eliot, 1846), in which he sought to explain the Gospel history on the mythical theory. The work aroused a storm of opposition, but nevertheless had a widespread influence. In consequence of his views, he was removed from his position and given a subordinate place in the Lyceum of Ludwigsburg. From 1836 until his death Strauss lived a somewhat wandering life, holding no position, though he had accepted, in 1839, an appointment in the University of Zurich, which position, on account of popular opposition, he had not been permitted to fill.

Because of his interest in the political agitations of the times he was elected a member of the Württemberg Diet in 1848. But he was not sufficiently radical for his constituents and so resigned. His second chief work, *Die christliche Glaubenslehre in ihrer geschichtlichen Entwickelung und im Kampf mit der modernen Wissenschaft dargestellt*, was even more skeptical than his *Leben Jesu*. After the publication in 1848 of *Sechs theologisch-politische Volksreden* Strauss turned from theological to literary criticism and biography. He wrote critical biographies of Schubart (1849), Märklin (1851), Frischlin (1855), Ulrich von Hutten (1857, 4th ed. 1878), Reimarus (1862), and Voltaire (1870, 5th ed. 1877), the last a work of remarkable merit. Not until 1864 did he again turn to theology, when he published *Das Leben Jesu für das deutsche Volk*, following it in the next year by *Die Halben und die Ganzen* and *Der Christus des Glaubens und der Jesus der Geschichte*. His last work was *Der alte und der neue Glaube, ein Bekenntnis* (1872, 11th ed. 1881). In these last works Strauss gave up entirely the faith he once may have had in Christianity. Strauss's popularity was doubtless due as much to his clear and captivating style as to any logical force in his arguments.

His *Gesammelte Schriften* were edited with an Introduction by his friend Eduard Zeller (Bonn, 1876-78, 12 vols.). For his life, consult: Zeller, *D. F. Strauss in seinem Leben und seinen Schriften* (Bonn, 1874); Hausrath, *D. F. Strauss und die Theologie seiner Zeit* (Heidelberg, 1876-78).

STRAUSS, JOHANN, the Elder (1804-49). An Austrian composer of dance music, born in Vienna. He received an imperfect musical education. In 1819 he was received into Pamer's orchestra, and four years later joined the celebrated Lanner Quartet as viola-player. He subsequently became assistant conductor of Lanner's orchestra, but in 1824 started an independent organization, with which he played at various resorts, and through which he gave to the world the waltzes which made him famous. In 1845 he was appointed conductor of the Court balls at Vienna. Conspicuous among the 152 waltzes which he published were the "Lorelei," "Gabrielen," "Taglioni," "Victoria," "Kettenbrücken," "Bajaderen," and the "Donau-Lieder." Both as conductor and as composer he succeeded in raising the dance form to an artistic plane, before unknown.

STRAUSS, JOHANN, the Younger (1825-99). A distinguished Austrian composer, born in

Vienna, son of the preceding. His father was averse to his adopting the profession of music, but, aided by his mother, he was enabled to secure instruction on the violin and in composition, and at nineteen years of age severed his home connections and secured an engagement as conductor of an orchestra at a popular restaurant in Hietzing. He used the opportunity to play his own waltz compositions and soon became widely popular. After his father's death he united both orchestras and began a concert tour through many European countries. From 1855 to 1865 he was the conductor of the Petropaulovski Park summer concerts in Saint Petersburg, and from 1863 to 1870 was also conductor of the Court balls. He composed nearly 500 dance pieces, which for the most part possess the highest merit. Among the best known may be mentioned: *The Beautiful Blue Danube; Roses from the South; Artist's Life; Vienna Blood; The One Thousand and One Nights; Wine, Women, and Song.* His operettas were entitled as follows: *Indigo* (1871); *Der Carneval in Rom* (1873); *Die Fledermaus* (1874); *Cagliostro* (1875); *Prinz Methusalem* (1877); *Der lustige Krieg* (1881); *Eine Nacht in Venedig* (1883); *Der Zigeunerbaron* (1885); *Simplicius* (1887); *Ritter Pasman* (1892); *Fürstin Ninetta* (1893); *Jabuka, oder das Apfelfest* (1894); *Waldmeister* (1895); *Die Göttin der Vernunft* (1897); and a ballet *Aschenbrödel.* For his biography consult Eisenberg (Leipzig, 1894) and Prochazka (Berlin, 1900).

His brothers, JOSEPH (1827-70), who became leader of the Vienna orchestra in 1863, and EDUARD (1835—), who assumed its direction in 1870, both did creditable work as musical conductors and composers of dance music.

STRAUSS, RICHARD (1864—). A German composer, the most ingenious disciple of the so-called school of Weimar. Born in Munich, he mastered the technics of the violin and piano when quite young, and in 1875-80 studied theory and composition with kapellmeister Wilhelm Mayer. In October, 1885, Strauss became musical director at Meiningen. In 1886-89 he was kapellmeister at Munich and was then called to Weimar. His radical tendencies were soon recognized, and his espousal of extremely modern music caused his conducting of Wagner to become of notable interest. On his return from a trip to Greece, Egypt, and Sicily, his music drama *Guntram,* opus 25, dedicated to his parents, was produced at Weimar, in 1894.

Strauss returned to Munich as Court kapellmeister in 1895, and in the same capacity went to Berlin in 1898. He wrote *Italia,* a symphonic fantasia, in 1886. It is fresh, vigorous, and characteristic in themes and coloring. Then followed a series of daring orchestral compositions. The chronology of the greater symphonic works is as follows: *Don Juan* (1888); *Macbeth* (1887); *Death and Apotheosis* (1889); *Till Eulenspiegel* (1895); *Thus Spake Zarathustra* (1895); *Don Quixote* (1897); *A Hero's Life* (1898). His later works include, besides numerous songs and choruses, an opera, *Feuersnot* (1901); a tone poem entitled *Sinfonia domestica;* and *Taillefer,* a choral work with orchestra, based on a poem by Uhland. Strauss's earlier productions tell no tale of genius; the mark of the file is upon them. But from his twentieth opus his originality shows itself. He invented the tone poem, in which the line of design is as sternly unwavering as the symphony, and the possibilities for expression almost illimitable. The Strauss themes condition their treatment, and if his harmonic scheme sometimes seems ugly, his melodic curve daring, and his orchestration polyodic, it must be remembered that the same criticisms were made of Richard Wagner's music. The developing sections in his tone poems are remarkable. Perhaps, following the trend of the Lied writers since Schumann in his songs, the voice is woven too closely in the dense fabric of harmony, yet many effects of pure, rhythmetic, and sensuous beauty are discovered. Here Strauss has often dared to be simple in sentiment. Such a song as the *Serenade* is heard with delight by audiences that do not realize the complexity of a scheme expressing itself so naïvely. It is the epical Strauss that appeals especially to the imaginative.

Consult: Fuller-Maitland, *Masters of German Music, with Illustrations* (London, 1894); Huneker, *Mezzotints in Modern Music* (New York, 1899); the monographs by Seidl and Klatte (Prague, 1896), and Brecher (Leipzig, 1900); and *The Musical Times,* vol. xliv., No. 719 (London, 1903).

STRAW BAIL. In old English law, the names of two or more fictitious persons entered on the records of a court as sureties for the appearance of a defendant in a civil action. In early times a defendant was first served with a summons, and if he did not appear he was considered to be guilty of contempt of court, for which the sheriff arrested him under a *capias,* and he was obliged to give bail for his appearance. Gradually, through the change of practice in serving only one process and the indulgence of the courts, this became a mere formality, and the fictitious names of 'John Doe' and 'Richard Roe' were entered as sureties. This was known as *common* or *straw bail.* This practice no longer prevails, but the name is retained to denote a financially irresponsible surety on a bail bond. See BAIL.

STRAWBERRY (AS. *strēawberie, strēawberige,* strawberry; perhaps so called either because the long stems resemble straws, or because of an old custom of stringing the berries on straws). Certain perennial herbs of the natural order Rosaceæ, widely distributed mostly in temperate regions throughout the world. The cultivated forms are all derived by the hybridization and crossing of three principal species, *Fragaria vesca, Fragaria Virginiana,* and *Fragaria Chiloënsis,* particularly the last named. The plants are low growing, have trifoliate leaves, white flowers either pistillate or polygamous, and numerous achenes on usually red, sometimes yellowish-white fleshy receptacles which constitute the edible part. The plants are hardy and may be grown in almost any region in America from Florida to Alaska. The varieties grown almost universally in America have a short season of fruitfulness, but several of the European varieties bear more or less continuously throughout the summer and early autumn.

Since young plants are most productive, the strawberry plantations are usually allowed to fruit only once, sometimes twice. The plants obtained from rooted runners are set in the field

in spring or in late summer, and are allowed to form matted rows from their runners or are grown in so-called hills, in which case the runners are cut off, and the plants made to form stools. The former method is by far the most popular, but finer and larger individual fruits, though in smaller number, are obtained by the latter method. The land may be any rich soil suitable for corn or potatoes, and should have been in cultivation for at least one year, preferably two or three, previous to the planting of the strawberries, in order to be free from the larvæ of certain insects that feed on the roots especially of grasses. The plants are usually set about 18 inches asunder, in rows three feet apart, and

COMMON WILD STRAWBERRY (*Fragaria Virginiana*).

given clean culture throughout the season. When the ground has frozen hard straw, marsh hay, or similar substance free from weeds is spread upon the plants as a winter mulch. This is raked between the rows when growth starts in the spring and allowed to remain to protect the berries from dirt during rains. Usually in the spring of the second year complete fertilizers are applied, but no cultivation is given. After the crop is gathered, the plants are plowed under and the land used for some crop such as cabbage, which will mature before frost. Land cropped with strawberries should be planted to other crops for two or three years before strawberries are again planted.

Since the introduction of refrigerator transportation the strawberry industry has vastly increased. Large areas in the Gulf States are devoted to the crop, shipments are made to the North in early spring, and as they cease areas farther to the north supply the demand until midsummer, when the market is furnished from northern localities. The whole industry has been developed since the introduction, in 1834, of the Hovey strawberry, a variety which originated in Massachusetts. Since that date thousands of varieties have been introduced, tested, and even if they were popular for a short time have been supplanted by superior ones. Strawberries are cultivated to a small extent under glass to supply a demand for forced fruits in some cities.

The principal disease to which the strawberry plant is subject is the blight or rust (*Sphærella fragariæ*), which appears on the leaves as small purple spots which increase in size and become brown with purple margins. Serious losses may follow severe attacks. Since the disease is carried over winter in the old leaves, all such should be collected and burned and the young foliage protected by two or three sprayings of Bordeaux mixture or other fungicide (q.v.). A mildew (*Sphærotheca castagnei*) sometimes appears on the leaves as a delicate cobweb which causes the crumpling of the leaves. It seldom causes much injury and is readily controlled as above indicated. Consult: Fuller, *The Strawberry Culturist* (New York, 1897); Terry and Root, *A B C of Strawberry Culture* (Medina, Ohio, 1902).

STRAWBERRY BUSH. See SPINDLE TREE.

STRAWBERRY INSECTS. The principal insect enemy of the strawberry in the Eastern United States is the strawberry weevil (*Anthonomus signatus*), which appears just before the blossoms expand lays an egg in the bud usually of the staminate varieties or those pistillate varieties rich in pollen, and then punctures the stem so that in a few days the bud drops to the ground. The larva develops within the severed bud and after pupation emerges as a dull red or nearly black beetle, about one-tenth of an inch long. Both larvæ and adults feed upon the pollen. Covering the beds, cultivating pistillate varieties, and clean culture are the remedies recommended.

The larva of the strawberry leaf-roller, a small reddish brown tortricid moth (*Ancylis comptana*), rolls the leaves of the strawberry into cylindrical cases during June, becomes a chrysalis within the folded leaf, and appears as a moth in July. A second generation occurs during August. An arsenical spray is the remedy.

The strawberry sawfly (*Harpiphorus maculatus*), a small, black insect, lays its eggs in the substance of the leaf early in May. The pale green larvæ, which feed upon the leaves, and when full-grown are nearly three-fourths of an inch long, burrow in the ground and form minute cocoons. A second generation appears in the late summer and hibernates under ground. Hellebore is recommended as a remedy. Consult: Saunders, *Insects Injurious to Fruits* (Philadelphia, 1889); Chittenden, *The Strawberry Weevil* (Washington, 1897).

STRAW MANUFACTURES (AS. *strēa*, *strēaw*, *strēw*, OHG, *strō*, Ger. *Stroh*, straw; connected with AS. *strēawian*, *strēowian*, Goth. *straujan*, OHG. *streuwen*, Ger. *streuen*, to strew, and with Lat. *sternere*, Gk. στορεννύναι, *storennynai*, στρώννυναι, *strōnnynai*, OChurch Slav. *streti*, Skt. *stṛ*, to scatter). Besides the use of straw for thatching, manufacture of paper (q.v.), straw is woven into great variety of forms, as hats,

baskets, and shoes. The most important branch of the straw-plaiting industry is the making of straw hats or of straw braid to be sewed into hats. Much of the straw braid which is used for hats in England and America is braided in China and Japan.

The conversion of straw into braid is a simple process, requiring few tools but deft fingers. Wheat straw is the material commonly used. The straw pipes must be sufficiently long between the joints, flexible, and of good color. The straw is prepared for braiding by first pulling, instead of mowing the crop. It is then cut into lengths and permitted to dry and bleach in the sun, after which the outer sheath is removed and the straw is again bleached, this time in sulphur fumes. The straw is then sorted as to diameter, length, and color.

It is estimated that in Saxony and Bohemia alone, from 20,000 to 30,000 persons of both sexes and all ages are engaged in this industry. The finest work is done in Tuscany, where the industry was established in the thirteenth century. Here a particularly fine grade of straw has been produced since 1718, from which the famous Leghorn braids are made. The Tuscan straws are not split. In 1840 looms were adapted to straw-braiding, but they have not superseded hand labor. The plaits are known by the numbers of bents into which they are worked as 7 or 11 bents. The production of the finer grades of Tuscan braids is a most delicate operation, so trying to eye and nerve that the workman cannot engage in it for more than two hours at a time.

Straw and Straw Manufactures Imported into the United States

STRAY. See Estray.

STREATOR, strē'tor. A city in La Salle County, Ill., 94 miles southwest of Chicago; on the Vermilion River, and on the Chicago, Burlington and Quincy, the Chicago and Alton, the Wabash, the Indiana, Illinois and Iowa, and the Atchison, Topeka and Santa Fe railroads (Map: Illinois, D 2). There is an attractive park in the heart of the city. Streator has important railroad interests, and is the centre of an agricultural section noted also for its deposits of coal and clay. Bottle and window glass works, foundries and machine shops, and brick and tile manufactories are some of the leading industrial establishments. The government is vested in a mayor, chosen every two years, a unicameral council, and subordinate officials who are appointed by the mayor with the consent of the council. Streator was settled in 1860, and was laid out in 1867. It was incorporated as a village in 1870, and organized as a city in 1882. Population, in 1890, 11,414; in 1900, 14,079.

STRECK'ER, Adolf (1812-71). A German chemist, born at Darmstadt. He taught successively at Giessen, Christiania, Tübingen, and Würzburg. His extensive original work led to interesting discoveries in connection with the galls of various animals, to the isolation of the coloring matter of madder, to the preparation of the mercury compounds of many alcoholic radicles, and to several important syntheses in organic chemistry, notably those of lactic acid, alanin, and taurin. His publications include: *Das chemische Laboratorium der Universität Kristiania* (1854); *Theorien und Experimente zur Bestimmung der Atomgewichte* (1859); and a German edition of Regnault's well-known textbook of chemistry (begun 1851).

STRECKER, Herman (1836-1901). An American entomologist, born in Philadelphia. He acquired considerable skill as a sculptor and designer, but his chief claim to distinction is due to his study of butterflies. His collection of these insects was the largest in America and one of the largest in the world. He published: *Butterflies and Moths of North America* and *Lepidoptera, Rhopalocera and Heterocera, Indigenous and Exotic.* After his death in 1901 his collection was bought by Dean Hoffman for $20,000 and was presented to the American Museum of Natural History in New York City.

STRECKFUSS, strĕk'fŏos, Karl (1778-1844). A German poet and translator. He was born at Gera, studied law at Leipzig, and occupied high positions in the Prussian civil service. His original works include: *Gedichte* (1823), *Neuere Dichtungen* (1834), and *Erzählungen* (1830), but he is best known as the translator of *Ariosto* (1818-20), *Tasso* (1822 and often), and *Dante* (1824-26).—His son Adolf (1823-95), a novelist and historian, was the author of *Friedrich I. und die Quitzows* (1859); *Vom Fischerdorf zur Weltstadt; 500 Jahre Berliner Geschichte* (last ed., 1899); and of *Weltgeschichte, dem deutschen Volk erzählt* (1865).

STREET (AS. *stræt*, from Lat. *strata*, street, highway, fem. sg. of *stratus*, p.p. of *sternere*, Gk. στορεννύναι, *storennynai*, στρωννύναι, *strōnnynai*, OChurch Slav. *streti*, Skt. *star*, Goth. *straujan*, OHG. *strewen*, Ger. *streuen*, AS. *strēawian*, *strēowian*, Eng. *strew*). The term as here used denotes a way for foot and vehicular traffic in cities and other more or less closely inhabited areas.

Some of the points to be observed in planning a city's streets are as follows: The streets should radiate from the principal centre, and sometimes there should be sub-radiations from local centres. This will save time and distance and afford an opportunity for better artistic effects in the way of commanding central features, such as public squares, monuments, and buildings, and pleasing vistas. Placing pipes and wires in subways, or underground galleries, is a modern means for relieving overhead congestion. Much relief has been gained in a number of cities by placing the wires in inclosed underground conduits accessible from manholes, or covered chambers placed sufficiently near together to render street excavations unnecessary. See Subways; etc.

In building sidewalks care must be taken to secure an unyielding, well-drained foundation, in order to prevent uneven settlement, cracks, or breaks. Boards or planks are generally laid crosswise of the walk, on longitudinal string-pieces, or timbers, designed to keep the boards off the ground and postpone the inevitable decay. On account of this decay, wooden sidewalks are, in the long run, decidedly uneconomical. Curbstones are from four to six inches thick and deep enough to form the necessary rise above the gutter and to extend into the earth sufficiently to give a firm foundation. They are often set on broken stone, to insure good drainage, or on concrete, to give a solid foundation. They may be of stone or of concrete. Where concrete is used it sometimes extends so as to form the gutter as well, and has the upper and outer edge of the curb protected with an iron bar or rod, imbedded in the concrete.

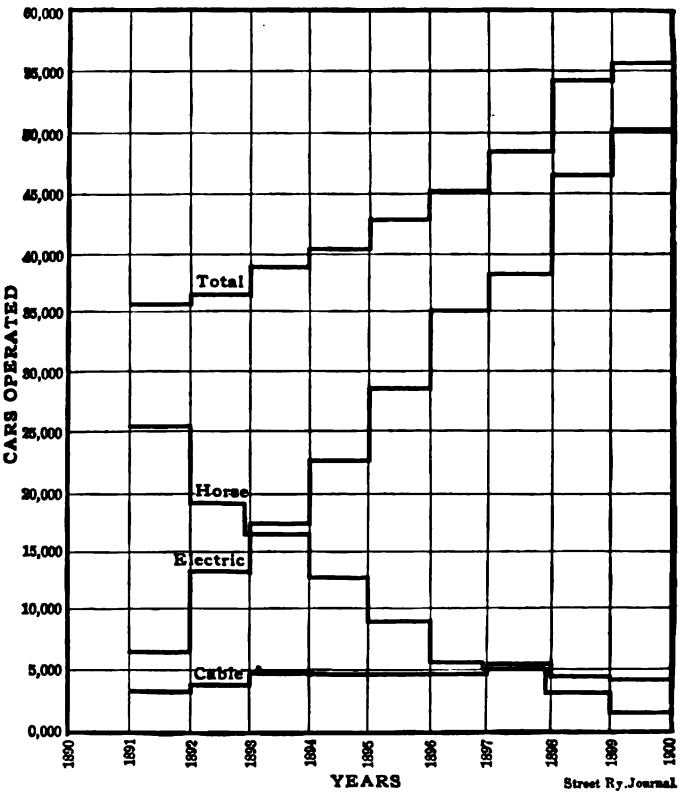
See BOULEVARDS; ELECTRIC LIGHTING; ELECTRIC RAILWAYS; STREET RAILWAY; GAS; HEATING AND VENTILATION (paragraph *Central Heating Plants*); PAVEMENT; ROAD AND STREET MACHINERY; ROAD; SEWERAGE AND DRAINAGE; SUBWAYS FOR PIPES AND WIRES; WATER-WORKS; etc.

STREET, ALFRED BILLINGS (1811-81). An American author, born at Poughkeepsie, N. Y. He studied law and began practice at Monticello, N. Y., but in 1839 removed to Albany, where he became editor of *The Northern Light*, and was, for the latter half of his life, State librarian. His poems deal with the sights and sounds of the woodland and the life of the more primitive days of the settlement of America. Among his verses are: *The Burning of Schenectady, and Other Poems* (1842); *Drawings and Tintings* (1844); *Fugitive Poems* (1846); and *Frontenac; or, the Atotarho of the Iroquois* (1849), a poetical romance. His chief prose works are: *Woods and Waters* (1860); *The Indian Pass* (1869); *Lake and Mountain; or, Autumn in the Adirondacks* (1870); *Eagle Pine; or, Sketches of a New York Frontier Village* (1871); and one learned work, *A Digest of Taxation in the United States* (1863).

STREET, GEORGE EDMUND (1824-81). An English architect. He studied under Gilbert Scott, from whom he got his partiality for the Gothic style and his talent in restoring mediæval monuments. Among his principal buildings are the theological college at Cuddesden, and the churches of Saint Philip and Saint James, at Oxford, of Saint Margaret, at Liverpool, and many well-designed minor churches. Among his restorations are the cathedrals of York, Bristol, and Carlisle, Jesus College Chapel, Oxford, and Wantage church. Among his writings are *The Brick and Marble Architecture of North Italy in the Middle Ages* (1855), and *Gothic Architecture in Spain* (1865), which are classics in their fields.

STREET RAILWAY. A railway laid upon the public streets of a city or a town, and intended principally for the transportation of passengers. The street railway had its origin in the early tramways of Great Britain (see RAILWAYS), and such roads are still denominated *tramways* in all European countries. The street railway for passenger traffic is, however, distinctly an American development, and the modern passenger tramways of Europe owe their inception to the United States. A street railway was operated in New York City in 1831-32, on which a horse car, much like an old English stage coach in construction, ran from Prince Street on the Bowery to Yorkville and Harlem, following for some distance the route now occupied by the Fourth Avenue Railway, which still operates under the original charter granted in 1831. The road was known as the New York and Harlem Railroad, and it continued in operation as a horse-car line until 1837, when it was temporarily changed to a steam-car line. In 1845 the operation of the horse cars on the railway line was resumed, and it remained the only horse-car line in New York until 1852, when charters were granted for the Second, Third, Sixth, and Eighth Avenue lines. Street railways were first built in Boston, Mass., in 1856. Philadelphia, Pa., had its first line in 1857. The street railway was introduced into England in 1860 through the efforts of George Francis Train, the first line being started in Birkenhead opposite Liverpool. Roads were laid in Liverpool in 1868, in London in 1869-71, and afterwards in Glasgow, Edinburgh, and Dublin. A recent authority (Dumont, *Automobiles sur rails*, 1898) says that the first horse tramway in France was built in 1856 on a line extending from Paris to Saint-Cloud, and was called the 'American' railway; but that the first horse-car line in Paris itself was not built until 1875. Street railway enterprises began to be taken up by the South American countries in 1866.

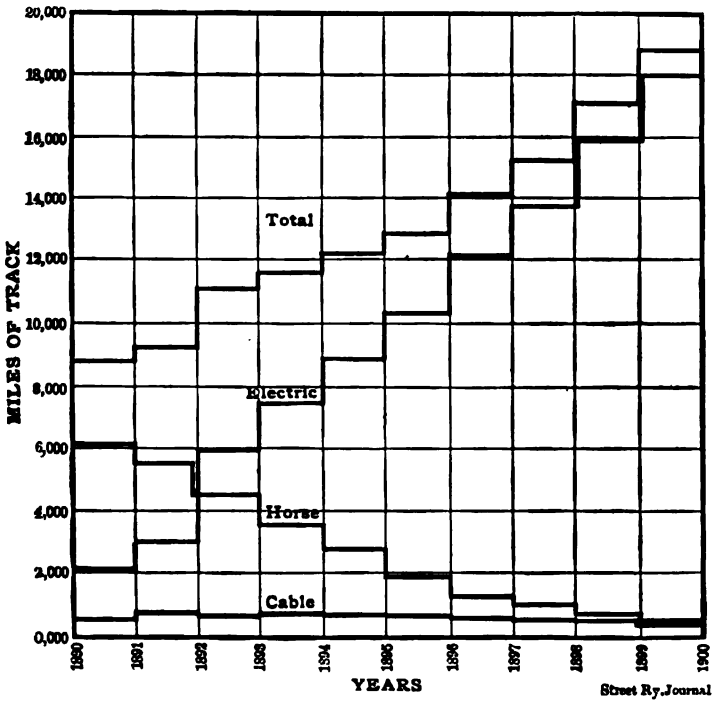
The street railway rail of 1832 was a wrought-iron bar about 5 inches wide, with a groove from 1¾ inches to 2¼ inches wide and from 1 inch to 1½ inches deep, for the wheel flange. The wide and deep groove in this rail gave trouble by catching the wheel tires of ordinary vehicles and wrenching them. To remedy this fault the step rail was adopted. This consisted of a flat bar having a flat surface from 3 inches to 5 inches wide flanked by a ridge or tread about 1 inch high and 1¾ inches wide. This form of rail came into extensive use, especially in America. Another form of step rail had the tread in the centre flanked by a flat surface on each side. The next development was a return to the grooved rail, but with the groove wedge-shaped and narrow. These early forms of rails were simply iron bars spiked to the tops of longitudinal timbers. This timber was replaced by metal longitudinals, chairs, and supports of various sorts as experience suggested improvements, until finally the attempt of trying to maintain the tread or wearing surface of the rail separate from the supporting body was abandoned and the modern girder rail was originated. The girder rail consists of a base and web like the ordinary T-rail for railways, but has a wide grooved head. With the advent of the girder rail the former difficulty of insecure and uneven joints was largely decreased and at the same time a rail was developed which gave the necessary stiffness for carrying the rapidly increasing weights of cars which were made possible by the development of mechanical propulsion. The construction of modern street railway tracks is more fully described in the article on ELECTRIC RAILWAYS.



The success of the first street railways established, inventors and engineers turned their attention to devising means of mechanical propul-

sion. These various methods fall into seven classes as follows: Traction by steam motors, by compressed air, by gas motors, by carbonic acid engines, by ammonia engines, by cables, and by electricity. Steam, gas, compressed air, and vapor motors have been employed in comparatively isolated instances and under special conditions, although they have been the subject of considerable experimentation and are to be met with occasionally in Europe and to a less extent in the United States. The only systems of mechanical propulsion which have attained extended use in America (leaving elevated railways out of account) are cable power and electric motors. The development of electric propulsion for street cars is described in the article on ELECTRIC RAILWAYS.

CABLE RAILWAYS for city passenger service had their origin in San Francisco, and it was at first thought that the system was only applicable to straight lines with heavy grades in favorable climates, but this view was changed when cable traction was established in Chicago on level lines with sharp and difficult curves and was operated despite snow and other climatic disadvantages. As a result an enormous impetus was given to the construction of cable railways in America and such lines were built in a score or more of American cities. In 1886 the Tenth Avenue and 125th Street cable road was put in operation in New York City, and several years later this was followed by the Third Avenue line, 12 miles long, and the Broadway and Lexington Avenue lines. In 1891 there were 70 cable street railway lines in operation in the United States, with an aggregate mileage of 577½ miles. The new construction and extension of the next two or three years increased this total to about 700 miles, which marked the height of the cable railway in America. Since that time the mileage has steadily decreased under the competition of electric traction, until in 1900 there were but 300 miles of cable railway in operation in the United States.



In construction the cable railway consists of a standard street railway track having an underground conduit between the rails. In this conduit there runs an endless wire rope cable guided by suitable pulleys. A slot at the top of the conduit permits a grip projecting downward from the bottom of the car to enter the conduit. This grip is provided at its lower end with jaws which can be so operated from the platforms of the car as to grasp and unloose the cable at will. Generally in modern practice duplicate cables are installed in the conduit, the purpose of which is to have a second cable ready for operation in case of breakage or other accident. Movement is given to the cable by means of a revolving drum around which the cable is wrapped, these drums being operated by powerful steam engines installed in power houses located at intervals along the line. Generally speaking, it is not desirable to operate a greater length of cable than 25,000 feet, but cables as long as 39,000 feet have been successfully operated. The prevalence of curves is perhaps the most important factor determining the length of cable which can be operated. As a general rule it is found that a right angle curve puts a strain upon the cable plant equal to that entailed upon it by 1000 feet of straight road. It may be assumed that from 40 per cent. to 60 per cent. of the power used in operating a cable railway is consumed in operating the cable itself. The size of cable most generally used is 1¼ inches, and the material favored is crucible steel. The life of street railway cables averages about fourteen months, giving from 70,000 to 80,000 miles of service, but there are records of cables having given 144,000 miles of service. In a few cases, of which the New York and Brooklyn Bridge is notable, the cable is not inclosed in a conduit, but is carried on pulleys above ground or on an elevated structure.

In respect to street railway transportation

generally the most notable facts are the enormous growth of street railways in mileage and capital invested, and the predominant position held by electric traction for street railway operation. Both of these facts are graphically illustrated in the accompanying diagrams, compiled by the *Street Railway Journal*. In the ten years

between 1890 and 1900 the street railway mileage of the United States more than doubled; the mileage of cable railways decreased about one-half; the mileage of horse railways decreased from over 6000 miles to 370 miles; and the mileage of electric railways increased from about 2000 miles to over 19,000 miles. A similar course of development has been recorded in the tramway systems of England and Continental Europe, although the totals do not reach the aggregates recorded for the United States. For a condensed statement of the development of electric railways in the countries outside of the United States and Canada, see ELECTRIC RAILWAYS.

BIBLIOGRAPHY. Outside of the electric railway field (see ELECTRIC RAILWAYS) there are no books of much value relating to street railways. There is, however, a large volume of periodical literature of high class available. Among the sources of information of this class the following may be consulted with advantage: *Reports of the American Street Railway Association* (Chicago); Volumes of the *Street Railway Journal* (New York), and the *Engineering News* (New York); *Street Railway Investments* (New York).

STREET RAILWAY EMPLOYEES, AMALGAMATED ASSOCIATION OF. See RAILWAY BROTHERHOODS.

STREITBERG, strīt'bĕrk, WILHELM (1864—). A German philologist, born in Rüdesheim, and educated in Leipzig, where he became docent in 1889. In the same year he was appointed professor of Indo-Germanic philology at Freiburg, a chair which he left in 1899 for a professorship in Sanskrit and comparative philology at Münster. In comparative grammar he ranks close to Osthoff and to Brugmann. In 1892 he became editor of the *Anzeiger für indogermanische Sprach- und Altertumskunde*, the annual bibliography of the *Indogermanische Forschungen*, and of a series, entitled *Germanische Elementarbücher*, in 1896, in which he wrote "Urgermanische Grammatik" (1896, revised 1903), and "Gotisches Elementarbuch" (1897). His earlier works on Germanics are *Die germanischen Komparative auf -oz-* (1890); *Zur germanischen Sprachgeschichte* (1892); and *Entstehung der Dehnstufe* (1894).

STRELITZ, strā'lĭts. A town in the Grand Duchy of Mecklenburg-Strelitz, about two miles south of Neustrelitz. It was formerly the capital of the country. It has some manufactures. Population, in 1900, 4165.

STREL'TSI, STRELTZI, or **STREL'ITZ.** The Russian Imperial guard, organized by Ivan IV. in the second half of the sixteenth century. At that time, and for long afterwards, they were the only standing force in Russia, and at times amounted to between 40,000 and 50,000 men. They were stationed at Moscow in time of peace, in a quarter of the capital which was set apart for them, and enjoyed special privileges. Incessant conspiracies rendered them in time dangerous. In 1698 a revolt of the Streltsi led to a bloody contest in which they were defeated with great loss. Peter the Great finally suppressed them (1705).

STREMAYR, strā'mĭr, KARL VON (1823-1904). An Austrian statesman, born at Gratz, where he also studied law, entered the Government service, and subsequently was Attorney-General and docent at the University. In 1868 he was appointed councilor in the Ministry of the Interior, and in 1870-79 was Minister of Public Instruction, when he brought about the repeal of the concordat of 1855. President of the Council after the going out of the Auersperg Ministry in 1879, he entered the Cabinet of Count Taaffe as Minister of Justice, but resigned in 1880, was appointed vice-president and, after Schmerling's resignation in 1891, president of the Supreme Court, from which post he retired in 1899. He was called to a seat in the House of Lords in 1889.

STRENGTH OF MATERIALS. A term which may be defined as the resistance which materials offer against deformation. Every load produces in the structure an internal resistance which balances it, and this internal resistance is called a *stress*. Three kinds of direct stress may be produced by load, viz. a stress tending to pull apart, or *tensile stress;* a stress tending to push together, or *compressive stress;* and a stress tending to slide on parallel planes, or shearing stress. Complex

stresses such as flexure and torsion are capable of being resolved into tension, compression, and shearing stresses. A *unit stress* is the stress per unit of area; the unit of area is the square inch in English-speaking countries and the square centimeter in countries where the metric system of measures prevails. In all cases of direct stress the total stress is supposed to be uniformly distributed over the area of the cross-section. When a tensile or compressive force is applied to a bar of metal it elongates or is shortened, and up to a certain limit the elongation or shortening is proportional to the load. Beyond this limit the elongation or shortening increases more rapidly than the load. The unit stress at which the deformations begin to increase in a faster ratio than the stress is called the *elastic limit*, or less commonly the elastic strength. When the unit stress in a bar is less than the elastic limit, the bar returns, when the stress is removed, to its original dimensions. When, however, the unit stress is greater than the elastic limit, the bar does not fully return to its original dimensions, but a permanent distortion remains. Therefore, if a material is strained beyond its elastic limit, a permanent injury results to its elastic properties; and for this reason it is the universal practice in designing engineering structures to make certain that the unit stresses never exceed the elastic limit of the material. When a material is under a stress exceeding its elastic limit it is usually in an unsafe condition. If the stress be increased the deformation rapidly increases until finally the material ruptures.

The unit stress which occurs just before rupture takes place is called the *ultimate strength* of the material. The ultimate strengths of materials are from two to four times as great as their elastic limits. The strength of materials is determined by straining a piece of the material to rupture and observing the elastic limit, ultimate strength, and other coördinate phenomena.

TENSION. In testing a material under tension a 'test piece' or 'test specimen,' usually eight inches long and one square inch in section, is broken by direct pull. The loads are gradually applied. At first each increment of load produces a proportionate increment of elongation, but after the load has reached a certain amount the elongation begins to increase more rapidly than the load. The unit load recorded just as this change in the rate of deformation takes place is the elastic strength or the elastic limit of the material. As the load continues to increase the elongation increases more rapidly than the load and is commonly accompanied by a reduction in area of the cross-section of the test piece. Finally the test piece breaks and its ultimate strength is recorded. Record is also taken of the total elongation of the piece and of the total reduction of area. These last two records are indices of the ductility of the material. The usual records of a tensile test of materials consist, therefore, of figures showing the elastic limit, the ultimate strength, the percentage of elongation, and, often, the percentage of reduction of area. These values vary greatly for different kinds of materials and considerably for different qualities of the same material. In printing figures for illustration, therefore, the best that can be done is to select rough average values. The following figures are taken from Prof. Mansfield Merriman's *The Strength of Materials* (New York, 1897), which will be found an excellent discussion of the subject for the non-technical reader:

MATERIAL	Elastic limit, lbs. per sq. inch.	Ultimate strength, lbs. per sq. inch.	Ultimate elongation, per cent.
Timber	3,000	10,000	1.5
Cast Iron	6,000	20,000	0.5
Wrought Iron	25,000	55,000	20.
Steel	50,000	100,000	10.

COMPRESSION. In testing for compressive strength the test piece used is short and thick, a cube and a short cylinder being the common forms of test pieces. The phenomena which occur are substantially as in tension, first a distortion proportional to the load until the elastic limit is reached, and then a distortion increasing more rapidly than the load increases until rupture occurs. The manner in which rupture occurs is quite different from the manner in which it occurs in tension. In tension the material draws down to a smaller diameter and finally parts by a more or less ragged fracture at approximately right angles to the direction of the pull; in compression the test piece first bulges to an increased diameter and then ruptures with a fracture oblique to the direction of the pressure. This method of fracture occurs only when the test piece is thick compared with its height; when the height is great compared with the thickness lateral flexure or bending occurs and the conditions of rupture are no longer those of simple compression, as it is explained in the succeeding paragraph on the strength of columns. As was the case with tension, only rough average figures of comparative strength can be given, owing to the fact that this strength varies for different materials and with different qualities of the same material. The following figures are quoted from the work of Professor Merriman which is named above:

MATERIAL	Elastic limit, lbs. per sq. inch	Ultimate strength, lbs. per sq. inch
Timber	3,000	8,000
Stone	—	6,000
Cast Iron	20,000	90,000
Wrought Iron	25,000	55,000
Steel	50,000	150,000

SHEAR. Shear is the stress produced by two parallel forces acting on the material in opposite directions, as, for example, do the blades of a pair of shears. If a weight be suspended by a bar which is composed of two shorter bars connected at one end by a rivet or bolt passing through them, the stress brought upon the rivet is a shearing stress. The same stress is exerted by a punching machine in punching holes in metal plates. The shearing strength of materials often differs according to the direction in which the shearing forces are exerted. Thus the shearing strength of timber is much less along the grain than at right angles to the grain. The following figures taken from Professor Merriman's book named above give the average ultimate shearing strengths of the more common structural materials:

MATERIAL	Pounds per sq. inch
Timber, longitudinal	600
Timber, transverse	3,000
Cast iron	20,000
Wrought iron	50,000
Steel	70,000

ACTUAL VALUES. The figures given in the preceding tabular statements show rough average values, useful chiefly to be memorized as a basis for approximation. In careful designing the engineer requires actual values as determined by authoritative tests upon the particular material he is using or proposes to use. These values vary within quite narrow limits for each kind or quality of any material and within broader limits for all kinds and qualities of the same material. The ultimate average strengths of six of the most common structural timbers are as follows:

TIMBER	Pounds per square inch	
	Tensile strength	Compressive strength
Hemlock	8,000	5,000
White pine	8,000	5,500
Chestnut	12,000	5,000
Red oak	9,000	6,000
Yellow pine	15,000	9,000
White oak	12,000	8,000

These values have been obtained by testing small pieces. Timbers of large size such as are actually used in engineering structures will fall from 20 per cent. to 50 per cent. below these values in strength. These values are also subject to a variation of about 25 per cent. according to time of cutting, place of growth, and methods of seasoning. The shearing strength of timber is more variable than either the tensile or the compressive strength. The values average about as follows:

TIMBER	Pounds per square inch	
	Along the grain	Across the grain
White pine	500	2,500
Chestnut	600	1,500
Yellow pine and oak	600	4,000

The elastic limit of timber is not well defined; it varies from one-third to one-half the ultimate strength in tension. The elongation at the point of rupture in tension is from 1 per cent. to 2 per cent. Tensile and shearing tests of brick are seldom made, but the compressive strength varies from 500 pounds per square inch for soft brick to 10,000 pounds for pressed brick, and to 15,000 pounds for the best qualities of hard burned paving brick. The crushing strengths of the principal building stones of the United States are about as follows:

STONE	Pounds per square inch	
	Minimum	Maximum
Trap rock	20,000	24,000
Granite	12,000	21,000
Marble	8,000	20,000
Limestone	7,000	20,000
Sandstone	5,000	15,000

Cast iron is so variable in quality that similar specimens will vary from 10 per cent. to 20 per cent. in strength. Fair average values are 20,000 pounds per square inch in tension and 90,000 pounds per square inch in compression. The elastic limit is poorly defined and the elongation is practically nil, indicating clearly the fact, known to every one familiar with this material, that it is a hard and brittle substance. A direct contrast to cast iron is afforded by wrought iron with a tensile and a compressive strength nearly equal and ranging between 50,000 and 60,000 pounds per square inch, and with an elongation of 20 per cent. to 30 per cent. and an elastic limit well defined at about 25,000 pounds.

Steel is manufactured in a variety of grades distinguished by the relative amounts of contained carbon, as mild steel, medium steel, hard steel, and extra hard steel. Ordinary structural steel for bridge and building construction has an ultimate tensile strength of from 60,000 pounds to 70,000 pounds per square inch and an elastic limit of from 30,000 pounds to 40,000 pounds per square inch. Nickel-steel, or steel containing a small percentage of nickel, has been made with a tensile strength of 277,000 pounds per square inch and an elastic limit of 100,000 pounds per square inch. The compressive strength of steel is always greater than its tensile strength. The maximum compressive strength recorded for hardened steel is 392,000 pounds or 196 tons per square inch.

The tensile strengths of some of the other more common metals are about as follows:

MATERIAL	Pounds per sq. inch
Brass, cast	23,500
Brass wire	49,000
Copper, cast	24,000
Copper wire	60,000
Gold, cast	20,000
Gold wire	27,500
Lead, cast	2,050
Lead wire	1,650
Platinum wire	56,000
Aluminum	25,000

Common mortar composed of one part lime and five parts sand has a tensile strength of from 15 to 30 pounds and a compressive strength of from 150 to 300 pounds per square inch at the age of six months. Natural hydraulic cement will test from 100 to 200 pounds per square inch in tension when one month old, and Portland cement will test from 600 to 800 pounds per square inch at the same age. Mortars and pastes of cement and lime increase in strength with age. For a concise statement of strengths of a great variety of other materials, see Trautwine, *Engineers' Pocket Book* (New York, 1900).

WORKING STRESSES. The loads carried by a structure should never strain the material to an amount at all close to its ultimate strength. Were they to do so the elastic limit of the material would be exceeded and distortion would ensue even though ultimate rupture did not occur. Therefore, in designing a structure a unit stress is adopted which is certain not to cause distortion or rupture, and the size of each member is determined by dividing this unit stress into the total load on the member. This assumed unit stress is called the working stress, and it varies for any material according to the character of the load it is to support. Thus the safe working stress for a varying load is less than for a steady load, and that for a sudden load or shock is less than for a varying load; a load producing tension and compression alternately requires the use of a smaller working stress than does a steady load or a va[illegible] in tension only. In all cases the wo[illegible]

must be less than the elastic limit of the material. It has long been the practice to call the ratio of the ultimate strength to the working stress *the factor of safety*. The factors of safety commonly employed for different materials and for different forms of load are given by Professor Merriman as follows:

MATERIAL	For steady stress (buildings)	For varying stress (bridges)	For shocks (machinery)
Timber	8	10	15
Brick and stone	15	25	35
Cast iron	6	15	20
Wrought iron	4	6	10
Steel	5	7	15

RESILIENCE. One of the most important properties of a material is its capacity to resist the work of external forces, or its resilience. If a bar is placed in a testing machine and pulled by a force gradually increasing from 0 to F, and this pull produces an elongation equal to *e*, the work done on the bar is the product of the average pull into the elongation, or one-half *Fe*. Since the internal stresses in the bar resist the work done by the external force, they must also perform an amount of work represented by one-half *Fe*, and the measure of resilience of a material is the product of the average force exerted upon it multiplied by the elongation which this force produces. Elastic resilience is that internal work which has been performed when the internal stress reaches the elastic limit; ultimate resilience is that internal work which has been performed when the material is replaced. Resilience, like work (see WORK), is measured in foot pounds, or, more commonly, in inch pounds. The higher the resilience of a material is the greater is its capacity to resist the work of external forces. Cast iron has very low resilience and wrought iron and steel have high resilience.

BENDING STRESS. When a beam is loaded it is bent from its original form and takes a curved shape. The fibres on one side of a loaded beam are, therefore, shortened or compressed and the fibres on the opposite side are lengthened or subjected to tension. Midway between the two sides where compression ends and tension begins there are fibres which are neither shortened nor lengthened, and this layer or surface of fibres is called the neutral surface. A simple beam is a bar resting upon supports at its ends and is the kind most commonly in use. A cantilever beam is a bar resting on one support at the middle, or if a part of a beam projects out from a wall or beyond a support it is called a cantilever beam. In a simple beam the lower part is under tension and the upper part is under compression; in a cantilever beam the reverse is the case. Beams almost universally fail by tearing apart under the horizontal tensile stress developed by bending. Mathematicians have calculated formulas for determining the resilience of beams to bending, the safe loads to be put on beams, etc., but a consideration of these is a matter of some intricacy and the reader is referred to the books mentioned at the close of this article for such information. From these studies, however, the following important laws regarding rectangular beams have been formulated: The strength varies directly as the breadth and directly as the square of the depth; the strength varies inversely as the length; a beam is twice as strong under a distributed load as under an equal concentrated load.

STRENGTH OF COLUMNS. A bar under compression whose length is greater than about ten times its thickness is called a column. Columns generally fail under stresses produced by combined compression and bending. The phenomena are very complex and their investigation is a problem of great intricacy, for whose solution the reader must consult special treatises on the subjects. Columns are of three kinds: Class *a* includes those with hinged ends; class *b* includes those with one end hinged and one end fixed (the piston rod of a steam engine is a column of this type); class *c* includes those having both ends fixed, these being used in bridge and building construction. It has been found by experiment that class *c* is stronger than class *b* and that class *b* is stronger than class *a*.

TORSION. Torsion is that kind of stress which occurs when external forces tend to twist a body round an axis. A shaft which transmits power is twisted by the forces applied to the pulleys and thus all its cross-sections are brought into stress. This stress is a kind of shearing, but the forces acting in different parts of a section are not parallel. Special formulas have been developed by engineers for calculating strength against torsional stress.

BIBLIOGRAPHY. Besides the work of Professor Merriman which has been mentioned, the reader may consult to advantage the following works: Johnson, *The Materials of Construction* (New York, 1897); Thurston, *Materials of Engineering* (ib., 1883); Unwin, *The Testing of Materials of Construction* (ib., 1899); Mehrtens, *Testing of Materials* (ib., 1901).

STRE'PHON. In Sidney's *Arcadia*, a shepherd in love with Mania. In literature, a stock name for a lover.

STREPSIP'TERA (Neo-Lat., from Gk. *στρέψαι, strepsai*, aor. of *στρέφειν, strephein*, to twist + *πτερόν, pteron*, wing). A group of insects of rather uncertain rank and position, comprising the curious family Stylopidæ, and now thought to fall in the Coleoptera. The group consists of a small number of species, very singular in structure and habits, apparently forming a connecting link between Coleoptera and Hymenoptera. The species are all small, and in their larval state live parasitically in the bodies of bees, wasps, and certain Hemiptera, forming the genera Stylops, Colacina, and Xenos. The first infests bees of the genus Andrena, and Xenos occurs in a genus of wasps (Polistes). Bees that are carrying or have carried Strepsiptera are said to be 'stylopized,' because the abdomen of the bee is deformed. These parasites do not cause the death of the host. When about ready to transform the larva pushes one end of the body out between two of the abdominal segments of its host. The metamorphosis of the female is very slight, while that of the male is complete. The male leads a short and extremely active life of a few hours only, or in some species of a day. The female never changes position and becomes little more than a sac filled with an enormous number of developing young. When the young emerge they are known as 'triungulins.' How the triungulins find their way to the bee-larvæ is not known. It is supposed by some writers that parthenogenesis occurs with the Strepsiptera,

but there appears to be no definite proof. The Strepsiptera are also sometimes called Riphiptera.

STREPTOCOCCUS. See BACTERIA; SEPTICÆMIA; PYÆMIA.

STRET'FORD. A manufacturing town in Lancashire, England, 3½ miles southwest of Manchester. Population, in 1891, 21,756; in 1901, 30,346.

STRET'TO (It., bound). In music, a term which signifies that the movement to which it is prefixed is to be performed rapidly, with a gradual acceleration toward the close. The term *stretto* is also applied to the finale of a fugue, where the subject and answer enter so closely together that they overlap. See FUGUE.

STRICK'LAND, AGNES (1796-1874). An English historian, daughter of Thomas Strickland, of Reydon Hall, near Southwold, in Suffolk, born in London. She was educated mostly at home under the direction of her father. After writing considerable verse and several historical tales for children, Miss Strickland planned a series of biographies of the Queens of England. In this undertaking she was much helped by her sister Elizabeth (1794-1875). *The Lives of the Queens of England* appeared in sections between 1840 and 1848, and filled twelve volumes (revised edition, 6 vols., 1864-65). Meanwhile, besides much miscellaneous work, Miss Strickland published *Letters of Mary Queen of Scots* (1842-43; complete ed., 5 vols., 1864); *Lives of the Queens of Scotland* (1850-59); *Bachelor Kings of England* (1861); and *Lives of the Last Four Stuart Princesses* (1872). Consult the *Life* by her sister Jane M. Strickland (Edinburgh, 1887), and *Pearls and Pebbles*, by another sister, Mrs. Catherine P. Traill (London, 1894).

STRICKLAND, HUGH EDWIN (1811-53). An English geologist. He studied at Oxford, and in 1850 became reader in geology at that university, succeeding Dr. Buckland, and retaining the post till his death. He was one of the founders of the Geological Society, and of the Ray Society, which on account of his representations undertook the publication of Agassiz's *Bibliographia Zoologiæ et Geologiæ*, three volumes of which he edited. He was associated with Sir Roderick I. Murchison in the recognition and study of the Silurian system.

STRICT CONSTRUCTIONISTS. A term in American politics applied to those who, for various reasons, have maintained that the Federal Constitution should be construed strictly in accordance with its letter, as opposed to those, known as 'broad constructionists,' who have believed that the Constitution should be construed liberally, and have claimed for the General Government more or less extensive powers, called 'indirect powers' or 'implied powers,' not granted specifically by the Fundamental Law. Conflicts between the adherents of the two views have recurred frequently in the history of the United States, e.g. in the controversies over the chartering of a United States Bank, over the question of 'internal improvements,' and over the power of the General Government with regard to the restriction or prohibition of slavery in the Territories; and it is upon this question that, directly or indirectly, party differences in the United States have been largely based. In general, it may be said that the strict constructionist view has been held, more or less consistently, by the Anti-Federalist and Democratic parties (qq.v.); and the broad constructionist view, more or less consistently, by the Federalist, National Republican, Whig, Free-Soil, and Republican parties (qq.v.); though there has been a tendency for the party in power, irrespective of its platform, to lean to the side of broad or liberal construction, and for the party in opposition, also irrespective of its platform, to lean to the side of strict construction. A broad constructionist policy has always had for its effect the strengthening of the Central Government as compared with the States; and a strict constructionist policy the strengthening of the States as compared with the Central Government. See CONSTITUTION; UNITED STATES, section on *History*.

STRICTURE (Lat. *strictura*, from *stringere*, to draw tight). A contraction in the calibre of one of the mucous-membrane-lined tubular structures of the body, such as the urethra, the rectum, the œsophagus, or the larynx. The most common form of stricture and the variety generally referred to when the term stricture is used alone is stricture of the urethra. Three varieties of stricture of the urethral canal are recognized: (1) spasmodic; (2) inflammatory; and (3) organic. The first form is due simply to reflex muscular contraction caused by irritation of some portion of the urethra, as from an ulcerating spot or a sensitive organic stricture. The second form is due to simple inflammatory swelling of some portion of the urethral tract, such as occurs in acute gonorrhœa or after the internal administration of such drugs as cantharides and turpentine. The third, and by far the most frequent and important variety of stricture, is caused by permanent changes in the tissues of the urethra and those surrounding it. These changes usually consist either in inflammatory thickening of the urethral wall and periurethral tissues or else in actual cicatrization and narrowing of the channel from the accompanying contraction; or both of these conditions may be present at the same time. The initial causes in bringing these changes about are chronic inflammation (*gonorrhœa*) or injuries by caustic or irritant substances.

The results of stricture of the urethra if allowed to persist are often far-reaching and disastrous. The bladder, ureters, and kidneys may finally in turn become the seat of disease from the continued retention of urine unable to find free and regular exit through the natural outlet, or rupture of the urethra from prolonged retention, allowing extravasation of urine into the surrounding tissues, with death resulting from uræmic poisoning.

The treatment of organic stricture of the urethra is mainly mechanical. It consists in dilatation of the contracted area by means of sounds or bougies, and where this method is inapplicable divulsion of the stricture by means of suitable cutting instruments is indicated. After division of the stricture the lumen of the urethra is kept open to the proper degree by the subsequent periodic passage of a sound. Consult Dennis, *American Text-Book of Surgery* (Philadelphia, 1892).

STRIEGAU, strē'gou. A town in the Province of Silesia, Prussia, 25 miles by rail south-

east of Liegnitz (Map: Germany, G 3). Leather products, cigars, sugar, brushes, and whips are the principal manufactures. Basalt and granite are mined in the vicinity. Population, in 1900, 12,858.

STRIGEL, strē'gel, BERNHARD (c.1460-1528). A German painter of the Swabian school, born at Memmingen and probably a pupil of Zeitblom at Ulm. He stood in high favor with the Emperor Maximilian I., in whose service he repeatedly journeyed to Augsburg, Innsbruck, and Vienna. His religious paintings, of which there are four interesting altar wings (1515) in the Berlin Museum and a Pietà, besides three others, in the Karlsruhe Gallery, do not quite equal his portraits, notable specimens of which are that of the Augsburg patrician Konrad Rehlinger (1517), in the Pinakothek, Munich; "Councilor Cuspinian and Family" (1520), in the Berlin Museum; and "Emperor Maximilian with Family" and "King Louis II. of Hungary" (1524), both in the Vienna Museum.

STRIGEL, VIKTORIN (1524-69). A theologian of the Reformation period. He was born at Kaufbeuren, Swabia, studied under Melanchthon in Wittenberg, and became professor at Jena in 1548. He became involved in the synergistic controversy (see SYNERGISM) and was imprisoned for several months in 1559. Ultimately he was forced to leave Jena, and went to Leipzig (1562), and later to Heidelberg (1567). Here he was charged with holding Calvinistic views. His chief work was the *Loci Theologici*, published posthumously (1581-84). Consult: Otto, *De Victorino Strigelio* (Jena, 1843); Döllinger, *Die Reformation*, vol. iii. (Regensburg, 1848).

STRIKE (AS. *strīcan*, to advance quickly, OHG., *strīhhan*, Ger. *streichen*, to stroke, Goth. *strīks*, stroke; connected with Lat. *stringere*, to draw tight, Gk. *στραγγάλη*, *strangalē*, halter, *στραγγός*, *strangos*, twisted). A term used in geology to indicate the line of intersection of a stratum with the plane of the horizon, the strike thus being at right angles to the dip. The line of strike coincides with the outcrop when the surface of the ground is level, or when the dip is vertical. If the dip is constant in one direction, the strike will be a straight line; but with a gradually changing dip, as from south through southeast to east, the strike will be a curve. In the case of a quaquaversal fold it is a complete circle. The strike is usually measured by placing the compass so that the north and south line is at right angles to the dip and then reading the number of degrees from the north pole of the needle to the north and south line; a strike of N. 45° E. thus means 45° east of north or northeast. See DIP.

STRIKES and LOCKOUTS. A strike, in industry, occurs when there is a cessation of work on the part of a body of employees acting in concert to enforce some demand upon the employer, or to resist some demand which the employer has made. The employees are here assumed to take the initiative in ceasing work. When, on the other hand, the employer shuts down his establishment in order to compel workmen to comply with some demand, the suspension is called a lockout. It is not always easy to distinguish the two in practice, especially as an employer may not infrequently lock out his men in anticipation of, or on threat of, a strike.

Certain popular movements in the Middle Ages bear resemblance to strikes, such as the disturbances in England in the second half of the fourteenth century. More like the modern strikes were the contests between different guild organizations, or between journeymen and guildsmen, in both English and Continental towns. But as a social problem, as a frequent and apparently enduring feature of the industrial system, strikes belong to the nineteenth century. The strike has usually been an essential part of the policy of trade unions (q.v.). Misused though the strike has sometimes been, the existence of the union as its directing and controlling agency has been the chief means in transforming local, half-insurrectionary outbreaks into carefully planned attempts to attain well-recognized ends.

The detailed causes of strikes are manifold, but the chief causes concern the wages question. In prosperous times strikes are likely to be made for increase of wages; in times of depression, against a decrease. Demand for a reduction of hours is a relatively frequent cause. Also of importance are strikes for the enforcement of union rules of work, for recognition of the union against the employment of non-union men, and in sympathy with strikes in other trades. The strike is often the first weapon employed by a newly organized body of laborers to strengthen their position. Laborers have sometimes complained that they were forced into a strike by their union, and an unsuccessful strike often results in the dissolution of a local union or in the decay of a larger body. The sympathetic strike has not generally proved advisable, and is regarded with disfavor by the best unions. To avoid or put down strikes employers may form organizations or use the lockout. They have at times been accused of instigating violence in order to bring the strike into public disfavor and obtain the aid of troops. On the employees' side boycotting and 'picketing' of all sorts are likely to occur in a serious strike. The bitter feeling against men who refuse to strike or who come to take strikers' places often makes the more peaceable forms of persuasion end in intimidation or violence. Public sympathy is an almost essential element in the success of any large strike, and is likely to be alienated by violence or the destruction of property. This is well realized by the better trade unions, but when disorder or riots occur—often due to a semi-criminal floating population—the public may probably fail to lay the blame elsewhere than on the strikers. The magnitude of some recent strikes in important industries has emphasized the harm done to general business, and the interest which the public has in labor disputes as a third and impartial party. Conciliation and arbitration have come prominently forward as remedies for strikes. In 1888 a Federal law provided for the appointment by the President of strike commissioners in disputes involving inter-State commerce, and the Chicago Strike Commission recommended a permanent commission on the subject. The improved organization of trade unions, their increased responsibility, and the use of the trade agreement may lessen the waste of strikes in the future.

LEGAL ASPECT. Any combination of laborers to raise wages was illegal in England until 1824,

and in France until 1864. In the United States strikes as such have never been illegal, but until after 1830 it was not definitely settled that strikers could not be arraigned for civil and criminal damages under the conspiracy laws. When a strike represents a combination to injure property or a definite person it is illegal, and the same is true of acts of intimidation, the destruction of property, or the forcible prevention of work. Some forms of sympathetic strikes and of the boycott have been held illegal. Riots are covered by the criminal law. In many States there are special statutes regarding strikes. Thus the common law of conspiracy has been expressly repealed in New York, Pennsylvania, New Jersey, and several Western States, but the statutes usually provide for punishment of the use of force or intimidation. Certain States have special laws regulating strikes on railways or in mines, a few make the municipality or county responsible for damages due to strikes, while Missouri and Wyoming forbid the employment of private officers from without the State for the protection of the employer's property against violence on the part of the strikers. The use of injunctions has been regulated by statute only in Kansas. A difficult question is often involved in determining how far workmen may go in persuading others to join a strike. A leading case is that of the Northern Pacific Railroad (Arthur *vs.* Oakes, 63 F. R., 310), in which the employees were enjoined from (1) intimidating, (2) persuading others to strike, or (3) combining to strike themselves in such manner as to cripple the railroad. On appeal, however, the second and third clauses were abolished. Since the passage of the Inter-State Commerce Act (1887) and the Anti-Trust Law (1890), the courts of equity have acquired enlarged powers. Interference with the United States mails or with inter-State commerce (in railroad strikes) may be a serious offense. The United States can obtain an injunction against strikers, who, if they violate its provisions, may be summarily punished for contempt of court. In cases where railroads are under receivers the receiver is regarded as an official of the court, and a strike against the road may be as such unlawful. The use of injunctions in labor disputes is by no means new, but was brought into special prominence by the Chicago strike of 1894. As a method of dealing with strikes the injunction is prompt and effective, but its execution practically involves arrest without indictment and trial without jury; it implies very great power in the hands of courts; and its frequent employment, not always in the wisest way, has created much bitter feeling and distrust of courts among workingmen.

HISTORY. In the United States there are a few records of strikes previous to 1800, such as those of the journeymen bakers in New York in 1741, and of the journeymen shoemakers in Philadelphia in 1796, 1798, 1799, and 1805. Something like a modern strike occurred in New York in 1802 among the sailors. They paraded the streets and compelled others to join them, but were dispersed by constables, and their leader was punished. From 1821 to 1834 there are accounts of only a few strikes each year, the records being doubtless very incomplete. These were generally among the building trades, hatters, tailors, shoemakers, and laborers on the Chesapeake and Ohio Canal. "In 1835," says the report of the Commissioner of Labor (1901, p. 721), "strikes had become so numerous as to call forth remonstrant comments from the public press." A number of strikes for a ten-hour day occurred in the thirties, while strikes for eight hours were general in 1872-73. From 1881 to 1900, according to the Reports of the United States Department of Labor, there have been 22,793 strikes, involving 117,509 establishments and 6,105,694 employees thrown out of employment. Of the latter 90 per cent. were males. The duration of strikes varies of course within wide limits, the average for twenty years being 23.8 days. The statistics of wage loss to employees ($257,000,000) and to employers ($122,000,000) have very little significance. More than $16,000,000 was contributed by labor organizations (the figure is probably too low). Considered by States, 28 per cent. of all strikes occurred in New York, 12½ per cent. in Pennsylvania, 11.6 per cent. in Illinois, 7½ per cent. in Massachusetts, and 6 per cent. in Ohio. In New York City 5090 strikes are recorded, in Chicago 1737. Considered by industries 19½ per cent. of all strikes occurred in the building trades, 11 per cent. in coal and coke, 9 per cent. in the metal trades, 6.6 per cent. in tobacco, 5.6 per cent. in transportation. The largest strikes usually occur in mining and railroading, as is shown by the fact that of the total number of striking employees 31 per cent. were in coal and coke, 7.9 per cent. in transportation, and only 10.9 per cent. in the building trades.

Labor organizations ordered 63.46 per cent. of the total strikes, and of these 52.86 per cent. (of establishments involved) were successful, 13.6 per cent. succeeded partly, and 33.54 per cent. failed. The corresponding figures for strikes not ordered by organizations are 35.56 per cent., 9.05 per cent., and 55.39 per cent., this advantage of organization appearing for each of the twenty years. As to cause, 28.7 per cent. of the strikes were for increase of wages, 11.23 per cent. for the same with reduction of hours, 11.16 per cent. for reduction of hours, 7.17 per cent. against reduction of wages, 3.47 per cent. in sympathy with a strike elsewhere, 2.34 per cent. against employment of non-union men, and 2.35 per cent. involving recognition of the union.

Among historic American strikes have been the great strikes of 1877 on the Baltimore and Ohio, Pennsylvania, and other railroads, in which much damage to property was done and troops were called out; the telegraph operators' strike in 1883; the strike on the Gould system in 1885; the Homestead strike at the Carnegie works in 1892, the bitterest in American history and involving a sanguinary battle between Pinkerton detectives and unionists; the Chicago strike of 1894, which grew out of an effort of the newly organized American Railway Union to boycott Pullman cars in order to aid strikers at the Pullman works; the bituminous coal strike in the summer of 1894; street railway strikes in several large cities (1900-01); the steel strike (1901); and the great anthracite coal strikes of 1900 and 1902.

In England, strikes being illegal, until 1824 participants could be and were punished for conspiracy. At that date the combination laws were repealed, and since then a number of statutes have defined the legal position and rights of

workmen in labor disputes. The better-developed English unions have adopted a conservative policy in regard to strikes. Employers are more accustomed to dealing on equal terms with their men than is true in the United States. The formation of unions of unskilled laborers has been accompanied by many strikes, among which the great Dock strike of 1889 attracted a remarkable amount of public sympathy and assistance. The engineering strike of 1896 roused much discussion as to the effect of unionism on English trade supremacy. In 1900 there occurred in Great Britain 648 strikes and lockouts, involving directly 135,145 employees; 202 of the disputes resulted in favor of the employees, 211 in favor of employers, and 221 were compromised. In Germany (1900) there were reported 1433 strikes, involving 122,803 workmen; 275 strikes succeeded and 505 succeeded partly. In France for the same year are recorded 1229 strikes and 432,324 strikers; 371 were wholly and 368 partly successful. In 1890 a famous strike occurred in New South Wales, beginning as a strike of the Shearers' Union against non-union men, but spreading to the railroads, and finally to nearly all industries. The report (Sydney, 1891) of the commission appointed to investigate it is one of the most valuable books upon the subject.
